ANNUNCIATE, ANNUNTIADA, or ANNUNTIATA, a denomination common to ſeveral orders, both religious and military; inſtituted with a view to the Annunciation. The firſt religious order of this kind was inſtituted in 1232, by ſeven Florentine merchants.—Theſe are alſo called *Servites,* q. d. *Servants.*

The ſecond was a nunnery at Bourges, founded by Joan, queen of France, after her divorce from Lewis XII.

The third was alſo a nunnery, founded by a Genoeſe lady in 1600.—The fourth was a friary, founded by cardinal Torrecremata, at Rome; which laſt are grown ſo very rich, that they give fortunes of ſixty Roman crowns to above 400 girls, on the anniverſary of the Annunciation.

ANNUNCIATA, *or knights of the* ANNUNTIADA, was a military order, inſtituted in 1362, by Amadeus VI. duke of Savoy; in memory of Amadeus I. who defended the iſle of Rhodes againſt the Turks.

It was at firſt called the order of the true lovers knots; in memory of a bracelet of hair preſented to the founder by a lady; but, upon the election of Amadeus VIII. to the pontificate, it changed its name for that of the *Annunciate,* in 1434. The great collar of the order, which the knights wear on public occaſions, weighs 250 crowns of gold, and the following letters are engraven on it: *F. E. R. T.* ſignifying *Fortitudo ejus Rhodum tenuit.*

ANNUNCIATION, the tidings which the angel Gabriel brought to the Holy Virgin, of the myſtery of the incarnation.

The word is compounded of *ad* and *nuncio, I declare.* The Greeks call it ευαγγελισμος, *good tidings;* and χαιρετισμος, *ſalutation.*

ANNUNCIATION is alſo the name of a feaſt, celebrated annually on the 25th of March, popularly called *Lady-day,* in commemoration of that wonderful event.

Some authors are of opinion, that the feaſt was originally ſolemnized in honour of our Saviour; and that the holding it in the name and honour of the Virgin is of a much later ſtanding.

Several of the eaſtern churches celebrate the *Annunciation* at a different ſeaſon from thoſe of the weſt.—The Syrians call it *baſcarach,* q. d. *ſearch, inquiry;* and mark it in their calendar for the firſt day of December. The Armenians hold it on the fifth of January; thus anticipating the time, to prevent its falling in Lent; but the Greeks make no ſcruple of celebrating the feſtival even in Lent.

The Jews alſo give the title *Annunciation* to part of the ceremony of their paſſover; viz. that, wherein they explain the origin and occaſion of that ſolemnity.—This explanation they call הגדה, *Haggada,* q. d. the *Annunciation.*

ANNUNTIATOR, in the Greek *Church,* an officer whoſe buſineſs is to give notice of the feaſts, and holy days to be obſerved.

ANOCHUS, an imaginary name of a *medicine,* concerning which many fruitleſs conjectures have been made. The word occurs only in Gaza's tranſlation of the account which Theophraſtus has left us of the EUONYMUS of thoſe times. The author ſays, that the goats which eat the leaves and fruit of the *eunonymus* were killed by it, and that they died of a ſtoppage of the bowels, which he has expreſſed by the words ανοχω, derived from the verb ανεσχειν, which ſignifies a retention of the ſtools.

It is to be obſerved by the way, that the *eunonymus* of the Greeks could not be the ſame plant known at this time by that name, ſince the cattle eat our *euonymus* or FUSANUS whenever they can get it, and that without any danger; but the deſcriptions of theſe plants in the ancient and modern authors ſhew alſo that they were very different.

ANOCTORON, in *Eccleſiaſtical Antiquity,* a name uſed by ſome writers for a church.

Anoctora properly import Roman halls, divers of which were converted into churches.

In which ſenſe *anoctora* amount to much the ſame with BASILICÆ.

ANOCYSTI, in *Natural Hiſtory,* the name of a claſs of the ECHINI *marini,* which have an aperture for the *anus* at the top of the ſhell.

Some of theſe approach to a hemiſpheric or ſpheroidal figure, others flatter, and in ſhape ſomewhat reſembling a ſhield.

ANODUS is uſed by ſome *Chemical Writers* to denote a putritious matter ſeparated by the kidneys.

In this ſenſe *anodus* ſtands contradiſtinguiſhed from the ſuperfluous part, that is the urine.

ANODYNE, in *Phyſic,* is underſtood of ſuch remedies, as calm and aſſuage pain.

The word is derived from the privative α, and ωδυνω, *doleo, to be in pain.*

Anodynes are of two kinds; the firſt proper, called alſo *paregorics.*

The ſecond *ſpurious,* or improper, which rather ſtupefy than alleviate; acting only by inducing a ſtupor, drowſineſs, or ſleep.

Theſe are more properly called *narcotics, hypnotics,* or *opiates.*

The true *anodynes* are applied externally to the part affected.—Such, among the claſs of ſimples, are, the onion, lily, root of mallows, leaves of violets, elder, &c. Camphor is the beſt *anodyne* in nervous caſes, and at the decline of fevers.

Anodynes ſhould not be given without great caution, nor on a full ſtomach, nor in dropſies. Hemlock procures eaſe and ſleep, without cauſing that head-ach next morning, uſually complained of after taking opium. If the pulſe be ſtrong a larger doſe is ſafe; if weak, a leſs doſe muſt be given.

We have alſo certain compound medicines in the ſhops, prepared with this intention, and called by this name.—Such is the *anodyne balſam,* made of Caſtile ſoap, camphor, ſaffron, and ſpirit of wine, digeſted in a ſand-heat. It is recommended not only for procuring eaſe in the moſt racking extremities of pain, but alſo for aſſiſting in diſcharging the peccant matters that occaſioned it. This balſam is much the ſame with the modern *opodeldoc.*

A ready way of preparing a uſeful, ſafe, and efficacious *anodyne,* is as follows: take half an ounce of opium, diſſolve it in a gentle heat in three ounces of water, ſtrain the ſolution, and evaporate it to a dry ſubſtance. Grind this to powder in a glaſs mortar with twice the quantity of loaf-ſugar, and you have an excellent preparation of opium, to be given three or four grains for a doſe. Shaw's Lect. p. 233.

By diſſolving the opium thus in water, we gid rid not only of its groſs and foul parts, but alſo of its reſinous, which are found much more pernicious than the reſt; and by dividing its parts afterwards with ſugar, the medicine is rendered more uniform, reſoluble, and miſcible with animal fluids.

But however opium is prepared, it ſtill muſt be acknowledged that it retains qualities that make it little leſs than a poiſon in a very large doſe; whence it were much to be wiſhed ſomething could be found that would be more innocent, and yet anſwer the ſame purpoſe. And this camphor and nitre will do on many, though not on all occaſions.

ANOINTED. See CHRIST and MESSIAH.

ANOINTERS, a religious ſect in ſome parts of England, ſo called from the ceremony they uſed of anointing all perſons before they admitted them into their church. They founded their opinion of anointing upon the fifth of James, verſes 14 and 15. See Plot's Oxfordſh. 208.

ANOLE, in *Zoology*, the name of a ſpecies of lizard common in the Weſt Indies, about houſes and plantations. It is of the ſize of the common lizard of Europe, but its head is longer, its ſkin of a yellowiſh colour, and its back variegated with green, blue, and grey lines running from the neck to the tail. They creep into holes for the night, and there make a continual and very diſagreeable noiſe; in the day time they are always in motion.

ANOLYMPIADES, in *Antiquity*, a name given by the Eleans to thoſe Olympic games, which had been celebrated under the direction of the Piſæans and Arcadians. The Eleans claimed the ſole right of managing the Olympic games, in which they ſometimes met with competitors. The hundred and fourth Olympiad was celebrated by order of the Arcadians, by whom the Eleans were at that time reduced very low; this, as well as thoſe managed by the inhabitants of Piſa, they called unlawful Olympiads, and left them out of their annals, wherein the names of the victors, and other occurrences, were regiſtered.

ANOMALISTICAL *year*, in *Aſtronomy*, called alſo *periodical year*, is the ſpace of time wherein the earth paſſes through her orbit.

The *anomaliſtical*, or common year, is ſomewhat greater than the tropical year; by reaſon of the PRECESSION of the equinox.

ANOMALOUS, *irregular*, ſomething that deviates from the ordinary rule and method of other things of the ſame kind.

The word is not compounded of the privative *α*, and *νομος*, *law*, as is uſually imagined: for whence, on ſuch ſuppoſition, ſhould the laſt ſyllable *al*, ariſe? But it comes from the Greek *ανωμαλος*, *uneven*, *rough*, *irregular*; formed of the privative *α* and *ομαλος*, *plain*, *even*.

ANOMALOUS *verbs*, in *Grammar*, are ſuch as are irregular in their conjugations; deviating from the rules or formulas obſerved by others.

There are *anomalous* verbs, or irregular inflexions of verbs, in all languages.—In the Engliſh, all the irregularity in our *anomalous* verbs lies in the formation of the preter tenſe, and paſſive participle; though this only holds of the native Teutonic or Saxon words, and not of the foreign words, borrowed from the Latin, French, &c.

The principal irregularity ariſes from the quickneſs of our pronunciation, whereby we change the conſonant *d* into *t*, cutting off the regular ending *ed*.

Thus for *mixed*, we write *mixt* or *mix'd*; for *dwelled*, *dwelt* or *dwell'd*; for *ſnatched*, *ſnacht*, &c.—But this properly is rather of the nature of a contraction than an irregularity; and is complained of by ſome of our politer writers as an abuſe, to the diſadvantage of our language, tending to disfigure it, and turn a tenth part of our ſmootheſt words into cluſters of conſonants; which is the more inexcuſable, becauſe our want of vowels has been the general complaint of the beſt writers.

Another irregularity relates to the preter tenſe, and paſſive participle.—Thus *give*, if it were regular, or formed according to the rule, would make *gived* in the preter tenſe, and the paſſive participle; whereas it makes *gave* in the preter tenſe, and *given* in the paſſive participle.

ANOMALY, in *Grammar*, denotes an irregularity in the accidents of a word, whereby it deviates from the common rules or paradigms whereby other words of the like kind are governed.

ANOMALY, in *Aſtronomy*, is the diſtance of a planet from the APHELION or APOGEE; or it is an irregularity in the motion of a planet, whereby it deviates from the *aphelion* or *apogee*.

Kepler diſtinguiſhes three kinds of theſe *anomalies*; *mean*, *eccentric*, and *true*.

ANOMALY, *mean* or *ſimple*, in the *Ancient Aſtronomy*, is the diſtance of a planet's mean place from the apogee.

In the modern aſtronomy, it is the time wherein the planet moves from its aphelion A, to the mean place or point of its orbit I (*Tab. Aſtronomy, fig.* 1.)

Hence, as the arch, or the angle, or the elliptic area ASI, is proportional to the time wherein the planet deſcribes the arch AI; that area may repreſent the mean *anomaly*. Or thus, the area SKA, found by drawing a line LK, through the planet's place, perpendicular to the line of the apſides PA, till it cuts the circle DA, and drawing the line SK, may repreſent the mean *anomaly*; for this area is every where proportional to the former area SIA, as is demonſtrated by Dr. Gregory, Phil. Tranſ. Nº 447.

ANOMALY *of the excentric*, or *of the center*, in the *New Aſtronomy*, is an arch of the excentric circle AK (*fig.* 1.) included between the aphelium A, and a right line KL, drawn through the centre of the planet I, perpendicularly to the line of the apſides AP. See EXCENTRIC.

In the ancient aſtronomy, it is an arch of the zodiac, terminated by the line of the apſides, and the line of the mean motion of the center.—See the methods of finding the *anomaly of the excentric*, in Phil. Tranſ. Nº 447.

ANOMALY, *true* or *equated*, is the angle at the ſun ASI, which a planet's diſtance from the aphelium AI, appears under; or it is the angle or area, taken proportional to the time in which the planet moves from the mean place I, to its aphelion A.

And hence, in the ſun's motion, it will be the diſtance of his true place from the apogee.

The true *anomaly* being given, the mean one is eaſily found; but it is difficult to find the true *anomaly* from the mean one given.

The geometrical methods of Wallis and Newton, by the protracted cycloid, are not fit for calculation; nor yet the method of ſeries, as being too laborious. Hence aſtronomers are forced to have recourſe to approximation. Ward, in his *Aſtronomia Geometrica*, takes the angle ASI, at the focus where the ſun is not, for the mean *anomaly*; which will nearly repreſent it, if the orbit of the planet be not very excentric; and thus eaſily ſolves the problem. But this method does not hold of the orbit of Mars, as being more excentric than thoſe of the other planets.

Sir Iſaac Newton ſhews how to effect even this; and when his correction is made, and the problem ſolved according to Ward's hypotheſis, Sir Iſaac affirms, that, even in the orbit of Mars, there will ſcarce ever be an error of above a ſecond.

ANOMOEANS, ANOMOEI, in *Church Hiſtory*, a ſect of Chriſtians, who denied any ſimilitude between the eſſence of the Father and that of the Son. See TRINITY.

The word is compoſed of the privative *α*, and *ὁμοιος*, *ſimilar*, *reſembling*; q. d. *different*, *diſſimilar*.

Anomœans was the name whereby the pure Arians were diſtinguiſhed in the fourth century, becauſe they not only denied the conſubſtantiality of the Word, but even aſſerted, that he was of a nature different from that of the Father; in contradiſtinction to the Semi-Arians, who indeed denied the conſubſtantiality of the Word; but who owned, at the ſame time, that he was like the Father.

ANOMIA, a genus of worms, ranged by Linnæus under the order of *teſtacea*.

ANOMORHOMBOIDIA, in *Natural Hiſtory*, the name of a genus of ſpars.

The word is derived from *ανωμαλος*, *irregular*, and *ῥομϐοιδης*, a *rhomboidal figure*.

The bodies of this genus are pellucid cryſtalline ſpars of no determinate regular external form, but always breaking into regularly rhomboidal maſſes; eaſily fiſſile, and compoſed of plates running both horizontally and perpendicularly through the maſſes, but cleaving more readily and evenly in an horizontal than in a perpendicular direction; the plates being ever compoſed of irregular arrangements of rhomboidal concretions.

Of this genus there are five known ſpecies, which have all, in ſome degree, the double refraction of the Iceland cryſtal.

ANONIS, in *Botany*, ſee REST-*Harrow*.

ANONYMOS, ſee CHELONE.

ANONYMOUS, ſomething that is nameleſs; or to which no name is affixed.

It is formed of the privative *α*, and *ονομα*, *name*.

The term is chiefly applied to books which do not expreſs their author's name, and to authors whoſe names are unknown. Decker, advocate of the imperial chamber of Spires, and Placcius of Hamburgh, have given treatiſes of *anonymous* books.—Burc. Gotth. Struvius treats of learned men who have endeavoured to inveſtigate the authors of *anonymous* books.

ANONYMOUS, in *Anatomy*, a name ſometimes given to parts newly diſcovered, or firſt taken notice of.

ANONYMOUS is alſo an appellation anciently given to the ſecond cartilage of the throat, by later writers called *cricoides*, or *annuliformis*.

ANONYMOUS, in *Commerce.*—Partnerſhips in trade in France are ſtyled *anonymous*, when they are not carried on under any particular name, but wherein each of the partners trades viſibly on his own account, and in his own name; after which all the partners give one another an account of their profit or loſs in trade. Theſe ſorts of partnerſhips are concealed, and known only to the parties themſelves.

ANONYMOUS *partnerſhips in Trade*, are alſo in France ſuch, wherein perſons of fortune and quality depoſit ſums of money, in order to ſhare of the profits and loſs. To this end thoſe who furniſh the capital have no trouble in carrying on the trade, nor do their names appear to be any way intereſted therein.

ANONYMOUS, in *Law*, the ſending *anonymous* letters demanding money, &c. is felony by the Black Act, 9 Geo. I. cap. 22.

ANOREXY, ANOREXIA, in *Medicine*, an inappetency, or loſs of appetite.

The word is compounded of the privative α, and ορεξω, *appeto*, *I deſire*.

Anorexia is properly a longer continuance than is natural without a deſire to eat.

If the thought, or the ſight, of proper food create a ſickneſs in the ſtomach, or a tendency to vomit, the caſe is more properly called a *nauſea*.

Anorexia is chiefly conſidered as a ſymptom of ſome other diſorder, from which the curative indications are to be taken, and afterwards ſtomachics uſed.

ANOTTA, in *Botany*. See BIXA.

ANPITS, in the *Military Art*, in ſome *Middle Age Writers*, denotes a breaſt-work, anſwering to what is otherwiſe called *barbacan*.

ANSÆ, ANSES, in *Aſtronomy*, thoſe apparently prominent parts of the planet Saturn's ring, diſcovered in its opening, and appearing like handles to the body of that planet. The Latin word literally ſignifies *handles*, or *ears*, of divers utenſils.

ANSARIUM, in the *Civil Law*, a duty impoſed on all proviſions carried in veſſels with *anſæ*.

This was otherwiſe called *anſurium*, and the collectors of it *anſurii*.

ANSATUM *telum*, according to ſome, denotes a dart, or javelin, with an *amentum* faſtened to it.

Others rather take the *anſæ* of a javelin to be thoſe two eminences about the middle of the *cuſpis*, or point, which hinders the weapon from piercing through the whole body.

ANSCOTE, in our *Ancient Law-Books*, the ſame with *anhlote*. See SCOT.

ANSEL *Weight*. See AUNSEL *Weight*.

ANSELM'S *Art*. See ART.

ANSER, in *Aſtronomy*, a ſmall ſtar, of the fifth or ſixth magnitude, in the milky way, between the ſwan and eagle, firſt brought into order by Hevelius.

ANSER *Americanus*. See TOUCAN.

ANSERES comprehends one of the ſix orders of birds in the Linnæan ſyſtem, diſtinguiſhed by a ſmooth beak, covered with a ſkin, and enlarged towards the apex; the feet are formed for ſwimming, having thin toes connected by a membrane; the legs are thick and ſhort; the body is bulky, and covered with a thin ſkin and feathers. This order of birds is analogous to the *belluæ*, in the claſs of *mammalia*. See GOOSE.

ANSES. See ANSÆ.

ANSPESSADES, or LANSPESSADES, a kind of inferior officers in the foot, below the corporals, and yet above the common centinels.

The word is formed of the Italian *lancia ſpezzata*, q. d. *broken lance*; which was occaſioned hence, that they were originally diſbanded *gendarmes*, who, for want of other ſubſiſtence, ſued for a place of ſome diſtinction in the infantry.

There are uſually four or five in each company.

ANSWER, in a law-ſenſe, &c. See REJOYNDER.

ANT, *formica*, a genus of inſects belonging to the order of *hymenoptera*, famous in *Natural Hiſtory*. It is diſtinguiſhed from the other *genera* of this order, by having an erect *ſquama*, or ſcaly body, placed between the thorax and abdomen. The male and female *ants* have wings, but the neutral have none. The ſting of the female and neutral is concealed. There are five ſpecies common in England. 1. The hill *ant*, called alſo the great *hippomyrmex*, or horſe-*ant*. 2. The jet *ant*. 3. The red *ant*. 4. The common yellow *ant*. 5. The ſmall black *ant*. Theſe ſeveral ſpecies poſſeſs, in common, a double ſaw, a mouth, a pair of articulated *antennæ*, or horns, two eyes, and a neck, which connects the head with the breaſt. They are viſibly diſtinguiſhed with reſpect both to their colour and ſize. The hill *ants* take their name from their uſual habitations, which are the ſunny banks of hills, for the advantage of bringing their young to maturity. They are alſo fond of the decayed roots of trees, where they may with greater eaſe form their apartments. Theſe are conſiderably larger than any of the reſt; their head and body are a fine brown, and their breaſt a faint red. The jet and red *ants* are of equal ſize, and they derive their name from their reſpective colours. The former uſually neſt at the bottom of old trees, and the latter under broad ſtones, or other rubbiſh. The common yellow and ſmall black *ants* are about half as big as the jet or red *ants*; and moſt frequently chuſe their habitation in thoſe eminences caſt up by moles, which, on account of the uſe they make of them, are called *ant-hills*. Nevertheleſs, *ants* of different ſpecies may take up their reſidence in any of the ſituations abovementioned, but they never aſſociate with each other. *Ants* of a particular ſpecies never go into any neſt but their own; the conſequence of an attempt of this kind would be inſtant death; even when purſued, they will never fly into another hole for ſhelter, except in the laſt extremity, and will ſometimes rather ſuffer themſelves to be taken. They do not ſeem to know what hoſpitality is. Sir Edmund King aſſures us, that if a red *ant* be put into a black *ant's* bank, war immediately ariſes; the black ſeize their gueſt, and never leave pinching him on the head with their forceps, or claws, till they have deſtroyed him; after which they drag the dead body out of the verge of the bank. If a black *ant* be put into a red *ant's* bank, he immediately ſeeks his ſafety by flight. Phil. Tranſ. Nº 23, or Abr. vol. ii. p. 789.

Ants of each ſpecies form ſeparate colonies; and they adapt the ſituation and ſtructure of their cells to the ſeaſons of the year. In winter they dig deep, and in ſummer riſe nearer to the ſurface of the ground. Their ſubterraneous habitation is divided into a number of different cells of an oval figure, all communicating with one another by circular and ſmooth paſſages, for the convenience of draining off the water, and furniſhing entries into their different apartments. The hill and jet *ants*, being protected by the trees under which they lodge, are not at the trouble of digging theſe channels for carrying off the water. They take great care in keeping their apartments clean, and remove any of their colony that dies out of their ſettlement. Pliny relates, that the *ants* of his country buried their dead; but that circumſtance has not been obſerved among us.

Each colony is uſually compoſed of a large female, which Mr. Gould, for diſtinction ſake, calls the queen, and various companies of workers. Beſide theſe, they are joined by a number of winged *ants*, which are commonly known by the name of *ant-flies*. The common *ants* are of neither ſex, but ſeem entirely deſtined to take care of the young which are committed by the queen to their protection. The queen is the mother of the whole brood, and is diſtinguiſhed from them by her ſuperior ſize and particular colour, as well as by the reſpect that is ſhewn her by her ſubjects. The colour of the queen is different in the ſeveral colonies. Her head is furniſhed like thoſe of the common *ants*. She has likewiſe three lucid ſpecks on her front, placed in a triangular form, which ſeem to be eyes of the ſame ſtructure with thoſe of the ſpider. The queen of the red colony is provided with a ſting, in which ſhe differs from thoſe of the other ſpecies. The queen, as ſoon as ſhe has depoſited a parcel of her eggs, leaves them to the affection and care of the workers, and withdraws to a ſeparate apartment. Two or three yellow queens have been ſometimes found in the ſame colony; and in the red colony there are ſeldom fewer than two; and in this reſpect they differ from the hill and ſmall black *ants*, which have only one.

Mr. Gould made a great number of experiments and obſervations, in order to evince this fact, that the queen alone ſupplies every particular colony with its inhabitants; and he adds, that ſhe lays three different ſorts of eggs, the male, female, and neutral. The two firſt are depoſited in the ſpring, and the laſt in July and Auguſt. When the queen has furniſhed an apartment with eggs, the common *ants* diſcover the greateſt tenderneſs and care in brooding over them, and preſerving them from moiſture. After the eggs have continued for ſome time in this ſtate, cheriſhed and protected by the workers, they begin to loſe their tranſparency; they are covered over with a number of ſmall hairs; they are extended with ſeveral rings, and appear in the ſhape of vermicles, or little worms. In proceſs of time a black ſpeck is obſervable in them, which Mr. Lewenhoeck, and Mr. Gould, take to be their digeſted food. Theſe *ant-vermicles* grow very ſlowly in the firſt ſummer; and in the ſucceeding winter they ſeem not to increaſe at all: but from April to June in the ſecond year they grow very faſt, and are prepared for another change into the nymph, or aurelia ſtate. They are previouſly transferred by the workers to a proper ſituation near the ſurface of the colony, where they weave in the manner of ſilk-worms, and infold themſelves in a kind of ſilken tiſſue; and in this ſtate they are vulgarly denominated *ant eggs*. The proceſs from this ſtate to that of *ants* is gradual and ſlow, and not uſually completed in leſs than a month. But the manner of their transformation cannot be accurately obſerved, becauſe they will not arrive, like moſt other aureliæ, to maturity under glaſſes. The female aureliæ are generally the firſt which transform, and are thoſe that make their appearance in the ſhape of large flies. Theſe give birth to new colonies, and intitle themſelves to the dignity of queens. The male, or ſmall *ant-flies*, appear next, and early enough to be contemporary with the others. Laſt of all, the neutral aureliæ change into common *ants*, or workers, without wings, but not till moſt or all the flies have forſook the ſettlement. The male *ants* are furniſhed with two or more ſmall hooks near their extremities, like thoſe of other inſects of the fly-kind, which are the external parts of generation, whereby they faſten to the females; they have likewiſe a triangle of eyes in the ſame poſition with thoſe of the large flies. Theſe *ant-flies*, both large and ſmall, are of very ſhort duration; they ſeldom continue above three weeks. Thoſe of the female kind, which are not neceſſary to the propagation of new colonies, together with the male, are deſtroyed either by a worm, which is generated in their bodies, or by furniſhing a repaſt for other creatures.

The labouring *ants* are inceſſantly employed by night as well as by day, in preparing and carrying materials for their reſpective cells. The horſe *ants* make their neſts of large quantities of ſticks, ſtraws, and fragments of leaves, which they place together in heaps, for the convenience of ſuddenly ſecreting themſelves on the approach of an enemy, as well as for promoting the maturity of the young nymphs. The common *ants* build only with ſmall pieces of dry earth, which, after it is cut by their double ſaw, they incruſt with blades of graſs, and form into conical mounts about half a foot high, for the purpoſe of favouring the growth of the vermicles, and the transformation of the nymphs. Another part of the employment of the labouring *ants* reſpects the young: in every ſtage of their progreſſion from eggs to perfect *ants*, the workers remove them every day into different parts of the colony; in the morning they transfer them to cells nearer the ſurface, for the benefit of the ſun's influence, and in the evening to ſuch as are more remote and guarded. They are likewiſe employed in collecting the juices of various fruits and inſects for the nutriment of the vermicles; which they convey firſt into their own alvus, and then into the bodies of the vermicles, or maggots. Another part of their employment is that of diſmantling the nymphs at the time of their transformation.

It has been maintained by many naturaliſts, ancient and modern, from the time of Solomon to our own, that *ants* provide for winter; that accordingly they lay up magazines or granaries of corn, and other proviſions; and that, to prevent the ſprouting of the corn, they cut off all the buds before they lay it up; and, in order to preſerve it from rotting, it has been ſaid, that they bring it out of their hoards in the middle of the day, and ſpread it on dry earth at the entrance of their neſts, for the benefit of the air and ſun. But this theory has been contradicted by later experiments and obſervations. Lewenhoeck is of opinion, that they do not eat at all in the winter, but ſpend that ſeaſon, like dormice, and many other ſorts of animals, in a ſtate of ſleep; and that the proviſion they collect together ſeems intended for preſent uſe; and not ſo much for themſelves as for their young. Mr. Gould confirms this opinion by a great variety of obſervations. He never could diſcover any reſervoirs of corn, or of other aliment; and for farther ſatisfaction, he placed in ſeveral flower-pots, and other convenient receptacles, different colonies of yellow, ſmall black, red, and hill *ants*, with their reſpective queens, attendants, and vermicles. They continued in this ſituation through the whole ſummer, autumn, and winter; they carried on their operations as in other ſettlements; formed their apartments, nouriſhed their young, and brought them to perfection. Had it been their uſual cuſtom, he preſumes that they ſhould have laid up their proviſions; but upon gradually removing the earth, and ſearching the lodgments, there was no appearance of magazines, corn, or any ſort of collected food; and he concludes from a number of trials, that Engliſh *ants* have no ſtorehouſe for their corn, nor require any other food in the winter than water. In exceſs of cold, he ſays, they are half benumbed; and at other times they are contented to regale themſelves with the common moiſture of the earth. However he intimates, that the cuſtoms of foreign *ants* may, in this and various inſtances, deviate from ours; though the contrary opinion has never been clearly and demonſtratively aſcertained.

In 1749, M. Carre publiſhed a Diſſertation on the Policy of *Ants*, the reſult of above thirty years obſervation; in which he concurs with Mr. Gould in rejecting the whole theory of their forecaſt and ſtorehouſes as fabulous; and M. Soriniere likewiſe, after having paid particular attention to the oeconomy of *ants* for twenty years, adopts the ſame opinion.

It has been a vulgar notion, that *ants* bite; but they have not ſtrength enough in their jaws and teeth to penetrate the cuticula. However the red *ants* have a ſting in the poſterior part of their bodies, which they thruſt out, and plunge into any thing that offends them, by a kind of vibratory motion, which injects an acrid, corroſive ſort of liquor, that occaſions a ſmart but momentary pain, and raiſes an inflammation. The other *ants* have no ſting.

Ants furniſh ſuſtenance for many ſpecies of animals; and particularly for young pheaſants and partridges; if the latter be bred under a hen, and ſupplied with *ant*-hills and freſh water, and at proper intervals a mixture of millepedes and ear-wigs, they will not fail to come to maturity. *Ants* alſo ſupply a reſin, an oil and an acid, which have been deemed of conſiderable ſervice in the art of phyſick.

Theſe ſmall animals are very injurious to gardens and paſture lands; as well by ſeeding on the fruit as by making hills for their habitation. In the hotter countries, as Italy, Spain, and the Weſt-Indies, *ants* are the great peſt of the fields and plantations: and no method has yet been diſcovered for effectually deſtroying them. Trees may be preſerved from them by incompaſſing the ſtem for four fingers breadth, with a roll of wool newly pulled from the ſheeps belly; or by laying ſaw duſt all around the ſtump of it. Some anoint the tree with tar, which has the ſame effect, but then tar is prejudicial to the tree. In Dr. Hawkeſworth's Account of the Voyages for making Diſcoveries in the Southern Hemiſphere, mention is frequently made of black, white, and green *ants*; their ſtings were ſharper than thoſe of the common biting *ant*. The white *ants* reſembled thoſe of the Eaſt Indies, which are the moſt pernicious of all animals; and their neſts were of a pyramidal form, from a few inches, to ſix feet high. Profeſſor Kalm in his North-American Travels ſpeaks of a ſmall *ant* in Penſylvania, whoſe length is one geometrical line, and colour either black or dark-red. Theſe live in ſwarms under ground and in walls; and, as Mr. Franklin apprehends, have a peculiar method of communicating their thoughts and deſires to one another. Neumann obſerves, that *ants* may be made uſe of for obtaining ſkeletons of ſmall animals, ſuch as mice, frogs, &c. exquiſitely beautiful and perfect; far ſurpaſſing any thing that can be executed by artificial anatomy. The ſubject is for this purpoſe to be incloſed in a wooden box, and properly diſtended, to prevent the parts from collapſing, or being cruſhed together by the earth. The box is to be penetrated with a number of holes, through which the *ants* will preſently find their way.

See more on this ſubject in Swammerdam's Bib. Nat. vol. i. Ray's Hiſt. of Inſects, p. 70. Bibl. Univ. t. xi. Melange's D'Hiſt. Nat. t. 1. Gould's Account of Engliſh *Ants*, 12mo. 1747, *paſſim*.

ANT-*bear*. See **ANT**-*eaters*.

ANT-*eater*, the name given by Linnæus to the creature called by others, the *tamandua-guacu*, or ant-bear; and *myrmecophago*.

The name is derived from the Greek μυρμὴς, an *ant*, and φαγω, *to eat*. The creature is ſo called becauſe his food is *ants*, which he eats by thruſting his long tongue into neſts, and drawing it back into his mouth when covered with them.

This, in the Linnæan ſyſtem of *Zoology*, is a diſtinct genus of animals, the characters of which are, that they have no teeth; have feet formed not for climbing, but walking, and have eight abdominal paps, ſix on the belly, and two on the breaſt.

There are two ſpecies, one of them covered with hair, the other with ſcales. The firſt is called by Linnæus *Myrmecophaga*, and the other *Manis*, of this latter ſpecies there are two ſorts; the firſt having five toes on both hind and fore feet, is called *Manis pentadactyla*; the other with four toes, is called *Manis tetradactyla*.

ANT-*eggs* is a name popularly given to a kind of little white balls found in the banks or neſts of *ants*, ordinarily ſuppoſed to be the ova of this inſect.

Sir Ed. King opened ſeveral of theſe vulgarly reputed eggs, in ſome of which he found only a maggot in the circumſtances as above deſcribed; while in another the maggot had begun to put on the ſhape of an *ant* about the head, having two little yellow ſpecks, where the eyes were to be. And in others, a further progreſs was obſerved, the included maggot being furniſhed with every thing to complete the ſhape of an *ant*, but wholly tranſparent, the eyes only excepted, which were as black as bugles. Laſtly, in others, he took out every way perfect and complete *ants*, which immediately crept about among the reſt.

The true *ants-eggs* are the white ſubſtance which upon opening their banks, appears to the eye like the ſcatterings of fine white ſugar, or ſalt, but very ſoft, and tender. Examined by a microſcope, it is found to conſiſt of ſeveral, pure, white appearances in diſtinct membranes, all figured like the leſſer ſort of bird eggs, and as clear as a fiſh's bladder.

The ſame ſubſtance is found in the bodies of the *ants* themſelves.—This ſpawn, when emitted, they lye in multitudes on, to brood; till in ſome time it is turned into little vermicles, as ſmall as mites, commonly called *ants-eggs*.

Ant-*hills* are little hillocks of earth, which the *ants* throw up for their habitation and the breeding of their young. They are a very great miſchief to dry paſtures, not only by waſting ſo much land as they cover, but by hindering the ſcythe in mowing the graſs, and yielding a poor hungry food, pernicious to cattle.

The manner of deſtroying them is to cut them into four parts from the top, and then dig into them ſo deep as to take out the core below, ſo deep that when the turf is laid down again it may lye ſomewhat lower than the level of the reſt of the land; by this means it will be wetter than the reſt of the land, and this will prevent the *ants* from returning to the ſame place, which otherwiſe they would certainly do. The earth that is taken out muſt be ſcattered to as great a diſtance every way as may be, otherwiſe they will collect it together, and make another hill juſt by. Some collect the hills together in heaps, and burn them for manure.

The proper time for doing this is winter; and if the places be left open, the froſt and rains of that time of the year will deſtroy the reſt; but in this caſe care muſt be taken, that they are covered up early enough in the ſpring, otherwiſe they will be leſs fertile in graſs than the other places.

Ants are likewiſe deſtroyed by ſcattering a good quantity of unſlaked lime about their hills. Some make uſe of quickſilver, as a general poiſon to inſects.

Ant-*lion*. See Formica-*Leo*.

Ant, *muſk*, the name given, by Liſter and Ray, to a peculiar ſpecies of *ant*, which is of the number of the perfumed inſects. It is found on dry banks, and is ſo much ſmaller than the common *ant*, that it needs no other diſtinction. Thoſe of this ſpecies which are without wings are of a yellowiſh colour, and when bruiſed or cruſhed emit a ſharp and acid ſmell, as the common *ant* does; but thoſe which have wings are coal-black, and theſe, inſtead of the four ſmell of the others, emit a perfume not to be endured for its ſtrength. The ſmell of all the perfumed inſects goes off in keeping; and theſe little creatures, after they have been dead and dry ſome time, are found to ſmell leſs ſtrongly, but much more agreeably. Phil. Tranſ. N° 77. or Abr. vol. ii. p. 792.

Ant, *viſiting*. At Paramaribo, a Dutch colony in the province of Surinam, there are *ants*, which the Portugueſe call *viſiting-ants*; they march in troops; and as ſoon as they appear, all the coffers and cheſts of drawers are laid open, which they clear of rats, mice, and a peculiar ſort of inſect in that country called *cackerlacs*, and of other noxious animals. If any one chance to moleſt them, they fall upon him, and tear in pieces his ſtockings and ſhoes. Their viſits are rare; and they do not ſometimes appear for three years. Templeman's Obſ. vol. i. p. 36.

ANTA, in the *Ancient Architecture*, a ſquare column, or pilaſter, placed at the corners of the walls of temples, and other edifices.

Theſe took their name, according to M. Perault, from the prepoſition *ante, before*; becauſe placed before the walls and coins of buildings, to ſecure or ſtrengthen them.

The *antæ* ſtood out of the wall, with a projecture equal to one eighth of their face, provided there were no ornament that had a greater projecture; but it was a rule, that the projecture of the *antæ* ſhould always equal that of the ornaments.

There were alſo *antæ* at doors and gates. Feſtus confines their uſe to this laſt place.

Vitruvius calls thoſe that have but two faces out of the wall angular *antæ*, to diſtinguiſh them from others which have three faces diſengaged, and which are placed at the ends of the walls of porticos.

ANTÆ. See Anticum.

ANTACÆUS, in *Ichthyology*, a name firſt given by the Greek writers Ælian and Strabo to the *ichthyocolla* PISCIS, the iſinglaſs-fiſh, or HUSO; and afterwards, by Johnſton and others, not only to this fiſh, but to the common STURGEON.

ANTACHATES is uſed, by ſome naturaliſts, for a kind of bituminous ſtone, of the nature of amber, though of a different colour, which in burning yields a ſmell like myrrh.

ANTACIDS, is uſed by ſome writers to denote medicines proper to qualify and reſiſt acid humours.

Antacids are chiefly of the alcalious kind.

Under the claſs of *antacids* come, 1. *Abſorbents*, as chalk, coral, ſea-ſhells, hæmatites, and ſteel-filings. 2. *Obtundents*, as oils, and fats. 3. *Immutants*, as lixivious ſalts and ſoaps.

ANTAGONIST, Antagonista, among the *Ancients*, denotes an adverſary in battle.

The word is formed from *αντι, contra, againſt*; and *αγωνιζω, I contend.*

In this ſenſe the word is rather uſed in ſpeaking of ſportive combats, or games, than of ſerious fighting.

Antagonist alſo denotes one of the parties in literary diſputes.

Antagonist *muſcles*, in *Anatomy*, are thoſe which have oppoſite functions.

Such are the *flexor* and *extenſor* of any limb, the one of which contracts it, and the other ſtretches it out.

Solitary muſcles are thoſe without any *antagoniſts*; as the heart, &c.

ANTALGIC, an epithet given by ſome writers to medicines proper to abate pain.

In this ſenſe *antalgics, antalgica*, amount to the ſame with ANODYNES.

ANTALIUM, in *Natural Hiſtory*, a ſmall ſea-ſhell of a tubular form, whence it is alſo denominated TUBULUS *marinus*.

The *antalium*, otherwiſe written *antale*, and *antalus*, is about an inch and half long; the thickneſs of a large quill at one end, and of a ſmall one at the other; fluted from end to end, of a white or greeniſh-white colour, and is found on rocks, and at the bottom of the ſea.

It is an *alcali*, and ſaid to be of ſome medicinal uſe as a reſolvent and dryer; at leaſt by the ancients.

The *antalium* bears a near affinity both in origin, ſtructure, and uſe, with the DENTALIUM.

ANTANACLASIS, a figure in *Rhetoric*; whereby the ſame word is repeated, but in a different, and ſometimes doubtful ſignification.—As, *Let the dead bury the dead.*

The word comes from *αντι*, and *ανακλαω, repercutio, I ſtrike again.*

ANTANAGOGE, a figure in *Rhetoric*; when, not being able to anſwer the accuſation of the adverſary, we return the charge, by loading him with the ſame or other crimes; which is uſually called RECRIMINATION.

ANTANISOPHYLLUM, in *Botany*. See Hog-weed.

ANTAPHRODISIAC, an epithet given to medicines, which diminiſh the ſeed, and extinguiſh the ſtimula or incitements to venery.

ANTAPOCHA, in the *Civil Law*, denotes one's acknowledgement in writing of money paid, in the way of rent, penſion, intereſt, or the like incumbrance. Such inſtrument, or *antapocha*, the debtor gives upon making payment to the creditor, to ſerve as a proof of the charge or incumbrance for futurity, and exclude any claim of preſcription againſt the payment of it. The *antapocha* differs from the *apocha*, in that this latter is given by the creditor to the debtor, the former *vice verſa*.

ANTARCTIC *pole*, denotes the ſouthern POLE, or end of the earth's axis.

The word is compoſed of *αντι, contra*; and *αρκτος, urſa, bear*; as being oppoſite to the Arctic pole.

The ſtars near the *antarctic* pole never appear above our horizon.

Antarctic *circle* is one of the leſſer circles of the ſphere, parallel to the equator, at the diſtance of 23 deg. 30 min. from the ſouth pole.

It takes its name from its being oppoſite to another circle, parallel likewiſe to the equator, and at the ſame diſtance from the north pole, called the ARCTIC *circle*.

ANTARES, in *Aſtronomy*, the ſcorpion's heart; a fixed ſtar of the firſt magnitude, in the conſtellation Scorpio.

ANTASTROPHE, in *Rhetoric*, a ſpecies of ANTEPOSITION.

ANTEAMBULONES, in *Antiquity*, a kind of ſtate-ſervants, who walked before their maſters to clear the way, and keep off the crowd.

The *formula* uſed by theſe was *Date locum domino meo.*

ANTECANIS is uſed, by ſome *Aſtronomers*, to denote the conſtellation otherwiſe called CANIS *minor*, or the ſtar PROCYON. It is thus denominated as preceding, or being

ing the forerunner of the CANIS *major*, and riſing a little before it.

ANTECEDENT, in the ſchools, ſomething that precedes, or goes before, another, in reſpect of time.

The word is compounded of *ante*, *before*, and *cedere*, *to go.*—In which ſenſe it ſtands oppoſed to *ſubſequent*.

Antecedent, in *Grammar*, the word which a relative refers to.

Antecedent, in *Logic*, denotes the firſt propoſition of an *enthymeme*, or of an argument which only conſiſts of two members.

In oppoſition to this, the latter is called the *conſequent*.

Thus, in the argument, *cogito, ergo ſum, I think, and therefore I exiſt*; *cogito* is the *antecedent*: being thus called, becauſe it precedes the *ergo*, or the *copula* of the argument.

Antecedent *of a* RATIO, in *Mathematics*, denotes the firſt TERM, or that which is compared with the other.

Thus, if the *ratio* be *a* : *b*, or of *a* to *b*; *a* is ſaid to be the *antecedent*.

Antecedent *ſigns*, in *Medicine*, are ſuch ſymptoms of diſorder as appear before a diſtemper is ſo formed as to be reducible to any particular claſs, or proper denomination.

Antecedents, in *Rhetoric*, are ſuch things as being once allowed, others neceſſarily or very probably follow. This is one of the ſixteen topics or common places enumerated by Cicero and Quintilian.

Antecedent *decree*, in *Theology*, is a decree preceding ſome other decree, or ſome action of the Creator, or the previſion of action.—It is a point much controverted, whether predeſtination be a decree *antecedent* to faith, or ſubſequent to it.

Antecedent *will*, or *deſire*, is that which precedes ſome other will or deſire, or ſome knowledge or previſion.—Thus we ſay, God by a ſincere, but *antecedent* deſire, wills all men to be ſaved: that is, this ſincere deſire of God precedes, and does not ſuppoſe, the knowlege of their faith and repentance.

Antecedent *neceſſity*. See Necessity.

ANTECEDENCY, Antecedence. See Antecedent, and Antecedentia.

ANTECEDENTIA, among *Aſtronomers*.—When a planet appears to move weſtward, contrary to the order or courſe of the ſigns; as from Taurus towards Aries; it is ſaid to move *in antecedentia*.

On the contrary, when it goes eaſtward, or forward, from Aries towards Taurus; it is ſaid to move *in conſequentia*.

ANTECESSOR, one that goes before, or that leads another. See Precursor, Predecessor, &c.

The term is particularly uſed in ſome univerſities for a public profeſſor, who teaches or lectures the civil law.

Antecessors, in the ancient art of *War*, is an appellation given to a party of horſe, diſpatched before the *agmen* or body of an army, partly by way of intelligence, and partly to chooſe out a proper place for encamping on, as well as the moſt convenient roads for the ſoldiery to travel in.

Theſe are alſo denominated *antecurſores*.

They amount to the ſame with what the Greeks call *prodromi*.

ANTECHAMBER, or Antichamber, an outer chamber, before the principal chamber of an apartment; where the ſervants wait, and where ſtrangers ſtay, till the perſon to be ſpoken with is at leiſure, &c.

The word is formed of *ante*, *before*, and *camera*, a CHAMBER.

ANTECHRIST. See Antichrist.

ANTECURSORES, ſee Antecessors.

ANTEDATE, a ſpurious date, prior to the true date of a writing, inſtrument, act, deed, or the like.

Antedates in *Commerce*, are of very dangerous conſequence in matters of trade. To *antedate* is to ſet down a falſe date; to date from a day prior to that on which the buſineſs is tranſacted, the note or bill drawn, or letters written, &c.

In France it was formerly the ill cuſtom to have blank orders on the backs of bills of exchange, that is, to indorſe them merely with a name, ſo that they could eaſily be antedated; which in caſe of failures was liable to cauſe very great abuſes. But by the regulations for commerce of 1683, it is ordered that the ſignatures on the backs of bills of exchange ſhall not ſerve for orders, unleſs dated: and *antedates* are puniſhed as forgery.

ANTEDILUVIAN, or Antidiluvian, ſomething that exiſted or happened before the DELUGE.

In this ſenſe, thoſe generations from Adam, till Noah's flood, are called *Antediluvians*; and thoſe ſince deſcended from Noah, to the preſent time, are called *Poſtdiluvians*.

Dr. Burnet, and Dr. Woodward, differ very widely about the *Antediluvian* world; the former imagines its face and appearance to have been ſmooth, equable, and in all reſpects different from what we now find it to be.

The latter, on the contrary, endeavours to prove, that the face of the terraqueous globe before the deluge was the ſame as it is now, viz. unequal, diſtinguiſhed into mountains, and dales, and having likewiſe a ſea, lakes, and rivers; that this ſea was ſalt, as ours is; was ſubject to tides; and poſſeſſed nearly the ſame ſpace and extent that it now does; and that the *Antediluvian* world was ſtocked with animals, vegetables, minerals, &c. that it had the ſame poſition, in reſpect of the ſun, which ours now hath, its axis not being perpendicular, but inclined, as at preſent, to the plane of the ecliptic; conſequently, that there were then the ſame ſucceſſion of weather, and the ſame viciſſitudes of ſeaſons, as now.

ANTEJURAMENTUM, or Præjuramentum, by our anceſtors alſo called *juramentum calumniæ*; an oath which both the accuſer and accuſed were anciently obliged to make before any trial or purgation.

The accuſer was to ſwear, that he would proſecute the criminal; and the accuſed was to make oath, on the very day that he was to undergo the ordeal, &c. that he was innocent of the fact with which he was charged.

If the accuſer failed, the criminal was diſcharged; if the accuſed, he was underſtood to be guilty, and was not to be admitted to purge himſelf by the ordeal.

ANTEJUSTINIANEAN, an appellation ſometimes given to the ancient Roman law, as it ſtood before the time of the emperor Juſtinian.

Tribonian has been often condemned for ſuppreſſing the writings of the *Antejuſtinianean* lawyers. Schulting, a celebrated profeſſor at Leyden, has a diſſertation on the equity of this cenſure. Fabricius gives a catalogue of the antient *Antejuſtinianean* lawyers. Schulting has publiſhed a collection of the *Antejuſtinianean* writers.

ANTELIUS, or Anthelius, in *Ancient Writers*, denotes an idol placed over the doors of houſes, ſuppoſed to have the guardianſhip, or protection of them.

The word is originally αντηλιος, q. d. againſt the ſun, as being expoſed thereto.

ANTELOPE, *Gazella* in *Zoology*, the name of an animal of the goat kind, of which there are three known ſpecies.

1. The *Gazella Africana Strepſicheros Plinii*. This is the ſpecies we uſually ſee under the name of the *antelope*; it is called the *addace* in Africa, and is the *dorcas Lybica* of Ælian. Its horns are ſlender and erect, they are black, tranſverſely radiated, and twiſted into the appearance of ſpiral lines; though theſe are in reality ſo many annular circles, they are toward the middle bent a little outwards, and thence they turn in again, ſo that they in ſome meaſure repreſent the antient lyre.

2. The *Gazella Indica*, or *Indian antelope*, with very long ſtrait horns, which are annulated only in that part near the head. The horns of this creature are ſometimes three feet long, and are perfectly ſmooth and gloſſy, except near the head, and black. The creature is of the ſize of our common deer, and is of a greyiſh colour; its tail is a foot long, and has longer hairs on it than thoſe on the reſt of the body. The horns of this ſpecies are very common in the muſæums of the curious. This creature ſeems to be the animal which produces the bezoar ſtone ſo much valued in medicine.

3. The African kind, which has flat horns annulated to the very top, and crooked near the middle; this has been ſeen alive ſometimes in England. It was much ſmaller than our deer, and of a ſandy colour; its belly is white, and its ſides where the white and ſand colour met, of a duſky appearance. Its tail is blacker and longer than that of the deer, is covered with a ſmaller number of hairs than thoſe of our deer, and is white on that part next the body. Its horns grow out of the middle of the forehead near the eyes, and are very long, ſharpening at the ends, and all the way marked with tranſverſe *ſtriæ* or furrows, and a little bent upwards. Its ears are large, and its legs very ſlender.

The hoofs and horns are uſed in medicine, being eſteemed good againſt the epilepſy and hyſterics.

ANTELUCAN, in *Eccleſiaſtical Writers*, is applied to things done in the night or before day.

We find frequent mention of the *antelucan* aſſemblies, *cœtus antelucani*, of the ancient Chriſtians in times of perſecution, for religious worſhip.

ANTELUDIA, in *Antiquity*, a day of ſhow or parade preceding the circenſes, wherein the preparations made for thoſe ſolemnities were expoſed in great form and pomp.

ANTEMURALE, in *Middle-age Writers*, denotes a kind of outer wall environing the other walls and works of a place, and preventing the too near acceſs of the enemy to them.

This is alſo called by Iſidore, *promurale*, as being *pro munitione muri*, *for the defence of the wall.*

In ſome writers we find it denominated *antepectoralis muris*, in others *anpits*.

ANTEMURALE is alſo uſed to denote any work without ſide the rampart or wall of the place.

In this ſenſe, *antemurale* amounts to the ſame with what we otherwiſe call OUTWORK.

ANTEMURALE is alſo uſed in *Eccleſiaſtical Writers* for the veſtibule or entrance of the *preſbyterium*, or BEMA.

ANTENATUS is uſed in ſome *Law Writers* for the firſt-born, or eldeſt ſon, anſwering to what we call *aiſnè*.

ANTENATUS is alſo ſometimes uſed for a ſon, the iſſue of a former marriage.

In which ſenſe, *antenatus* amounts to the ſame with *privignus*.

ANTENATI, in the modern *Engliſh Hiſtory*, is chiefly underſtood of the ſubjects of Scotland, born before king James the Firſt's acceſſion to the Engliſh crown, and alive after it.

In relation to theſe, thoſe who were born after the acceſſion were denominated POSTNATI.

The *antenati* were conſidered as aliens in England, whereas the *poſtnati* claimed the privilege of natural ſubjects.

ANTENCLEMA, αντεγκλημα, in *Oratory*, is where the whole defence of the perſon accuſed turns on criminating the accuſer.

Such is the defence of Oreſtes, or the oration for Milo, *Occiſus eſt ſed latro. Exſectus ſed raptor.*

See RECRIMINATION.

ANTENICENE, in *Eccleſiaſtical Writers*, denotes a thing or perſon prior to the firſt council of Nice.

We ſay the *Antenicene* faith, *Antenicene* creeds, *Antenicene* fathers.

ANTENNÆ, in *Natural Hiſtory*. See FEELERS.

ANTENUPTIAL, ſomething that precedes marriage.

In this ſenſe, we ſay *antenuptial* promiſes, *antenuptial* preſents, *antenuptial* covenants, *antenuptial* fornication, &c.

Neoſtadius has a treatiſe *De Pactis Antenuptialibus*.

ANTEPAGMENTA, or ANTIPAGMENTA, in the *Ancient Architecture*, the jambs of a door, or lintels of a window.

The word is alſo uſed for the intire *chambranle*, i. e. the door-caſe, or window-frame.

ANTEPENULTIMA, or ANTEPENULTIMATE, in *Grammar*, the third ſyllable of a word, reckoning from the latter end; or the laſt ſyllable except two.

The word is compounded of the prepoſition *ante*, *before*, and *penultimate*, *laſt but one*.

It was upon this ſyllable, that the Greeks placed their acute accents.—The *antepenultimate* of a dactyle is always long.

ANTEPILANI, among the ancient Romans, denote the *haſtati* or *principes* of a legion.

They are ſuppoſed to have been thus called becauſe ranged before the *triarii*, who were alſo called *pilani*.

Some will have the word to be a corruption for *anteſignani*.

ANTEPILEPTIC, in *Medicine*, denotes a quality in bodies, whereby they reſiſt or oppoſe the epilepſy and convulſive motions.

The chief *antepileptics* from the vegetable kingdom are, the roots of pæony, valerian, the flowers of the lime tree, miſletoe of the oak, hazel, and lime.

The animal kingdom affords a great number of *antepileptics* either real or imaginary. Such are elks claws, *caſtoreum*, divers parts of the deer, ſwallows-hearts, the human *cranium*, blood, ſecundines, &c. the *hippomanes*, lizards, frogs and moles liver and ſpine, lions and peacocks dung, earth worms, &c.

The mineral kingdom affords hyacinths and ſmaragds prepared, alſo tincture of luna.

ANTEPOSITION, a grammatical figure, whereby a word which by the ordinary rules of ſyntax ought to follow another, comes before it. As when in the Latin the adjective is put before the ſubſtantive, the verb before the nominative caſe, &c.

Antepoſition ſtands oppoſed to *poſtpoſition*. One caſe or ſpecies of this figure is called by a particular name, *antaſtrophe*.

ANTEPREDICAMENTS, ANTEPRÆDICAMENTA, in *Logic*, certain previous matters, requiſite to a more eaſy and clear apprehenſion of the doctrine of PREDICAMENTS or CATEGORIES.

Such are definitions of common terms; as equivocals, univocals, &c. See DEFINITION, DIVISION, &c.

They are thus called, becauſe treated by Ariſtotle, before the predicaments; that the thread of the diſcourſe might not afterwards be interrupted.

ANTERIDES, in the *Ancient Architecture*, denote buttreſſes erected to ſupport a wall.

Theſe are ſometimes called *antes*, ſometimes *criſmæ*, and by the Greeks ἐρεισματα.

Anterides anſwer to what the modern builders call *counterforts*, *arcbutants*; the Italians, *barbicane*, and *ſperoni*, or ſpurs.

ANTERIOR, or ANTERIOUR, ſomething before another, chiefly in reſpect of place.

The word is formed of the prepoſition *ante*, *before*.

In which ſenſe the term amounts to the ſame with *prior*, and ſtands oppoſed to *poſterior*.

ANTERIOR *Ramus*. See the article RAMUS.

ANTEROS, in *Mythology*, one of the two Cupids who were the chief of the number. They are placed at the foot of the Venus of Medici; this is repreſented with a heavy and ſullen look, agreeably to the poetical deſcription of him, as the cauſe of love's ceaſing. The other was called *Eros*. *Ovid. Rem. Amor.* V. verſe 549 to 576.

ANTEROTES, a name given by ſome of the ancient writers on gems to a ſpecies of the amethyſt. Some have imagined they meant by it a ſort of opal; but Pliny expreſly contradicts this, making the *anterotes* the fifth kind of AMETHYST in value.

ANTES, in *Architecture*, ſee ANTA.

ANTESIGNANI, in the Roman armies, a kind of ſoldiery poſted before the eagles, and other enſigns of the legions, whence their appellation.

The *anteſignani* ſtand contradiſtinguiſhed from the *ſubſignani*, who were ranged in the ſame line with the enſign; and from the *poſtſignani*, who were placed behind them.

ANTESTATURE, in *Fortification*, a ſmall retrenchment, made of palliſadoes, or ſacks of earth, ſet up in haſte, to diſpute with the enemy the remainder of a piece of ground, part whereof hath been already gained.

ANTHALIUM, among the *Ancients*, a root growing in dry places, and about the bigneſs of the fruit of the medlar; it was dug up for food, and eſteemed very pleaſant and wholeſome.

ANTHELION, in *Phyſics*, ſignifies a mock or ſpurious ſun, and denotes a meteor, not very common, of a luminous appearance, ſomewhat reſembling the ſun, ſeen through clouds, bigger, ſometimes four or five times, than the ſolar diſk. In its moſt refulgent ſtate, it is as yellow as the ſun; but the lucid tract ſurrounding it is of a paler yellow, or whitiſh caſt, interſperſed ſometimes with a few reddiſh or ſubfuſcous ſpots. The moſt received opinion relative to the formation of this kind of meteor, attributes the *phænomenon* to a multitude of minute icy or ſnowy particles ſuſpended in the air, and either refracting or reflecting the ſolar rays in ſuch a manner, as to multiply the image of the ſun. But the theory of *anthelia*, for want of a proper number of obſervations, ſeems not yet to be brought to ſuch a degree of ſatisfaction, as by every lover of phyſiology could be deſired. The inſtances of them are but rare. See Phil. Tranſ. vol. LII. Part I. Nº 16. An. 1761. See HALO and PARHELION.

ANTHELIX, in *Anatomy*, the inner circuit of the auricle; thus called from its oppoſition to the outer circuit, called the HELIX.

ANTHELMIA, Indian PINK.

ANTHELMINTICS, medicines good to deſtroy worms.

The word is compounded of αντι, *contra*, *againſt*, and ἑλμινς, *worm*.

Purgatives ſeem to be the only proper *anthelmintics*.

ANTHEM, a church-ſong, performed in cathedral and other ſervice, by the choiriſters, divided for that purpoſe into choruſes, who ſing alternately.

The word was originally uſed both for pſalms and hymns, when thus performed.

Socrates repreſents St. Ignatius as the author of this way of ſinging among the Greeks; and St. Ambroſe among the Latins.—Theodoret attributes it to Diodorus and Flavian.

Amalarius Fortunatus has written expreſly of the order of *Anthems*, "*De antiphonarum ordine.*"

At preſent the term is uſed in a ſomewhat narrower ſenſe; being applied to certain paſſages taken out of the pſalms, &c. and often accommodated to the particular ſolemnity in hand.

Anthems were firſt introduced into the reformed ſervice of the Engliſh church in the beginning of the reign of queen Elizabeth.

ANTHEMIS, ſee CHAMOMILE.

ANTHERÆ, in *Botany*, a term uſed by ſome authors for the yellow, or ruddy globules in the middle of certain flowers, as of lilies, ſaffron, &c.

Some confine the *antheræ* to the yellowiſh globules in the middle of roſes.—Theſe are held more aſtringent than the reſt of the plant.

Others apply the name ANTHERÆ to thoſe little tufts or knobs which grow on the tops of the *ſtamina* of all other flowers; more uſually called APICES.

The *anthera* or apex of the ſtamen, in the Linnæan ſyſtem, is a principal part of the male organ of generation in plants, and contains within it a fine powder called *pollen* or *farina fæcundans*, deſtined for the impregnation of the *germen*, and which, when come to maturity, it diſcharges.

ANTHERICUM, in *Botany*. See SPIDERWORT.

ANTHESPHORIA, in *Antiquity*, a feaſt celebrated in Sicily, in honour of Proſerpine.

The word is derived from ανθος, *flower*, and φερω, *I carry*; in relation to Pluto's having forced away that goddeſs, when ſhe was gathering flowers in the fields. Yet Feſtus does not aſcribe the feaſt to Proſerpine; but ſays it was thus called, becauſe ears of corn were carried on this day to the temples.

Antheſphoria ſeems to be the ſame thing with the *floriſertum* of the Latins; and anſwers to the *harveſt-home* among us.

ANTHESTERIA, in *Antiquity*, was a feaſt celebrated by the Athenians, in honour of Bacchus.

The moſt natural derivation of the word is from ανθος, *flos, a flower*; it being the cuſtom at this feaſt to offer garlands of flowers to Bacchus.

Some are of opinion it took its name from the month *Antheſterion*, in which it was celebrated.—Others pretend, that this was not the name of any particular feaſt, but that all the feaſts of Bacchus were called *antheſteria*.

The *antheſteria* laſted three days, the eleventh, twelfth, and thirteenth day of the month; each of which days had a name ſuited to the proper office of the day.—The firſt day of the feaſt was called ϖιθοιγια, i. e. opening the veſſels, becauſe on this day they tapped the veſſels, and taſted the wine.—The ſecond they called χοος, *congii*, the name of a meaſure, containing the weight of about ten pounds: on this day they drank the wine prepared the day before.—The third day they called χυτροι, *kettles*: on this day they boiled all ſorts of pulſe in kettles; which, however, they were not allowed to taſte, as being all to be offered to Mercury.

ANTHESTERION, in *Ancient Chronology*, the ſixth month of the Athenian year. It contained twenty-nine days, and anſwered to the latter part of our November and beginning of December. The Macedonians called it *Dæſion* or *Deſion*.

It had its name from the feſtival ANTHESTERIA kept in it.

ANTHIA, in *Zoology*, a name by which ſome improperly call the *falx Venetorum*, or ſickle fiſh, a long anguilliform fiſh of the TÆNIA kind.

ANTHIAS, in *Zoology*, the name of a fiſh ſeeming to approach to the TURDUS or wraſſe kind, of which Rondeletius and ſome other authors have deſcribed four ſpecies. Linnæus makes it a ſpecies of the LABRUS.

ANTHINE, among *Ancient Naturaliſts*, is an appellation given to certain ſpecies of wine and oil.

In this ſenſe the word is alſo written *anthinos*.

Vinum anthines, οινος Ανθινης, was that prepared with certain fragrant flowers to give it the more agreeable odour.

Oleum anthinum is alſo denominated *liliaceum*, ſometimes *ſuſinum*.

Some alſo give the appellation *anthine* to the compoſition otherwiſe called CYCEON.

ANTHOCEROS, in *Botany*, the name of a genus of moſſes, of the *cryptogamia algæ*, in the Linnæan ſyſtem.

The name was given by Micheli; and Linnæus characteriſes it, as having male and female flowers: the calyx of the male is ſeſſile, cylindric, and entire: the anthera is ſubulated, very long, and furniſhed with two valves: the calyx of the female is divided into ſix ſegments, and contains three ſeeds. He reckons three ſpecies.

ANTHOLOGION, a church-book in uſe among the Greeks.

It was called ανθολογιον, q. d. *florilegium*, or a collection of flowers.

The *anthologion* is a ſort of breviary or maſs-book, containing the daily offices addreſſed to our Saviour, the Virgin, and the principal ſaints; with other common offices of prophets, apoſtles, martyrs, pontiffs, and confeſſors, according to the Greek rite. See BREVIARY, MASS, and OFFICE.

ANTHOLOGY, ANTHOLOGIA, a diſcourſe or treatiſe of flowers; or of beautiful paſſages from any authors.

Thus called from ανθος, *flos, a flower*, and λογος, *ſermo, diſcourſe*.—Though others chooſe rather to derive it from ανθος, *flos, a flower*, and λεγω, *I gather*; and uſe it to ſignify a collection of flowers.

ANTHOLOGY is frequently uſed for a collection of epigrams of divers Greek poets.

ANTHOLYZA, in *Botany*, of the *triandria monogynia*; we have no Engliſh name for this plant.

The characters are, that it hath an imbricated ſheath, which is permanent; the flower is of one leaf, and opens above with compreſſed jaws. The under lip is trifid and ſhort; the middle ſegment turns downward. Under the flower is ſituated the *germen*, which afterward becomes a roundiſh three-cornered veſſel having three cells, in which are lodged many triangular ſeeds. Mr. Miller enumerates two ſpecies.

They are a great ornament to the green-houſe when they are in flower; and as they require but little culture, they deſerve a place in every good garden.

ANTHONY—Knights of St. *Anthony*, an order of knighthood, eſtabliſhed in 1382, by Albert of Bavaria, &c. who had then taken a reſolution to make war againſt the Turks.

The knights of this order wore a collar of gold, with a hermit's girdle, to which hung a crutch, and a little bell. Some authors mention another order of St. *Anthony* in Ethiopia, inſtituted in 370, by Preſter John.

St. *Anthony* alſo gives the denomination to an order of religious founded in France about the year 1095, under the pontificate of Urban II. to take care of thoſe afflicted with *St. Anthony's fire*.

The *Anthonins*, or monks of St. *Anthony*, are by ſome ſaid to be of the begging kind. Their founder was Gaſton Frank, who erected a monaſtery for them at La Motte, near Vienne, where the general ſtill lives; they follow the rule of St. Auguſtine. Others give a different account of their origin, and ſuppoſe them thus called, not on account of *St. Anthony's fire*, but becauſe inſtituted by a St. *Anthony*, prior of a monaſtery in that neighbourhood. The friers of this order came into England in the reign of king Henry III. and had one houſe at London, and another at Hereford.

It is ſaid in ſome places, theſe monks aſſume to themſelves a power of giving, as well as removing the *ignis ſacer*, or ERYSIPELA, a power which is uſefully employed for keeping the poor people in ſubjection and extorting alms.

ST. ANTHONY'S *Fire*, ſee ERYSIPELA.

ANTHOPHYLLI, a denomination given to the larger ſpecies of cloves.

The word is otherwiſe written *antophali*.

ANTHORA, a medicinal plant, of the ACONITE kind, having yellow flowers, reſembling helmets; growing chiefly on the mountains in Switzerland and Savoy.

This is otherwiſe called *antithora*, as being reputed an antidote againſt the *thora*; ſometimes ACONITUM *ſalutiferum*, in Engliſh the HELMET-*flower*.

The root, *anthoræ radix*, has been chiefly in uſe. It holds a place in the catalogues of the *Materia Medica*, but is not kept at this time in the ſhops. It is of a duſky brown without and whitiſh within, of a warm bitteriſh taſte, and is reputed a cardiac and alexipharmic, much of the ſame qualities with CONTRAYERVA root; on which account ſome alſo denominate it the *German contrayerva*, though it now only obtains in a few officinal compoſitions.

ANTHORISMUS, in *Rhetoric*, denotes a counter definition or deſcription of a thing.

Thus, if the plantiff urge, that to take any thing away from another, without his knowledge or conſent, is a theft; this is called ορος, or definition. If the defendant reply, that to take a thing away from another, without his knowledge or conſent, provided it be done with deſign to return it to him again, is not theft; this is an ανθοϱισμος.

ANTHOS, in its original Greek, ſignifies flower; but by way of excellency is appropriated to roſemary, ſo as to expreſs only that plant.

ANTHOS, in *Chemiſtry*, is uſed to denote the quinteſſence or elixir of gold; and ſometimes for a medicine extracted from pearls.

ANTHOS *philoſophorum* is more particularly uſed, to denote a method of tranſmuting metals by means of vitriol.

ANTHOSMIAS, in ſome *Ancient Naturaliſts*, denotes a rich odoriferous kind of wine.

In this ſenſe *anthoſmias* differs from *anthinos*, as the latter imports a medicated wine ſcented with odoriferous herbs, whereas the former derived its fragrancy from the native grapes.

ANTHOSPERMUM, in *Botany*. See AMBER *tree*.

ANTHOXANTHUM, in the Linnæan ſyſtem of *Botany*, the name of a ſort of graſs which makes a diſtinct genus of plants, of the *diandria digynia* claſs. The characters of this are, that the *calix*, or flower-cup, is compoſed of two glumes, the exterior containing one flower compoſed of two valves of an oval figure, pointed, hollow, and the one larger than the other; the interior glume is compoſed of two valves of the ſame length with the exterior large valve, and each ſending out a fine beard or acorn from its hinder part: this alſo contains one flower, which is compoſed of two unequal-ſized valves, and is extremely thin in its whole ſtructure, and quickly falls off. The *ſtamina* are three capillary filaments; the *antheræ* are long, and ſplit at their ends; the *germen* of the *piſtillum* is oblong; the ſtyles are capillary, two in number, and hoary; the *ſtigmata* are ſimple; the interior glume grows firmly to the ſeed, which is ſingle, oblong and pointed at each end.

ANTHRACIS, in *Natural Hiſtory*, a word uſed for a gem by the ancients, but in ſeveral different ſenſes. All which ſeem evidently to refer to the cat's eye, or *aſteriu* kind.

Many of the ancients alſo have called the HÆMATITES, or blood-ſtone, by this name, *anthracitis*, becauſe of its being of the colour of a burning coal.

ANTHRACOSIS, a diſeaſe of the eyes, occaſioned by a corroſive ulcer, either in the bulb of the eye, or the eyelids, covered with ſkin, and attended with a general ſwelling of the parts adjoining.

The word denotes an inflammation reſembling a coal; ανθραξ ſignifying a coal.

ANTHRAX, in the *Natural Hiſtory* of the *Ancients*, was a word uſed by the moſt early writers for the ſubſtance we now call pit-coal and *lithanthrax*. Theophraſtus plainly tells us, that the ſubſtance ſtrictly and properly called *anthrax* (for they alſo knew a gem by the ſame name, uſed in a metaphorical ſenſe) was an earthy foſſile ſubſtance, which was broken in pieces to be uſed, and kindled well, and burnt almoſt like wood-coals, and was uſed by the ſmiths.

ANTHRAX, Ανϑραξ, in *Medicine*, means figuratively, a ſcab or blotch, made by a corroſive humour, which, as it were, burns the ſkin, and occaſions ſharp pricking pains.

The *anthrax* is the ſame with what is otherwiſe denominated *carbo* and *carbunculus*.

Some pretend to make a diſtinction between the *anthrax* and CARBUNCLE, limiting this latter to the glandular parts, and the former to all the others. But the diſtinction is ſcarce worth the making.

Rivettus, Toſius, Gemma, and Meurerus, have diſcourſes expreſsly on the *anthrax*.

ANTHROMETRICA *machina*. See ANTHROPOMETRICA.

ANTHROPODÆMON, in *Ancient Writers*, a demon concealed under the figure or appearance of a man.

ANTHROPOGLOTTUS, in *Natural Hiſtory*, ſomething that has a tongue, or ſpeech reſembling that of man.

The parrot kind are denominated *anthropoglotti*, on account of their broad, thick and muſcular tongues, by which they are enabled to ſpeak, and to roll their meat from ſide to ſide under the edges of their bills.

ANTHROPOGRAPHIA, a deſcription of man; more particularly, of the ſtructure of his body and the parts thereof.

ANTHROPOLATRÆ, a title given to the Neſtorians, on account of their believing Chriſt to be a mere man, yet paying him the honour of a God.

ANTHROPOLATRIA, the paying divine worſhip or honours to a man. *Anthropolatria* is ſuppoſed by ſome to have been the moſt ancient ſpecies of IDOLATRY.

ANTHROPOLOGY, a diſcourſe, or treatiſe, upon man, or human nature; conſidered as in a ſound, or healthy ſtate.

It is compounded of ανϑρωπος, *man*, and λογος, *diſcourſe*.

Anthropology includes the conſideration both of the human body and ſoul, with the laws and effects of their union; as ſenſation, motion, &c.

It is particularly uſed, in *Theology*, for a way of ſpeaking of God, after the manner of men; by attributing human parts and paſſions to him; as eyes, hands, ears, anger, joy, &c.

We have frequent inſtances of *anthropology* in holy ſcripture; by which we are only to underſtand the effect, or the thing which God does, as if he had hands, &c.

ANTHROPOMANCY, a method of divination, performed by inſpecting the *viſcera* of a perſon deceaſed.

The word is compounded of ανθρωπος, *man*, and μαντεια, *divination*.

ANTHROPOMETRIA, a deſcription of the human body, with its ſeveral parts and members according to the three dimenſions, length, breadth, and thickneſs, both conſidered in themſelves, and comparatively to each other.

ANTHROPOMETRICA *machina*, a name which Sanctorius gave to his weighing chair, contrived for meaſuring the quantity of *inſenſible* PERSPIRATION.

ANTHROPOMORPHA, in the Linnæan ſyſtem of nature, a claſs of animals in ſome degree reſembling the human form.

The word is derived from ανθωπος, *a man*, and μορφη, *form*.

This author makes it comprehend the monkey, the *ignavus* or ſloath, and the *tamandua guacu*, or ant-bear, as it is uſually called.

ANTHROPOMORPHITE, in a general ſenſe, one who attributes to God the figure of a man.

The word comes from the Greek ανθρωπος, *man*, and μορφη, *ſhape*.

ANTHROPOMORPHITES were a ſect of ancient heretics, who, taking every thing ſpoken of God in the ſcriptures in a literal ſenſe, imagined he had real hands, feet, &c. The paſſage they chiefly inſiſted on was that in Geneſis, where it is ſaid, that God made man after his own image.

Even philoſophers, for want of a better acquaintance with metaphyſics, ſeem to have fallen into *anthropomorphiſm*, repreſenting God much after the manner of a human ſoul, without conſidering the difference between a finite and an infinite being, limited and abſolute perfections. Wolfius has laboured hard to avoid this rock, by having the difference ſtill preſent to his mind, and proceeding according to the ancient rule, *Quæ de Deo dicuntur* ανθρωποπαθως, *ea intellige* Θεοπρεπως.

The whole ſect of Stoics held God to be corporeal; and, not to mention Tertullian and others among the fathers, Hobbes and his followers aſſert the ſame among ourſelves. Leibnitz charges Sir Iſaac Newton and his followers with repreſenting God under the conditions of a man. But with what juſtice it would be hard to ſay.

Thoſe who held the contrary, viz. that God is incorporeal, and without any bodily form, the *Anthropomorphites* branded by the name of *Origeniſts*, becauſe *Origen* taught how to allegorize thoſe expreſſions.

Epiphanius calls the *Anthropomorphites*, *Audiani*, or *Odiani*, from *Audius*, the ſuppoſed founder of the ſect; who lived, about the time of Arius, in Meſopotamia. St. Auguſtine calls them *Vadiani*.

This ſyſtem was revived in the year 939.

ANTHROPOMORPHOUS, ſomething that bears the figure or reſemblance of a man. Naturaliſts give inſtances of *anthropomorphous* plants, *anthropomorphous* minerals, &c. Theſe generally come under the claſs of what they call *luſus naturæ*, or monſters.

Anthropomorphous ſtones make a ſpecies of thoſe called figured ſtones.

ANTHROPOMORPHOUS is an appellation more peculiarly given to MANDRAGORA, or *mandrake*.

ANTHROPOPATHY, a figure, expreſſion, or diſcourſe, whereby ſome paſſion is attributed to God, which properly belongs only to man.

It is compounded of ανθρωπος, *man*, and παθος, *paſſion*.

Anthropopathy is frequently uſed promiſcuouſly with *anthropology*; yet, in ſtrictneſs, they ought to be diſtinguiſhed, as the genus from the ſpecies.—*Anthropology* may be underſtood of any thing human attributed to God; but *anthropopathy*, only of human affections, paſſions, ſenſations, &c.

ANTHROPOPHAGI, people who feed on human fleſh.

Compounded of the Greek ανθρωπος, *man*, and φαγειν, *edere*, *to eat*.

The Cyclops, the Leſtrygons, and Scylla, are all repreſented in Homer as *anthropophagi*, or man-eaters; and the female phantoms, Circe, and the Syrens, firſt bewitched with a ſhew of pleaſure, and then deſtroyed.—This, like the other parts of Homer's poetry, had a foundation in the manners of the times preceding his own. It was ſtill in many places the age ſpoken of by Orpheus,

> When men devour'd each other like the beaſts,
> Gorging on human fleſh. ——

Some remains of the uſage ſubſiſted much longer, even among the moſt civilized nations, in the practice of offering human ſacrifices.

Hiſtory gives us divers inſtances of perſons driven by exceſs of hunger to eat their own relations. Others commence *anthropophagi* out of revenge and hatred; there are many inſtances of ſoldiers who in the heat of battle have been carried to ſuch exceſs of rage, as to tear their enemies with their teeth.

The violence of love has ſometimes produced the ſame effect as the exceſs of hatred. The *Tapuii* eat the bodies of their friends and neareſt relations to preſerve them from worms and putrefaction, thinking they do not only hereby afford them an honourable grave, but even a new life, a kind of revivification in themſelves. Artemiſia did ſomething like this, when ſhe ſwallowed the aſhes of her dead huſband, Mauſolus. Among the Eſſedonian Scythians, when a man's father died, his neighbours brought him ſeveral beaſts, which they killed, minced, and mixed up with the fleſh of the deceaſed, and made a feaſt.

Among the *Maſſageti*, when any perſon grew old, they killed him and eat his fleſh; but if the party died of ſickneſs, they buried him, eſteeming him unhappy.

Idolatry and ſuperſtition have occaſioned the eating more men, than both love and hatred put together. There are few nations but have offered human victims to their deities; and it was an eſtabliſhed cuſtom to eat part of the ſacrifices they offered.

The Jagos and the ſubjects of the great Macoco, are ſaid to be *anthropophagi*. This prince is very powerful, having ten kings for his vaſſals; his court is ſo numerous, that there are 200 men butchered every day to ſupply the table; part of this number are criminals, the reſt ſlaves furniſhed in the nature of tribute.

It appears pretty certain from Dr. Hawkeſworth's Account of the Voyages to the South Seas, that the inhabitants of the iſland of New Zeland, a country unfurniſhed with the neceſſaries of life, eat the bodies of their enemies. It appears alſo to be very probable, that both the wars and *anthropophagy* of theſe ſavages take their riſe, and owe their continuance to irreſiſtible neceſſity, and the dreadful alternative of deſtroying each other by violence, or of periſhing by hunger. See Vol. III. p. 447 & ſeq. and Vol. II. p. 389 &c.

M. Petit has a learned diſſertation on the nature and manners of the *anthropophagi*. Among other things, he diſputes whether or no the *anthropophagi* act contrary to nature? The philoſophers, Diogenes, Chryſippus, and Zeno, followed by the whole body of Stoics, held it a very reaſonable thing for men to eat each other.

According to Sextus Empiricus, the firſt laws were thoſe made to prevent men from eating each other, as had been done till that time. The Greek writers repreſent *anthropophagy* as univerſal before Orpheus. To ſhew further, that *anthropophagy* is not contrary to nature, a modern author urges, that cats, dogs, rabbits, and other animals, feed on each other. Pliny, after Ariſtotle, affirms, that ſwans eat each other; and the bees alſo eat their *nymphæ*, which are their young. The Dutch in Nova Zembla ſaw bears devour each other, and the like has been obſerved in the fiſh kind: the *tiburones*, according to Ovid, are caught with a hook baited with their own fleſh. Leonardus Floroventius having fed a hog with hog's fleſh, and a dog with dog's fleſh, found a repugnancy in nature to ſuch food; the former loſt all its briſtles; the latter its hair; and the whole body broke out in blotches. The origin of the venereal diſeaſe is by ſome attributed to the eating of human fleſh.

It may be ſaid, that whether the dead body of an enemy be eaten or buried, is a matter perfectly indifferent; but whatever the practice of eating human fleſh may be in itſelf, it certainly is, relatively and in its conſequences, moſt pernicious. It manifeſtly tends to eradicate a principle, which is the chief ſecurity of human life, and more frequently reſtrains the hand of the murderer, than the ſenſe of duty, or the dread of puniſhment. If even this horrid practice originates from hunger, ſtill it muſt be perpetuated from revenge. Death muſt loſe much of its horror among thoſe who are accuſtomed to eat the dead; and where there is little horror at the ſight of death, there muſt be leſs repugnance to murder. See ſome further obſervations on this ſubject, equally juſt and ingenious, by Dr. Hawkeſworth, *ut ſupra*.

It may be aſked, whether the uſe which is made of certain parts of the human body in phyſic, come under the denomination of *anthropophagy*? How often have tombs been violated on this occaſion? To ſay nothing of mummies and the like. Pliny aſſures us, that in his time the phyſicians ordered their epileptic patients to apply their lips to the wounds of gladiators, and ſwallow the blood as it ſtreamed from them.

Some carry their reſpect for dead bodies a great length. M. Petit does not think it lawful for anatomiſts to diſſect human bodies, in order to learn their ſtructure, except thoſe of condemned criminals, and ſuch as are denied the rites of burial. The Arabs went farther; notwithſtanding all their curioſity and deſire to be acquainted with the human ſtructure, they could never be induced to make one diſſection; but were contented to borrow all their knowledge of this kind from the Greek phyſicians.

Some maintain it impoſſible, whatever precaution is uſed, to prevent the ingreſs of the parts of dead bodies with our food and drink. Add, that if we do not feed on our own ſpecies, we feed on plants and animals, which derive a great part of their nutriment from us. Whence the impoſſibility of the RESURRECTION of the ſame body has been inferred.

ANTHROPOPHAGIA, the act or habit of eating human fleſh.

This is pretended by ſome to be the effect of a diſeaſe, which leads people affected with it to eat every thing alike. Some chooſe only to conſider it as a ſpecies of PICA.

The annals of Milan furniſh an extraordinary inſtance of *anthropophagy*. A Milaneſe woman, named Elizabeth, from a depraved appetite, like what women with child, and thoſe whoſe *menſes* are obſtructed, frequently experience, had an invincible inclination to human fleſh, of which ſhe made proviſion by enticing children into her houſe, where ſhe killed and ſalted them; a diſcovery of which having been made, ſhe was broken on the wheel and burnt in 1519.

Some phyſicians vainly think they have diſcovered the principle of *anthropophagy*; and that it conſiſts in an acrid atrabiliary humour, which being lodged in the coats of the ventricle, produces this voracity. And they give ſeveral inſtances of this inhuman hunger, even among their own patients.

ANTHROPOSCOPIA, the art of judging or diſcovering a man's character, diſpoſition, paſſions, and inclinations, from the lineaments of his body.

In which ſenſe, *anthropoſcopia* ſeems of ſomewhat greater extent than PHYSIOGNOMY, or METOPOSCOPY.

Otto has publiſhed an ANTHROPOSCOPIA, *ſive judicium hominis de homine ex lineamentis externis.*

ANTHROPOSOPHIA, the ſcience of the nature of man, and his ſtructure and compoſition, both internal and external.

In this ſenſe, *anthropoſophia* amounts to much the ſame with the medical *phyſiology* or *anatomy*.

The word is uſed by Charleton, but with no great propriety; ſince *ſophia* or wiſdom imports the ſcience of uſing means to obtain an end, which is foreign to Charleton's intention.

ANTHROPOTHYSIA, in *Ancient Writers*, denotes the offering of human victims.

The *anthropothyſia* was a frequent practice among the ancients. Some have imagined that the ſacrifice of Abraham was the firſt inſtance. Many reaſonings and diſquiſitions have been founded on this ſuppoſition; by which the ſeverity of Abraham's trial is thought by ſome to have been ſomewhat exaggerated. Human ſacrifices were in uſe among the Gentiles before that time; practiſed by kings as well as by private perſons; nay by entire nations, as the Egyptians, Phœnicians, Canaanites, &c.

ANTHUMON, in the *Materia Medica* of the *Ancients*, a name given to the EPITHYMUM, or *dodder*, growing upon THYME.

ANTHUS, in *Zoology*, a name by which Aldrovand and ſome other authors have called that ſpecies of the OENANTHE known in England by the name of the WHIN-CHATT.

ANTHYLLIS, in *Botany*. See LADY's *finger*.

ANTHYPOMOSIA, in *Ancient Writers*, an oath taken by a proſecutor or accuſer, declaring that the abſence of the party accuſed is not for any juſt cauſe, and therefore demanding that judgment may no longer be delayed on that account.

ANTHYPOPHORA, in *Rhetoric*, a figure whereby we covertly obviate a reaſon or objection.

In this ſenſe *anthypophora* ſtands oppoſed to *hypophora*, e. gr. If the HYPOPHORA be, grammar is very difficult to obtain; the *anthypophora* may be, grammar is indeed a little difficult to attain, but then its uſe is infinite.

ANTI, Αντι, is a prepoſition uſed in compoſition with ſeveral words, both in Greek, Latin, Engliſh, &c. in different ſenſes. In Engliſh, it ſometimes happens before; as in *antichamber*, a place before the chamber.—In which caſe it has the ſame meaning with the Latin, *ante*, *before*.

Sometimes, again, it ſignifies *contrary*, or *oppoſite*; and is then derived from αντι, *contra*, *againſt*.

In this latter ſenſe, the word makes part of the name of various medicines, to denote ſome peculiar or ſpecific virtue in them againſt certain diſeaſes: ſuch, e. gr. are antivenereals, antiſcorbutics, antinephritics, &c.

The prepoſition is frequently, however, omitted on theſe occaſions, without any alteration of the ſenſe; as in nephritics, arthritics, aſthmatics, &c.

ANTI, in matters of *Literature*, is a title given to divers pieces written by way of anſwer to others, whoſe names are uſually annexed to the *anti*.

See the *Anti* of M. Baillet; and the *Anti-Baillet* of M. Menage: there are alſo *Anti-Menagiani*, &c. Cæſar the dictator wrote two books by way of anſwer to what had been objected to him by Cato, which he called *Anti-Catones*; theſe are mentioned by Juvenal, Cicero, &c.—Vives aſſures us, he had ſeen Cæſar's *Anti-Catones* in an ancient library.

ANTIADES, a term uſed by ſome writers for the glandules, and kernels, more commonly called TONSILS, and ALMONDS *of the ears*.

ANTIADIAPHORISTS, ANTIADIAPHORISTÆ, oppoſite to the ADIAPHORISTS.

The word is compounded of *αντι*, *contra*, *againſt*, and *αδιαφορος*, *indifferent*.

This name was given, in the fourteenth century, to the rigid Lutherans, who diſavowed the epiſcopal juriſdiction, and many of the church-ceremonies, retained by the moderate LUTHERANS.

ANTIBACCHIUS, in the *Ancient Poetry*, a foot, conſiſting of three ſyllables; the two firſt whereof are long, and the third ſhort.

Such are the words *cāntārĕ*, *vīrtūtĕ*, Ε̄λλη̄νε̆ς.

It is ſo called as being contrary to the BACCHIUS, the firſt ſyllable whereof is ſhort, and the two laſt long.

Among the ancients, this foot is alſo denominated *Palimbacchius*, and *Saturnius*; and, by ſome, *Propontícus*, and *Theſſalius*. Diom. III. p. 475.

ANTIBARBAROUS, a title given to ſeveral works levelled againſt the uſe of barbarous terms and phraſes, chiefly in the Latin tongue.

Eraſmus, Nizolius, and Cellarius, have publiſhed *Antibarbara*. Noltenius has given us a Lexicon *Anti-barbarum*, conſiſting of obſervations made by the grammarians of late ages in relation to the purity and corruption of Latin words.

Sixt. Amama has given an *Antibarbarus Biblicus*, wherein he pretends to have diſcovered ſeven ſources of the barbariſms which have got footing of late ages in the BIBLE.

Peter du Moulin uſed the title *Antibarbarus* for a book againſt the uſe of an unknown tongue in divine ſervice.

ANTIBIBLOS, in the *Civil Law*, an inſtrument or ſignature whereby the defendant owns he has received the libel, or a copy of it, and notes the day whereon he received it. This is uſually done on the back of the LIBEL.

ANTICADMIA denotes a ſpecies of mineral CADMIA, ſometimes alſo called *pſeudo*-CADMIA.

It takes the denomination *anticadmia*, not as being oppoſite in quality to the *cadmia*, but becauſe it is uſed as a ſubſtitute for it.

ANTICARDIUM, in *Anatomy*, &c. that hollow part under the breaſt, juſt againſt the heart, commonly called the *pit of the ſtomach*: called alſo *ſcrobiculus cordis*.

The word is compounded of *αντι*, *contra*, *againſt*; and *καρδια*, *cor*, *heart*.

ANTICATARRHAL, an epithet given to medicines preſcribed for catarrhs.

ANTICATEGORIA, in *Oratory*, denotes a recrimination or mutual accuſation; where the two parties charge each other with the ſame crime.

Apollodorus conſiders the *anticategoria* as two ſeveral cauſes or actions.

ANTICAUSOTICS, among *Phyſicians*, denote medicines againſt burning fevers.

In this ſenſe Juncker has given the deſcription of *anticauſotic* ſyrup.

ANTICHAMBER, ſee ANTECHAMBER.

ANTICHORUS, in *Botany*, a genus of the *octandria monogynia*, which has a four-leaved calyx, four petals, an awl-ſhaped, four-celled capſule, with four valves, and many ſeeds.

ANTICHRESIS, in the *Civil Law*, a covenant, or convention, whereby a perſon borrowing money of another engages, or makes over his lands or goods to the creditor, with the uſe and occupation thereof, for the intereſt of the money lent. This covenant was allowed of by the Romans; among whom uſury was prohibited: it was afterwards called MORT-GAGE, to diſtinguiſh it from a ſimple engagement, where the fruits of the ground were not alienated, which was called VIF-*gage*.

ANTICHRIST, in a general ſenſe, denotes an adverſary of Chriſt, or one who denies that the Meſſiah is come.

The word is compounded of *αντι*, *contra*, *againſt*; and *Χρισος*, *Chriſt*.

In this ſenſe, Jews, infidels, &c. may be ſaid to be *Antichriſts*.

ANTICHRIST is more particularly uſed for a tyrant who is to reign on earth, toward the end of the world; to make the ultimate proof of the elect; and to give a ſhining inſtance of the Divine vengeance, before the laſt judgment.

The Bible and the fathers all ſpeak of *Antichriſt* as a ſingle man; though they aſſure, withal, that he is to have divers precurſors, or fore-runners.—Yet many Proteſtant writers apply to the Romiſh church, and the pope, who is at the head of it, the ſeveral marks and ſignatures of *Antichriſt* enumerated in the Apocalypſe; which would rather imply *Antichriſt* to be a corrupt ſociety, or a long ſeries of perſecuting pontiffs, than a ſingle perſon. Or rather, a certain power or government, that may be held for many generations, by a number of individuals ſucceeding one another. The *Antichriſt* mentioned by the apoſtle John, 1 Ep. ii. 18. and more particularly deſcribed in the book of Revelation, ſeems evidently to be the ſame with the *Man of Sin*, &c. characteriſed by St. Paul in his ſecond Epiſtle to the Theſſalonians, ch. ii. And the whole deſcription literally applies to the exceſſes of papal power. Had the right of private judgment, ſays an excellent writer, been always adopted and maintained, *Antichriſt* could never have been; and when that ſacred right comes to be univerſally aſſerted, and men follow the voice of their own reaſon and conſciences, *Antichriſt* can be no more.

However, the point having been maturely debated at the council of Gap, held in 1603, a reſolution was taken thereupon, to inſert an article in the confeſſion of faith, whereby the pope is formally declared to be *Antichriſt*.—Pope Clement VIII. was ſtung to the life with this deciſion; and even king Henry IV. of France was not a little mortified, to be thus declared, as he ſaid, an imp of *Antichriſt*.

The learned Grotius maintains, that Caligula was *Antichriſt*; others have affirmed the ſame of Nero; but theſe do not agree with his appearance at the end of the world.

F. Malvenda, a Spaniſh Jeſuit, has publiſhed a large and learned work, *De Antichriſto*, in thirteen books.—In the firſt, he relates all the opinions of the fathers with regard to *Antichriſt*. In the ſecond, he ſpeaks of the time when he ſhall appear; and ſhews, that all the fathers, who ſuppoſed *Antichriſt* to be near at hand, judged the world, alſo, was near its period. In the third he diſcourſes of his origin and nation; and ſhews, that he is to be a Jew, of the tribe of Dan: this he founds on the authority of the fathers; on that paſſage in Geneſis xlix. *Dan ſhall be a ſerpent by the way*, &c. on that of Jeremy viii. 16. where it is ſaid, *The armies of Dan ſhall devour the earth*; and on the Apocalypſe, chap. vii. where St. John, enumerating all the tribes of Iſrael, makes no mention of that of Dan. In the fourth and fifth books, he treats of the ſigns of *Antichriſt*. In the ſixth, of his reign and wars. In the ſeventh, of his vices. In the eighth, of his doctrine and miracles. In the ninth, of his perſecutions; and, in the reſt, of the coming of Enoch and Elias, the converſion of the Jews, the reign of Jeſus Chriſt, and the death of *Antichriſt*, after his having reigned three years and a half.

Hippolitus, and others, held that the devil himſelf was the true *Antichriſt*, that he was to be incarnate, and make his appearance in human ſhape before the conſummation of things.

How endleſs are conjectures? Some of the Jews we are told actually took Cromwell for Chriſt, while ſome others have laboured to prove him *Antichriſt* himſelf. Pfaffius aſſures us he ſaw a folio book in the Bodleian library, written on purpoſe to demonſtrate this latter poſition.

ANTICHRISTIANISM, a ſtate or quality in perſons or principles, which denominates them antichriſtian, or oppoſite to the kingdom of Chriſt, and the genius and ſpirit of his religion.

ANTICHRISTIANS properly denote the followers or worſhippers of *Antichriſt*.

ANTICHRISTIANS are more particularly underſtood of thoſe who ſet up, or believe in a falſe Chriſt, or Meſſiah.

ANTICHTHON, in its primitive aſtronomic ſenſe, denotes a kind of globe or earth reſembling ours, and like it ſuppoſed to be moving round the ſun, but inviſible to us, becauſe on the oppoſite ſide of the ſun, that luminary being ſtill exactly interpoſed between this other earth and ours.

In this ſenſe it is, that Pythagoras and his diſciples aſſerted an *antichthon*; for which we have the teſtimonies of Ariſtotle, Plutarch, &c.

By reaſon of the perfection of the number ten, they concluded there muſt be juſt ſo many ſpheres; and as our ſenſes only diſcover nine, viz. the ſeven planets, the ſphere of the fixed ſtars, and our earth, they imagined a tenth oppoſite to ours.

Some of the fathers, who endeavoured to accommodate the doctrine of the heathen philoſophers to thoſe of Chriſtianity, aſſert that this Pythagorean earth is no other than the heavens of the righteous.

Thomaſius has a diſſertation on the Pythagorean *antichthon*.

ANTICHTHONES, in *Geography*, are thoſe people who inhabit countries diametrically oppoſite to each other.

The word is compounded of *αντι*, *contra*; and *χθων*, *terra*, *earth*. They are ſometimes alſo called, by Latin writers, *antigenæ*.

In which ſenſe *antichthones* amounts to much the ſame with what we more uſually call *antipodes*.

Antichthones is alſo uſed, in *Ancient Writers*, to denote the inhabitants of contrary hemiſpheres.

In which ſenſe *antichthones* differs from *antoeci*, and *antipodes*.

The ancients conſidered the earth as divided by the equator into two hemiſpheres, the northern and ſouthern; and all thoſe who inhabited one of theſe hemiſpheres, were reputed *antichthones* to thoſe of the other.

ANTICIPATION, the act of preventing, or being beforehand with a perſon, or thing; or of doing a thing before the time.

Anticipating a payment denotes the diſcharging it before it falls due.—Such a debt was not yet become due; he *anticipated* the time of payment.

Anticipation is alſo uſed, in a *logical* ſenſe, for a preſumption, prejudice, or preconceived opinion.

This is alſo denominated preconception, preſenſation, or inſtinct.

Anticipation, in a medicinal ſenſe, is applied to diſeaſes, wherein part of the ſymptoms which regularly belong to ſome future period, appear in the beginning; or, the word may be underſtood of thoſe diſeaſes, which having their acceſſes and remiſſions at ſtated hours, gain in point of time, and finiſh their period ſooner than ordinary.

In this ſenſe, *anticipation*, or *anticipated* diſeaſes, by the Greeks called προληπτικοι, ſtands oppoſed to hyſteretic, ὑϛερητικοι, which come after the time.

Anticipation, in the Epicurean *Philoſophy*, denotes the firſt idea, or definition of a thing, without which we can neither name, think, doubt, or even inquire, concerning it.

This is otherwiſe denominated PRENOTION.

Anticipation, in this ſenſe, makes the ſecond of Epicurus's criterions of truth.

Anticipation is alſo uſed by Shafteſbury, in ſpeaking of painting, to denote the expreſſion of ſome future action, reſolution, or the like.

Anticipation, in *Rhetoric*, a figure otherwiſe called PROLEPSIS.

ANTICK, in *Sculpture* and *Painting*, denotes a fantaſtical compoſure of figures of different natures, ſexes, &c. As men, beaſts, birds, flowers, fiſhes, and even things merely imaginary, or which have no exiſtence in the nature of things.

Antick amounts to much the ſame thing with what the Italians call *groteſca*, and the French *groteſque*.

ANTICLIMAX, in *Rhetoric*, is a figure, whereby the progreſs of a diſcourſe deſcends from great to little; and this is ſometimes rendered peculiarly agreeable by ſuch a concord between the ſenſe and ſound as may contribute to make diminutions appear ſtill more diminutive. Horace affords a ſtriking example:

> *Parturiunt montes, naſcetur ridiculus mus.*

ANTICNEMION, in *Anatomy*, denotes the ſhin; or the fore prominent part of the *tibia*.

This is otherwiſe called ακανθα, by the Latins *prima tibia*, or *anterior tibia*, and ſtands oppoſed to the *ſura*, or calf of the leg, ſometimes called *ocrea*.

ANTICOR, **Anticoeur**, or *avant cœur*, among *Farriers*, is uſually deſcribed as a preternatural ſwelling, of the ſize and figure of an apple, occaſioned by a ſanguine and bilious humour, and appearing in a horſe's breaſt, oppoſite to his heart. A late writer affirms, that the generality of authors on that ſubject have been miſtaken as to this diſeaſe, attributing it to the heart; whence it is by Solleyſel called the *ſwelling of the pericardium*; whereas it is really an inflammation in the gullet and throat; and is the ſame that, in human bodies is called the *angina*, or *ſquinancy*.

The cure of this diſeaſe ſhould be attempted by copious bleedings, in order to reduce the inflammation. Emollient clyſters ſhould alſo be injected twice or thrice a day, with an ounce of ſal prunella in each. The ſwelling ſhould be bathed with marſhmallow ointment; and an opening poultice, with onions boiled in it, ſhould be daily applied to it. If the inflammation be hereby removed, the ſwelling ſhould be brought, if poſſible, to maturation; for this purpoſe the poultice muſt be continued, and two ounces of Venice treacle, diſſolved in a pint of beer, muſt be given to the horſe every night. When the ſwelling is ſoftened, it muſt be opened with a knife, and dreſſed with turpentine digeſtive. But if the ſwelling cannot be brought to matter, and ſhould endanger ſuffocation, Solleyſel, and others, adviſe opening the ſkin, in order to introduce a piece of black hellebore root ſteeped in vinegar, and to confine it there for twenty-four hours. In order to ſtimulate and promote a diſcharge, the adjacent parts ſhould be fomented, and bathed with ointment of marſhmallows.

ANTICUM, in *Architecture*, a porch before a door; alſo that part of a temple, which is called the outer temple, and lies between the body of the temple and the portico: It is ſometimes called *antæ*.

ANTICUS, *ſerratus minor*. See SERRATUS.

Anticus, *peronæus*. See PERONÆUS.

Anticus, *tibialis*. See TIBIALIS.

ANTIDACTYLUS, a name given by ſome to a kind of poetical foot, which is the reverſe of a dactyl, as conſiſting of three ſyllables, whereof the firſt two are ſhort, and the laſt long.

ANTIDÆMONICI, in *Eccleſiaſtical Hiſtory*, a ſect who denied the exiſtence of devils, or evil ſpirits; alſo all ſpectres, incantations, witchcrafts, &c.

ANTIDICOMARIANITES, a ſect of ancient Chriſtians, who thought that the Holy Virgin did not preſerve a perpetual virginity, but that ſhe had ſeveral children by Joſeph after our Saviour's birth.

Theſe are otherwiſe called *antidicomaritæ*; and *antidicomarites*, and *antidicomarianiſts*; ſometimes alſo *antimariani*.

The opinion was grounded on ſome expreſſions of our Saviour, wherein he mentions his brothers, and his ſiſters; and on that text of St. Matthew, wherein he ſays, that Joſeph knew not Mary till ſhe had brought forth her firſt-born ſon.

The *antidicomarianites* were the diſciples of Helvidius and Jovinian, who appeared in Rome toward the cloſe of the fourth century.

ANTIDISMA, in *Botany*, a genus of the *dioecia pentandria*, without an Engliſh name.

ANTIDORON, in *Eccleſiaſtical Writers*, a name given by the Greeks to the conſecrated bread, out of which the middle part marked with the croſs, wherein the conſecration reſides, being taken away by the prieſt, the remainder is diſtributed, after maſs, to the poor.

On the ſides of the *antidoron* are impreſſed the words *Jeſus Chriſtus vicit*.

The word is formed from δωρον, *donum*, a *giſt*, as being given away *loco muneris*, or *in charity*.

The *antidoron* is alſo called *panis præſanctificatus*.

Some ſuppoſe the *antidoron* to be diſtributed in lieu of the ſacrament, to ſuch as were prevented from attending in perſon at the celebration; and thence derive the origin of the word, the Euchariſt being denominated *doron*, *giſt*, by way of eminence.

ANTIDOSIS, in *Antiquity*, denotes an exchange of eſtates, practiſed by the Greeks on certain occaſions with peculiar ceremonies, and firſt inſtituted by Solon.

When a perſon was nominated to an office, the expence of which he was not able to ſupport, he had recourſe to the *antidoſis*, that is, he was to ſeek ſome other citizen of better ſubſtance than himſelf, who was free from this, and other offices; in which caſe, the former was excuſed. In caſe the perſon thus ſubſtituted denied himſelf to be the richeſt, they were to exchange eſtates, after this manner; the doors of their houſes were cloſe ſhut up and ſealed, that nothing might be conveyed away; then both took an oath to make a faithful diſcovery of all their effects, except what lay in the ſilver mines; which by the laws was excuſed from all impoſts; accordingly, within three days, a full diſcovery and exchange of eſtates was made.

ANTIDOTARY is uſed by ſome writers for what we more uſually call a DISPENSATORY.

We have *antidotaries* extant of ſeveral authors, as thoſe of Nicolaus, Meuſe, Myrepſus, Rhaſis, &c.

ANTIDOTE, a remedy taken either to prevent, or cure, ſome contagious, malignant, or other dangerous diſeaſe. The word is borrowed from αντι, *againſt*, and διδωμι, *I give*; as being ſomething given againſt poiſon, either by way of cure, or preſervative.

Antidote is alſo uſed to ſignify a medicine taken to prevent the ill effects of ſome other; for inſtance, poiſon.

In which ſenſe the word has the ſame ſignification with alexipharmic, alexiterial, and counterpoiſon.

The Indian phyſic conſiſts much in the uſe of *antidotes*; viz. the root *mungo*, and the viper-ſtone; both held ſovereign againſt the bite of the *cobras do cabelo*, and other venomous creatures.

Antidote is alſo uſed, in a more general ſenſe, for any compound medicine.

In which ſenſe, Peter Damian ſpeaks of a perſon who in his whole life never took any antidote.

Antidote is alſo uſed in a leſs proper ſenſe for any remedy againſt any diſeaſe, chiefly if it be inveterate, and ariſe from ſome ulcer or abſceſs.

Antidote is alſo uſed for a particular form of medicines, otherwiſe called *opiates*, or more properly CONFECTIONS.

Antidote is alſo *myſtically* applied to the philoſopher's ſtone.

ANTIENT, ſee ANCIENT.

ANTIGRAPHE, in *Antiquity*, denotes a law-ſuit about kindred, whereby a perſon claimed relation to ſuch or ſuch a family.

The *antigraphe* appears to have been the ſame with the παρακαταβολη.

ANTIGRAPHUS, in *Antiquity*, an officer of Athens, who kept a counterpart of the *apodecti*, or chief treaſurer's accounts, to prevent miſtakes, and keep them from being falſified.

ANTIGRAPHUS is alſo uſed, in *Middle Age Writers*, for a ſecretary or chancellor. He is thus called, according to the old gloſſariſts, on account of his writing anſwers to the letters ſent to his maſter. The *antigraphus* is ſometimes alſo called *archigraphus*; and his dignity *antigraphia*, or *archigraphia*.

ANTIGRAPHUS is alſo uſed in Iſidorus for one of the notes of ſentences, which is placed with a dot to denote a diverſity of ſenſe in tranſlations.

ANTIGRAPHUS is alſo applied in *Eccleſiaſtical Writers* to an ABBREVIATOR of the papal letters.

In which ſenſe the word is uſed by pope Gregory the great in his regiſter.

Of late days the office of *antigraphus* conſiſts in making minutes of bulls from the petitions agreed to by his holineſs, and renewing the BULLS after engroſſing.

ANTIGUGLER, is a crooked tube of metal, ſo bent, as eaſily to be introduced into the necks of bottles, and uſed in decanting liquors, without diſturbing them. For this purpoſe the bottle ſhould be a little inclined, and about half a ſpoonful of the liquor poured out, ſo as to admit an equal quantity of air; let one end of the bent tube be ſtopped with the finger, whilſt the other is thruſt into the body of the liquor near to the bubble of air already admitted. When the finger is taken off, the bottle will have vent, and the liquor will run out ſteadily and undiſturbed. See SIPHON.

ANTIHECTICS, remedies againſt hectical diſorders.

ANTIHECTICUM *Poterii*, in *Pharmacy*, a celebrated chymical preparation, made of equal quantities of tin and chalybeated regulus of antimony, by melting them in a large crucible, and putting to them, by little and little, three times the quantity of nitre: the DETONATION being over, the whole is to be waſhed with warm water till no ſaltneſs remains.

This has been formerly eſteemed as a very penetrating medicine, making way into the minuteſt paſſages, and ſearching even the nervous cells; whence its uſe in hectic diſorders, from which it derives its name. It has been accordingly recommended in heavineſſes of the head, giddineſs, and dimneſs of ſight, from whence proceed apoplexies and epilepſies; and in all affections and foulneſſes of the viſcera of the lower belly; and alſo in the jaundice, dropſies, and all kind of cachexies.—Quincy adds, that there is ſcarce a preparation in the chemical pharmacy of greater efficacy in moſt obſtinate chronic diſtempers. But Neumann obſerves, that it has no claim to antihectic virtues, nor indeed to any ſalutary operation; and it is now generally diſregarded. See Neumann's Chem. Works, p. 89, and 138.

ANTIHECTICUM *Poterii* is alſo called *antimonium diaphoreticum joviale*.

There are divers methods of preparing it, given by Wedelius, Etmuller, &c.

A learned author ſpeaks of it as fatal to conſumptive perſons.

ANTILEXIS, in *Antiquity*, denotes a new trial granted in the Athenian judicatories, where judgment had before paſſed againſt a party for non-appearance.

ANTILOGARITHM, the COMPLEMENT of the LOGARITHM of a ſine, tangent, or ſecant.

ANTILOGY, a contradiction between two expreſſions, or paſſages, in an author.

The word is αντιλογια, q. d. *contrary ſaying*.

Tirinus has publiſhed a large index of the ſeeming *antilogies* in the BIBLE, i. e. of texts which apparently contradict each other, but which are all explained and reconciled by him, in his comments on the Bible.—Dom. Magri, a Malteſe of the *Oratory* in Italy, has attempted the like; but he has done little more than rehearſe what occurs of that kind in the principal commentators.

ANTILUTHERANS, a ſect or party among the ancient reformers, who maintained opinions, chiefly in relation to the Euchariſt, different from thoſe of Luther.

Such were Caroloſtadius and his followers, called alſo *Sacramentarians*, and thoſe of Zuinglius denominated *Zuinglians*.

The ſect of *Antilutherans*, at firſt confined within narrow bounds, in a few years time ſubdivided into ſix or ſeven inferior ſects, and ere long into an infinite number more variouſly denominated.

ANTILYSSUS *pulvis*, in *Medicine*, is compoſed of equal parts of the LICHEN *cinereus terreſtris* & *piper niger*. It is reckoned uſeful in preventing the RABIES *canina*. Phil. Tranſ. N° 448.

ANTIMENSIUM, a kind of conſecrated table-cloth, occaſionally uſed in the Greek church, in places where there is no proper altar.

F. Goar obſerves, that in regard the Greeks had but few conſecrated churches, and that conſecrated altars are not things eaſy to be removed; that church has, for many ages, made uſe of certain conſecrated ſtuffs, or linens, called *antimenſia*, to ſerve the purpoſes thereof.

ANTIMENSIUM, in the Greek *Church*, anſwers to the *altare portabile*, or portable altar, in the Latin church. They are both only of late invention, though Habertus would have them as old as St. Baſil. But Durant and Bona do not pretend to find them in any author before the time of Bede and Charlemaign.

ANTIMENSIA is alſo applied to other tables, uſed in offices of religion, beſides thoſe whereon the Euchariſt is adminiſtred: ſuch, e. gr. are thoſe whereon the hoſt is expoſed, &c.

The origin of the *antimenſia* is deſcribed by Meurſius; when the biſhop had conſecrated a church, the cloth which had been ſpread on the ground, and over the communion table, was torn in pieces, and diſtributed among the prieſts, who carried each a fragment away, to ſerve to cover the tables in their churches and chapels. Not that it was neceſſary that ſuch cloths ſhould be laid on all tables: but only on thoſe which either were not conſecrated, or at leaſt whoſe conſecration was doubted of.

ANTIMENSIUS, an ancient officer in the Greek church, whoſe buſineſs was to introduce and place the communicants at the Euchariſt.

Some have imagined that he had the care of the *antimenſia*. But this rather belonged to the office of great *ſcevophylax*.

He is otherwiſe called chief of the *antimenſii*.

ANTIMERIA, in *Grammar*, a figure whereby one part of ſpeech is uſed for another; e. gr. *velle ſuum cuique eſt*, for *voluntas ſua cuique eſt*; alſo, *populus late rex*, for *populus late regnans*.

ANTIMERIA, in a more reſtrained ſenſe, is a figure whereby the noun is repeated inſtead of the pronoun.

The *antimeria* is frequent in the Hebrew, and is ſometimes retained in our verſion of the Old Teſtament accordingly: e. gr. *Hear my voice, ye wives of Lamech*, for *my wives*. Gen. ch. iv. ver. 23.

ANTIMETABOLE, in *Rhetoric*, a figure which ſets two things in oppoſition to each other.

The word is compounded of αντι, *againſt*, and μεταβολη, from μεταβαλλω, *I ſhift* or *transfer*; i. e. a ſhifting, or ſetting two things over-againſt each other.

This figure is twice exemplified in an apophthegm of Muſonius; which, on account of its excellence, is called *aureum monitum*, the golden maxim or precept.

Ἂν τὶ πράξῃς καλὸν μετὰ πόνȣ, ὁ μὲν πόνος ὄιχεται, τὸ δὲ καλὸν μένει.
Ἂν τὶ ποιήσῃς αισχρὸν μετα ἡδονῆς, τὸ μὲν ἡδὺ ὄιχεται, τὸ δὲ αισχρὸν μένει.

In Engliſh thus:

Allowing the performance of an honourable action to be attended with labour; the labour is ſoon over, but the honour immortal: whereas, ſhould even pleaſure wait on the commiſſion of what is diſhonourable, the pleaſure is ſoon gone, but the diſhonour eternal.

ANTIMETATHESIS, in *Rhetoric*, is the inverſion of the parts or members of an ANTITHESIS. Such is that of Cicero, in Verrem, lib. iv. cap. 52. 'Compare this 'peace with that war; the arrival of this governor with 'the victory of that general; his profligate troops with 'the invincible army of the other; the luxury of the 'former with the temperance of the latter: you will 'ſay, that Syracuſe was founded by him who took it; 'and taken by him, who held it when founded.'

ANTIMISIUM, in *Antiquity*, a table placed before the Roman tribunal, or judgment ſeat.

What relation this has to the *antimenſia* in the Greek church does not appear. Some writers confound them together as the ſame thing.

ANTIMONARCHICAL, ſomething that oppoſes, or ſtands againſt, monarchy, or kingly government.

Antimonarchical is frequently uſed in the ſenſe of *republican*.

ANTIMONARCHIST, a perſon who maintains *antimonarchical* principles.

Buchanan, Milton, Hottoman, Languet, Ludlow, Sydney, and others, are celebrated *antimonarchiſts*.

ANTIMONARCHOMACHI, *antimonarchomachiſts*, is uſed by ſome political writers to denote maintainers of monarchical or abſolute power veſted by divine right in the perſons of princes.

In which ſenſe, *antimonarchomachi* ſtand oppoſed to *monarchomachi*.

King James the firſt, Salmaſius, Peter du Moulin, biſhop Bramhall, Albericus Gentilis, Ziegler, William and George Barclays, Bochart, &c. have diſtinguiſhed themſelves in the claſs of *antimonarchomachiſts*. Acker has treated profeſſedly of the *monarchomachiſts* and *antimonarchomachiſts*.

ANTIMONIALS, in *Medicine*, denote preparations of antimony; or remedies whereof antimony is the baſis, or principal ingredient.

Antimonials are chiefly of an emetic tendency; though they may be ſo qualified, as to become either cathartic, or diaphoretic, or even only alterative. See WARD's *Pill*.

Quincy aſſures us, that there are no medicines in pharmacy to be compared with theſe in *maniacal* affections; for that there are no emetics, or cathartics, of any other tribe, that are ſtrong enough for ſuch patients, unleſs in an over-doſe; which might be dangerous.

An *antimonial* cup, made either of glaſs of *antimony*, or of *antimony* prepared with ſalt-petre, though a ſubſtance indiſſoluble by the ſtomach, will give a ſtrong cathartic, or emetic quality to any liquor poured into it, without any diminution of its own weight.

Beſides thoſe numerous preparations which take their denominations from *antimony*, the chief of which are enumerated under that article, there are ſeveral other *antimonial* medicines. Such are the *crocus metallorum*, Poterius's cordial, the TINCTURA *metallorum*, *mercurius vitæ*, or powder of ALGAROT, *bezoardicum minerale*, *ſulphur metallorum*, the Carthuſian powder, or KERMES mineral, &c.

Lemery deſcribes ſeveral other preparations of this mineral.

ANTIMONIATED, ſomething tinged with the qualities, or reſembling the appearances, of *antimony*.

Dr. Woodward ſpeaks of a kind of ſtriated, or *antimoniated*, lead-ore.

ANTIMONY, in *Natural Hiſtory*, a mineral ſubſtance, of a metalline nature; having all the ſeeming characters of a real metal, excepting only *malleability*. It is of a ſhining leaden colour, its maſſes have no determinate figure, but are compoſed of long brittle parallel needles. It is made up of a ſemi-metallic ſubſtance, called its *regulus*, united with ſulphur, as moſt metallic ſubſtances are in their mineral ſtate.

There are two kinds of antimony; 1. *Antimony native* or *mineral*, which is in the ſame ſtate as when dug out of the earth. 2. *Antimony fuſed*, ſo called, becauſe it has been actually *fuſed*, to ſeparate it from adhering ſtones and earth. This operation, which ought rather to be called *liquation* than *fuſion*, conſidering theſe words in their metallurgic ſenſe, is made in great perfection upon the grounds whence *antimony* is dug. The proceſs is very ſimple and eaſy. It conſiſts in placing the minerals in earthen pots, pierced in their bottoms with ſmall holes, and put into a furnace, where they receive the neceſſary heat for the *fuſion* of the *antimony*. As it is very *fuſible*, for it melts before it is red, this heat is much leſs than is neceſſary for the fuſion of the earthy and ſtony matters mixed with it; when it is thus melted, it runs through the holes above-mentioned, into other pots below, defended from the heat as much as poſſible. In theſe receivers the *antimony* is allowed to cool and fix, and from them it takes the form of cakes, in which it is ſold.

Hungary and Auvergne furniſh moſt *antimony*, though it is alſo found in other countries and in different forms.

Antimony is the *ſtibium* of the ancients; by the Greeks called ϛιμμι.—The reaſon of its modern denomination, *antimony*, is uſually referred to Baſil Valentine, a German monk, who, as the tradition relates, having thrown ſome of it to the hogs, obſerved, that, after purging them violently, they immediately grew fat upon it. This made him think, that, by giving his fellow-monks a like doſe, they would be the better for it. The experiment, however, ſucceeded ſo ill, that they all died of it; and the medicine, thenceforward, was called *antimony*, q. d. *anti-monk*.

Its ſingular properties and effects have occaſioned it various other denominations; as *proteus*, by reaſon of its various forms and appearances, *lupus*, *devorator*, SATURN *of the philoſophers*, *balneum ſolis*, *lavacrum leproſorum*, *radix metallorum*, *magneſia Saturni*, &c. all chiefly reſpecting its faculty of deſtroying and diſſipating whatever metals are fuſed along with it, except gold; whence its great uſe in refining and purifying.

Antimony is found in mines of all metals; but chiefly in thoſe of ſilver and lead: that in gold mines is uſually held the beſt.—It has alſo its own peculiar mines.

Antimony is found in clods of ſeveral ſizes, bearing a near reſemblance to black lead; only that it is lighter and harder; whence alſo it is called *marcaſite of lead*; and its metalline part has been by ſome ſuppoſed to be of that ſpecies.

Its texture is ſomewhat particular, being full of little ſhining veins or threads, like needles, brittle as glaſs.—Sometimes there are veins of a red, or golden colour intermixed, from which it is called *male antimony*; that without them being denominated *female*.

Antimony ores are found in fiſſures and veins at different depths, and often very near the ſurface, and is variouſly accompanied with ſpars, cryſtals, ſulphurs, and other ſubſtances. Sometimes the veins of it are every way ſurrounded by a tolerably pure yellow native ſulphur; ſometimes with a more debaſed matter, made of a mixture of ſulphur, earth and ſpar, differing according to the different diſpoſition and admixture of theſe bodies.

Antimony is found in great abundance in England and Germany; we have ſeveral mines of it in Cornwall; and many other parts of the world afford it in very great abundance.

ANTIMONY, *ore of*. The way of running down *antimony* out of its ore by the *aſſayers*, is as follows. Take a crucible that will hold ſome pounds of *antimony* ore, broken into pieces of the ſize of a hazel-nut, and bore at the bottom of it a few ſmall holes with a common gimblet; place this bottom in the mouth of another ſmaller crucible, put in the ore, and cover the orifice with a tile; then lute all the junctures, and place this on the pavement of the hearth, making a circle of ſtones all round it, at ſix inches diſtance; fill this intermediate ſpace with aſhes, ſo high, that the lower pot may be covered up to its rim, then put freſh burning coals upon the whole, and blow the fire ſtrongly with a pair of hand-bellows, to make the upper veſſel red-hot: when it has been ſo a quarter of an hour, take away the fire, and when the veſſels are cold, open them, and the *antimony* will be found in form of a *regulus* in the under veſſel. Cramer's Art of Aſſaying, p. 356.

The moſt ready method of fuſing *antimony*, yet known, is by means of that mineral ſubſtance called CAWK. A lump of this, of the bigneſs of a wallnut, thrown red-hot into a pound of *antimony* in fuſion, converts almoſt the whole ſubſtance of it into glaſs, fifteen ounces of clean and fine glaſs being thus produced; and what is very remarkable, the *cawk* itſelf never melts in the metal.

ANTIMONY, *texture of*. M. de Reaumur gives the following account of the contexture of *antimony*, or *ſtibium*.

Nothing is more common, than to obſerve on the ſurface of broken *antimony* long and ſhining needles, as it were; and that *antimony*, on which theſe are moſt diſtinct and viſible, is eſteemed the beſt. Sometimes theſe ſtreaks are ranged with ſo much order, and branch out ſo regularly in certain directions, that thoſe who are ever ſo converſant with it, cannot but admire its beauty. The figures of the conſtituent molecules of this mineral may poſſibly contribute ſomething to the formation of theſe needles, but the texture, and configuration of the conſtituent parts, will not alone account for the diſpoſition of theſe ſtreaks, and their arrangements, in regard to one another; ſince upon breaking different lumps of the ſame *antimony*, and thoſe of the ſame ſhape, we frequently obſerve quite different configurations of the needles. Let us take, for inſtance, equal maſſes of *antimony* of a regular conic figure, theſe being moſt frequent, from the ſhape of the veſſel they cool in, which reſembles a funnel, or inverted cone; let ſeveral of theſe conical maſſes be broken into different parts, and we ſhall ſee the needles in very different directions in theſe ſeveral parts. Notwithſtanding, however, all theſe varieties in form, the cauſe of all the appearances is wholly the ſame, and is no other than that refrigeration, by which the maſs is changed from a fluid into a ſolid ſtate; and to the progreſs of this the needles plainly owe their different directions.

All melted metals cool firſt at the tops and ſides, and thence by degrees through the whole body of the maſs: the particles at the ſides and top, which firſt cool, becoming fixt to thoſe which are neareſt them, affix thoſe, and they are the next that cool, and ſo on, in ſucceſſive order; now *moleculæ*, of whatever ſhape, thus affixed ſucceſſively to each other, form a kind of threads or needles, the ſeveral directions of which ſhew the order in which the refrigeration has been carried on.

If the crucible, or other veſſel, in which the melted *antimony* is ſuffered to cool, were in the ſhape of a hollow bowl; if its ſides were every where equally thick, and equally warm, and acted equally upon by an air equally cold; and if the melted ſubſtance were of the ſame uniform nature, alſo, in all its parts, all the needles or fibres would be then ſo many rays, terminating in the center of the bowl; and if the ſubſtance were ſuch, that its fixed particles were naturally all of a length, we ſhould find ſo many concentrical beds of needles, formed by parcels of each ray, and lying at equal diſtances from the center.

But ſo many regular circumſtances do not concur in the cooling of melted *antimony*; and hence the before-mentioned irregularities muſt neceſſarily ariſe. In melting *antimony* in conical crucibles, and ſuffering it to cool in them, the needles may be determined ſeveral ways, to any directions one may chooſe.

Lead, when heated to a certain degree, ceaſes to be ductile, and is brittle, and broken at this juncture is found to be granulated, appearing like broken ſteel; there is no reaſon to doubt, but that this is alſo the caſe, when that metal is perfectly cold, but that the force required to ſeparate, or break it, deſtroys its proper ſtructure.

M. Reaumur melted lead in a conical crucible, and ſuffering it to cool to a certain degree only, he broke the maſs into ſeveral large lumps by a ſmart blow of a hammer, and in theſe found the ſame needles as in *antimony*, the granules having cohered in long trains, juſt as the *moleculæ* of the *antimony*; and the diſpoſitions of the ſeveral groupes of needles in the lead, in regard to the ſides and bottom of the crucible, were the very ſame with thoſe of *antimony*. But there is this manifeſt difference between the needles of lead, and thoſe of *antimony*, that whereas the latter are flat and extremely gloſſy, the former are viſibly round, and much leſs bright. Mem. Acad. Scienc. Par. 1724.

Antimony is ſuppoſed, by many of the *Chemiſts*, to contain the ſeminal principles of all kind of metals; and accordingly the character whereby it is denoted in their writings, is the ſame with the character of the earth; to denote that *antimony* is a kind of microcoſm.

There have not been wanting perſons, who have pretended to extract a mere running *mercury* from *antimony*, and Mr. Boyle believed it might be done: but this is one of the many great things pretended to by chemiſtry, of which we have yet no ſufficient proof.

The uſes of *antimony* are very numerous, and important. It is a common ingredient in *ſpecula*, or *burning* CONCAVES, ſerving to give the compoſition a finer texture. It makes a part in BELL *metal*; and renders the ſound more clear. It is mingled with TIN to make it more hard, white, and ſounding; and with LEAD, in the caſting of printers letters, to render them more ſmooth and firm. It is alſo a general help in the melting of metals, and eſpecially in the caſting of cannon balls.

The purification of gold, by means of *antimony*, is performed in this manner. Before you enter on the proceſs, it is neceſſary to gueſs, as nearly as may be, at the alloy of the gold, by the TOUCH *needles*, or otherwiſe. If the quantity of gold in the maſs is not leſs than three quarters, that is, eighteen carats, the maſs muſt be melted in a wind-furnace, and the crucible muſt be covered, to prevent coals falling in; this done, put into it, at ſeveral times, double the quantity of crude *antimony* in fine powder, as ſoon as one portion of the *antimony* is melted, putting in another: let the whole continue in fuſion a few minutes, then pour it into a melting cone, warmed, and rubbed with tallow, and ſtrike with a hammer on the floor, near where the cone ſtands, that the heavier part may ſink to the bottom. When all is cold, invert the cone, and ſtrike it, and a maſs will fall out, having at bottom a *regulus*, more or leſs yellow, according to the quantity of the gold in the mixture; this may with a few blows be ſeparated from the ſulphureous cruſt, which is at top. Melt in a ſmaller fire this *regulus*, and when in fuſion add to it a double quantity of crude *antimony* in powder, and pour it out into the cone again a little after; ſeparate the *regulus* from the *antimony* at top, and then repeat this operation once more. When this is done, put the ſeparated *regulus* into a thick good teſt, place this in the furnace immediately before the bellows, put coals round it, and one or two pieces of wood upon them, and make a middling fire, ſuch as is ſufficient to melt the *regulus*, the reguline part of the *antimony* will vaniſh in a thick ſmoak; then encreaſe the fire, and keep it ſo, till the fumes are over, and the ſurface of the gold is of a fine green; and afterwards give the gold another fuſion with borax and nitre, and it will be perfectly pure. But gold cannot be ſeparated from *platina* in this way; and ſometimes a little ſilver will remain, which has been defended by the gold from the action of the *antimony*.

When the gold to be purified by this proceſs is impure to an alloy of eight carats, it is not proper to perform the precipitation by *antimony* alone, but there ſhould be added as many times two carats of common ſulphur, as the alloy of the gold is ſo many carats leſs than eighteen. Cramer's Art of Aſſaying, p. 276.

Mr. Homberg being well aſſured, that water was a *menſtruum* capable of diſſolving all the metals, if properly applied, uſed it, in ſeveral different manners, in his *analyſis* of *antimony*. He made an *infuſion of antimony* in water, putting into ſeveral glaſs veſſels crude *antimony*, coarſely powdered, five pounds into each veſſel, and to each of theſe quantities he added two pints of rain-water; after the *antimony* had ſtood thus for ſix months, the ſeveral parcels were uſed on different occaſions, one only excepted, which had been forgotten, and had at length ſtood two winters and a ſummer: having at length found this veſſel, he obſerved, that its inſide was every where coated over with configurations of leaves; he at firſt ſuppoſed this to be owing to ſome ſalts of the *antimony*, which had been diſſolved in the water, and had afterwards cryſtallized themſelves in this manner, as the *butter of antimony* is ſometimes known to do in ſublimation; but on rubbing the ſides of the veſſel with a finger, and afterwards ſcraping them with a knife, he found that they were covered with a yellowiſh pellicle, without the leaſt appearance of ſalt, and that the configurations of the leaves were not raiſed upon this pellicle, but ſunk, as if graved by a tool. The water taſted ſomewhat acid, and being tried on *turnſol*, and on different metallic ſolutions, it turned the *turnſol* to a light red, and turned a ſolution of ſilver white; whence it appeared to be an acid, and of the nature of that of ſea-ſalt. The ſunſhine had turned this water ſour, had made it act upon the *antimony*, and take up a part of its ſalt. This ſalt, in the winter, was probably afterwards concreted into the figures of leaves, formed upon the mud depoſited by the water on the ſides of the veſſel; and theſe ſalts being afterwards diſſolved again in ſome hotter weather, had eaten their way into this ſediment of mud, in the form of the leaves, &c. in which they had concreted. Mem. Acad. Par. 1693.

Antimony, at firſt, was of ſervice only in the compoſition of paint. Scripture deſcribes it to us as a ſort of paint, with which the women blackened their eye-brows. Jezebel underſtanding that Jehu was to enter Samaria, painted her eyes with *antimony*, or, according to the Hebrew, "put her eyes in *antimony*."

As large black eyes were thought the fineſt, they of both ſexes, who were careful of their beauty, rubbed their eyes, eye-lids, and round the eyes, with a needle dipped in a box of paint made of *antimony*, with a deſign of blackening them.

At this day the women of Syria, Arabia, and Babylonia, anoint and blacken themſelves about the eyes; and both men and women put black upon their eyes in the deſert, to preſerve them from the heat of the ſun, and the piercing of its rays. M. Darvieux tells us, that the Arabian women border their eyes with a black colour made of *tutty*, which the Arabians call *rebel*. They draw a line of this kind of blacking without the corner of their eyes, to make them appear larger. Iſaiah, in his enumeration of the ſeveral ornaments belonging to the daughters of Sion, has not forgot the needles which they made uſe of in painting their eyes and eye-lids; nor has this practice eſcaped the laſh of Juvenal.

Ille ſupercilium madida fuligine tinctum
Obliqua producit acu, pingitque trementes
Attollens oculos.

Ezekiel, diſcovering the irregularities of the Jewiſh nation under the idea of a debauched woman, ſays, that ſhe bathed, and perfumed herſelf, and that ſhe anointed her eyes with *antimony*. Job ſhews ſufficiently how much *antimony* was in eſteem, by calling one of his daughters a veſſel of *antimony*, or a box to put paint in, *cornu ſtibii*. Tertullian and St. Cyprian have declaimed very warmly againſt this cuſtom of painting their eyes and eye-brows.

ANTIMONY, *medicinal hiſtory of*. Before the fourteenth century, *antimony* had no place in *Medicine*. But, about that time, Baſil Valentine, having found a method of preparing and correcting the dangerous qualities of its ſulphur, publiſhed a book, intituled *Currus triumphalis antimonii*, wherein he maintained it a ſure remedy for all diſeaſes.—But, in ſpite of all he could ſay in its behalf, though confirmed by experience, *antimony* remained in a general neglect upwards of an hundred years; till about the beginning of the ſixteenth century, when it was brought into vogue by Paracelſus.—The parliament of Paris, immediately upon this reſtoration, condemned the uſe of it in form; and a phyſician, named Beſnier, having been found delinquent herein, was expelled the faculty. It ſeems, a great deal of miſchief had been done by it, for want of knowing the proper ways of giving it; ſo that the *arret* of parliament repreſents it as a mere poiſon, incapable of being corrected by any method of preparation, and not to be taken inwardly, without the utmoſt damage.

Several learned men complained of ſo ſevere and unjuſt a prohibition; and, by a courſe of happy experiments, at length brought it into eſteem again: whence, in ſpite of all the invectives made againſt *antimony* by divers authors, it was at length replaced, in the year 1637, by public authority, among the number of purgative drugs; and was inſerted, accordingly, in the *Pharmacopoeia*, publiſhed by the faculty that ſame year.

Patin did all he could to decry *antimony*: in his letters we find an unuſual vehemence expreſſed againſt it.—He had even compiled a large regiſter of perſons whom the phyſicians had killed by it; which he called *the Martyrology of antimony.*

Antimony, in *Medicine*, &c. is not only given in ſubſtance, but many preparations of it are uſed; which are either emetic, cathartic, diaphoretic, or ſudorific. *Crude antimony* in powder is found good for diſſolving viſcidities, in cutaneous diſeaſes, and, as ſome very confidently aſſert, in convulſions and epilepſies.

Crude antimony is recommended in palſies, pains and numbneſs, which come on after a ſalivation, and is ſaid to have cured ſeveral who were paralytic from other cauſes. The method of giving it, is to begin with three grains, increaſing the doſe with three grains every day, to half a drachm; after which the doſe is diminiſhed three grains every day, till it comes down to the quantity of the firſt doſe. Externally, in ointments, it is commended for drying up ulcers, curing the itch, and in plaſters for reſolving of tumors.

There appears no reaſon for people's being afraid of giving crude *antimony* internally; experience ſhews it to be a ſafe medicine, unleſs by accident the acid of the ſtomach ſhould be ſufficient to act as a *menſtruum* to it.

The preparations of *antimony* are, 1. *Sulphur præcipitatum antimonii.* 2. *Crocus antimonii*, called alſo *crocus metallorum.* 3. *Crocus antimonii lotus.* 4. *Calx antimonii*, called *antimonium diaphoreticum.* 5. *Tartarum emeticum.* 6 *Cauſticum antimoniale.* 7. *Cinnabaris antimonii.* 8. *Regulus antimonii martialis.* 9. *Tinctura antimonii.* 10. The *Kermes* mineral, or *Carthuſian* powder. See theſe articles ſeparately.

The virtues of *antimony*, in the diſeaſes of animals, are very great, and very evident on any trial. Pigs that have the meaſles are at all times recovered by it, which proves it a great purifier of the blood. Horſes who have running heels, that cannot be cured by the common methods uſed by the farriers, will generally be cured by this medicine in a little time. The manner of uſing it is this: mix one drachm with every feeding of oats which the horſe has in a morning; it is beſt put together in one place, buried under a few oats, and the horſe's head being with-held a little, and then let go juſt againſt that place, he will take it all in at a mouthful. Some horſes do not diſlike it, others obſtinately refuſe it, but to theſe it may eaſily be given in balls. The virtues of this drug, in fattening of cattle, has by many been thought imaginary, but experiment proves it to be a real truth. A horſe that is lean and ſcabby, and not to be fatted by any other means, will become fat on taking a doſe of *antimony* every morning, for two months together. A boar fed for brawn, and having an ounce of *antimony* given him every morning, will become fat a fortnight ſooner than others put into the ſtye at the ſame time, and fed in the ſame manner, but without the *antimony*. Phil. Tranſ. N° 39.

It is generally ſuppoſed, that the vapours of *antimony* are poiſonous when raiſed by fire, but it appears otherwiſe from the operations Mr. Geoffroy made on it; he having once gone through ſixty calcinations of twelve ounces of *antimony*, without receiving any harm from it: whence it is very evident, that the common opinion of the fumes of *antimony* containing an arſenical ſulphur, is an erroneous one; and it may be added, that one great mark of *antimony*'s being good, is, that it loſes a great deal of its weight in calcination. It has more ſulphur in this caſe, which the fire raiſes in a vapour, and leſs of the terreſtrial matter or ſpar, which are uſually very abundant in it. Mr. Geoffroy, by theſe nice obſervations and experiments, diſcovered that *antimony* contained much leſs common ſulphur than had been generally ſuppoſed, ſince it can be made to loſe, at the utmoſt, only three ounces and five drachms in the pound in calcination. The emetic quality of the *regulus* proves, however, that it yet contains a very large ſhare of ſulphur, though of another kind: this Mr. Geoffroy diſtinguiſhes from the common ſulphur, by the name of the *metallic* SULPHUR. Mem. Acad. Scienc. Par. 1736.

It is evident, that whatever acid *antimony* contains, muſt be of the nature of ſpirit of ſulphur, ſince ſulphur ſo greatly abounds in the compoſition of that mineral, and its ſulphur is wholly the ſame with the common brimſtone. Whatever acid, therefore, of this kind could be produced, would be wholly the produce of the common ſulphur in that mineral, and not of the *reguline* part, which alone is properly *antimony*. Experiment proves the truth of this opinion, the *acid of antimony*, truly ſeparated from it, being no way different, in any particular, from that of crude ſulphur.

There are ſeveral ways by which it may be made, but it is but little that can be obtained, and then it is aſſuredly the pure acid of the ſulphur of *antimony*. The operation, however perfect, is of little value. Mem. Acad. Par. 1700.

ANTIMONY, *butter of*, is a white and thick liquor; otherwiſe called *icy oil of antimony*; compoſed of marine acid united to the reguline part of *antimony*, whence its property of attracting moiſture from the air, and its cauſticity. It is uſually prepared of *crude* (though ſometimes of *regulus* of) *antimony*, and corroſive ſublimate, by pulverizing, mixing, and diſtilling them by a gentle heat: upon which the butter riſes into the neck of the retort; from which, when full, it is to be melted down into a receiver, by the application of live coals.

It is a very fiery, corroſive metallic ſalt, and a poiſon when uſed internally. Externally it is applied as a cauſtic to ſtop gangrenes, and cure carieſes, cancers, &c.

This *butter* may be converted into an oil, called alſo *rectified butter of antimony*; by gently diſtilling it a ſecond time; which renders it more fluid, ſubtile, volatile, and efficacious.

This, digeſted with thrice its weight of *alcohol*, makes the purple tincture of *antimony*; a ſecret highly valued by Mr. Boyle, as an excellent vomit.

Of *butter of antimony* are alſo prepared the BEZOAR *mineral*, and *powder* of ALGAROT.

The operation of making *butter of antimony* furniſhes an inſtance of the power of the Newtonian principle of attraction. When *mercury ſublimate* is ſublimed from *antimony*, or from *regulus* of *antimony*, the ſpirit of ſalt lets go the *mercury*, and unites with the *antimonial* metal, which attracts it more ſtrongly, and ſtays with it till the heat be great enough to make them both aſcend together, and then carries the metal with it in the form of a *butter of antimony*; though the ſpirit of ſalt alone be almoſt as volatile as water, and the *antimony* alone as fixed as lead.

ANTIMONY, *calx of*, is obtained by expoſing *crude antimony*, groſsly powdered, in a flat and ſhallow earthen veſſel, to the action of a moderate fire, taking care to ſtir it conſtantly. During this *calcination* the ſulphur, being leſs fixed than the metalline part, is gradually evaporated, and the *calcination* is continued, till no more ſulphureous vapour ariſe. What remains is the metallic part, ſeparated from the mineral ſulphur, and even deprived of part of its own inflammable principle. This ſubſtance is more fixed and leſs fuſible than *antimony*, as in general all metallic earths are, becauſe deprived of more of their inflammable principle. It is called CALX *of antimony*, and is of a grey aſh colour. This is violently emetic, and purgative.

ANTIMONY, *ceruſe of*, is the *regulus* diſtilled with ſpirit of nitre, in a ſand-furnace; what remains after the fumes are all ſpent, is a white powder; which, being waſhed ſweet, is the *ceruſe* required.—It is diaphoretic; and, by many, is ſet on a footing with the *mineral bezoar*.

ANTIMONY, *cinnabar of*, is prepared of mercury, ſulphur, and *antimony*, mixed and ſublimed in a luted bolt-head, and a naked fire.—It is a good diaphoretic and alterative.

There is alſo a *cinnabar of antimony* procured after the *butter of antimony* has done riſing, by increaſing the degree of fire.—This, ſublimed a ſecond time, makes yet a better *cinnabar*.

ANTIMONY, *clyſſus of*. See CLYSSUS.

ANTIMONY, *crocus of*, is the ſame with what we otherwiſe call *crocus metallorum*; excepting that this latter is more mild, and leſs emetic; being made by repeated lotions of the former, in warm water, and then drying it again to a powder. See CROCUS *metallorum*.

It is alſo called *opaline magneſia*, *terra ſancta Rulandi*, *terra aurea*, *terra rubra*, &c.

ANTIMONY, *crude*, or *antimony in ſubſtance*, is the native mineral *antimony*, melted down and caſt in cones as above mentioned.—It is much uſed in diet-drinks, and decoctions of the woods, and in compoſitions againſt the ſcurvy, as a diaphoretic, and deobſtruent.

ANTIMONY, *diaphoretic*, is prepared of *antimony*, powdered, and mixed with three times the quantity of nitre;

and the mixture thrown, at ſeveral times, into an ignited crucible: upon which, a detonation enſues. What remains, being kept in fuſion a quarter of an hour, turns into a white maſs, called *antimonium diaphoreticum nitratum*, or *diaphoretic antimony with nitre*; the *antimony* being hereby bereaved of its emetic and purgative virtue, and rendered only diaphoretic.

If the air have acceſs to it, it will again become emetic.

There is alſo a kind of ſweet diaphoretic *antimony*, made of the former, by pulverizing, boiling it in water, and filtrating the decoction: upon which a white powder will be left in the filtre; which being waſhed by repeated affuſions of warm water, and dried, is the *dulcified diaphoretic antimony*.—This is given as an alexipharmic in malignant fevers, ſmall-pox, &c. particularly in caſe of deliriums. It is alſo applied in ſcorbutic and venereal diſorders: but the learned Boerhaave abſolutely decries it, as a mere metalline calx, deſtitute of all medicinal virtue, and only fit to load and choak up the body, by its inactivity and weight.

ANTIMONY, *diaphoretic nitre of*, is made by exhaling the ſolution of the preceding preparation over a gentle fire to a dryneſs; upon which, there remains a ſalt compoſed of nitre, and the *ſulphur* of the *antimony*, called *nitrum antimoniatum*.—It is no other than a ſort of SAL *prunellæ*, or SAL *polychreſtum*; and accordingly is found aperitive, cooling, diuretic; and good in inflammatory fevers, &c.

ANTIMONY, *eſſence of*. An emetic wine made with *glaſs of antimony*; to which is ſometimes added a ſpicy ſtomachic.

Dr. Huxham ſays, he never found any antimonial preparation better, ſafer, and more efficacious than this ſimple infuſion of the *glaſs of antimony* in a generous white wine, with a little ſpice to render it more grateful to the ſtomach. This medicine given to twenty or thirty drops, operates by gentle ſweats, and purges in larger doſes very mildly. The judicious phyſician, here mentioned, recommends it in obſtinate rheumatiſms.

ANTIMONY, *flower of*, is *antimony* pulverized, and ſublimed in an aludel; the volatile parts whereof then ſtick to the ſubliming pot.

This is alſo a powerful vomitive; and is of ſingular efficacy in maniac caſes; being the Herculean remedy, by which ſome have gained ſo much reputation.

Another ſort of flowers are made of the *regulus of antimony*, with SAL *armoniac*, ſublimed as before; which make a remedy ſomewhat gentler than the former.—Helmont alſo gives us a preparation of purging *flowers of antimony*.

ANTIMONY, *glaſs of*, *vitrum antimonii*, is crude *antimony*, ground and calcined by a vehement fire, in an earthen crucible, till it ceaſe to fume; which is a proof, that its ſulphur is evaporated. The calx is then vitrified in a wind-furnace; upon which it becomes tranſparent, ruddy, and ſhining, and of a more or leſs deep hyacinthine colour.

This is the ſtrongeſt emetic of any preparation of *antimony*. Yet, if diſſolved in ſpirit of urine, it ceaſes to be either *emetic* or *cathartic*; even though the *menſtruum* be afterwards drawn from it. See VITRUM *antimonii ceratum*.

ANTIMONY, *liver of*. The *calx*, when fuſed and cooled, ſometimes becomes an opake brown maſs, which is called by this name. This is ſtrongly emetic.

ANTIMONY, *magiſtery of*, is crude *antimony* digeſted with *aqua regia* eight or ten days; to which water is then put, but poured off again ere it ſettle: this to be repeated till there remain nothing behind but a yellowiſh powder; which, being ſuffered to ſettle, and the water decanted off, becomes, by repeated ablutions, an inſipid magiſtery.

Its operation is rather cathartic than emetic, though ſometimes only ſudorific.

ANTIMONY, *Ward's pill of*. See WARD's *pill*.

ANTIMONY, *powder of*, is a mixture of two grains of emetic tartar, finely pulverized, with half a dram of any of the teſtaceous powders.

This is a ſubſtitute for Dr. James's febrifuge powder; and has the ſame virtues with the antimonial wine above deſcribed, and EMETIC *tartar*.

ANTIMONY, *regulus of*. See REGULUS.

Antimony, purified by ſimple fuſion, is called *regulus of antimony*; or *regulus antimonii philoſophorum*—But the more common way of reducing it into a *regulus*, is with the addition of FLUX *powders*, as tartar and nitre.

The curious may ſee in the *Arts & Metiers*, an account of the fabrication of the *regulus* and of the *glaſs* of *antimony*, under the *Art du Diſtillateur des Eaux fortes*, p. 141 and ſeq. See *ibid.* a further account of *antimony*, and of the utenſils proper for its fabrication, p. 136.

The *ſcoria* found at the top of this *regulus* is violently emetic, as well as the *regulus* itſelf, whereof if cups or drinking-veſſels be caſt, the wine put into them will become ſtrongly vomitive.

Of this *regulus* caſt in moulds are made thoſe commonly called the *antimonial pills*, weighing about eight or ten grains each, one of which being ſwallowed, will operate conſiderably both by vomit and ſtool.

Theſe pills having thus performed their office, and having been diſcharged from the body, will ſerve the ſame purpoſe again and again; whence they have obtained the name of *perpetual pills*—The virtue of this *regulus* is not however inexhauſtible, as has been imagined; for by repeated infuſions in wine, though the liquor be made violently emetic at firſt, yet by degrees it loſes its force, and at length ceaſes to be vomitive.

ANTIMONY, *martial regulus of*, is made by a mixture of little bits of iron, as the nails of horſes ſhoes melted with the *regulus*.

In this operation, the iron diſſolving and abſorbing the ſulphureous parts of the *antimony*, more ſtrongly than the fluxes in the former caſe, and turning it into a CROCUS, the *antimony* is hereby brought to a greater degree of purity, and rendered more efficacious than in the common *regulus*.

This *regulus* is ſometimes farther purified by repeated fuſions and detonations, with the addition of freſh *antimony*, and more nitre, alternately: in which caſe it becomes *regulus antimonii ſtellatus*, or the *ſtarry regulus of antimony*.

Mr. Geoffroy has been the inventor of a new method of treating this mineral, by which it yields much more *regulus* than according to thoſe preſcribed by Kunkel and Stahl, and is purified without the addition of ſalts, and with very little loſs.

ANTIMONY, *golden ſulphur of*, is made of the *ſcoria* which ariſe in preparing the REGULUS; by boiling it, filtrating the hot decoction, and adding diſtilled vinegar: upon which the whole coagulates, changes into a brown colour, emits a ſtercoraceous odour, and precipitates a red powder. The whole maſs being waſhed by repeated affuſions of water, till the liquor come away ſcentleſs and inſipid, and then dried, it becomes a red powder, called the *golden ſulphur*, or *precipitate of antimony*, either on account of its own colour, or the yellow one it gives to glaſs, metals, &c.

This is alſo called the *panacea of antimony*, and is ſaid to be the baſis of Lockyer's pills.—It either proves emetic, cathartic, diuretic, or ſudorific, as its force happens to be determined.

ANTIMONY, *prepared*, is either crude *antimony* levigated, or that which has undergone ſome chemical proceſs, whereby its nature and powers are altered or abated; and this differently, according to the circumſtances of the preparation.

Antimony, ſays Mr. Boyle, alone, or aſſociated with one or two other ingredients, by a variety of operations and compoſitions, might be brought to furniſh a whole apothecary's ſhop: it will anſwer the phyſician's intention, whether he wants to employ a cathartic, or an emetic, a diuretic, diaphoretic, deobſtruent, bezoardic, or cordial.

ANTIMONY, *revivified*, *antimonium reſuſcitatum*, is prepared of flowers of *antimony* and SAL *ammoniac*, digeſted in diſtilled vinegar; then exhaled, and the remainder ſweetened by abluſion.—It is emetic, and ſometimes alſo ſudorific, and is good in maniacal caſes, &c.

ANTIMONY, *tincture of*; ſee TINCTURE.

All theſe preparations of *antimony*, how ſevere ſoever alone, may yet be ſo managed, as to operate little or nothing at all in the *primæ viæ*, nor be perceived till they are got into the ſmalleſt veſſels.—And then it is they are qualified to combat the gout, pox, evil, &c. See Neumann's Chemical Works, p. 128, &c. and Macquer's Chemical Dictionary, under *Antimony*.

ANTINOEIA, in *Antiquity*, annual ſacrifices, and quinquennial games, in memory of Antinous the Bithynian. They were inſtituted at the command of Adrian the Roman emperor, at Mantinea, in Arcadia, where Antinous was honoured with a temple and divine worſhip.

ANTINOMIANS, in *Church Hiſtory*, denote thoſe who maintain the law of no uſe or obligation under the goſpel diſpenſation, or who hold doctrines that clearly ſuperſede the neceſſity of good works and a virtuous life. The *antinomians* took their origin from John Agricola about the year 1538, who taught that the law is no ways neceſſary under the goſpel; that good works do not promote our ſalvation, nor ill ones hinder it; that repentance is not to be preached from the decalogue, but only from the goſpel.

This ſect ſprung up in England during the protectorate of Oliver Cromwell; and extended their ſyſtem of libertiniſm much farther than Agricola, the diſciple of Luther. Some of their teachers expreſsly maintained, that as the elect cannot fall from grace, nor forfeit the divine favour, the wicked actions they commit are not really ſinful, nor are to be conſidered as inſtances of their violation of the divine law; and that conſequently they have no occaſion either to confeſs their ſins, or to break them off by repentance. According to them, it is one of the eſſential and diſtinctive characters of the elect, that they cannot do any thing which is either diſpleaſing to God, or prohibited by the law.

Luther, Rutherford, Schluſſelburg, Sedgwick, Gataker, Witſius, Bull, Williams, &c. have written refutations; Criſp, Richardſon, Saltmarſh, &c. defences of the *antinomians*; Wigandus, a compariſon between ancient and modern *antinomians*.

The doctrine of Agricola was in itſelf obſcure, and perhaps repreſented worſe than it really was, by Luther, who wrote with acrimony againſt him, and firſt ſtiled him and his followers *antinomians*. Agricola ſtood on his own defence, and complained, that opinions were imputed to him, which he did not hold. Nicolas Amſdorf fell under the ſame odious name and imputation, and ſeems to have been treated more unfairly than even Agricola himſelf. It is rather hard to charge upon a man all the opinions that may be inferred from things that have haſtily dropped from him, when he himſelf diſavows ſuch inferences.

ANTINOMY, ANTINOMIA, a contradiction between two laws, or between two articles of the ſame LAW.

The word is derived from *αντι*, *contra*, and *νομος*, *lex*.

ANTINOMY, ſometimes alſo ſignifies an oppoſition to all law. Whence a ſect of enthuſiaſts, who are for carrying goſpel liberty above all moral regards, and who ſlight the motives of virtue as inſufficient to ſalvation, are called *antinomians*; and ſometimes *anomians*.

ANTINOUS, in *Aſtronomy*, a part of the conſtellation AQUILA, or the eagle.

ANTIOCHIAN *ſect*, or *academy*, a name given to the fifth academy, or branch of academies.

It took the denomination from its being founded by Antiochus, a philoſopher contemporary with Cicero.

The *Antiochian* academy ſucceeded the Philonian.—As to point of doctrine, the philoſophers of this ſect appear to have reſtored that of the ancient academy, except that in the article of the *criterion* of truth, Antiochus was really a Stoic, and only nominally an academic.

ANTIOCHIAN *epocha*, a method of computing time from the proclamation of liberty granted the city of Antioch, about the time of the battle of Pharſalia.

ANTI-PÆDO-BAPTISTS, derived from *αντι*, *againſt*, *παις*, *παιδος*, *child*, and *βαπτιζω*, *baptize*, whence *βαπτιςης*, is a diſtinguiſhing denomination given to thoſe who object to the baptiſm of infants; becauſe, they ſay, infants are incapable of being inſtructed, and of making that profeſſion of faith, which intitles them to this ordinance, and an admiſſion into church communion. See ANABAPTISTS and BAPTISTS.

ANTIPAGMENTS, *Antipagmenta*. See ANTEPAGMENTA.

ANTIPAPINIANUS, *αντιπαπινιανος*, a title given by the Greek lawyers to the fourth part of the Digeſt, including four books, beginning with the title *De pignoribus*.

This is otherwiſe called *antipapianus*.

The *Antipapinian* was thus denominated, not as being intended in oppoſition to Papinian, but becauſe it was to ſerve in the ſchools of the civil law in lieu of the books of that lawyer, purſuant to an edict of the emperor Juſtinian; ſo that the *Antipapinian* was ſo far from being a refutation of Papinian, that it was only a ſubſtitute for his writings, which were not ſo proper for the uſe of the younger ſort of ſtudents.

ANTIPARALLELS, in *Geometry*, are thoſe lines joining the two legs of an angle, which make the ſame angles like parallel lines, but in oppoſite directions. M. Leibnitz, however, calls thoſe lines *antiparallels*, which cut two parallels ſo, that the outward angle being added to the inward one, the ſum may be equal to a right angle.

ANTIPARASTASIS, in *Rhetoric*, a reply made to an opponent, by allowing part of his argument, and denying the reſt, e. gr. you may paint whatever you pleaſe, provided the public ſuffer no prejudice from it; but you muſt not, if it does.

ANTIPASCHA, in *Eccleſiaſtical Writers*, denotes the firſt Sunday after Eaſter.

This is otherwiſe called DOMINICA *in albis*.

ANTIPATHES, among the *Ancient Naturaliſts*, was uſed to expreſs any ſtone or gem, which, according to their ſuperſtitious ideas of the virtues of gems at that time, was ſuppoſed to have a power of reſiſting the force of inchantments. Pliny mentions a very valuable gem, called by the ancients *antipathes* for this very reaſon; and the black coral had the ſame name, on the ſame account.

ANTIPATHES, a ſpecies of the *gorgonia*, in the order of *zoophytes*.

ANTIPATHY, a natural enmity or averſion of one body to another.—In which ſenſe the word ſtands oppoſed to SYMPATHY.

The word is compounded of *αντι*, *contra*, *againſt*, and *παθος*, *paſſion*.

Such an averſion is commonly ſaid to be between the ſalamander and the tortoiſe, the vine and the elm, the toad and the weaſel, the ſheep and the wolf, the olive and the oak, &c. Phil. Tranſ. N° 339.

The Peripatetics account for *antipathies*, from certain occult qualities inherent in the bodies.

Some think that the term *antipathy* can only be applied to any certain purpoſe, when uſed with the reſtriction of modern philoſophers; among whom it ſignifies no more than a *vis centrifuga*, or repelling power.

A large part of the inſtances of *antipathies* are, perhaps, no better than fables, and a ſevere examination would leave them on no other footing than vulgar errors.

ANTIPATHY is ſometimes alſo uſed in a *moral* ſenſe, to denote a conteſt between the mind and the body, or between reaſon and inclination.

ANTIPATHY is uſed in *Painting*, for an oppoſition between the qualities of colours.

This *antipathy* is chiefly obſerved between colours, which endeavour, as it were, to predominate over each other, and which by their mixture deſtroy each other, e. gr. *ultramarine* and *vermillion*. This does not obtain in the *claro obſcuro*; for, though there be nothing more oppoſite to each other than black and white, as the one repreſents light, and the other darkneſs; yet they each preſerve themſelves in the mixture, and form together a grey which partakes of both.

ANTIPELARGIA, among the *Ancients*, a law, whereby children are obliged to furniſh neceſſaries to their aged parents.

The *ciconia*, or ſtork, is a bird famous for the care it takes of its parents when grown old.

Hence, in ſome Latin writers, this is rendered LEX *ciconiaria*, or the ſtorks law. Paſſavant has publiſhed a diſſertation *de antipelargia*. Baſil, 1672, 4°.

ANTIPERISTALTIC, in *Anatomy*, a motion of the inteſtines contrary to the PERISTALTIC motion.

The word is derived from *αντι*, *againſt*, *περι*, *about*, and *ςαλτικος*, *that which hath the power of compreſſing*.

As the *periſtaltic* motion is a contraction of the fibres of two inteſtines from above, downwards; the *antiperiſtaltic* motion is their contraction from below, upwards.

Phyſicians, ancient as well as modern, have uſually had recourſe to the notion of an *antiperiſtaltic* motion, to account for the action of vomiting, and the *phænomena* of the *miſereri mei*, or *iliac paſſion*. In behalf of the former, M. Littre alledges, that as the *œſophagus*, the ſtomach, and inteſtines, are but one and the ſame continued canal, every where lined with the ſame fleſhy fibres, and as it is allowed, that the inteſtines, beſides their natural or PERISTALTIC motion (whereby, being ſucceſſively contracted from above downwards, they expel their contents in this direction) have alſo an *antiperiſtaltic* or preternatural motion, whereby they contract from below upwards, and thus reject their contents; it is highly probable, that the other members of the ſame canal, viz. the ſtomach, and *œſophagus*, are alſo ſometimes ſubject to the like *antiperiſtaltic* motion; and return their contents to the mouth. Hiſt. Acad. Scienc. ann 1700.

The cauſe of the *antiperiſtaltic* motion is uſually aſſigned to be a ſtoppage of ſome of the inteſtines, but chiefly of the *ilium*.

Some late ingenious authors ſeem to have over-turned the whole *antiperiſtaltic* ſyſtem, and ſhewn this motion imaginary, as well as unneceſſary for accounting for theſe diſorders. Meſſ. Chirac and Du Verney have endeavoured to prove this in reſpect of vomiting; and M. Haguenot, and after him M. St. Andre, in the iliac paſſion. Mem. Acad. Scienc. an. 1713. Phil. Tranſ. N° 351.

ANTIPERISTASIS, in *Philoſophy*, the action of two contrary qualities; one whereof is ſuppoſed, by its oppoſition, to excite and heighten the force of the other.

The word is formed of *αντι*, *contra*, *againſt*, and *περιςαμαι*, *to ſtand round*, or *to reſtrain*; q. d. *circumobſiſtentia*, or the renitency againſt any thing that ſurrounds or beſets another.

Antiperiſtaſis is uſually defined, "the oppoſition of a

“ contrary quality, whereby the quality it oppoſes becomes heightened, or intended: or the action whereby a body, attacked by another, collects itſelf, and becomes ſtronger by ſuch oppoſition: or it is an intention of the activity of one quality, cauſed by the oppoſition of another.”

Thus cold, ſay the ſchool-philoſophers, on many occaſions, exalts the degree of heat, and dryneſs that of moiſture.

Thus it is, that quick-lime is ſet on fire by the affuſion of cold water: and ſo water becomes warmer in winter than in ſummer, by *antiperiſtaſis:* and to the ſame cauſe it is owing, that thunder and lightning are excited in the middle region of the air, which is continually cold.

This *antiperiſtaſis* was a principle of great uſe and extent in the Peripatetic philoſophy.

Mr. Boyle has canvaſſed this doctrine thoroughly, in his Hiſtory of Cold.—It is certain, that *a priori*, or conſidering the reaſon of the thing abſtracted from the experiments alledged to prove an *antiperiſtaſis*, it appears highly abſurd; ſince, according to the courſe of nature, one contrary ought to deſtroy, not to ſtrengthen another.

It is commonly, indeed, alledged, as a proof of a power nature has given bodies of flying their contraries, that drops of water, falling on a table, collect into little globules, to avoid the contrary quality in the table, and keep themſelves from being ſwallowed up by the dry wood; but this we can account for on more intelligible principles, viz. the power of ATTRACTION, and REPULSION.

In effect, not only reaſon, but experiment alſo, concludes againſt the notion of an *antiperiſtaſis:* the leading argument urged in behalf of it is, the heating of quick-lime in cold water: now, how aſtoniſhing the lazineſs and credulity of mankind, who have ſo long and generally acquieſced in what they might ſo eaſily have found to be falſe! for if, inſtead of cold water, the lime be quenched with hot water, the ebullition will always be far greater than if the liquor were cold.

Again; in freezing a baſon to a joint-ſtool, with a mixture of ſnow and ſalt, by the fire-ſide, it is pretended, that the fire ſo intends the cold, as to enable it to congeal the water that ſtagnated upon the ſurface of the ſtool, betwixt that and the bottom of the veſſel. But how little need there is of an *antiperiſtaſis* in this experiment, appears hence, that Mr. Boyle has purpoſely made it with good ſucceſs, in a place where there neither was, nor ever, probably, had been, a fire.

As to the refreſhing coldneſs which ſubterraneous places afford in ſummer, it may be denied, that they are then really colder than in winter; though, if the contrary were allowed, it would not neceſſarily infer an *antiperiſtaſis*. The ſmoking of waters, drawn from deep places in froſty weather, does not neceſſarily infer ſuch water to be warmer than at other times when it does not ſmoke; ſince that effect may proceed, not from the greater warmth of the water, but from the greater coldneſs of the air. For a man's breath in a cold ſummer, or in mild winter weather, becomes very viſible; the cold ambient air ſuddenly condenſing the fuliginous ſteams diſcharged by the lungs; which in warm weather are readily diffuſed in imperceptible particles through the air. See COLD and EFFLUVIA.

ANTIPHERNA, among the ancient Greeks, denoted a kind of ſettlement made on a wife in caſe of ſurviving her huſband, as an equivalent for her dowry.

This word ſeems to anſwer what in our law is called a JOINTURE.

ANTIPHONALLY, in reſpect of church muſic, imports as much as alternately, or anthem-wiſe.

The Greeks have a method of ſinging *antiphonally*, *antiphonatim*, called by them παρακοντακιον, wherein two perſons ſing together, and then are ſilent, and ſucceeded by two others, who ſing a while and then are ſilent, and ſo on.

ANTIPHONARY, *antiphonarium*, a ſervice book which contained all the invitatories, reſponſories, collects, and whatever elſe was ſung or ſaid in the choir, except the leſſons.

This is otherwiſe called *reſponſarium*, from the reſponſes therein contained.

The author of the Roman *antiphonary* was pope Gregory the Great.

We alſo find mention of nocturnal and diurnal *antiphonaries*, for the uſe of the daily and nightly offices; ſummer and winter *antiphonaries*; alſo *antiphonaries* for country churches, &c. By the provincial conſtitutions of archbiſhop Winchelſey, made at Merton, A. D. 1305, it is required that one of theſe ſhould be found in every church within the province of Canterbury.

The uſe of theſe, and many other popiſh books, were forbid by the 3d and 4th of Edward VI. c. 10.

ANTIPHONY, ANTIPHONA, the anſwer made by one choir to another, when the pſalm or anthem is ſung between two.

ANTIPHONY, ſometimes denotes a ſpecies of pſalmody, wherein the congregation, being divided into two parts, repeat the pſalms, verſe for verſe, alternately.

In this ſenſe, *antiphony* ſtands contradiſtinguiſhed from SYMPHONY, where the whole congregation ſings together.

Antiphony differs from *reſponſorium*, becauſe in this latter the verſe is only ſpoke by one perſon, whereas in the former, the verſes are ſung by the two choirs alternately. The original of *antiphonal* ſinging in the weſtern churches is referred to the time of St. Ambroſe, about the year 374. That father is ſaid to have firſt introduced it into the church of Milan, in imitation of the cuſtom of the eaſtern church, where it appears to be of greater antiquity, though as to the time of its inſtituion, authors are not agreed. It was moſt probably introduced at Antioch, between the years of Chriſt 347 and 356.

ANTIPHONY is alſo uſed to denote the words given out at the beginning of the pſalm, to which both the choirs are to accommodate their ſinging.

ANTIPHONY, in a more modern ſenſe, denotes a kind of compoſition made of ſeveral verſes extracted out of different pſalms, adapted to expreſs the myſtery ſolemnized on the occaſion.

ANTIPHONA *ad introitum*, that anciently ſung in the introit of the maſs.

ANTIPHONA *invitatiora*, that repeated at the pſalm *Venite exultemus*.

ANTIPHONÆ *majores*, thoſe ſeven uſed to be ſung in the time of Advent, at the Magnificat, and during the ſeven days before Chriſtmas.

ANTIPHONÆ *proceſſionales*, thoſe ſung at proceſſions.

ANTIPHONÆ *rogationes*, thoſe rehearſed at rogations.

ANTIPHRASIS, a ſort of figurative expreſſion, which has a contrary meaning to what it carries in appearance. Or, a kind of irony, wherein we ſay one thing, and mean the contrary.

The word is derived from αντι, and φρασις, of φραζω, *I ſpeak*.

Sanctius defines *antiphraſis* to be a form of irony, whereby we ſay a thing, by denying what we ought rather to affirm it to be: as when we ſay, *it did not diſpleaſe me*; or, *he is no fool*; meaning, *I was pleaſed with it*; or, *he is a man of ſenſe*.—On this principle, the *antiphraſes* ought to be ranked among the figures of ſentences, and not among thoſe of words.

It is a common error, to make *antiphraſes* conſiſt in ſingle words; as when we ſay, that the Parcæ are thus called by *antiphraſes*, becauſe they ſpare nobody, PARCÆ, *quia nemini parcunt*.—S. Jerom, in his epiſtle to Riparius againſt Vigilantius, ſays, he ought rather to be called *Dormitantius per antiphraſin*, than Vigilantius, becauſe he oppoſed the Chriſtians holding wakes at the tombs of the martyrs.

Sanctius holds it improper to call theſe *antiphraſes*; becauſe *phraſis* is not applicable to a ſingle word, but ſignifies *orationem, aut loquendi modum*.

ANTIPODES, in *Geography*, a relative term, denoting ſuch inhabitants of the earth as live diametrically oppoſite to one another.

The word comes from αντι, *againſt*, and πους, ποδος, *a foot*.

The *Antipodes* are thoſe who live in parallels of latitude equally diſtant from the equator, the one toward the north, the other to the ſouth; and under the ſame meridian, though 180°, or juſt half of that meridian, diſtant from one another.

The *Antipodes* have nearly the ſame degree of heat and cold; and the ſame length of night and day; but at contrary times: it being midnight with one, when it is noon with the other; and the longeſt day with one, when it is the ſhorteſt with the other.

Again, as the horizon of any place is 90° diſtant from its zenith, the *Antipodes* have the ſame HORIZON. And hence, when the ſun riſes to one, he ſets to the other.

Plato is ſaid to have firſt ſtarted the notion of *Antipodes*; and likewiſe to have given them the name: as he conceived the earth to be of a ſpherical figure, it was eaſy for him to infer, that there muſt be *Antipodes*.

Many, and particularly Lactantius and Auguſtine, laughed at the notion.—The latter of thoſe fathers is ſtrangely perplexed to think how men and trees ſhould hang pendulous in the air, their feet uppermoſt, as he thought they muſt do in the other hemiſphere.

And if we may believe Aventine, Boniface, archbiſhop of Mentz, and legate of pope Zachary, in the eighth century, declared a biſhop of that time, called Virgilius, heretic, for maintaining that there was ſuch a thing as *Antipodes*.

But this piece of hiſtory is controverted by the authors of the *Mem. de Trevoux*; as having been made uſe of, it ſeems, by ſome perſons, to ſhew, that the church has been miſtaken in its deciſions.

As to the ſentiments of the primitive Chriſtians with regard to *Antipodes*; ſome, rather than admit the concluſions of the philoſophers, abſolutely denied the whole, even the demonſtrations of the geometricians relating to the ſphericity of the earth: which is Lactantius's way, *Inſtit. lib.* iii. *c.* 24. Others only called in queſtion the conjectures of the philoſophers; which is St. Auguſtine's method, *De Civit. Dei. lib.* xvi. *c.* 9.—After putting the queſtion, whether there ever were nations of cyclopes, or pygmies, or of people whoſe feet ſtood outward, &c. he comes to the point of *Antipodes*, and aſks, "whether "the lower part of our earth be inhabited by *Antipodes?*" He made no doubt of the earth's being round, nor of there being a part diametrically oppoſite to ours; but only diſputes its being really inhabited. And the conſiderations he ſuggeſts for that purpoſe are juſt enough; as, that they who aſſerted *Antipodes*, had no hiſtory for it; that the lower part of the earth may be covered with water; and that to place *Antipodes* there, of a different origin from us (as muſt have been the opinion of the ancients, ſince they thought it impoſſible to go from our world to theirs), is to contradict ſcripture, which teaches, that the whole race deſcended from one man. Such are the ſentiments of that father. It may be added, that the chriſtian fathers were not the only perſons who diſputed the truth of the *Antipodes*. Lucretius had done it before them, at the end of his firſt book, v. 1063, &c. See alſo Plutarch, *lib. De facie in orbe lunæ*; and Pliny, who refutes the opinion, *lib.* ii. *c.* 5.

ANTIPOPE, a falſe or pretended pope; or, one that is, or is pretended to be, irregularly elected in oppoſition to another.

Geddes gives the hiſtory of no leſs than twenty-four ſchiſms in the Romiſh church, cauſed by *antipopes*; ſome took their riſe from a diverſity of doctrine and belief, which led different parties to elect each their ſeveral pope; but the greater part from dubious controverted rights of election, the fruits of chicane and ambition.

ANTI-PORTICO is uſed by ſome for a veſtible, or porch, at the entrance of an edifice.

ANTIPRAXIA, in the *Ancient Phyſic*, denotes a contrariety of functions, temperaments, &c. in different parts of the body; invented to account for that contrariety of ſymptoms which frequently concur in hypochondriac caſes, when, e. gr. the liver is charged with being immoderately hot, and the ſtomach exceſſively cold.

The moderns, particularly Etmuller, refute the notion of an *antipraxia*, on this principle, that the blood circulating duly through the whole body, warms all the parts, as well the ſtomach as liver proportionably. To which ſome advocates for the ancient ſyſtem object, that this is confounding the preternatural ſtate with the natural.

ANTIPREDICAMENTS, in *Logic*. See ANTEPREDICAMENT.

ANTIPROBABILISM, the doctrine or ſyſtem of thoſe who hold it unlawful to follow the leſs probable opinion, in oppoſition to the more probable one.

There have been vigorous advocates for *antiprobabiliſm*; for even among its greateſt enemies, the Jeſuits, F. Giſbert has a treatiſe expreſly in favour of *antiprobabiliſm*, viz. ANTIPROBABILISMUS, *ſeu tractatus theologicus fidelem totius probabiliſmi ſtateram continens*, &c. Par. 1703. 4°.

ANTIPROBOLE, in *Rhetoric*, a figure whereby the defendant adopts or admits the charge brought againſt him by the proſecutor.

E. gr. Suppoſing the proſecutor's ϖροϐολη to be, *Titus has killed Caius*; the defendant's *antiprobole* may be, *I have killed him, but undeſignedly*.

ANTIPROPEMPTICON, in *Poetry*, a poem wherein a perſon going a journey addreſſes himſelf to his friends. Such is that of Ovid, lib. i. Triſt.

Cum ſubit illius triſtiſſima noctis imago, &c.

It is oppoſed to PROPEMPTICON.

ANTIPROTASIS, in *Rhetoric*, a ſolution of the PROTASIS.

ANTIPSORA, in *Pharmacy*, remedies proper againſt the itch.

ANTIPTOSIS, a figure in *Grammar*, whereby one caſe is put for another.

The word comes from αντι, *pro*, and ϖτωσις, *caſus*.

ANTIPYRETON, among *Phyſicians*, an appellation given to the medicines againſt fevers.

ANTIQUARE, among Roman lawyers, properly denotes the rejecting of a new law, or refuſing to paſs it. In which ſenſe, *antiquating* differs from *abrogating*; as the latter imports the annulling an old law, the former the rejecting a new one. See A.

ANTIQUARE is alſo uſed for a law's growing obſolete, or into diſuſe, either by age or non-obſervance.

ANTIQUARIUM, among the *Ancients*, denoted a place or apartment, wherein their *antique* monuments were preſerved.

ANTIQUARTIUM is uſed by ſome modern practitioners, for a ſpecific againſt the quartan ague.

Hence ſome call the Jeſuits bark *antiquartium Peruvianum*.

Wedelius alſo ſpeaks of an *eſſentia antiquartia*.

The *antiquartan* of Riverius is a preparation of *mercurius dulcis*, *aurum fulminans*, ſulphur of antimony, and ſcammony.

ANTIQUARY, ANTIQUARIUS, a perſon who ſtudies and ſearches after monuments and remains of the ancients; as, old medals, books, ſtatues, ſculptures, and inſcriptions: and, in general, all curious pieces that may afford any light into *antiquity*.

Formerly there were ſeveral other kinds of *antiquaries*. The LIBRARII, or copiſts, i. e. thoſe who tranſcribed in fair legible characters, what had been before written in notes, were called by this name. They were alſo denominated *calligraphi*. They were alſo employed in repairing books injured by age.

In the chief cities of Greece and Italy, there were other perſons of diſtinction, called *antiquaries*, whoſe buſineſs it was to ſhew ſtrangers the antiquities of the place, to explain the ancient inſcriptions, and to give them all the aſſiſtance they could in this way of learning.

This was, doubtleſs, a very curious and uſeful inſtitution; and might well deſerve to be re-eſtabliſhed.—Pauſanias calls theſe *antiquaries*, Εξηγηται. The Sicilians call them *myſtogogi*.

There was an ancient college of *antiquaries* erected in Ireland by Ollamh Fodhla, 700 years before Chriſt, for compoſing a hiſtory of that country. And to this, ſay the Iriſh hiſtorians, it is owing, that the hiſtory and antiquities of that kingdom may be traced back beyond thoſe of moſt other nations.

The office of the ancient Iriſh *antiquaries* was to preſerve the genealogies of the kings of Ireland, to correct the regal tables of ſucceſſion, and deliver down the pedigree of every collateral branch of the royal family.

The kings of Sweden have been at great expences in order to illuſtrate the *antiquity* of their country, having eſtabliſhed an academy of *antiquaries* with this ſingle view.

Foundations of this kind have often been wiſhed for, and ſometimes alſo attempted in England.

Sir H. Spelman ſpeaks of a ſociety of *antiquaries* in his time, to whom his treatiſe of the terms, written in the year 1614, was communicated, he himſelf being one of the number.

The ſociety was formed by archbiſhop Parker, Camden, Sir Robert Cotton, Stow, and others, in 1572. In 1589, application was made to queen Elizabeth for a charter and houſe, wherein they might hold their meetings, erect a library, and the like. But by the death of that princeſs, their application proved abortive. Her ſucceſſor, king James I. was far from favouring their deſign.

In the year 1717, this ſociety was revived again, ſince which time no interruptions having happened, it is at preſent in a very flouriſhing condition; and the buſineſs of its members is to diſcover the antiquities of their own, as well as thoſe of other nations.

This ſociety was incorporated by the king's charter in the year 1751; and began to publiſh its diſcoveries, &c. in 1770, under the title of *Archæologia*.

ANTIQUARY is alſo uſed, by *Ancient Writers*, for the keeper of the *antiquarium*, or cabinet of antiquities.

This officer is otherwiſe called *archæota*, or *antiquary* of a king, a prince, a ſtate, or the like.

Henry VIII. gave John Leland the title of his *antiquary*, a title which, ſays the author of his life, no body ever enjoyed beſides himſelf. But the reſtriction, we ſuppoſe, was only intended to be underſtood in reſpect of the kings of England; M. Schott, we find, had the title of *antiquary* to the king of Pruſſia; P. Pedruzzi, that of *antiquary* of the duke of Parma; M. Galland reſided ſome time in Turky, under the title of *antiquary* of the king of France.

The Univerſity of Oxford have ſtill their *antiquary*, under the denomination of *cuſtos archivorum*.

P. Labbe and Petavius have publiſhed pieces expreſly concerning the apparatus of *antiquaries*.

ANTIQUATED, ANTIQUATUS, ſomething obſolete, or grown out of date, or uſe.

ANTIQUE, Antiquus, in a general ſenſe, ſomething that is ancient.

Antique is chiefly uſed among architects, ſculptors, and painters; who apply it to ſuch pieces of buildings, ſculpture, painting, &c. as were made at the time when the arts were in their greateſt perfection, among the ancient Greeks and Romans; viz. from the age of Alexander, to the time of the emperor Phocas, about the year of Chriſt 600, when Italy became over-run by the Goths and Vandals.

In this ſenſe the word ſtands oppoſed to *modern.*—Thus we ſay, an *antique* building, or a building after the *antique*; an *antique* buſt, or bas-relievo; the *antique* manner, taſte, &c.

The ſcience of *antiques* is alſo called by Spon ARCHÆOGRAPHIA.

Under this is included the knowledge of ancient coins, medals, inſcriptions, buildings, ſtatues, ſculptures, MSS. veſſels, weights, meaſures, &c.

Antique is ſometimes alſo contradiſtinguiſhed from *ancient*, which denotes the leſſer degree of antiquity, when the art was not in its utmoſt purity.

Thus, *antique architecture* is frequently diſtinguiſhed from *ancient architecture.*

Some writers alſo uſe the compound, *antiquo-modern*, in reſpect of the old Gothic churches, and other buildings: to diſtinguiſh them from thoſe of the Greeks and Romans.

ANTIQUITY, Antiquitas, is uſed to denote the times or ages paſt long ago.

Thus we ſay, the heroes of *antiquity*, the marks, or footſteps of *antiquity*, monuments of *antiquity*, &c.

Antiquity is alſo uſed to denote the works or remains of ancient times. See Monument, Remains, Ruins, &c.

Thus we ſay, a fine, a curious piece of *antiquity*; Italy, France, and England, abound in *antiquities.*

Antiquity is alſo uſed to denote the great age of a thing, or its duration from times of old.

In this ſenſe we ſay, the *antiquity* of a kingdom, a cuſtom, or the like: moſt nations lay claim to an *antiquity* much greater than they can truly warrant.

There are great diſputes concerning the *antiquity*, or age of the world.

Ariſtotle carried it even to eternity; and Parmenides, Pythagoras, and the Chaldeans, were of the ſame opinion; but the generality of philoſophers, as well as divines and hiſtorians, have always held an origin of it.

Though where to fix that origin, is the difficulty. The different ſyſtems of the CHRONOLOGY of the Greeks, the Egyptians, the Jews, the Hebrew text, and the Septuagint verſion of Scaliger, of Pezron, of Sir Iſaac Newton, &c. to ſay nothing of the Chineſe annals, leave the point very much embarraſſed.

Dom. Pezron thinks he has merited well of the public by adding 2000 years to the age of the world, which had been taken from it by Scaliger and others; but this did not hinder F. Martianay from entering a proſecution againſt him in the archbiſhop's court of Paris, for hereſy.—His crime was following the heathen, rather than the Hebrew chronology, in which however he was preceded by the generality of the ſathers and primitive writers of the church; among whom it appears to have been a common practice, to make 5500 years between the creation, and the incarnation. In reality, the Jews are charged with having corrupted their chronology; by which the moderns have been miſled.

Some have propoſed to trace out the *antiquity* of the earth, by an obſervation of the ſaltneſs of the ſea; others by obſerving the elevation of the bottom of the ſea, or the growth of its ſtrata.—One mark or proof of *antiquity* has been ſtarted by Rudbeck, which he pretends to have carried to a demonſtration; it is taken from the thickneſs of a certain black cruſt, called in the Swediſh tongue, *mat-iorden*, and *ſwart-myllan*, which covers the ſurface of the earth, being formed of a mixture of rotten graſs, and other herbs, with duſt and a kind of mud, which the melted ſnow leaves behind it. According to this antiquary, there are at leaſt 500 years requiſite to form an inch thick of this cruſt, which in many places of Sweden is found to be upwards of ſeven inches thick, where urns have been dug up full of bones and aſhes. From whence it follows, according to this author, that it is upwards of 3500 years ſince burning the dead was practiſed in Scandinavia.

Recupero, the hiſtoriographer of Ætna, ſuggeſts an argument in favour of the *antiquity* of the earth from the ſeveral ſtrata of lava, that have iſſued at different times from this mountain. A ſtream of lava, which Diodorus Siculus relates to have burſt out in the time of the ſecond Punic war, is covered at this day only with a very ſcanty ſoil; and in digging pits and wells, ſeveral ſtrata of lava have been diſcovered with earth to a conſiderable thickneſs over the ſurface of each ſtratum; in one inſtance ſeven diſtinct ſurfaces of this kind were pierced; and allowing 2000 years for the interval between two eruptions, the lava that compoſed the firſt or loweſt ſtratum, muſt have flowed from the mountain above 14000 years ago. Brydone's Tour, &c. vol. i. p. 131.

But this argument is very fallacious, becauſe we learn from Sir William Hamilton's remarks on the ſoil of Naples, that, ſince the firſt eruption of Veſuvius, which deſtroyed the ancient town of Herculaneum in the year 79, there have been ſix eruptions of *lava*, forming as many different ſtrata, with veins of good ſoil between them. Phil. Tranſ. vol. lxi. N° 1.

There is ſcarce a nation under heaven, but lays claim to a greater degree of *antiquity* than the reſt of its neighbours; the Scythians, the Phrygians, the Chaldeans, Egyptians, Greeks, Chineſe, &c. pretend each to the honour of being the firſt inhabitants of the earth; ſeveral of theſe nations, leſt they ſhould be outſtripped in their pretenſions by any of the reſt, have traced up their origin to ages long before the received account of the creation. Hence the appellation *aborigines*, *indigenæ*, *terrigina*, *antelunares*, &c. The Athenians were not aſhamed to pretend to be *autochthones*; and what is moſt remarkable, Socrates himſelf gives them this ridiculous appellation, which, as ſome others of the philoſophers have wiſely obſerved, only put them on a level with ants and graſhoppers.

The Chaldeans pretend to aſtronomical obſervations of 470,000 years; they mention the preciſe king who reigned over them at the time of the deluge, whoſe name was Xiſuthrus, and attribute to him ſeveral things which we aſcribe to Noah.

The Chaldaic *antiquities* of Beroſus are loſt, except a few fragments which have been collected by Joſ. Scaliger, and ſince more fully by Fabricius. Annius of Viterbo, a Dominican monk, towards the cloſe of the fifteenth century, would not ſuffer us to want ſuch a treaſure, but officiouſly went to work, and forged a Beroſus out of his own brain, which he publiſhed at Rome in 1498. The monk went further; and from the ſame mint ſoon after produced Manetho's ſupplement to Beroſus, from the time of Ægyptus king of Egypt, to the origin of the Roman ſtate. The miſchief is, Manetho lived before Beroſus; this anachroniſm alone had ſufficed to betray the cheat.

St. Auguſtin laughs at the folly of the Egyptians, who pretend to obſervations of the ſtars above 100,000 years old; in effect, no people appear to have been warmer in the conteſt for *antiquity* than thoſe of Egypt. They pretend two periods of time; one ſhorter, during which the throne of Egypt had been filled by men, the other almoſt infinite, wherein gods, and demi-gods, had wore the crown. From Iſis and Oſiris to Alexander they reckoned a ſpace of 23000 years, the time before that, while the gods reigned, made 42984 years more; the whole duration from the beginning of their monarchy amounting to 65984.

The computation of their dynaſties as given by Manetho, a writer of their own, (of whom we have extracts in Syncellus, taken from Julius Africanus and Euſebius) extends to 5550 years before Alexander's time; and the Egyptian chronicle, cited by the ſame Syncellus, goes further, reckoning 36525 years. Diogenes Laertius makes no leſs than 48863 years from the reign of Vulcan. Yet the Scythians, the Phrygians, the Ethiopians, and ſome others, ſtill inſiſted on their priority to the Egyptians; and in the judgment of many ſeem to have carried their point. Juſtin, after Trogus, gives the precedency to the Scythians; and affirms, that they were always allowed to have been before the Egyptians.

No wonder their catalogues ſhould be ridiculouſly incredible, when the Egyptians make their firſt kings reign 1200 years a-piece; and the Aſſyrians theirs about 4000, as in the article Saros.

But the Chineſe is eſteemed the moſt ancient monarchy in the univerſe; having cultivated the ſciences from the earlieſt ages, and ſubſiſted at leaſt theſe 4000 years with the ſame laws, manners, and uſages.

Some indeed have called in queſtion the truth and authenticity of the Chineſe annals; yet we find them confirmed, at leaſt as high as 660 years before Chriſt, by the annals of Japan. At worſt the Chineſe *antiquities* ſtand on as good a footing as thoſe either of Greece or Rome. Their annaliſts both for order and chronology are not inferior to any of thoſe ancients ſo much admired among us; but far ſurpaſs them in point of *antiquity*, and have a better title to be credited, as having written by public authority, which can be ſaid of few Greek or Roman pieces, except perhaps the Capitoline Marbles, which are not properly a hiſtory.

We have no inconſiderable confirmation of the truth of the Chineſe account, from an ancient obſervation of a grand conjunction of the planets under Chuen-Hio, emperor of China, related by Martinius. That prince lived 2513 years before Chriſt. M. Kirchius has defended the obſervation againſt Caſſini, and ſhewn a conjunction muſt really have happened at the time mentioned by the Chineſe annals.

But the authenticity of this obſervation, and the whole of the Chineſe chronology, has been lately attacked by an ingenious author, Mr. Coſtar. See *Chineſe* Chronology.

Dionyſius Halicarnaſſeus has traced the Roman *antiquities*, Joſephus the Jewiſh *antiquities*, Beroſus the Chaldaic *antiquities*, Sanconiathon the Phœnician *antiquities*, Manetho aud Marſham the Egyptian *antiquities*.

The Phœnician *antiquities* of Sanconiathon are preſerved in part by Euſebius. We have an Engliſh tranſlation of Sanconiathon, with notes by biſhop Cumberland, and a continuation from the canon of Eratoſthenes. Lond. 1720. 8vo.

Dionyſius gave his book the title of Roman *antiquities*, on account of the curious inquiries he had made concerning the origin of the Romans, by tracing them back to the remoteſt ages. For fidelity as well as inſtruction he is generally preferred to Livy; his accounts are more ample, and his facts deſcribed with more particulars; he gives a full idea of the Roman ceremonies, the worſhip of their gods, ſacrifices, manners, cuſtoms, diſcipline, policy, courts, laws, &c.

To the claſs of ſuppoſititious *antiquities* belong the Hetrurian *antiquities*, pretended to have been found by Scornelli near Volaterra, and publiſhed in 1636 by Curtius Inghiramus, who is generally ſuppoſed to have been the forger of them. A great number of fictitious names of ancient authors are cited in this book to give the better face to the cheat; but the ſtyle betrayed it. Allatius and Ernſtius early detected the impoſture.

The Britiſh *antiquities* before Cæſar's invaſion are very dubious, not to ſay fabulous. Old chronicles ſpeak of Samothes, the ſon of Japhet, as the founder of the Britiſh monarchy; Albion, a deſcendant of Cham, invaded it three hundred years after; and about 600 years after this, Brute, grandſon of Æneas, came and took poſſeſſion of the iſland in the year of the world 2880, giving it the name which it ſtill retained when Cæſar made his attempt. This is Jeffrey of Monmouth's ſyſtem of the *antiquities* of the Britiſh nation, which the generality of our hiſtorians admit for want of a better. It has been defended by A. Thomſon of Queen's College, in the preface to his Engliſh tranſlation of that writer.

It muſt not be forgot that the Iriſh alſo pretend to be the moſt ancient of all nations; they trace their origin without interruption up to Japhet. But the Scots ſtill diſpute the priority with them, holding themſelves to be an elder branch of the Scythians, the firſt of men.

The *antiquity* of religion has been often urged as a proof of the truth of it. Jews, Gentiles, Chriſtians, Proteſtants, Papiſts, have all in their turns made uſe of the argument from *antiquity*. It is indeed of the inartificial kind; and comes rather under the denomination of a preſumption than a proof; on the whole it ſeems to have ſerved the cauſe of error as much, if not more, than that of truth.

Antiquity is more peculiarly uſed to denote the ceremonies, cuſtoms, and uſages, which obtained in ancient times, either with regard to perſons, places, or things.

Antiquities, in this ſenſe, are uſually divided into ſacred, political, military, literary, and domeſtic; ſometimes only into civil and eccleſiaſtical.

Antiquities, *ſacred*, thoſe relating to the religious worſhip, diſcipline, and belief of ancient times and people.

Theſe may be ſubdivided into heathen, Chriſtian, and Mahometan, &c.

Reland has a treatiſe expreſly on the ſacred *antiquities* of the Jews; Struvius on thoſe of the Romans; Lakemacher on thoſe of the Greeks; and Stillingfleet on thoſe of the Britiſh churches.

Fabricius has given two plans of a theſaurus, or body of *antiquities*; the one of Hebrew *antiquities*, after the manner of Grævius and Gronovius; the other of eccleſiaſtical *antiquities*, divided into twelve books. He gives the names and titles of 156 authors to be included in the firſt, and 101 authors for the ſecond.

Antiquities, *Chriſtian*, thoſe which relate to the ancient ſtate of the Chriſtian church.

Theſe are the ſame with what we otherwiſe call *eccleſiaſtical antiquities*.

The Magdeburg centuries are looked upon by proteſtants as a library of Chriſtian *antiquities*.

Mr. Bingham has publiſhed a learned ſyſtem of Chriſtian *antiquities*.

A principal branch of Chriſtian *antiquities* are,

Antiquities, *Biblical*, the notices of ancient laws, ceremonies, events, &c. occurring in the Scriptures.

Theſe make a branch of *eccleſiaſtical antiquities*, and bear a near relation to the Jewiſh, &c. *antiquities*.

Some pretend to deduce moſt of the heathen *antiquities* from the Bible; others, as Spencer, &c. take the contrary courſe, and deduce the *antiquities* of the Bible from thoſe of *heatheniſm*.

To interpret Scripture it is abſolutely neceſſary that regard ſhould be had to the heathen *antiquities* alluded to in them, and theſe not only ſuch as are directly aimed at, or approved, but alſo ſuch as are purpoſely oppoſed.

Dr. Cave has publiſhed a treatiſe of apoſtolical *antiquities*, *Antiquitates Apoſtolicæ*; or the Lives, Acts, &c. of the Apoſtles, Evangeliſts, &c. Lond. 1674. fol. 1684, and 1686.

Antiquities, *civil*, all that belong not to the head of *eccleſiaſtical*.

Antiquities, *political*, thoſe relating to the origins of ſtates, governments, magiſtrates, and laws.

Antiquities, *national*, thoſe employed in tracing the origin, ancient actions, uſages, monuments, remains, &c. of ſome nation or people.

Gronovius has given a collection of the chief writers on the Greek *antiquities*; Rouſe, Pfeiffer, Bos, and biſhop Potter, have given ſhorter ſyſtems; the laſt is the beſt eſteemed, though found too ſhort by ſome in what relates to the religion, the gods, vows, and temples of Greece.

The beſt ſyſtem of Roman *antiquities* yet extant is that of Roſinus, with Dempſter's notes.

We have compendiums and introductions to the Roman *antiquities* by Hoepfner, Nieuport, Godwin, Cantelius, Baſil Kennet, &c.

Heineccius has given a collection of Roman *antiquities*, for illuſtration of the civil law; and Briſſonius another, drawn from the books of the civil law. Gravina's *Origines Juris Civilis* is excellent on this ſubject.

A body of the writers on the Roman *antiquities* have been publiſhed by Grævius, and another of thoſe on the Greek *antiquities* by Gronovius, both under the titles of Theſauri.

A ſupplement to the former has been publiſhed by Sallengre, and Polenus. Danet and Pitiſcus have alſo publiſhed lexicons of the Roman *antiquities*. Varro's books of Roman *antiquities* are intirely loſt, excepting ſome fragments, preſerved by St. Auguſtin.

Antiquities, *parochial*, thoſe confined to the limits of one or more pariſhes, and converſant chiefly in what relates to the tithes, revenues, &c. of the churches.

Dr. Kennet has publiſhed a learned and curious work under the title of *Parochial Antiquities*, attempted in the hiſtory of Ambroſden and Burcheſter, and other adjacent parts in the counties of Oxford and Bucks. Oxf. 1695. 4to. See Phil. Tranſ. N° 220.

Antiquities, *literary*, thoſe relating to matters of learning and ſtudy; a principal branch of theſe, are

Antiquities, *academical*, the origins, uſages, &c. of the ancient academies, ſchools, colleges, and other literary ſocieties. Theſe bear a near relation to ſcholaſtic *antiquities*, and make a branch or diviſion of literary *antiquities*. Herm. Conringius has given a body of *academical antiquities*, Urſinus a treatiſe of the *ſcholaſtical antiquities* of the Hebrews.

ANTI-RATIONALISTS, a name ſometimes given to divines, who in matters of religion are for humbling reaſon, and making it bend to faith; aſſerting that the abſurdity of a thing is no reaſon for rejecting it.

In this ſenſe, the rigid Calviniſts and adherers to the ſynod of Dort are denominated *anti-rationaliſts*, on account of the doctrine of abſolute predeſtination, &c. The Roman catholics are alſo entitled to the ſame appellation, on account of the doctrine of tranſubſtantiation. —M. Bayle took ſhelter in the ſyſtem of the *anti-rationaliſts*, the better to combat the Chriſtian doctrines of the origin of evil, Providence, &c.

ANTIRRHETICUM, in *Literary Hiſtory*, denotes a refutation of ſome book, author, or opinion.

In this ſenſe, we alſo meet with the word *antirrheſis*.

ANTIRRHINUM, in *Botany*. See Snap-Dragon.

ANTI-SABBATARIANS, a modern religious ſect, who oppoſe the obſervance of the Chriſtian Sabbath.

The great principle of the *anti-ſabbatarians* is, that the Jewiſh ſabbath was only of ceremonial not moral obligation; and conſequently is aboliſhed by the coming of Chriſt.

ANTISAGOGE, in *Rhetoric*, a figure differing little from that called Conceſſion. The following paſſage from Cicero is an inſtance of it: *Difficilis ratio belli gerendi; at plena fidei, plena pietatis; et ſi dicas, magnus labor, multa pericula proponuntur; at gloria ex his immortalis eſt conſecutura.*

ANTI-SCEPTIC, ſomething oppoſed to the reaſonings and ſyſtem of Pyrrhoniſts, or ſceptics.

ANTISCII, in *Geography*, denominates people who dwell in the oppoſite hemiſpheres of the earth, and whoſe ſhadows at noon fall in contrary directions.

The word is compounded of *αντι*, *againſt*, and *σκια*, a *ſhadow*.

Thus the people of the north are *antiſcii* to thoſe of the ſouth. The one project their ſhadows at mid-day towards the arctic pole; and the others towards the antarctic pole.

The *antiſcii* are very often confounded with the ANTŒCI, though the former term is more general than the latter. The *antiſcii* ſtand contradiſtinguiſhed from *periſcii*, &c.

ANTISCII is ſometimes alſo uſed, among *Aſtrologers*, for two points of the heavens equally diſtant from the tropics.—Thus the ſigns Leo and Taurus are held *antiſcii* to each other.

ANTISCORBUTICS, medicines proper for the cure of the ſcurvy.

ANTISEPTIC, an appellation given to ſuch ſubſtances as reſiſt PUTREFACTION; and more lately extended to ſuch as have a power of reſtoring ſweetneſs to ſubſtances actually putrid.

We have ſome curious experiments in relation to *antiſeptic* ſubſtances by Dr. Pringle, who has aſcertained their ſeveral virtues. Thus, in order to ſettle the *antiſeptic* virtue of ſalts, he compared it with that of common ſea-ſalt; which being one of the weakeſt, he ſuppoſes equal to unity, and expreſſes the proportional ſtrength of the reſt by higher numbers, as in the following table.

Salts, their antiſeptic virtue.		Salts, their antiſeptic virtue.	
Sea-ſalt - -	1	Saline mixture -	3
Sal gemmæ -	1+	Nitre - -	4+
Tartar vitriolated	2	Salt of hartſhorn -	4+
Spiritus Mindereri	2	Salt of wormwood	4+
Tartarus ſolubilis	2	*Borax* - -	12+
Sal diureticus -	2+	Salt of amber -	20+
Crude *ſal ammoniac*	3	Alum - -	30+

In this table the proportions are marked in integral numbers; only to ſome there is added the ſign +, to ſhew, that thoſe ſalts are poſſeſſed of a ſtronger *antiſeptic* virtue than the number in the table expreſſes, by ſome fraction; unleſs in the three laſt, where the ſame ſign imports, that the ſalt may be ſtronger by ſome units.

Some reſinous and other ſubſtances even exceed the *antiſeptic* virtues of the neutral ſalts; thus myrrh, *aſſa-fœtida*, *terra japonica*, and aloes, are at leaſt twelve times more *antiſeptic* than ſea-ſalt. Camphor prevents putrefaction with a power three hundred times greater than is that of ſalt. An infuſion of a few grains of Virginian ſnake-root, in powder, exceeds twelve times its weight of ſea-ſalt. Chamomile flowers have nearly the ſame extraordinary quality. The Jeſuits bark has it alſo. Beſides theſe, pepper, ginger, ſaffron, contrayerva-root, are twelve times more *antiſeptic* than ſea-ſalt. Dried ſage, rhubarb, the root of the wild valerian, mint, angelica, ground-ivy, ſena, green-tea, red-roſes, wormwood, muſtard, and horſe-raddiſh, were likewiſe found more *antiſeptic* than the ſtandard: and a ſimilar power likewiſe belongs to many other of the common eſculent vegetables, as carrots, turnipt, garlic, onions, celery, cabbage, and colewort.

To the claſs of *antiſeptic* medicines may likewiſe be added fermented liquors, acids, ſpirits, and even thoſe plants called anti-acids, and erroneouſly ſuppoſed haſteners of putrefaction, particularly horſe-raddiſh. Now vegetables, poſſeſſing this virtue, are the more valuable, in that, being uſually free of acrimony, they may be taken in much greater quantities, than either ſpirits, acids, reſins, or even the neutral ſalts.

Antiſeptics are preſcribed in all putrid, malignant, and peſtilential caſes. It is to be remarked, however, that different kinds of them are to be given in different diſeaſes, and even in different ſtages of the ſame diſeaſe. Thus, the bark is a ſpecific in a gangrene, when the veſſels are relaxed, and the blood reſolved or diſpoſed to putrefaction; but will fail, if the veſſels are too full, or the blood be too thick. With the ſame caution is the bark to be uſed in wounds, viz. chiefly in caſes of abſorbed matter, when it infects the humours, and brings on a hectic-fever.

By the great *antiſeptic* virtue of alum, the bark, and other aſtringents, it ſhould ſeem, that aſtriction had no ſmall ſhare in the cure of putrid diſorders; and, indeed, the very nature of putrefaction conſiſts in a ſeparation or diſunion of the parts. Beſides, the bark ferments in the body, and diſcharges an *antiſeptic* vapour, or *fixed* AIR, which mingles with the blood, and contributes to reſtore its conſiſtence, and correct its acrimony. But as aſtringents are improper to be adminiſtered in many caſes, contrayerva-root, ſnake-root, camphor, &c. may ſupply their place; which, though highly *antiſeptic*, have very little, or any, of an aſtringent quality. Pringle's Obſ. on the Diſeaſes of the Army. Dr. Macbride's Eſſay on the reſpective Powers, &c. of *Antiſeptics*.

ANTISIGMA, among the *Ancient Grammarians*, ſignifies one of the notes of ſentences affixed to thoſe verſes whoſe order was to be changed.

ANTISPASMODICS, are medicines proper for the cure of ſpaſms and convulſions. Opium, balſam of Peru, and the eſſential oils of many vegetables, are the principal in this claſs of medicines. Opium excells for it immediate effects. Peruvian balſam, in many inſtances, produces more laſting benefit than opium, and ſometimes ſucceeds where opium fails. As *antiſpaſmodics*, the eſſential oils differ in this from opium, that they act more on a particular part than on the ſyſtem in general, and have no ſoporific effect. Some medicines remove ſpaſms by immediate contact, as aſſes milk, cream, oil of almonds; others by repelling heat, as gas, ſulphur, nitre, ſal ammoniac, &c. And where the ſtrictures are produced by inanition, and a defect of vital heat, ſpaſms are removed by thoſe medicines that reſtore the *vis vitæ*, ſuch as valerian, caſtor, muſk, &c.

ANTISPASTUS, a poetical foot, conſiſting of four ſyllables, whereof the firſt is ſhort, the ſecond and third long, and the fourth ſhort.

ANTISPODIUM. See the article SPODIUM.

ANTI-STANCARIANS, a ſect of German proteſtants, who oppoſe the doctrine of Stancarius, who aſſerted that juſtification was the ſole effect of Chriſt's human nature, excluſive of his divinity.

ANTISTASIS, in *Oratory*, a defence of an action from the conſideration, that had it been omitted worſe would have enſued.

This is called by Latin writers *comparativum argumentum*, ſuch, e. gr. would be the general's defence, who had made an inglorious capitulation, that without it, the whole army muſt have periſhed.

ANTISTASIS, in *Antiquity*, denotes the gibbous part of the liver in the Grecian victims.

ANTISTES, in *Eccleſiaſtical Writers*, a title uſually given to biſhops, though ſometimes alſo to prieſts or preſbyters.

Among the ancient Romans, *antiſtes* was an appellation given to the chief or firſt orders of the prieſts in the provinces.

In which ſenſe, *antiſtes* ſtands diſtinguiſhed from *patres* and *magiſtri*.—In the more uſual ſenſe notwithſtanding, *antiſtes* denotes the ſame with *ſacerdos*.

There were alſo females of this quality under the title of *antiſtæ*.

ANTISTITIUM is a term uſed in ancient chronicles for an abbey or monaſtery.

ANTISTŒCHON, a grammatical figure whereby one letter is uſed inſtead of another.

This is otherwiſe called *antiſtichon*, by ſome writers.

ANTISTROPHE, a kind of dance in uſe among the ancients; wherein they ſtepped ſometimes to the right, and ſometimes to the left, ſtill doubling their turns or converſions.

The motion towards the left they called *antiſtrophe*; from *αντι*, *againſt*; *ςροφη*, of *ςρεφω*, *I turn*.

It was cuſtomary among the Greeks, on ſome occaſions, to dance round the altars, whilſt they ſung the ſacred hymns, which conſiſted of three ſtanzas, or parts; the firſt of which, called *ſtrophe*, was ſung in turning from eaſt to weſt; the other, named *antiſtrophe*, in returning from weſt to eaſt. Then they ſtood before the altar, and ſung the epode, which was the laſt part of the ſong.—Hence,

ANTISTROPHE is alſo uſed in *Lyric Poetry*, in ſpeaking of the ODE, which is uſually divided into the *ſtrophe*, *antiſtrophe*, and *epode*.

The *antiſtrophe* is a kind of echo, or replication to the *ſtrophe*; and the *epode* is a launching out from them both.

ANTISTROPHE is alſo a figure in grammar, whereby two terms or things, mutually dependent one on another, are reciprocally converted.

As if one ſhould ſay, the maſter of the ſervant, and the ſervant of the maſter.

ANTISTROPHE, in *Rhetoric*, the ſame with what is more commonly called *epiſtrophe*.

ANTISYLLOGISM, in *Logic*, a ſyllogiſm, which infers a contrary concluſion to that of another SYLLOGISM.

ANTITACTÆ, or **ANTITACTICI**, in *Antiquity*, a kind of Gnoſtics, who owned that God, the Creator of the univerſe, was good and juſt; but aſſerted, withal, that one of his creatures had created evil, and had engaged us to follow it, in order to ſet us in oppoſition to God the Creator; and that it becomes our duty to oppoſe this author of evil, in order to avenge God of his enemy. Hence the name; which is derived from *αντιταττω*, *I oppoſe*.

ANTITHENAR, in *Anatomy*, a name given to divers muſcles, otherwiſe called ADDUCTORS, or *adducent muſcles*. The word is compounded of *αντι*, *againſt*; and *ϑεναρ*; becauſe theſe muſcles act as antagoniſts to the *thenars*, or *abductors*.

ANTITHENAR is likewiſe a muſcle called alſo the *ſemi-interoſſeus pollicis*. It is ſmall, flat, and fleſhy, and is ſituated obliquely between the firſt phalanx of the thumb, and firſt bone of the *metacarpus*; it is fixed by one end toward the baſis of the firſt metacarpal bone, near the firſt bone of the ſecond row of the *carpus*; from thence it runs obliquely toward the head of the firſt phalanx of the thumb, and is inſerted in the lateral external part of that bone, or on that ſide which is turned to the firſt metacarpal bone. It croſſes over the *ſemi-interoſſeus indicis*; this muſcle lying toward the back of the hand, the *antithenar* here deſcribed toward the palm.

ANTITHENAR *pedis*, a ſmall compound muſcle lying obliquely under the metatarſal bones, fixed poſteriorly in the lower parts of the ſecond, third, and fourth of theſe bones, near their baſes; in the ligaments of theſe bones, and thoſe of the *tarſus*, and in a lateral *aponeuroſis* of the *hypothenar*, all theſe portions contracting into a ſmall compaſs, are inſerted in the outſide of the external ſeſamoide bone of the firſt phalanx of the great toe.

ANTITHESIS, in *Rhetoric*, a ſetting two things together by way of oppoſition to each other, that the different qualities of each may appear the more ſtrongly.

Such is that of Cicero, in the ſecond Catilinarian: 'On 'the one ſide ſtands modeſty, on the other impudence; 'on the one fidelity, on the other deceit; here piety, 'there ſacrilege; here continency, there luſt,' &c.—Such alſo is that of Auguſtus to ſome ſeditious young men; *audite, juvenes, ſenem, quem juvenem ſenes audivere.* —Such again is that of Seneca: *Curæ læves loquuntur, ingentes ſtupent*. And that of Virgil:

Flectere ſi nequeo ſuperos, Acheronta movebo.

St. Auguſtine, Seneca, Salvian, and many other ancient writers, ſeem greatly to affect *antitheſes*; but among the moderns they are generally decried. Deſmaretes repreſents them as the favourites of young writers.

ANTITHESIS is ſometimes uſed for controverſy.

In this ſenſe we meet with *antithetic* method, *antithetic* diſcourſes, &c.

ANTITHESIS is alſo a figure in grammar, whereby one letter is ſubſtituted in the room of another; as *olli* for *illi*.

ANTITHETARIUS, a term occurring in the title of a chapter in the laws of Canutus, but not in the chapter itſelf.

The meaning of the word is, a man who endeavours to diſcharge himſelf of the fact of which he is accuſed, by recriminating, i. e. by charging the accuſer with the ſame fact.

ANTITHETON, in *Rhetoric*, a figure wherein contraries are ſet in oppoſition to each other.

Some diſtinguiſh between the *antitheſis* and *antitheton*. Voſſius thinks that in the *antitheton* nouns and verbs are oppoſed; but in the *antitheſis* epithets only. Others comprehend the *antitheſis* under *antitheton*.

ANTITHORA. See ANTHORA.

ANTITRAGICUS, in *Anatomy*, a name given by Albinus to one of the muſcles of the eye, called by Santorini and others *muſculus antitragi*.

ANTITRAGUS, in *Anatomy*, is the thicker part of the *anthelix*, or that ridge juſt above the TRAGUS.

A ramification of the hard portion of the auditory nerve, running on the back of the *antitragus*, is ſometimes ſucceſsfully cauterized in the tooth-ach. Phil. Tranſ. Nº 299. p. 1981.

ANTITRINITARIANS, thoſe who deny the Trinity, and teach, that there are not three perſons in the Godhead.

Thus the Samoſatenians, who do not believe the diſtinction of perſons in God; the Arians, who deny the divinity of the Word; and the Macedonians, who deny that of the Holy Spirit, are all properly *Antitrinitarians*. Among the moderns, *Antitrinitarians* are particularly underſtood of Socinians, called alſo Unitarians.

The *Bibliotheca Antitrinitariorum*, or *Antitrinitarian* Library, is a poſthumous work of Chriſtopher Sandius, an eminent *Antitrinitarian*; wherein he gives a liſt, digeſted in order of time, of all the Socinian or modern *Antitrinitarian* authors, with a brief account of their lives, and a catalogue of their works. See UNITARIAN.

ANTITYPE, a Greek word, properly ſignifying a type or figure correſpondent to ſome other type.

The word *antitype* occurs twice in the New Teſtament; viz. in the Epiſtle to the Hebrews, ix. 24. and in St. Peter, 1 Ep. iii. 21. where its genuine import has been much controverted.—The former ſays, that 'Chriſt is 'not entered into the holy places made with hands, 'which are *αντιτυπα*, the figures or *antitypes* of the 'true—now to appear in the preſence of God for us.'—Now *τυπος*, as is elſewhere obſerved, ſignifies the pattern by which another thing is made; and as Moſes was obliged to make the tabernacle, and all things in it, according to the pattern ſhewed him in the Mount; the tabernacle ſo formed was the *antitype* of what was ſhewn to Moſes: any thing, therefore, formed according to a model, or pattern, is an *antitype*.

In the latter paſſage, the Apoſtle, ſpeaking of Noah's flood, and the deliverance only of eight perſons in the ark from it, ſays, Ω και ἡμας αντιτυπον νυν σωζει βαπτισμα, *baptiſm, being an antitype to that, now ſaves us*; *not putting away the filth of the fleſh, but the anſwer of a good conſcience towards God*, &c. The meaning is, that righteouſneſs, or the anſwer of a good conſcience towards God, now ſaves us by means of the reſurrection of Chriſt, as formerly righteouſneſs ſaved thoſe eight perſons by means of the ark, during the flood.—The word *antitype*, therefore, here ſignifies a general ſimilitude of circumſtances; and the particle ῷ, *whereunto*, refers, not to the immediate antecedent, ὑδατος, *water*, but to all that precedes.

ANTITYPE, among the *Ancient* Greek *Fathers*, and in the Greek *Liturgy*, is alſo applied to the ſymbols of bread and wine in the Sacrament.

Hence it hath been argued, by many proteſtants, that the Greeks do not really believe the doctrine of tranſubſtantiation; becauſe they call the bread and wine *antitypes*, *αντιτυπα*, q. d. figures, ſimilitudes; and this even after the conſecration.

ANTLER, among *Hunters*, the firſt of the pearls that grow about the bur of a deer's horn.

There are alſo ſur-*antlers*, brow-*antlers*, &c.

ANTLIA, an ancient machine, ſuppoſed to be the ſame with our pump.

Hence the phraſe, in *antliam condemnari*, according to the critics, denotes a kind of puniſhment, whereby criminals were condemned to drain ponds, ditches, or the like.

ANTŒCI, in *Geography*, thoſe inhabitants of the earth who live under the ſame meridian, and at the ſame diſtance from the equator; the one toward the north, and the other towards the ſouth.

The word is formed of *αντι*, *contra*, and *οικεω*, *I inhabit*.—The *Antœci* are contradiſtinguiſhed from the *Periœci*.

Hence the *Antœci* have the ſame longitude, and equal latitudes, only of a different denomination.

The inhabitants of Peloponneſus are nearly *Antœci* to the Hottentots of the Cape of Good Hope.—*Antœci* are frequently confounded with ANTISCII.

The *Antœci* have preciſely the ſame hours of the day and night, but oppoſite ſeaſons: when it is 12 o'clock in the longeſt ſummer's day with one, it is 12 o'clock of the ſhorteſt winter's day with the other; and hence the night of the one is always equal to the day of the other.

ANTOMOSIA, in *Ancient Writers*, an oath taken by both the parties in a criminal accuſation; whereby the accuſer charges the other with the fact, and the accuſed in his turn denies the ſame.

In which ſenſe *antomoſia* amounts to the ſame with *diomoſia*, though ſome diſtinguiſh between the two, reſtraining *antomoſia* to the oath of the perſon accuſed, whereby he engages to make no other than a fair defence; and *diomoſia* to the proſecutor's oath, whereby he ſwears that his accuſation is juſtly founded.

Others will have *antomoſia* properly to denote a law-ſuit about things to which there are no witneſſes, and which can only be decided by the oaths of the parties.—Others again will have it to be, where the accuſed party alledging ſickneſs for his non-appearance, the proſecutor takes an oath, that the ſickneſs is only feigned, upon which the judges proceed to ſentence.

ANTONIAN *waters*, in the *Materia Medica*, the name of a medicinal water of Germany, remarkably pleaſant to the taſte, and of ſervice in many caſes as a medicine.

This water, if mixed with any acid liquor, raiſes a conſiderable efferveſcence, and, when mixed with Rheniſh wine and ſugar, which is a common way of drinking it, makes a great hiſſing and bubbling, and becomes turbid and milky. If powder of galls be added to it, it ſuffers no change, but remains limpid and colourleſs; whence it is plain that it contains no iron, nor vitriol. Syrup of vitriol mixed with it, turns the whole green, whence it is plain that it contains an alkali; and if oil of tartar be added to it, it becomes turbid and milky, and precipitates a white ſediment, whence it appears that there is either common ſalt or a calcareous earth in it. If it be expoſed ſome time to the air in an open veſſel, it, like all the other mineral waters, loſes its pungent taſte and pellucidity, becoming turbid and vapid. A quart of it evaporated with a very gentle heat, leaves two ſcruples of a very dry ſediment, which being ſeparated by another ſolution, is found to be one half of an alkaline ſalt, and the other a calcareous earth. Oil of vitriol mixed with the ſalt, produces a great efferveſcence, and a penetrating ſcent ariſes like that produced by the mixing oil of vitriol and common ſalt. Hence it appears, that theſe waters contain a ſmall portion of an alkaline ſalt, a larger portion of ſea-ſalt, and a yet larger of a calcareous earth, and with theſe a very conſiderable quantity of a ſubtile and penetrating mineral ſpirit.

It is a very temperate water, not too ſtrongly operating either by ſtool or urine; and hence it is a very proper drink for perſons in chronic and in many acute caſes, either alone, or mixed with wine, to ſupply the place of malt liquor, which is proper but in very few illneſſes. A long uſe of it alone may alſo prove of conſiderable ſervice in hypochondriac caſes.

ANTONINE *column*. See COLUMN.

ANTONOMASIA, a figure in rhetoric, whereby a noun appellative is uſed inſtead of a proper name, or *vice verſa*.

The word is compounded of *αντι*, *for*, and *ονομα*, *name*. Thus we ſay, the philoſopher, inſtead of Ariſtotle; the orator, for Cicero; the apoſtle, for St. Paul; the prophet for Moſes, &c.—Thus alſo we call a voluptuous perſon, a Sardanapalus, &c. And thus the French ſay, Henry the Great, meaning Henry IV. of France.

ANTOPHYLLUS, in *Botany*, ſignifies the fruit of the CLOVE-*tree*.

ANTOSIANDRIANS, a ſect of rigid Lutherans, who oppoſe the doctrine of Oſiander relating to juſtification. Theſe are otherwiſe denominated *Oſiandro-maſtiges*.

The *Antoſiandrians* deny that man is made juſt, with that juſtice wherewith God himſelf is juſt; that is, they aſſert, that he is not made eſſentially, but only imputatively juſt; or, that he is not really made juſt, but only pronounced ſo.

ANTRUM *buccinoſum* is uſed by ſome anatomiſts for the COCHLEA of the ear.

ANTRUM *genæ*, a large cavity in the fourth bone of the upper jaw, communicating with the *foramina narium*.

It was thus called by Caſſerius, but by Dr. Highmore *antrum maxillæ ſuperioris*.

The *antrum genæ* is near two inches long, and above an inch in depth, ſeated between the lower margin of the orbit of the eye, and the *dentes molares* of the ſame ſide. Backwards the thin bony parts of this cavity, with the *os ſphenoides*, make the *foramen lacerum externum*; its lower ſurface makes a thin covering to all the roots of the *dentes molares*, as well as *dens caninus* of the ſame ſide. It is very thin, and, on drawing any teeth to which it ſticks, is frequently taken along with it, whereby this cavity is opened into the *alveolus*, and conſequently into the mouth, to the great terror and ſurpriſe of the patient.

The *antrum genæ* appears to be the chief ſeat of the *ozena*. Dr. Drake mentions an operation which he put in practice for the cure of that diſeaſe; taking out the foremoſt *dens molaris*, and not finding any aperture from its *alveolus*, as is frequently obſerved, he bored a hole through the *alveolus* into the *antrum genæ*, whereby the *pus*, which before lay in the *antrum*, run out, and the medicines daily injected by this aperture paſſed into the noſtrils, whereby the patient was cured.

ANTRUM *Highmorianum* is a cavity diſcovered within the ſinus of each maxillary bone.

Surgeons ſometimes miſtake this for a *caries* of the bone; finding they can penetrate ſo deep into it with a probe.

ANTRUM *pylori*, a large cavity, at the bottom of the PYLORUS.

Antrum pylori was thus denominated by Willis, who aſſigned it the office of keeping the firſt digeſted chyle, till that which was later taken into the ſtomach be digeſted; though, if what Dr. Wharton ſuggeſts, that there are lacteals at the bottom of the ſtomach, be true, ſuch a proviſion ſeems unneceſſary.

ANTYLION, in the *Ancient Pharmacy*, a kind of aſtringent *malagma*, deſcribed by Ægineta.

ANTYX, in *Antiquity*, the outermoſt round, or circumference of a ſhield.

ANVIL, a ſmith's utenſil, ſerving to place the work on, to be hammered or forged.

The face, or uppermoſt ſurface of the *anvil*, muſt be very flat and ſmooth, without flaws; and ſo hard, that a file will not touch it.—At one end there is ſometimes a pike, bickern, or beak-iron, for the rounding of hollow-work.—The whole is uſually mounted on a firm wooden block.

Forged *anvils* are better than thoſe of caſt work; and the beſt have the upper part made of ſteel. Lockſmiths have a ſmaller kind of *anvil*, called the STAKE, which is moveable, and placed ordinarily on their work-bench. Its uſe is for ſetting ſmall cold work ſtraight, or to cut or punch on with the cold chiſſel, or cold punch.

ANUBIS, one of the deities of the Egyptians, painted with a dog's head, holding in one hand a branch of palm, and a *caducæum*, or Mercury's wand, in the other.

ANUS, in *Anatomy*, the lower extremity of the *inteſtinum rectum*; or the orifice of the fundament.—See *Tab. Anat.* (*Splanch.*) *fig.* 9. *lit. u.*

The Philiſtines ſent golden *emerods* back with the ark, to be cured of a diſeaſe which afflicted them in the *anus*. 1 Sam. ch. vi.

ANUS, *muſcles of the*, are the *ſphincter*, *levator*, and *ſcalptor*, or *latiſſimus dorſi*.

In ſome creatures the *anus* is found to have other uſes. In the pond muſcle the ſame aperture ſerves indifferently for *mouth* and *anus*. In fowl the *anus* has apparently ſome concern in the action of reſpiration; there are found many veſicles extended from the *bronchiæ* through the abdomen to the *anus* of fowls; which may be the cauſe of its conſtant motion, the air having both ingreſs and egreſs there. Whence it is that they are alſo found to have an attractive power, and as ſuch are uſed by ſome to draw out the poiſon and malignity in certain diſeaſes. It may be added, that a kind of alternate *ſyſtole* and *diaſtole* is perceived, at leaſt on many occaſions, in the *anus* of divers quadrupeds, as cows, mares, &c. Hiſt. Acad. Scienc. 1710.

The *ani* of fowls, applied in malignant diſtempers to draw the infection out of the body, act like cupping-glaſſes; inſomuch that the fowl has often ſtuck by its *anus* to the part till it died. Mr. Temple affirms he has ſeen ſeven chickens thus applied to the groin of one perſon ſeized with the plague, which all ſtuck till they died. The eighth went quickly off and lived. Phil. Tranſ. N° 86. p. 5031. and Ephem. Acad. N. C. Dec. 2. An. 9. Obſ. 138.

The *anus* of birds and quadrupeds is generally conſtant and regular as to the place it occupies in the body; in fiſh it conſiderably differs in the various kinds, and makes one of their marks of diſtinction.

Some authors ſpeak of attempts made not without ſucceſs, for conveying nouriſhment to the human body by nutritive clyſters conveyed up the *anus*, where the common canal by the *gula* has been rendered impracticable. Mem. Acad. Scienc. 1716. p. 237.

It may be added, that we have inſtances of births or deliveries by the *anus*; dead *fœtuſes* long detained *in utero*, finding no other out-let, have been frequently voided piece-meal at the *anus*. Dr. Wallis's and Halley's caſe is much more extraordinary, who ſpeaks of a male greyhound delivered of an intire whelp the ſame way. For *calculi* or ſtones, inſtances of their being voided by the *anus* are frequent. Phil. Tranſ. N° 385 and 38c. Mem. Acad. Scienc. an. 1702.

ANUS, *diſeaſes of the*, are a fiſtula, and the *procidentia*, or *prolapſus ani*; to which may be added the hæmorrhoids, or piles.

ANUS, *imperforate*.—When children are born without an *anus*, it is very difficult to hit on the right part for making a perforation into the *rectum*, becauſe the extremity of the gut is generally formed into a knot. For performing ſuch a perforation, Mr. Petit recommends a trocar, the *canula* and circular plate of which are ſo ſlit open, as to ſerve as a groove for a biſtoury to be run in, to enlarge the aperture after the trocar has been puſhed into the gut. See Mem. de l'Acad. de Chirurg. tom. i.

Affections about the *anus* are difficult to be cured for many reaſons. The part is endued with a very tender ſenſe, and therefore is eaſily irritated by acrimonious and auſtere medicines. Beſide, the ſuperfluities of the aliment in their paſſage, are not only acrid in themſelves, but much more ſo on account of the bilious, and ſometimes ſerous humours, which paſs along with them. Moreover, the phyſician can fix no certain times for attending his patients, who ſometimes eaſe nature this way at very inconvenient ſeaſons. The humidity and heat of the place alſo, which require drying as well as cooling remedies, are no ſmall obſtacles to the cure of ulcers in thoſe parts; for aſtringents are acrid, which the place, by reaſon of its exquiſite ſenſe, is not able to bear. Wherefore ſuch medicines agree with them as are aſtringent without aſperity; of which quality are principally metals, which are neither acrimonious nor extremely rough; theſe waſhed, anſwer the intention effectually, without mordacity. Vegetables, and draſtic purges, ſuch as the oil of caſtor, &c. are beſt; and aloes exceedingly hurtful to thoſe who are ſubject to the piles, and the *procedentia ani*.

ANI *ſpeculum*. See SPECULUM.

ANUS is alſo uſed for a ſmall hole in the third ventricle of the brain, which leads into the fourth ventricle of the *cerebellum*.

It is properly the poſterior orifice of the canal called *aquæductus ſylvii*.

Anus, in *Botany*, denotes the poſterior opening of a monopetalous flower.

Anus, a ſpecies of *murex* in the claſs of *worms.*

AONIDES, in *Mythology.* See **Muse.**

AORISTIA, in the *Sceptic Philoſophy*, denotes that ſtate of the mind, where we neither aſſert nor deny any thing poſitively, but only ſpeak of things as ſeeming or appearing to us in ſuch a manner.

The *aoriſtia* is one of the great points or terms of *ſcepticiſm*, to which the philoſophers of that denomination had continual recourſe by way of explication, or ſubterfuge. Their adverſaries, the *dogmatiſts*, charged them with dogmatizing, and aſſerting the principles and poſitions of their ſect to be true and certain.

AORISTUS, in the Greek *Grammar*, an indefinite or indeterminate kind of tenſe, which ſometimes expreſſes the preſent, ſometimes the future, but moſt frequently the paſt time.

The word is compounded of *α* privative; and ὁριζω, *to limit.*

The Greeks have two *aoriſti*; the Latins have none.

AORTA, in *Anatomy*, the great ARTERY proceeding from the left ventricle of the heart; from which all the other arteries either mediately or immediately proceed, and by which the whole maſs of blood is conveyed to all parts of the body. V. *Tab. Anat.* (Angeiol.) *fig.* 1. *n.* 1. and *fig.* 3. (Splanch.) *fig.* 12. *lit. r.* and *o.* and *fig.* 1. *lit. n.* and Angeiol. *fig.* 1. *n.* 28.

The word is formed of αορτη, which ſignifies a *bag, cheſt*, &c.

Anatomiſts treat of the ſtructure of the *aorta*, compreſſion of the *aorta*, valves, coats, ramifications, &c. of the *aorta.* Vieuſſens alſo ſpeaks of a kind of veſicular glands in the *parietes* of the *aorta.* Dr. Keil gives a computation of the velocity of the blood in the *aorta.*

The *aorta* iſſuing from the heart by only one trunk, is furniſhed with three ſemi-lunar valves to prevent the blood's regurgitating: immediately above theſe it ſends out to the heart two arteries called *coronariæ*; and afterwards bending down in form of a bow, divides itſelf into what they call its aſcending and deſcending parts. Phil. Tranſ. N° 280.

Aorta, *aſcending*, or rather trunks of the *aorta*, are thoſe which take their courſe towards the upper and lateral parts of the body. Such are the two carotids, the ſubclavian, cervical, ſcapular, upper intercoſtal, mediaſtinal, upper diaphragmatic, mammary, axillary, and brachial arteries.

Aorta, *deſcending*, or trunk of the *aorta*, ſometimes alſo called ſimply *aorta*, is that which takes its courſe downwards through the *thorax* and *abdomen* to the *os ſacrum.* From this ariſe Ruyſch's bronchial artery, the lower intercoſtals, œſophageous, lower diaphragmatic, cæliac, epiploic, emulgent, ſpermatic, meſenteric, and hypogaſtric arteries.

The diviſion of the *aorta* into aſcending and deſcending trunks, though generally received by anatomiſts, is excepted to by Heiſter as leſs natural; and ſuited rather to the ſtructure of quadrupeds, as dogs, calves, and the like, from which it ſeems to have been originally taken, than to that of the human body. In reality the aſcending *aorta* is not one ſingle trunk, as the name ſhould import, but conſiſts of three large branches or trunks: in ſome inſtances there have even been four obſerved, ſcarce ever only two, and never one; which, however, is uſually the caſe in quadrupeds.

The flexure of the *aorta*, after its quitting the heart, and before its diviſion into aſcending branches, is noted by Dr. Lower as an inſtance of the wiſdom of the Creator, to effect a more equable and gentle diſtribution of the blood to the ſeveral parts of the body. For whereas the orifice of the heart opens right upwards, if the *aorta*, which receives the firſt impulſe, were continued in a ſtraight line up to the region of the head, the blood would be poured too ſwiftly and plentifully on the brain, and the inferior parts be defrauded of their vital liquor. To obviate this, the *aorta* is ſo diſpoſed, that the blood does not run directly into the aſcending branches, the axillaries and carotids, but fetches as it were a compaſs by means of the flexure, which ſuſtains the firſt effort of the ejected blood, and directs the greateſt torrent towards the deſcending trunk.

The diſpoſition of the *aorta* is varied according to the kinds of animals, their different poſtures, and other occaſions: in man, by reaſon of his erect ſituation, the blood tends to flow faſter and more plentifully by the deſcending, than by the aſcending trunks; in brutes, which bend downwards, the contrary; in both, proper proviſions are made for an equable diſtribution. In the male ſex of our ſpecies, Dr. Pitcairn aſſures us, the deſcending *aorta* has fewer ramifications, and conſequently the blood will flow ſlower proportionably, than in that of the female ſex, where there are more ramifications, and conſequently the blood finding leſs reſiſtance will flow more largely to the lower parts of women than men, from which cauſe ariſe the menſes.

The *deſcending aorta* is liable to compreſſions from the ſtomach and inteſtinal tube, and that either ordinarily or extraordinarily. The firſt happens, whenever the ſtomach, &c. is full; the ſecond, when it is dilated beyond meaſure, by the *plethora* and ebullition excited in fevers. The effect in either caſe will be an interruption or diminution of the flux of blood to the lower parts of the body; and an increaſe of that to the head, and higher parts. The ordinary, according to Dr. Woodward, is neceſſary to ſupply the buſineſs of cogitation, furniſh matter for animal ſpirits, &c. The extraordinary ſerves M. Silva to account for the violent head-achs, deliriums, and other ſymptoms of fevers.

The *aorta* is found in divers ſtates, natural, morbid, oſſified, cartilaginous, aneuriſmatical, polypoſe, calculoſe, &c.

Oſſifications or petrefactions of the coats of the *aorta*, as it riſes from the heart, are ſo frequent, that ſome think it a conſtant caſe.—Mr. Cowper, however, has an expreſs diſcourſe to ſhew, that whenever ſuch oſſifications happen in man, it is a diſeaſe, and incommodes the part in the due execution of its office.

Of this he gives us ſeveral inſtances: one, in which an intermiſſion of pulſe was produced; in another, a coldneſs of the extremes, with a gangrene, &c. Phil. Tranſ. N° 299.

Some will have oſſifications of the *aorta* one of the great cauſes of ſudden deaths. Hiſt. Acad. Scienc. an. 1701.

In an old man who died at the age of 130, Dr. Keil found the *aorta* in the abdomen and iliacs to be for the greateſt part cartilaginous, which apparently was one cauſe of his death. Phil. Tranſ. N° 306.

The academiſts *Naturæ Curioſi* give an inſtance of ſix nail-like ſtones, or *calculi*, found in a prominence of the *aorta*, under the kidneys of a perſon who had died of a moſt acute pain in the region of the loins. At each pulſation of the artery, theſe would be driven againſt the membranous *fibrillæ* of the coat of the veſſel, and hence thoſe ſhooting pains; the cauſe of concretion is attributed to the too frequent uſe of the viperine powder, taken for an ulcerated breaſt. Ephem. Acad. N. C. Cent. 9.

For diſorders of the *aorta*, ſee **Aneurism** and **Sinus.**

AOUTA, the name of the paper mulberry-tree at Otaheite, in the South Sea, from which a cloth is manufactured, that is worn by the principal inhabiants. The bark of the trees is ſtripped off, and depoſited to ſoak in running water; when it is ſufficiently ſoftened, the fibres of the inner coat are carefully ſeparated from the reſt of the bark; they are then placed in lengths of about eleven or twelve yards, one by the ſide of another, till they are about a foot broad; and two or three layers are laid one upon the other. This is done in the evening; and by the next morning the water is drained off, and the ſeveral fibres adhere together in one piece. It is afterwards beaten on a ſmooth piece of wood with inſtruments marked lengthways, with ſmall grooves of different degrees of fineneſs; and by means of this operation, becomes as thin as muſlin; and after bleaching it in the air, in order to whiten it, it is fit for uſe. If the cloth breaks in the beating, it is eaſily repaired by paſting on a patch with a gluten that is prepared from the root of the *pea*, which is done ſo nicely that it cannot be diſcovered. This cloth is cool and ſoft, but as liable to be rent as paper. The colours with which it is dyed are principally red and yellow. The red is a beautiful ſcarlet, and produced by mixing the juices of two vegetables, viz. the fruit of the fig called *matle*, and the leaves of the *cordia ſebeſtina*, or *etou.* The yellow is made of the bark of the root of the *marinda citrifolia*, called *nono*, by ſcraping and infuſing it in water. The inhabitants of the iſland alſo dye yellow with the fruit of the *tamanu.* Hawkeſworth's Voyages, &c. vol. ii. p. 210, &c.

APÆDUSIA, denotes ignorance or unſkilfulneſs in what relates to learning and the ſciences.

Hence alſo perſons uninſtructed and illiterate are called *apædeutæ.*

The term *apædeutæ* was particularly uſed among the French in the time of Huet; when the men of wit at Paris were divided in two factions, one called by way of reproach, *apædeutæ*, and the other *eruditi.*

The *apædeutæ* are repreſented by Huet, as perſons who, finding themſelves either incapable or unwilling to undergo a ſevere courſe of ſtudy, in order to become truly learned, conſpired to decry learning, and turn the knowledge of antiquity into ridicule, thus making a merit of their own incapacity.

The *apædeutæ*, in effect, were the men of pleaſure; the *eruditi* the men of ſtudy.

APAGMA, a term uſed, by ſome writers in *Chirurgery*, for the thruſting of a bone, or other part, out of its proper place. But it is more properly uſed for a fracture of a bone, at or near the part whereby it is articulated with another.

APAGOGE, in the *Athenian Law*, the carrying a criminal taken in the fact, to the magiſtrate. If the accuſer was not able to bring him to the magiſtrate, it was uſual to take the magiſtrate along with him to the houſe where the criminal lay concealed, or defended himſelf.

Apagoge, in *Logic*; ſee Abduction.

Apagoge, in *Mathematics*, is ſometimes uſed to denote a progreſs or paſſage from one propoſition to another; when the firſt having been once demonſtrated, is afterwards employed in the proving of others.

APAGOGICAL *demonſtration*, is ſuch as does not prove the thing directly, but ſhews the impoſſibility and abſurdity which ariſes from denying it.

Hence it is alſo called *reductio ad impoſſibile*, or *ad abſurdum*.

APALACHINE, in *Botany*, a name given by ſome authors to the ſhrub *caſſine vera floridanorum* of other writers. This plant is uſed as tea, and celebrated for many virtues.

APANAGE, Appenage, Appanage, Apannage, or Apennage, in the *French Laws*, the fortune of a king's younger ſon; or a ſettled portion of lands, &c. aſſigned for the ſubſiſtence of the cadets, or younger ſons of a ſovereign prince.

Nicod and Menage derive the word from *panis*, *bread*; which frequently includes all other ſorts of proviſion neceſſary for ſubſiſtence.

Some will have the *apanages*, at their firſt inſtitution, to have been only penſions, or annual payments, of a certain ſum of money.—The younger ſons of England have no certain *apanages*, as in France; but only what the good pleaſure of the king beſtows upon them.

Even in France, during the firſt and ſecond races of kings, the right of primogeniture and *apanages* were unknown; but the domains were divided pretty equally among all the children.

Great inconveniences ariſing hence, it was at length found proper to put off the younger-born with counties, duchies, or other diſtricts; on condition of their paying homage and fealty for the ſame, and of their reverting, in defect of heirs male, to the crown.

This has happened, accordingly, to the firſt and ſecond branch of the dukes of Burgundy.—The duchy of Orleans is the *apanage* of the ſecond ſon of France.

The *apanage* is unalienable; collateral branches do not inherit it. The eldeſt ſon alone is heir to the whole *apanage*; but is to allow the younger an honourable maintenance.

In France, *apanages* are of two kinds, *royal* and *cuſtomary*; the firſt only granted to males the king's brothers, excluſive of the females. Theſe are not ſo properly alienations of the king's demeſnes, as diſmembering of them.

Cuſtomary apanages are thoſe granted to women, the king's ſiſters.

Joach. Meierus has publiſhed a body of all the writers on *apanage* and *parage*, in one volume in folio.

APARINE, in *Botany*; ſee Cleavers.

APARITHMESIS, or *enumeration*, in *Rhetoric*, is a figure, whereby that which might be expreſſed in few words is branched out into ſeveral particulars, to enlarge the idea, and render it the more affecting: and ſometimes it denotes the anſwer to the *protaſis* or propoſition itſelf. Thus if the *protaſis* be *appellandi tempus non erat*, the *aparithmeſis* is *at tecum anno plus vixi*.

APARTISMENUS, in the *Ancient Poetry*, an appellation given to a verſe, which comprehended an entire ſenſe or ſentence in itſelf.

This is ſometimes alſo written, *apartemenus*, i. e. ſuſpended, as not needing any following verſe.

APARTMENT, a portion of a large houſe, wherein a perſon may lodge ſeparately; having all the conveniences requiſite to make a complete habitation.

The word comes from *apartimentum*, of the verb *partiri*, *to divide*; or, as ſome imagine, *a parte manſionis*, *making part of the dwelling*.

A complete *apartment* muſt conſiſt of a hall, a chamber, an antechamber, a cloſet, and a cabinet or wardrobe.

APATHY, in a moral ſenſe, denotes an inſenſibility; or a privation of all paſſion, all emotion, or perturbation of mind.

The word is formed of the privative α, and παθος, *paſſion*.

The Stoics affected an intire *apathy*: their wiſdom was to enjoy a perfect calmneſs or tranquillity of mind, incapable of being ruffled, and above the reach of any ſenſe either of pleaſure or pain.

In the firſt ages of the church, the chriſtians adopted the term *apathy* to expreſs a contempt of all earthly concerns; a ſtate of mortification, ſuch as the goſpel preſcribes. Clemens Alexandrinus, in particular, brought it exceedingly in vogue; thinking, hereby, to draw the philoſophers to chriſtianity, who aſpired after ſuch a ſublime pitch of virtue.

Quietiſm is only *apathy* diſguiſed under the appearance of devotion.

APATURIA, in *Antiquity*, a ſolemn feaſt celebrated by the Athenians in honour of Bacchus.

The word is uſually derived from απατη, *fraud*.

It is ſaid to have been inſtituted in memory of a fraudulent victory obtained by Melanthus, king of Athens, over Xanthus, king of Bœotia, in a ſingle combat, which they agreed upon, to put an end to a debate between them relating to the frontiers of their countries.—Hence Budæus calls it *feſtum deceptionis*, *the feaſt of deceit*.

Other authors give a different etymology of this feaſt, from what we have now related: they tell us, that the young Athenians were not admitted into the tribes on the third day of the *apaturia*, till their fathers had firſt ſworn, that they were their own children; and that, till that time, they were ſuppoſed, in ſome meaſure, to be without fathers, απατορες; whence the feaſt, ſay they, took its name.

Xenophon, on the other hand, informs us, that the relations and friends met on this occaſion, and joined with the fathers of the young people who were to be received into the tribes; and that from this aſſembly the feaſt took its name: that in απατυρια, the α far from being a privative, being here a conjunctive, ſignifies the ſame thing with ομου, *together*.

This feaſt laſted four days: the firſt day, thoſe of the ſame tribe made merry together; and this they called δορπια. The ſecond day, which they called αναρρυσις, they ſacrificed to Jupiter and Minerva. The third day, which they called κουρεωτις, ſuch of their young men and maids as were of age were admitted into their tribes. The fourth day they called επιβδης.

APAULIA, in *Antiquity*, the third day of a marriage ſolemnity.

It was thus called, becauſe the bride, returning to her father's houſe, did απαυλιζεσθαι τω νυμφιω, lodge apart from the bridegroom. Some will have the *apaulia* to have been the ſecond day of the marriage, viz. that whereon the chief ceremony was performed; thus called by way of contradiſtinction from the firſt day, which was called προαυλια. On the day called απαυλια, (whenever that was) the bride preſented her bridegroom with a garment called απαυλιστηρια.

APE; ſee Simia.

APECHEMA, Απηχημα, in *Medicine*, the ſame with contrafissure.

APEDIA, a ſpecies of ape.

APEIBA of the Braſilians. See Sloanea.

APELLA, among *Phyſicians*, a name given to thoſe, whoſe prepuce is either wanting, or ſhrunk, ſo that it can no longer cover the glans.

Apella, a ſpecies of ape found in America.

APELLITÆ, in the *Primitive Church*, denotes thoſe who taught, in the ſecond century, that Chriſt left his body diſſolved in the air; and ſo aſcended into heaven without it.

APENE, in *Antiquity*, a kind of chariot wherein the images of the gods were carried in proceſſion on certain days, attended with a ſolemn pomp, ſongs, hymns, dancings, &c.

The *apene*, or ſacred chariot of the Greeks, is called *tenſa*.

It was very rich, made ſometimes of ivory, or of ſilver itſelf, and variouſly decorated.

APENNAGE, ſee Apanage.

APENNIS, in *Ancient Laws*, a deed or inſtrument made in favour of a perſon, who has loſt the title-deeds to his houſe or land by fire.

In ſuch caſe, an aſſembly of the people of the neighbourhood being called, and an exact inquiry made before the judge, another inſtrument was framed to confirm and ſecure the unhappy perſon's right.

APEPSY, in *Medicine*, denotes crudity, or a want of digeſtion.

The word is formed from the privative particle α, and πεπτω, *I concoct*.

Apepſia may be defined a defect in the ſtomach, which prevents the aliment taken in from affording a proper chyle for ſupplying the blood, and nouriſhing the body. Abſtemiouſneſs and exceſs are alike cauſes of indigeſtion. The method of treatment in the *apepſy*, is the ſame as in the *anorexy*. The columbo root is particularly uſeful, when the ſtomach is languid, and digeſtion difficult, &c. It may be given in ſubſtance with any grateful aromatic, or in Madeira wine, now and then interpoſing gentle doſes of rhubarb in tincture. A mixture of muſtard ſeed with the *columbo* root, is of great utility in caſes of this nature, where acidity and flatulence prevail much in the *primæ viæ*. See Percival's Eſſays, &c.

APER, *boar*, in *Zoology*. See Boar and Hog.

Aper is alſo uſed for the name of a ſea-fiſh, called by ſome *ſtrivale* and *riondo*. It approaches very much in ſhape to the *faber* or DOREE, but is much ſmaller. See *Tab. of Fiſh*, N° 19.

Aper *moſchiferus*, a name by which many authors have called the TAJACU of America.

Aper *piſcis*, a name by which ſome authors have called the ſea-fiſh more uſually called the CAPRISCUS.

APEREA, in *Zoology*, the name of a ſmall American animal, of the rabbit kind, and ſeeming to be of a mixt nature between the rabbit and the mouſe, having exactly the ſhort roundiſh ears of the mouſe-kind, and all the other particulars of the rabbit. It grows, at its full ſize, to ten or twelve inches long, and its hair is juſt of the colour of our hares on the back and ſides, and whitiſh on the belly.

APERIENS *Os*, in *Anatomy*, a name given by ſome writers to a muſcle of the mouth, called by Albinus *biventer maxillæ inferioris*, and by others DIGASTRICUS.

Aperiens *palpebram rectus*, in *Anatomy*, is a muſcle, which, riſing in the orbit of the eye, near the entrance of the optic nerve, paſſes over the attollent muſcle of the eye, and is at laſt inſerted into the whole ſuperior part of the upper eye-lid, which it ſerves to open.

APERIENTS, or Aperitive *medicines*, from *aperio, I open*, are ſuch as open the obſtructed paſſages of the ſmall veſſels, glands, and pores; and, by that means, promote a due circulation of the contained juices.

Aperients, then, coincide with what we otherwiſe call openers, ANASTOMATICS, and DEOBSTRUENTS.

The five leſſer *aperient*, or opening roots, are graſs, madder, eryngo, capers, and chammoc.

The greater *aperient*, or opening roots, are ſmallage, fennel, aſparagus, parſly, and butchers-broom.

Aperiens, *crocus martis*, opening ſaffron of iron, is a preparation of iron-plates or filings, made by expoſing them to the rain or dew, till they contract a ruſt; which is the medicine required. It is a good *aperient*. See Crocus.

APERISTATON, from α, *without*, and περιστασις, *unfavourable circumſtance*, in the *Ancient Phyſic*, denotes an ulcer of a mild, or benign kind, and not attended with any ſevere ſymptom.

APERTIONS, in *Architecture*, are the openings in a building; as doors, windows, ſtair-caſes, chimneys, outlets and inlets for light, ſmoke, &c.

The *apertions* ſhould be as few as may be; it being a rule, that all openings are weakenings: and they ſhould not approach too near the angles of the walls.

APERTOR *oculi*, in *Anatomy*, a name given by Spigelius and others to the muſcle called the APERIENS *palpebram*, and LEVATOR *palpebræ ſuperioris* by others.

APERTURE, the opening of any thing; or a hole, cleft, or vacant place, in ſome otherwiſe ſolid or continuous ſubject. It comes from *aperire, to open*.

In *Geometry*, *aperture* is uſed for the ſpace left between two lines, which mutually incline towards each other to form an angle.

In *Optics*, *aperture* is the hole next the object-glaſs of a teleſcope, or microſcope; through which the light and image of the object come into the tube, and are thence carried to the eye.

Aperture is alſo underſtood of that part of the object-glaſs itſelf which covers the former, and which is left pervious to the rays. See Telescope.

A great deal depends on having a juſt *aperture*.—To find it experimentally; apply ſeveral circles of black ſmutted paper, each bigger than the other, upon the face of the glaſs, from the breadth of a ſtraw to ſuch as leave only a ſmall hole in the glaſs; and with each of theſe, ſeparately, view ſeveral diſtinct objects; as the moon, ſtars, &c. that through which they appear the moſt diſtinctly, is to be pitched upon.

M. Auzout affirms, that he found, that the *apertures* of teleſcopes ought to be nearly in the ſubduplicate ratio of their lengths: but Huygens, who firſt introduced the uſe of *apertures*, aſſures us, he found by experience, that the *aperture* of an object-glaſs, e. gr. of 30 feet, is to be determined by this proportion: as 30 to 3, that is, as 10 to 1, ſo is the root of the diſtance of the focus of any glaſs multiplied by 30, to its *aperture*: and the focal diſtances of the eye-glaſſes are to be proportional to the *apertures*.—A table of *apertures* for teleſcopes of various lengths, &c. ſee under the article Telescope.

The greater or leſs *aperture* of an object-glaſs, it is to be noted, does not increaſe or diminiſh the viſible area of the object; all that is effected by this is, the admittance of more or fewer rays, and, conſequently, the more bright or obſcure appearance of the object; but the largeneſs of the *aperture* or focal diſtance, cauſes the irregularity of its refractions. See Aberration.

Hence, in viewing Venus through a teleſcope, a much leſs *aperture* is to be uſed than for the Moon, Jupiter, or Saturn, becauſe her light is ſo vivid and glaring.—Which conſideration does a little invalidate and diſturb M. Auzout's proportion, as is ſhewn by Dr. Hook, Phil. Tranſ. N° 4.

Apertura *tabularum*, in *Ancient Law-Books*, ſignifies the breaking open a laſt WILL and TESTAMENT.

Apertura *feudi* denotes the loſs of a feudal tenure, by default of iſſue to him to whom the feud or FEE was firſt granted.

APETALOUS, or Apetalose *plants*, are ſuch as are without, or have an imperfect or ſtamineous flower. They are ſo called becauſe not compoſed of thoſe tender, fugacious, coloured leaves called PETALA; but only of a calyx or cup, and of ſtamina or capillaments of ſtyles. Phil. Tranſ. N° 186.

The word comes from the privative particle α, and πεταλον, *folium, a leaf*.

The *apetalous* kind is ſubdivided by Ray 1. Into ſuch whoſe fruits are not contiguous to their flowers, as in hops, hemp, nettles, ſpinach, mercury, *palma Chriſti*, the American phyſic nut, &c. 2. Such as have a triquetrous or triangular ſeed, as the docks, ſorrels, arſmarts, knot-graſs, ſnake-weeds. 3. Thoſe which have round, compreſſed, and otherwiſe figured ſeeds, as the pond-weeds, oraches, ſea-purſlane, the blites, the amaranthi, the beets, ſome kalies, &c. See *Tab. 1. of Botany, Claſs* 15. See Leaf.

APEUCTIC, from απευχομαι, *I deprecate*, in the *Ancient Poetry*, denotes a kind of poem or prayer preferred to God for the averting ſome evil.

In which ſenſe, *apeucticum* ſtands contradiſtinguiſhed from *proſeucticum carmen*, which begs for ſome good, e. gr. *dii prohibete minas, dii talem avertite caſum, et placidi ſervate pios*.

APEX, the vertex or ſummit of any thing.

Apex is peculiarly uſed in *Antiquity* for a kind of cap or covering of the head, wore by the flamens, or prieſts of Jupiter. This was otherwiſe denominated *pileus epiroticus*, or *albanus*.

The *apex* is deſcribed as a ſtitched cap in form of a helmet, with the addition of a little ſtick fixed on the top, and wound about with white wool.

The other flamens only wore the *apex*, in the time of performing divine ſervice; the flamen dialis always wore it out of doors; for within it was allowed him to be bare-headed. See Apiculum.

Apex was alſo uſed among the Romans for the creſt of a helmet.

Apex is alſo uſed by *Grammarians*, for a long accent or mark, to denote that a ſyllable is to be pronounced long. Quinctilian condemns the practice of putting the *apex* on all long ſyllables; yet in ſome caſes he allows the *apex* neceſſary, e. gr. where the different lengths of a ſyllable diſtinguiſh the different ſenſes of a word, as in *malus*, which as long, or ſhort, denotes an *ill man*, or an *apple-tree*. See Accent.

APHÆRESIS, from αφαιρεω, *I take away*, in *Grammar*, a figure, whereby ſomething is taken away from the beginning of a word.

Thus *ciconia*, by *aphæreſis*, is written *conia*; *contemnere*, *temnere*; *omittere*, *mittere*, &c.

A like retrenchment at the end of a word is called APOCOPE.

Aphæresis, in *Medicine*, denotes a neceſſary taking away or removal of ſomething that is noxious.

In *Surgery*, it ſignifies an operation whereby ſomething ſuperfluous is taken away.

APHANES, *Parſley-piert*, in the Linnæan ſyſtem of botany, the name of a genus of plants, of the *tetrandria digynia* claſs; the characters of which are theſe: the cup is a tubular *perianthium*, remaining till the ſeeds are ripe; it conſiſts of one leaf divided at the extremity into eight ſegments, which are extremely ſmall, and alternately different in ſize. There are no petals; the *ſtamina* are four erect, pointed, and very ſmall filaments, inſerted on the rim of the cup; the *antheræ* are roundiſh. The piſtillum has two germina of an oval figure, and two ſtyles of the ſame length with the ſtamina, inſerted on the baſis of theſe germina; the ſtigmata are headed. The cup ſupplies the place of a fruit, ſhutting together at its mouth, and containing two oval, pointed, compreſſed ſeeds, of the length of the ſtyles.

APHASIA, from α, and φημι, *I ſpeak*, in the *Sceptic Philoſophy*, denotes a ſtate of doubt, wherein a perſon not knowing what to determine on, it is beſt for him to be ſilent.

In this ſenſe, *aphaſia* ſtands oppoſed to *phaſis*, under which are included both aſſertion and negation.

APHELIA, from αφελης, *ſimple*, in *Rhetoric*, is uſed to denote ſimplicity of DICTION.

APHELION, in *Aſtronomy*, that point of the earth's or a planet's orbit, in which it is at the greateſt diſtance from the ſun.

The word comes from απο, *from*, and ἡλιος, *ſun*.

Thus a planet being in A (*Tab. Aſtron. fig.* 1.), its utmoſt diſtance from the ſun S, is ſaid to be in its *aphelion.* In the ſyſtem or ſuppoſition of the ſun's moving round the earth, the point in which he appears when the planet is in its *aphelion*, is called *apogee.* The *aphelion* ſtands oppoſed to the *perihelion.*

The *aphelia* of all the primary planets are at reſt; excepting that thoſe planets neareſt the ſun, viz. Mercury, Venus, the Earth, and Mars, being acted upon by Jupiter and Saturn, their *aphelia* move a ſmall matter in conſequentia with reſpect to the fixed ſtars, and this in the ſeſquiplicate ratio of the diſtances of thoſe planets from the ſun.

Hence, if the *aphelion* of Mars move 35 minutes in conſequentia in reſpect of the fixed ſtars in 100 years; the *aphelia* of the Earth, Venus, and Mercury, will move, in 100 years, 18 min. 36 ſec. 11 min. 27 ſec. and 4 min. 29 ſec.

The method of finding the place of the *aphelion* is, by obſerving ſeveral of the greater digreſſions of the planet from the ſun; till by two or three repeated obſervations it be ſound to remain at a ſtand.—In the Phil. Tranſ. N° 128, we have a geometrical method of finding the *aphelia* of the planets, given by Dr. Halley.

Kepler places the *aphelion* of Saturn for the year 1700, in 28° 3′ 44″ of Sagittarius: De la Hire, in 29° 14′ 41″.—The *aphelion* of Jupiter in 8° 10′ 40″ of Libra: De la Hire in 10° 17′ 14″.—The *aphelion* of Mars in 0° 51′ 29″ of Virgo: De la Hire in 0° 35′ 25″.—The *aphelion* of the Earth in 8° 25′ 30″ of Cancer.—The *aphelion* of Venus in 30° 24′ 27″ of Aquarius: De la Hire in 6° 56′ 10″.—And the *aphelion* of Mercury in 15° 44′ 29″ of Sagittarius: De la Hire in 13° 3′ 40″.

The annual motion, according to Kepler, of the *aphelion* of Saturn is 1′ 10″, of Jupiter, 47′, of Mars, 1′ 7″, of Venus, 1′ 18″, and of Mercury, 1′ 45″. According to De la Hire, that of Saturn is 1′ 22″, of Jupiter, 1′ 34″, of Mars, 1′ 7″, of Venus, 1′ 26″, and of Mercury, 1′ 39″.

APHERNOUSLI, a ſpecies of pine growing wild on the Alps. The timber is large, and the planks made of it are of a finer grain, and more beautifully variegated than deal; and may therefore be applied to many uſes. It grows in bleak and barren ground, and moſt reſembles that which is called in England the Weymouth PINE.

APHESIS, from αφιημι, *I remit*, in the *Athenian Laws*, was applied to the caſe of a perſon deeply indebted, who deſired the people to remit part of the debt, on account of his diſability to make payment.

Voetius has a diſſertation expreſs on the words *apheſis* and *pareſis*, and their difference.

APHETERIA, in the *Ancient Military Art*, a kind of engines uſed in the beſieging of towns.

Suidas does not mention their particular form or ſtructure. Aquinus takes them to have been of the projectile kind.

APHILANTHROPY, from α, φιλος, *friend*, and ανθρωπος, *man*, among *Phyſicians*, denotes the ſtate or diſorder, wherein a perſon has an unnatural diſreliſh for mirth and ſociety, and indulges ſolitude and melancholy.

APHIOCEM, a compoſition made principally of the buds of hemp before they flower. It is much in uſe among the Arabs, and has the intoxicating quality of OPIUM.

APHIS, in the hiſtory of inſects, the name of a genus of animals, otherwiſe called *pediculus arboreus*, and in Engliſh the *tree-louſe.* The *aphis* belongs to the *hemiptera inſecta* of Linnæus.

The trunk of the *aphis* is reflex; the body terminates in two horns behind; the wings are four, and erect, or altogether wanting; and the legs are formed for walking, not leaping.

Of this genus there are a great many ſpecies, denominated from the trees or buſhes on which they are found. According to Dr. Richardſon's obſervations, the *aphides* are at one time of the year viviparous, and at another time oviparous. Thoſe of the roſe-tree came immediately under his notice; and of ten generations of them, which he obſerved regularly to ſucceed each other in the courſe of one ſpring, ſummer, and autumn, the firſt proceeds from eggs laid during the preceding autumn; the eight following are all produced viviparous, and conſiſt entirely of females, as does likewiſe the firſt. In the tenth generation, which uſually comes forth before the middle of September, a few male inſects appear. Theſe arrive at their full growth in about three weeks, and have an intercourſe with the females, who ſoon afterwards lay thoſe eggs which are hatched in the ſpring. Phil. Tranſ. Vol. lxi. N° 22.

APHLASTUM, from α and φλαςος, *frangible*, in the *Ancient Navigation*, a wooden ornament, ſhaped like a plume of feathers, faſtened on the gooſe's or ſwan's neck uſed by the ancient Greeks in the heads of their ſhips.

The *aphlaſtum* had much the ſame office and effect in a ſhip that the creſt had on a helmet. It ſeems alſo to have had this further uſe, viz. by the waving of a party-coloured ribband faſtened to it, to indicate from what quarter the wind blew.

The *aphlaſtum* was the proper ornament of the head, as the *arcoſtolium* was of the ſtern.

The Greek *aphlaſtum* anſwered to, and was probably the origin of the Latin *apluſtere.*

APHONIA, in *Medicine*, the ſtate of a perſon who is deprived of voice.

The word is compounded of the privative α, and φωνη, *voice*; q. d. a loſs of ſpeech, or voice.

Hippocrates, Lib. de Rat. Vict. in Morb. acut ſays, "a "ſtop put to the circulation of the blood and ſpirits, "cauſes a ſudden loſs of voice." Here Galen obſerves, that by this one ſymptom *aphonia*, are denoted the epilepſy, apoplexy, and cardiacal *ſyncope.* He adds, that an *aphonia* in ſick perſons is ſometimes cauſed by a diſorder affecting the organs of voice or reſpiration, with a reſolution, or by ſome other depravation of the faculty. An *aphonia* ſometimes proceeds from a diſorder of the brain, a refrigeration of the natural heat, and total ceſſation of the locomotive powers; when the organs of voice are in ſuch a ſtate of reſolution, that the patient can neither cry, groan, nor utter any ſound. It is more accurate, therefore, to render αφωνος, *deprived of voice* (*voce defectus ac privatus*), rather than dumb (*mutus*): ſince Hippocrates, περι σαρκων, and Ariſtotle, lib. iv. Hiſt. Anim. attribute voice to the dumb. *Foeſius.*

Among other cauſes which contribute to an *aphonia*, are the wanton abuſe of ſpiritous liquors, and frequent ſurfeits. The prognoſtics vary, according to the reſpective cauſes from which they proceed. That ſpecies which owes its origin to worms, hyſteric diſorders, or a different eruption of the *menſes*, is eaſily cured; whereas that kind of it which proceeds from a palſy of the tongue, either entirely fruſtrates the uſe of all means, or being cured, eaſily returns, and proves the direful harbinger of a more terrible diſorder of the brain.

The method of cure muſt be varied, according to the particular ſpecies or cauſes of the diſorder.

Menjotius has a diſſertation expreſs *de Aphonia.*

APHORISM, a maxim, general rule, or principle, of a ſcience; or a brief ſentence, comprehending a great deal of matter in a few words.

The word comes from αφοριζω, *I ſeparate*, q. d. a choice or ſelect ſentence.

The term is chiefly uſed in *Medicine* and *Law.*—We ſay, the *aphoriſms* of Hippocrates, of Sanctorius, of Boerhaave, &c. *aphoriſms* of the civil law, &c.

APHORISM is uſed in *Eccleſiaſtical Writers* for the leſſer excommunication, by which the delinquent was cut off from the benefit of the ſacraments and the prayers of the faithful; but allowed to bear a part in the reſt of the ſervice.

APHORISM is alſo uſed for a kind of figure in *Rhetoric*, whereby ſomething that has been ſaid is limited or corrected. This is otherwiſe called *dioriſmus.*

APHORISTIC, ſomething relating to, or partaking of the nature of *aphoriſms.*

The *aphoriſtic* method ſtands contradiſtinguiſhed from the *ſyſtematic*, or methodical, as alſo from the *diexodic*, or diſcurſive way.

The *aphoriſtic* method has great advantages, as containing much matter in a ſmall compaſs; ſentiments are here almoſt as numerous as expreſſions; and doctrines may be counted by phraſes. Every thing is cloſe and pertinent, no room for uſeleſs diſcuſſions; or for languiſhing connections, and tranſitions; there is hardly a word to be loſt.

APHRACTI, from α and φρακτος, *incloſed*, in the *Ancient Military Art*, denotes open veſſels, without decks or hatches, furniſhed only at head and ſtern with croſs planks, whereon the men ſtood to fight.

The *aphracti*, or open veſſels, ſtood contradiſtinguiſhed from *cataphracti*, or covered ones.

APHRODISIA, in *Antiquity*, feſtivals in honour of the goddeſs Αφροδιτη, or Venus. There were ſeveral of theſe *aphrodiſia* obſerved in divers parts of Greece; the moſt remarkable was that at Cyprus, firſt inſtituted by Cinyras, out of whoſe family certain prieſts of Venus were elected, and for that reaſon named Κινυραδαι. At this ſolemnity ſeveral myſterious rites were practiſed: all who were initiated to them offered a piece of money to Venus as an harlot, and received as a token of the goddeſs's favour a meaſure of ſalt, and a φαλλος; the former, becauſe ſalt is a concretion of ſea-water, to which Venus was thought to owe her birth; the latter, becauſe ſhe was the goddeſs of wantonneſs.

APHRODISIA, or APHRODISIASMUS, in *Medicine*, denotes the uſe of venery, or the act of copulation between male and female.

APHRODISIA is alſo uſed for the age of venery, more frequently denominated *puberty*.

APHRODISIACS, in *Pharmacy*, denote medicines proper to increaſe the ſeed, and promote luſt, or an inclination to venery.

In which ſenſe *aphrodiſiacs* ſtand contradiſtinguiſhed from *antaphrodiſiacs*.

Some authors give the appellation *aphrodiſiaca* to the EPILEPSY.

APHRODISIACE, in the writings of the ancients, a name given to a gem, ſuppoſed according to the idle traditions of thoſe times, to have a power of procuring love to the perſon who wore it about him ; all the deſcription we have of it is, that it was of a pale fleſh-colour ; but the ſtone, as well as its virtues, are wholly unknown to the world at preſent.

APHRODISIUS, in *Chronology*, denotes the eleventh month in the Bithynian year, commencing on the 25th of July in ours.

APHRODITA, in the hiſtory of inſects, a genus of ſea-inſects about two inches in length and one in breadth, of an oval figure, and aculeated ; it has alſo a perforation in the middle of the back, and is called in Engliſh the *ſea-mouſe*. It is one of the *gymnarthrodia*, or inſects with naked bodies, and may be met with in great abundance on the Kentiſh coaſt, among rocks. There are ſeveral ſpecies of it. It belongs to the order of *molluſca*, in the Linnæan arrangement of *worms*.

Columna calls it *pudendum regale* ; Bartholine, *vermis aureus* ; others, *eruca marina griſeo-fuſca* ; and ſome, *mus marinus*, or the *ſea-mouſe*.

APHRODITARIUM, in the *Ancient Pharmacy*, denotes a kind of dry medicine, compounded of frankincenſe, the ſcales of copper, ceruſs, ſtarch, and pomegranates, mixed in equal quantities.

The name is alſo given to a kind of *collyrium*, mentioned by Galen.

APHRODITE, in *Mythology*, a name of Venus, derived from αφρος, *froth*, becauſe, according to the poets, Venus is ſuppoſed to be produced from the froth or foam of the ſea.

APHRODITES, in *Natural Hiſtory*, a name given by ſome authors to the fineſt ſpecies of amethyſt.

APHROGALA, from αφρος, *froth*, and γαλα, *milk*, in the *Ancient Phyſic*, denotes a kind of whipt cream, or milk agitated till it be converted wholly into froth.

The *aphrogala* is directed by Galen, as proper againſt hot diſorders of the ſtomach.

APHROLITRUM, in the *Ancient Phyſic*, denotes the ſpume, or froth of *litrum*.

In which ſenſe, *aphrolitrum* ſeems to amount to the ſame with *aphronitrum*. Hoffman affirms, that the *nitron* and *litron* only differ in dialect. It appears, however, there was a great difference between the two medicines, *aphrolitrum* reſembling meal, or farina, and being of a kind of intermediate virtue between *aphronitrum* and ſalt.

APHRONITRE, a kind of nitre, mentioned by the ancients ; ſuppoſed to be the ſpume, or the lighteſt and ſubtileſt part thereof, emerging to the top.

The word is compounded of αφρος, *froth*, and νιτρον, *nitre*. Some modern naturaliſts rather take the ancient *aphronitre* to have been a native ſalt-petre, gathering like an eſfloreſcence on old walls, &c. now called *ſalt-petre of the rock*.

Greek authors expreſſed two different ſubſtances by the word *aphronitrum* ; the one only a particular appearance of the NATRUM, or native nitre of thoſe ages ; and the other a factitious ſubſtance, the froth or ſpume of the veſſels in which they boiled and purified their nitre. The earlieſt authors, however, diſtinguiſhed theſe two, calling the factitious ſubſtance *aphros nitron*, and the native *aphronitron* ; and Galen plainly tells us, that theſe were two different ſubſtances.

APHROSELENOS, among *Ancient Naturaliſts*, a denomination given to the SELENITES, or *lapis ſpecularis*.

APHTHÆ, in *Medicine*, little ulcers or pimples riſing in the mouth, the palate, gums, and at the root of the tongue ; attended with inflammation, and a difficulty of ſwallowing.

The word ſeems derived from φθιω, *I corrupt* ; or from απτω, *I kindle*.

Hippocrates applies the word to ulcers in the *pudenda* of women, alſo to thoſe in the *aſpera arteria* ; and Galen ſpeaks of the teſticles as ſubject to the ſame diſeaſe.

Sucking children are particularly ſubject to *aphthæ*, when either the nurſe's milk is corrupted, or the child's ſtomach becomes unfit for digeſtion : for, in theſe caſes, the ſharp acrimonious parts of the milk riſing up, eaſily exulcerate thoſe tender and delicate parts.

There are ſome *aphthæ* white, others red, others livid and blackiſh : the white and red ſorts are the leaſt dangerous, and the moſt eaſily cured ; the livid and black often prove mortal. The black THRUSH very rarely occurs ; but when it does, it is always a putrid ſymptom, and not an original diſeaſe. Dr. Hunter thinks theſe white ſpecks are inflammatory exudations, and not ulcers, which appears probable, from their dropping off in ſucceſſion to each other.

When they happen in grown perſons, they are owing to thin, ſerous, and ſharp humours, turned from the ſeveral parts of the body to the mouth.

External cauſes alſo frequently concur to the production of *aphthæ* ; and eſpecially a neglect of keeping the tongue and fauces clean ; the pernicious and prepoſterous method of curing fevers, and other inflammatory diſeaſes, by hot medicines ; and expoſing the bodies of children, when over heated, to a cold air, which, by checking perſpiration, has an almoſt unavoidable tendency to accumulate and hoard up ſaline and ſulphureous *ſordes* in the maſs of humours. Nor ought we on this occaſion to exclude other cauſes, which have an immediate and direct influence on the lax compages of the *fauces* ; ſuch as crumbs of bread or ſugar wrapt up in a piece of linen cloth in form of a tent, as alſo a piece of bread dipped in ale, and given to children to be ſucked.

A lineament of *mel roſatum* and oil of vitriol is eſteemed a good remedy for the *aphthæ* : plantane-water is alſo in uſe on the ſame occaſion. Dr. Canvance recommends the *oleum ricini* as a purge in this diſorder, for infants, and the ipecacuhana in the interval of purging, as a perſpirative.

APHTHARTODOCETÆ, a ſect, ſworn enemies of the council of Chalcedon.

The word is derived from αφθαρτος, *incorruptible*, and δοκεω, *I imagine* ; and was given them, becauſe they imagined the body of Jeſus Chriſt was incorruptible and impaſſible, and not capable of death.

They aroſe among the Eutychians, and made their firſt appearance in the year 535.

APHUA *cobites*, in *Zoology*, the name of a ſmall fiſh common in the Mediterranean and ſome other ſeas, and called by us the ſea-loach. It never exceeds three or four inches in length, its body is round, and flatted a little on the back ; its colour is white, variegated with black ſpots. Rondeletius.

APHYLLANTHES, in *Botany*, the name of a genus of plants, of the *hexandria monogynia* claſs ; the characters of which are theſe : The flower is of the liliaceous kind, and is compoſed of ſix petals, which ariſe from the center of a ſquamoſe, and in ſome degree tubular cup, the piſtil ariſes alſo from the cup, and finally becomes a trigonal turbinated fruit, which when ripe burſts into three parts or cells, which contain roundiſh ſeeds.

There is only one known ſpecies of this plant, which is the Montpelier *aphyllanthes*, called by ſome the blue Montpelier *pink*.

APHYLLON, in *Botany*. See *Broom*-RAPE.

APIARIA, in *Natural Hiſtory*, the name given by authors to a fly found only in autumn, and frequently met with on parſley ; it is a two winged fly, of a deep and ſhining black, and gathers wax on its legs in the manner of the bee. It is a ſpecies of the ATTELABUS.

APIARY, *bee-houſe* ; a place where bees are kept ; and furniſhed with all the apparatus neceſſary for that purpoſe.

The word comes from *apis*, *a bee*.

The *apiary* ſhould be ſcreened from high winds on every ſide, either naturally or artificially ; and well defended from poultry, &c. whoſe dung is offenſive to bees. Columella gives ſeveral directions reſpecting the ſituation of an *apiary*. He recommends a ſouth aſpect, and a proper medium between extreme heat and extreme cold : he prefers a low ſituation to an eminence, that the loaded bees may more eaſily deſcend to their habitation. The *apiary* ſhould likewiſe be near the dwelling-houſe, that the bees may be more conveniently watched ; and they ſhould be provided with water, if they are not ſituated near a running ſtream ; and the garden, in which the *apiary* ſtands, ſhould be well furniſhed with ſuch plants as afford a proper ſupply of food. Of theſe he ſpecifies thyme, the oak, the pine, the ſweet-ſmelling cedar, and all fruit-trees. Furze, broom, muſtard, clover, heath, buck wheat, &c. are excellent for this purpoſe.

Celſus adviſed that bees ſhould be removed, as occaſion required, to places abounding with autumnal flowers : and this method was practiſed by conveying the bees from Achaia to Attica, from Eubæa and the Cyclad iſlands to Scyrus, and alſo in Sicily, where they were brought to Hybla from other parts of the iſland. The ancient inhabitants of Lower Egypt, likewiſe, obſerving that plants bloſſomed, and fruits ripened, about ſix weeks ſooner in Upper Egypt than with them, availed themſelves of this circumſtance, and removed their bees thither, that they might reap the benefit of the more forward vegetation : and the ſame practice is continued in that country to the preſent day. About the end of October, hives of bees are embarked upon the Nile, and conveyed into Upper Egypt, where they arrive juſt as the inundation ſubſides, and the flowers begin to bud. When they have remained for ſome time at their fartheſt ſtation, they are brought two or three leagues lower down; and thus they are ſucceſſively removed, as the vegetation advances, from one ſtation to another, collecting, as they journey, the rich produce of the banks of the Nile, and return home about the beginning of February. This method of tranſporting bees from place to place, for the convenience of paſture, is practiſed in France, and might be adopted with great advantage in this kingdom. See BEE and HIVE.

APIASTELLUM, in *Botany*, the name of two different ſpecies of plants with different authors; Dodonæus expreſſing by it the common baum, and Apuleius the black bryony.

APIASTER, in *Zoology*, a name given by ſome authors to the bee-eater, called by the generality of authors MEROPS.

APIASTRUM, in *Botany*, a name given by the ancients to two different plants, of ſuch contrary form and qualities, that it is unlucky they ſhould have given occaſion of confounding them together, as miſtakes about them might be of fatal conſequence. The one of theſe plants was the poiſonous *water*-CROWFOOT; which they called *apiaſtrum*, becauſe of its having leaves that ſomewhat reſembled ſmallage. The other *apiaſtrum* is the common garden baum, ſo called by theſe writers, from their having obſerved that the bees were very fond of it. Beſides this, they have in ſome places called the SELINUM by this name, from its reſembling parſley, which they alſo called *apium*; and ſome of them have extended the name even to the animal world, and given it to a ſort of bird that feeds on bees.

APICES, *ſummits*, in *Botany*, little knobs growing on the tops of the *ſtamina* or chives in the middle of flowers.

The word is the nominative plural of *apex*, *the top* or *ſummit* of any thing.

They are commonly of a roundiſh figure.—By the microſcope they have been diſcovered to be, as it were, a ſort of *capſulæ ſeminales*, or ſeed-veſſels, containing in them ſmall globular, and often oval particles of various colours, and exquiſitely formed; called the FARINA *fæcundans*.

Theſe particles are a kind of male ſperm, which, falling down into the flower, fecundates and ripens the ſeed. See *Generation of* PLANTS.

APICULUM, in *Antiquity*, a kind of thread or fillet which the Flamens wore, in the heat of ſummer, in lieu of the APEX.

Feſtus ſpeaks of the *apiculum*, as a cover for the *apex*; but the paſſage ſeems to be corrupt.

APINEL, the name of a gentleman given to an American root, called by the natives *Yabacani*. See Hiſt. de l' Acad. Roy. an. 1724. Hiſt. 19.

APIOS, in *Botany*, a name given by many authors, to thoſe ſpecies of the TITHYMAL, or ſpurge, which have tuberoſe or knobby roots.

APIOS is alſo the name given by Boerhaave to ſome of the leguminous plants, compriſed by Linnæus under the name GLYCINE.

APIS, *muſca*, the *bee*, or *fly*, in *Aſtronomy*, a ſouthern conſtellation, containing the following ſtars:

Situation of the Stars.	Signs.	Long.			Lat.			Magn.
		°	′	″	°	′	″	
In the head, - -	♏	16	20	41	55	11	10	4
In the right wing,		16	36	29	56	29	50	4
In the left ditto,		22	22	15	56	43	27	5
In the tail, - - -		20	14	18	58	47	43	5

APIS, or APES, in *Zoology*, a genus of four-winged inſects with wings entirely membranaceous, and their tails furniſhed with a ſting; comprehending the BEE, HORNET, WASP, and HUMBLE-BEE.

This genus is ranged under the *hymenoptera* of Linnæus, and includes a great variety of ſpecies.

APIS, in *Mythology*, a divinity worſhipped by the ancient Egyptians at Memphis. It was an ox, having certain exterior marks; in which animal the ſoul of the great Oſiris was ſuppoſed to ſubſiſt. This animal had the preference to all others, as being the ſymbol of agriculture, the improvement of which that prince had ſo much at heart.

The Egyptians conſulted him as an oracle. If he accepted what was preſented him to eat, it was a good preſage; his refuſal was a bad omen. Dr. Bryant apprehends that the name of *apis* was an Egyptian term for a father; that it referred to the patriarch Noah; and that the creſcent which was uſually marked on the ſide of the animal, was a repreſentation of the ark. Ancient Myth. vol. ii. p. 420.

APITES, APITES VINUM, from απιος, *the pear-tree*; *perry*, wine of pears. It is thus prepared by ſome:

Cut and pound the pears, and having preſſed out the juice, to every twelve pints thereof add one pint of honey, and let it ferment.—After the ſame manner are prepared wines of *carobs*, *medlars*, and *ſervices*. All theſe kinds are aſtringents, have a greatful ſourneſs, are good for the ſtomach, and reſtrain inward fluxes. Dioſcorides, lib. v. cap. 32.

APIUM, in *Botany*, PARSLEY; of the *pentandria digynia* claſs.

The characters are, that it is a plant with an umbelliferous flower; each flower has five *ſtamina*. Under the flower is ſituated the *germen*, which afterwards becomes an oval channelled fruit, dividing into two parts, having two oval ſeeds channelled on one ſide, and plain on the other.

There are ſeven ſpecies; 1 *Common parſley*. 2. *Curled parſley*. 3. *Large rooted parſley*. 4. *Smallage*; or *water parſley*. 5. *Upright celery*. 6. *Celeriac*; or *turnep-rooted celery*. 7. *Greateſt Portugal parſley, with a leaf having three lobes and a yellowiſh flower*. See CELERY, PARSLEY, &c.

APIUM *antariticum*. See CELERY, *wild*.

APIUM *Macedonicum*. See BUBON.

APIUM *aniſum dictum*. See ANISE.

APIVORUS BUTEO, in *Zoology*, the name by which authors call the bird known in England by the name of the *honey*-BUZZARD. It is ſomewhat larger than the common buzzard; its beak is black, very much hooked, and proturberant in the middle, and covered to the noſtrils with a black wrinkled ſkin; its mouth opens very wide, and is yellow within. It builds its neſt with ſticks covered with wool, and ſometimes uſes the deſerted neſt of a kite to lay and breed its young in, which it feeds principally with the nymphs, or maggot worms of bees and waſps; and it is common to find pieces of honey-combs in the neſts. It feeds on newts, frogs, and other ſmall animals, and is remarkable for running very ſwiftly on the ground: the female is larger than the male, as in moſt other birds of prey. Ray.

APLUDA, in *Botany*, a genus of the *polygamia monoecia* claſs of plants.

The calyx is a common bivalve glume, with a female floſculus, and male peduncles.

APLUSTRE, or AMPLUSTRE, in the *Ancient Naval Architecture*, a carved tablet, ſomewhat after the manner of a ſhield, fixed by way of decoration to the extremity of a ſhip's head.

The *roſtra* or beaks of ſhips were ſometimes alſo called *apluſtria*.

But ſome think that the *apluſtre* anſwered to what we call the flag, or enſign.

APNOEA, from α and πνεω, *I breathe*, in *Medicine*, denotes a want of breath, or loſs of reſpiration.

In this ſenſe is the word uſed among the ancients, not as importing a total privation of breath, which would only be another name for death; but to denote the reſpiration very ſmall, and ſlow, ſo as to ſeem quite gone, as is the caſe in ſuffocations of the *uterus*, apoplexies, ſyncopes, lethargies, &c.

APOBAMINA, is uſed by ſome phyſicians for a liquor wherein pieces of gold, or chains heated red hot, have been extinguiſhed, in order to fortify the ſpirits and principal members.

APOBATERION, from αποβαινω, *I depart*, among the *Ancients*, a farewel ſpeech, or poem, made by a perſon on his departure out of his own country, or ſome other place where he had been kindly received, and entertained.

Such is that of Æneas to Helenus and Andromache, Æn. lib. iii.—The *apobaterion* ſtands oppoſed to the EPIBATERION.

APOBATHRÆ, in *Antiquity*, a kind of little bridges, or ſtairs, joining the land to ſhips, or one ſhip to another.

APOBEE, in *Botany*, a name give by the natives of Guinea to a ſpecies of corn-marygold, called by Petiver CHRYSANTHEMUM *acaulon Guineenſe foliis longis anguſtis*, from its having long and narrow leaves, and no ſtalk to ſupport the flower. The people of the place uſe this in the ſmall-pox, and other eruptive fevers, boiled in water, and the liquor drank warm. Phil. Tranſ. N° 232.

APOBOMIOI, from απο, *below*, and βωμος, *altar*, in *Antiquity*, ſacrifices offered on the bare earth, without altars.

APOCALYPSE, *Revelation*: the name of the laſt book in the canon of Scripture.

The word is formed of αποκαλυπτω, *I reveal*.

The *Apocalypſe* contains diſcoveries or revelations made to the apoſtle St. John, in the iſle of Patmos, during his baniſhment there, under the perſecution of Domitian.

This, of all the books of the New Teſtament, is that, about which the ancient fathers, and the practice of the church, were the moſt, and the longeſt, divided.—When it was firſt univerſally received as canonical, is not eaſy to decide. St. Jerom relates, that the Greek church doubted of its authenticity, even in his days: St. Baſil and Gregory Nazianzen abſolutely reject it; and the council of Laodicea never mention it in their canon of the ſacred writings.

Some attribute it to Cerinthus; and others, to another John, diſciple of St. John. Dionyſius Alexandrinus cenſures it as written in bad Greek, though he allows it to contain a myſtic ſenſe, which, he ſays, he admires, even where he does not underſtand it.

On the other hand, St. Juſtin, Irenæus, Theophilus Antiochenus, Melito, Apollonius, Clemens Alexandrinus, and Tertullian, make no doubt of its being canonical. The third council of Carthage, held in 397, placed it in the canon of the New Teſtament; and the churches both of the Eaſt and Weſt have acknowledged it ever ſince.

The Alogians are repreſented, by eccleſiaſtical writers, as great declaimers againſt the *Apocalypſe*, many of the flights whereof they turned into ridicule; particularly the viſions of the ſeven trumpets, the four angels bound on the river Euphrates, &c. St. Epiphanius defends it againſt them: the book, he obſerves, is not a mere hiſtory, but a prophecy: ſo that it is no wonder the author ſhould expreſs himſelf after the manner of the prophets, whoſe ſtyle is uſually figurative.

Of all their objections againſt the authority of this book, that ſeems the beſt grounded which is drawn from thoſe words in chap. ii. ver. 18. *Write to the angel of the church of Thyatira:* there was not, ſay they, any Chriſtian church at Thyatira at that time. St. Epiphanius, who grants them this point, is forced to have recourſe to the prophetic ſpirit; as if St. John had foreſeen there would be a church there in courſe of time.

Some late authors have made a good amendment to St. Epiphanius's anſwer: it is probable, in the time of that father, the catalogue of the biſhops, with other acts, which ſhew that there had been a church eſtabliſhed there from the time of the apoſtles, might not be known. Grotius adds, that though there was not, indeed, any church of Gentile converts at Thyatira when St. John wrote; yet there was one of Jews, as there had been another at Theſſalonica before St. Paul preached there.

Several orthodox writers have rejected the *Apocalypſe* as a book which countenanced the reveries of Cerinthus, touching the carnal reign of Chriſt on earth.

Though Dionyſius Alexandrinus(ap. Euſeb. Hiſt. Eccl. vii. 25.) allowed the *Apocalypſe* for an inſpired writing; yet he took it for the work of another John, different from St. John the Evangeliſt; which he endeavours to make appear from the diverſity of ſtyle. But we all know how precarious the arguments are, which are drawn from the mere conſideration of ſtyle. It is true, in moſt of the ancient Greek copies, both printed and manuſcript, we find the name *John the Divine*; but they who put this title, meant no more thereby than to denote the apoſtle St. John, whom the Greek fathers call *the Divine*; by way of eminence, to diſtinguiſh him from the other Evangeliſts.

There have been ſeveral other works publiſhed under the title of *Apocalypſes*. Sozomen mentions a book uſed in the churches of Paleſtine, called the *Apocalypſe*, or *Revelation of St. Peter*. He alſo mentions an *Apocalypſe* of St. Paul; which the Cophtæ retain to this day. Euſebius alſo ſpeaks of both theſe *Apocalypſes*. St. Epiphanius mentions an *Apocalypſe* of Adam: Nicephorus, an *Apocalypſe* of Eſdras: Gratian and Cedrenus, an *Apocalypſe* of Moſes, another of St. Thomas, and another of St. Stephen: St. Jerom, an *Apocalypſe* of Elias.

Porphyry, in his life of Plotin, makes mention of the *Apocalypſes* or revelations of Zoroaſter, Zoſtrian, Nicothæus, Allogenes, &c.

APOCARITES, from αποκειρω, *I cut off*, in *Eccleſiaſtical Hiſtory*, denote thoſe who aſſerted that the human ſoul is part of, or derived from, the ſubſtance of God.

The *apocaritæ* are ranked as a branch of the Manicheans.

APOCARPASUM, in *Natural Hiſtory*, a name given by the ancient Greeks, to a poiſonous drug, called alſo ſometimes ſimply *carpaſum*; it was the exudation of a tree growing in the country of the Abyſſines, and was ſo like the fineſt myrrh, that it was often mixed with it, and many lives were loſt by adminiſtering it as myrrh. The wood of the tree which produced it was alſo poiſonous, though in a leſs degree, and was called by the ſame writers *apocarpaſum*, as the wood of the balm of Gilead tree is *apobalſamum*.

APOCATASTASIS, from αποκαθιστημι, *I reſtore*, denotes the entire reſtitution, or redintegration of a thing.

In this ſenſe, we read of the *apocataſtaſis* of the world, or of all things.

APOCATASTASIS, among *Aſtronomers*, denotes the period of a planet, or the time wherein it returns to the ſame point of the zodiac from which it ſet out.

APOCATASTASIS is alſo uſed in *Medicine*, to denote the ſubſiding, or ſinking of a thing.

In this ſenſe, we read of the *apocataſtaſis* of urine, the *apocataſtaſis* of tumours; and other diſeaſes.

APOCATHARSIS, in a general ſenſe, denotes the ſame with *catharſis*, or expurgation.

In this ſenſe, we read of *apocatharſes* of bile, a ſymptom mentioned by Thucydides in the plague of Athens.

Quincy defines *apocatharſis* a purging upwards and downwards, but without ſufficient authority. Hence alſo *apocathartica*, a denomination ſometimes given to what we otherwiſe call ſimply CATHARTICS.

APOCHA, from απο and εχω, *I have*, in *Civil Law*, denotes an acquittance, or receipt given by the creditor to his debtor for money paid. In which ſenſe, the word ſtands contradiſtinguiſhed from *antapocha*, which is given by the debtor to the creditor. Reuſner and Zieglerus have diſſertations *de apochis*.

APOCHYLISMA, from απο and χυλιζω, *I extract the juice*, in *Pharmacy*, denotes an inſpiſſated vegetable juice; anſwering to what is called in the ſhops a ROB.

APOCOPE, a figure in *Grammar*, wherein part of the end of a word is cut off; as in *dic* for *dice*, *fac* for *face*, *nil* for *nihil*, *hyp* or *hypo* for *hypochondriacal*.

The word is compounded of the prepoſition απο, and the verb κοπτω, *I cut*.

A like retrenchment at the beginning of a word is called *apheræſis*.

When the *apocopation* is marked with a ſuperior comma (called an *apoſtrophus*), the word is ſaid to be *apoſtrophated*: as *thro'* for *through*.

APOCRISIARIUS, in *Antiquity*, an officer appointed to carry or deliver the meſſages, orders, and anſwers, of a prince or emperor.

The word is formed from αποκρισις, *reſponſum*, *anſwer*. Hence he is uſually called *reſponſalis*, q. d. anſwerer.

The *apocriſiarius* afterwards became the emperor's chancellor, and kept the ſeal. In the barbarous Latin we ſometimes meet with *aſecrata*, *ſecretary*, for *apocriſiary*. Zoſimus defines *apocriſiarius*, ſecretary for foreign affairs; being the ſame with what Vopiſcus, in the life of Aurelian, calls *notarius ſecretorum*.

The title of *apocriſiary* became at length appropriated, as it were, to the pope's deputy, or agent, who reſided at Conſtantinople to receive the pope's orders, and the emperor's anſwer.

St. Gregory was *apocriſiary* of pope Pelagius, at the time when he compoſed his morals on Job. The *apocriſiary* did the office of the modern NUNTIO. Sometimes, however, he had the rank and quality of the pope's LEGATE.

The inſtitution of *apocriſiarii* ſeems to have been in the time of Conſtantine, or not long after, when, the emperors being become Chriſtians, foreign churches had more occaſion to promote their ſuits at court than formerly; at leaſt we find the office eſtabliſhed by law in the time of Juſtinian. In one of the Novels it is ordered, that as no biſhop was to be long abſent from his church without ſpecial command from the emperor, if any one had occaſion to negociate any eccleſiaſtical cauſe at court, he ſhould prefer his petition either by the *apocriſiarius* of his church, appointed for ſuch purpoſe, or by the œconomus, or ſome of his clergy ſent expreſs. In imitation of the *apocriſiarii* of churches, almoſt every monaſtery had their *apocriſiarius* likewiſe, whoſe buſineſs was not to reſide in the royal city, as the former did, but to act as proctors for their monaſtery, or any member of it, when they had occaſion to enter any appearance at law, before the biſhop, under whoſe juriſdiction they were. This appears from another of Juſtinian's Novels, which requires the Aſcetics in ſuch caſes to anſwer by their *apocriſiarii*, or *reſponſales*. Du-Cange. Bingham. Orig. Eccleſ. lib. iii. cap. 13. § 6.

The hereſy of the Monothelites, and afterwards that of the Iconoclaſts, broke off the cuſtom of having a papal *apocriſiary* at Conſtantinople.

APOCRISIS, αποκρισις, literally denotes an anſwer. Under this denomination were anciently included, not only the reſcripts of the emperors to the petitions of parties, but all kinds of decrees and mandates.

We have ſeveral books extant under the title of *Apocriſes*, and ſome in oppoſition to theſe, under the title of *Antapocriſes*.

APOCRUSTICS, in *Medicine*, remedies endued with a repelling and aſtringent power, whereby they prevent the too great afflux of humours to a part diſeaſed.

The word is derived from αποκρυω, *pulſo*, *pello*, *I drive*.

Apocruſtics are uſually cold and aſtringent, and conſiſt of large particles, wherein they differ from drawing medicines, which are hot, and conſiſt of more ſubtile parts.

APOCRYPHAL, ſomething dubious; or that comes from an uncertain author, on which much credit cannot be repoſed.

We ſay, an *apocryphal* book, paſſage, hiſtory, &c. meaning, ſuch as are of ſuſpected authority.

Voſſius obſerves, that, with regard to the ſacred books, none are to be accounted *apocryphal*, except ſuch as have neither been admitted into the ſynagogue, nor the church, ſo as to be added to the canon, and read in public.

For this reaſon, alſo, the books of Sibyls were anciently called *apocryphal*, as being committed to the truſt of the *decemviri* alone: and for the like reaſon the annals of the Egyptians and Tyrians were called by the ſame name.

Before the Septuagint verſion, the books of the Old Teſtament were all *apocryphal* in this ſenſe. But in proceſs of time, the ſenſe of the word was changed, and thoſe books alone were called *apocryphal*, which were of doubtful or ſuſpected authority.

In the original meaning of the word, all the writings depoſited in the temple were called *apocryphal*: by reaſon they were kept ſecret from the people.

When the Jews publiſhed their ſacred books, they only gave the appellations of *canonical* and *divine* to ſuch as they thus made public; and ſuch as were ſtill retained in their archives they called *apocryphal*, for no other reaſon, but becauſe they were not public; ſo that they might be really ſacred and divine, though not promulged as ſuch.

Thus, in reſpect of the Bible, all books were called *apocryphal*, which were not inſerted in the Jewiſh canon of Scripture; and it is in this ſenſe that St. Epiphanius is to be underſtood, when he ſays, that the *apocryphal* books are not put in the ark among the other inſpired writings.

There has been a great diſpute between the Romaniſts and the Reformed, about the authority of thoſe books, now called, by the latter, *apocryphal*; and by the former, *deutero-canonical*; as Judith, Tobit, Eſdras, Maccabees, &c. the one having the opinions of many of the primitive fathers for their vouchers, and the others, the tradition of their church.

The word is derived from αποκρυπτειν, *to hide*; becauſe the origin of ſuch books was unknown, or becauſe they contain ſome myſteries not fit to be known.

M. Simon contends, that they muſt have been read in Greek, even by the apoſtles themſelves; which he infers from divers paſſages in their writings. He adds, that the church received them, with the other books of Scripture, from the Helleniſt Jews; and that if the churches of Paleſtine never admitted them, it was not for their accounting them *apocryphal* in the ſenſe the word is now uſed, but becauſe they read none but what were written in Hebrew.

To this may be oppoſed the authority of the greateſt part of writers in all ages, till the council of Trent; which makes a preciſe diſtinction between the books now called *apocryphal*, and thoſe contained in the Jewiſh canon. This council, ſeſſ. 4. declared ſix of them to be canonical, viz. Tobit, Judith, Wiſdom, Eccleſiaſticus, and the 1ſt and 2d of Maccabees; but joined Baruch with Jeremiah, which makes in all ſeven.

The *apocryphal* books are alſo called *acanonical*, and by ſome writers, *eccleſiaſtical* books, becauſe, though not held of divine authority, they were allowed to be read in churches, as containing many things tending to edification, and godly inſtruction; on which account they continue ſtill in uſe in the church of England, though forbidden in the other reformed churches.

Wolfius gives the literary hiſtory of the *apocryphal* books, their various editions, tranſlations, commentaries, &c.

We meet with numerous *apocryphal*, or ſuppoſititious books, publiſhed under the names of patriarchs, prophets, evangeliſts, apoſtles, primitive fathers, ſaints, martyrs, &c. *Apocryphal* propheſies, *apocryphal* goſpels, *apocryphal* epiſtles, *apocryphal* acts, *apocryphal* apocalypſes, &c.

The writing of books under ſpurious names, and obtruding them for the works of inſpired authors, though once reputed laudable, and conſecrated under the name of pious fraud, was condemned very early by an apoſtolical canon, in the inſtance of a prieſt, who was depoſed for forging the acts of Paul and Thecla. Bing. Orig. Eccleſ. lib. xvii. cap. 5.

Fabricius has publiſhed the fragments and remains of the *apocryphal* books both of the Old and New Teſtament. Fabric. Codex Pſeudepigraphus Veteris Teſtamenti. Hamb. 1722 & 1723. 8°. 2 vol. Codex Apocryphus Novi Teſtamenti, 2 vol. Hamb. 1719, &c. 8°.

APOCYMA, from απο, and κυμα, *wave*, in the *Materia Medica* of the *Ancients*, a name given by the Greek authors to a ſort of cement, uſed to daub over the bottoms of their ſhips, to preſerve them from injuries by the water; they called this alſo by the name of ZOPISSA, and Avicenna and Serapion call it *ketran*, *kitran*, or *alkitran*. It was a mixture of bees-wax and pitch melted together, and after it had been ſoaked ſome time in the ſea-water, it was ſuppoſed to have peculiar virtues, and was uſed in many compoſitions.

APOCYNUM, in *Botany*. See DOGS-BANE.

APODACRYTICA, from απο, and δακρυ, *a tear*, in *Pharmacy*, medicines proper to excite tears.

Some alſo uſe the term *apodacrytica*, for remedies proper to ſuppreſs tears.

APODECTÆ, from αποδεχομαι, *I receive*, in *Antiquity*, a denomination given to ten general receivers, appointed by the Athenians, to receive the public revenues, taxes, debts, and the like.

The *apodectæ* had alſo a power to decide controverſies ariſing in relation to money and taxes, all but thoſe of the moſt difficult nature and higheſt concern, which were reſerved to the courts of judicature.

APODECTÆI, in the Athenian government, officers appointed to ſee that the meaſures of corn were juſt.

The *apodectæi* were nearly related to the *agoranomi*.

APODEMICA, from αποδημεω, *I travel*, the doctrine or ſcience of travelling, whether for knowledge or devotion's ſake.

Jo. Meraker has publiſhed an *Apodemica*. Ranzovius a *Methodus apodemica*.

APODES, in a general ſenſe, from α and πους, denotes things without feet. Zoologiſts apply the name to a fabulous ſort of birds, ſaid to be found in ſome of the iſlands of the new world, which being entirely without feet, ſupport themſelves on the branches of trees by their crooked bills.

The Germans and Dutch have alſo their *apodes*, a ſort of birds ſomewhat like ſwallows, whoſe legs and feet are ſo very ſmall, that they ſeem rather formed for creeping than running.

APODES, is one of the four orders of fiſhes in the Linnæan diſtribution of animals. Their character is, that they have no belly fins.

APODICTICAL *argument*, or SYLLOGISM, ſignifies a clear, convincing proof, or demonſtration, of a thing.

The word is formed of αποδεικνυμι, *I demonſtrate*.

APODICTICAL *method* is uſed by ſome writers, to denote the ſyſtematical or ſcientifical method of teaching or writing.

APODIOXIS, from αποδιωκω, *I exclude*, in *Rhetoric*, a figure whereby we either paſs over a thing ſlightly, or refer treating of it to ſome other time or place.

This is alſo called by Latin writers, *rejectio*, e. gr. *Quid ego ſenatum defendam, judices? Equidem debeo, &c.* Again, *Quid ego ſenatum hoc loco defendam, judices? Fiat id rectius, tum quum, &c.*

APODIOXIS, in *Logic*, the rejection of ſuch things as do not neceſſarily belong to the queſtion to be conſidered.

APODIXIS, from αποδεικνυμι, in *Rhetoric*, denotes an evident proof, or demonſtration of a point.

We have ſeveral books extant under the names of *apodixes*, and ſome by way of anſwer to theſe, under that of *antapodixes*.

APODIXIS, in *Middle-age Writers*, denotes a receipt for money paid.

In which ſenſe it amounts to the ſame with *apocha*.

APODIXIS is alſo ſometimes uſed for a ſpecimen or proof of a thing.

APODOSIS, from αποδιδωμι, *I apply*, in *Rhetoric*, makes the third part of a complete *exordium*, being properly the application, or reſtriction of the *protaſis*.

The *apodoſis* is the ſame with what is otherwiſe called *axioſis*, and ſtands oppoſed to *protaſis*; e. gr. *protaſis*, all branches of hiſtory are neceſſary for a ſtudent; *cataſceue*, ſo that without theſe he can never make any conſiderable figure; *apodoſis*, but literary hiſtory is of a more eſpecial uſe, which recommends it, &c.

APODOSIS is alſo uſed, in ſpeaking of ſimiles, for that part which makes the application of them,

APODOSIS is alſo uſed in a rhetorical period, for the conſequent to a *protaſis*, or antecedent preceding.

APODOSIS is alſo uſed for a return to ſomething antecedent, or that went before.

This is otherwiſe called *antiſtrophe*.

APODYTERIUM, in *Antiquity*, a ſtripping-room, or apartment at the entrance of baths, wherein perſons dreſſed and undreſſed.

This was otherwiſe denominated *coriceum*, *gymnaſterium*, and *ſpoliarium*.

Some will have the *apodyterium* to have been the ſame with the *coniſterium*; but Voſſius ſhews they were two different places.

The word is formed of αποδυειν, *to undreſs*.

APOGEE, APOGÆUM, in *Aſtronomy*, that point in the orbit of the ſun, or a planet, which is fartheſt diſtant from the earth.

The word is formed of απο, *from*, and γη, *earth*.—In the corrupt Latin, *apogee* ſometimes ſignifies a grotto, or ſubterraneous vault.

The *apogee* is a point in the heavens at the extreme of the line of the apſides; in which the ſun, or a planet, is at the greateſt diſtance that it can be at, from the earth, in its whole revolution.

The oppoſite point to this is called the PERIGEE.

The ancient aſtronomers, regarding the earth as the centre of the ſyſtem, chiefly conſidered the *apogee* and *perigee*: the moderns, making the ſun the centre, change the *apogee* and *perigee* for APHELION and PERIHELION. See SYSTEM.

The quantity of the motion of the *apogee* may be found by comparing two obſervations thereof made at a great diſtance of time; converting the difference into minutes, and dividing it by the number of years elapſed between the two obſervations: the quotient gives the annual motion of the *apogee*.—Thus, from an obſervation made by Hipparchus in the year before Chriſt 140, whereby the ſun's *apogee* was found 5° 30′ of ♊; and another made by Ricciolus, in the year of Chriſt 1646, wherein it was found 7° 26′ of ♋; the annual motion of the *apogee* is found to be 1′ 2″.

APOGEE *of the moon.* See MOON.

APOGEE *of the equant*, is its fartheſt diſtance from the earth; or that point where the circumference of the EQUANT is interſected by the line of the *apſides*, in the remoteſt part of the diameter.

So the *perigee* of the *equant* is the oppoſite point, or the neareſt part of the diameter.

The mean *apogee* of the *epicycle* is a point where the epicycle is cut above, by a right line drawn from its centre to the centre of the *equant*, or the point of the epicycle moſt remote from the earth.

APOGRAPH, a copy or tranſcript of ſome book or writing.

The word is formed of απο, *ab, from*, and γραφω, *I write.* In this ſenſe, *apograph* ſtands oppoſed to *autograph*; as a *copy* to an *original.*

APOGRAPHE, in the *Ancient Law*, was, when a perſon being ſued for money ſuppoſed due to the public, pleaded that the charge was unjuſt, and withal produced all the money he was poſſeſſed of, and declared by what means it came to his hands.

Suidas adds, that it is ſometimes taken for an action againſt ſuch as neither paid the fines laid upon them before the ninth *prytanea* following their ſentence, nor were able to give ſufficient ſecurity to the city. Potter Arch. Græc. lib. i. cap. 23.

APOGRAPHE, in the Roman *Law*, denotes a catalogue, or inventory of goods.

APOLEPSIS, from απολειπω, *I leave*, in the Athenian *Law*, an action of divorce; brought when a woman had fled from her huſband.

APOLEPSIS, from απολαμϐανω, *I retain*, in the *Ancient Phyſic*, denotes a retention of the urine, or any other matter which ought to be evacuated.

APOLEPSIS is alſo underſtood of an interception of the blood or ſpirits, or an extinction of the native heat of the veins.

APOLEPSIS is alſo a denomination of a ſpecies of apoplexy, wherein the ſpeech, ſenſe, motion, &c. ſuddenly fail.

This ſeems to coincide with what is otherwiſe called a CATALEPSIS.

APOLIDES, from α, and πολις, *city*, in *Antiquity*, thoſe condemned for life to the public works, or exiled into ſome iſland, and thus diveſted of the privileges of Roman citizens.

APOLLINARIANS, APOLLINARISTS, called alſo by Epiphanius *Dimaritæ*, ancient heretics, who denied the proper humanity of Chriſt, and maintained that the body which he aſſumed was endowed with a ſenſitive, and not a rational ſoul, but that the Divine Nature ſupplied the place of the intellectual principle in man.

This ſect derived its name from Apollinaris, biſhop of Laodicea, in the fourth century.

The *Apollinarians* have been charged with other opinions, ſuch as, the *Millenarian* and *Sabellian*, the preexiſtence of the body of Chriſt, and the paſſion of his Deity; but eccleſiaſtical writers are not agreed with reſpect to theſe and other particulars. Their doctrine was firſt condemned by a council of Alexandria in the year 362, and afterwards in a more formal manner by a council at Rome in 375; and by another council in 378, which depoſed Apollinaris from his biſhopric. Notwithſtanding all, his doctrine ſpread through moſt of the churches of the Eaſt; and his followers were ſubdivided into various ſects. In 388, the emperor Theodoſius enacted a law, forbidding them to hold aſſemblies, to have any eccleſiaſtics or biſhops, or to dwell in cities. The rigorous execution of this law, in concurrence with the decrees of different councils, reduced them to a very ſmall number, and their doctrine had no long duration.

APOLLINARIAN *games, Apollinares ludi*, in *Antiquity*, games at Rome, celebrated yearly in honour of Apollo, on the fifth day of July, under the direction of the prætor, in the *Circus maximus.*

The occaſion was a kind of oracle delivered by the prophet Marcus after the fatal battle at Cannæ, declaring, that, to expel the enemy, and cure the people of an infectious diſeaſe, which then prevailed, ſacred games were to be annually performed in honour of Apollo. And that the prætor was to have the direction of them; and the *decemviri* to offer ſacrifices after the Grecian rite.

The ſenate ordered that this oracle ſhould be obſerved, becauſe another of the ſame Marcus, wherein he had foretold the overthrow at Cannæ, had been verified; for this reaſon they gave the prætor twelve thouſand *aſſes* out of the public caſh to defray the ſolemnity. There were ſacrificed an ox to Apollo, as alſo two white goats, and a cow to Latona; all with their horns gilt. Apollo had alſo a collection made for him, beſides what the people, who were ſpectators, gave voluntarily. The firſt prætor by whom they were held was P. Cornelius Sylla. For ſome time they were moveable or indictive, but at length were fixed, under P. Licinius Varus, to the fifth of July, and made perpetual.

The men, who were ſpectators at theſe games, wore garlands on their heads; the women performed their devotions in the temples at the ſame time, and at laſt they carouſed together in the veſtibles of their houſes, the doors ſtanding open.

The tradition reports, that, at the firſt celebration hereof, the people were ſuddenly invaded by the enemy, and obliged to take to their arms: upon which occaſion a cloud of darts and arrows falling upon their enemies, the Romans ſoon returned victors to their ſports.

The *Apollinarian* games were only ſcenical; and at firſt only obſerved with ſinging, piping, and other ſorts of muſic; but afterwards there were alſo introduced all kinds of mountebank-tricks, dances, and the like, yet ſo as that they ſtill remained ſcenical, no chariot races, wreſtlings, or the like laborious exerciſes of the body being ever practiſed at them.

Danet, and others, confound the *ludi Apollinares* with the ACTIACI.

APOLLINARES *ludi* was alſo a general name given to all SCENICAL games.

Theſe were alſo called *ludi liberales*, and *ſcenici.*

They differed from the *ludi theatrales*, in that the former were celebrated with all ſorts of plays, farces, poems, recitations, &c. the latter only by dancing and muſic.

This kind of *Apollinarians* had their ſhare in almoſt all the ſolemn games.

APOLLINARIS, in *Botany*, a name given by ſome authors to henbane.

APOLLO, in *Mythology*, a pagan deity worſhipped by the Greeks and Romans. He was the god of light and poetry; and was regarded as the inventor and patron of the fine arts. He had a famous temple at Delphos, where his oracle was in great eſtimation.

Apollo is principally diſtinguiſhed in ancient ſtatues by the beauty of his face, and the gracefulneſs of his figure. Accordingly Virgil calls him, the beautiful; and Tibullus, the well-ſhaped god. Æn. iii. ver. 119. Tibullus, lib. ii. El. iii. ver. 11.

APOLLO *Belvedere*, one in the firſt claſs of the ancient ſtatues. The excellence of this ſtatue conſiſts in the expreſſion of ſomething divine, whereas the reſt excel only in things that are common to men. This ſtatue may, perhaps juſtly enough, claim the preference, even in the ſuperior and diſtinguiſhed claſs of the beſt remains of all antiquity. There are about twenty ancient ſtatues, which the moderns have diſcovered, that are referred to the firſt claſs; and conſidered, each as the chief beauty in its kind.

APOLLONIA, in *Antiquity*, feaſts ſacred to Apollo at Egialea.

APOLLONIAN *hyperbola* and *parabola.* See HYPERBOLA, &c.

APOLOGETIC, APOLOGETICAL, ſomething ſaid or written, by way of excuſe or *apology*, for any action or perſon.

The *Apologetic* of Tertullian is a work full of ſtrength and ſpirit.—He there vindicates the Chriſtians from all that had been objected to them; particularly from the abominable crimes ſaid to be perpetrated at their meetings, and their want of love and fidelity to their country. The ground of this laſt accuſation was, their refuſing to take the accuſtomed oaths, and ſwear by the tutelary gods of the empire—Tertullian addreſſes his *Apologetic* to the magiſtrates of Rome; the emperor Severus being then abſent.

APOLOGUE, APOLOGUS, a moral FABLE; or a feigned relation, intended to inform and amend the manners. Jul. Scaliger derives the name απο λογȣ, inaſmuch as the *apologue* means ſomething more than what at firſt ſight it expreſſes.

Such are the fables of Æſop; whence, moral fables are uſually denominated *Æſopic Fables.*

F. De Colonia makes it eſſential to the *apologue*, that it contain what paſſes among brutes; and diſtinguiſhes it from the *parable* by this, that the latter, though feigned, conſiſts of poſſible circumſtances, which the former does not, ſince beaſts cannot ſpeak. There is this farther difference between them, that the latter is a ſimilitude drawn from natural, moral, or any other branches of knowlege; the former only from moral topics.

Apologue, according to ſome, differs from FABLE, as the former is uſed in ſpeeches and harangues, to perſuade; the latter in tragedies, comedies, and other pieces of poetry, to inſtruct and correct the manners. *Apologue* alſo differs from *ænus*, as the latter is only calculated for the uſe of men, and carries a graver and weightier admonition; whereas *apologues* are propoſed to children. We find many things in authors concerning the origin of *apologues*, the diſtinguiſhing characters of *apologues*, the uſe and advantages of the way of teaching by *apologues.* See Bayle, Dict. Crit. in voc. & Shafteſb. Charact. tom. iii.

APOLOGY, APOLOGIA, *defence*; a diſcourſe or writing in vindication of a perſon.

The word is formed of απολογειν, *to refute.*

The principal ancient *apologies* in favour of the Chriſtians are thoſe of Quadratus, written about the year 124, and addreſſed to the emperor Adrian; of Ariſtides, written ſoon after the former; two of Juſtin Martyr, one of which was written in the year 150, and addreſſed to Antonine, and the other in 166, addreſſed to the Roman ſenate; one of Athenagoras, in 166, to the emperors M. Aurelius, and Lucius Verus; the APOLOGETIC of Tertullian; and the dialogue of Minutius Felix, called *Octavius*, written in the third century.

APOLYSIS, from απολυω, *I releaſe*, in a general ſenſe, the ſolution, or reſolution of any thing. Thus we read of the *apolyſis* of a diſeaſe, the *apolyſis* of a bandage, or the like.

APOLYSIS, in a more particular ſenſe, denotes the excluſion of any thing. Thus we read of the *apolyſis* of the *fœtus*, the ſecundines, and the like.

APOMELI, in *Medicine*, a kind of decoction prepared of honey, or an honey-comb mixed with vinegar, and boiled a ſhort time, till the qualities of both be united, and the acrimony of the vinegar allayed.

The *apomeli* is repreſented as a kind of medium between mulſe and oxymel. It was anciently of great uſe among the Greeks, as a detergent, promoter of ſtool, urine, &c.

APOMYOS *Deus*, from απο, and μυια, *fly*, in the *Heathen Mythology*, a name under which Jupiter was worſhipped at Elis, and Hercules as well as Jupiter at the Olympic games. Theſe deities were ſupplicated under this name, to deſtroy or drive away the vaſt number of flies which always attended at the great ſacrifices; and in thoſe which accompanied the Olympic games, the firſt was always to the *Apomyos*, or *Myiagrus Deus*, that he might drive away the flies from the reſt. The uſual ſacrifice was a bull.

APONEUROSIS, among *Anatomiſts*, the ſpreading or expanſion of a nerve, or tendon, breadth-wiſe; in manner of a membrane.

The word is compounded of απο, *from*, and νευρον, *a nerve.*

APONEUROSIS ſometimes alſo ſignifies the cutting off a nerve, or tendon.—And in ſome writers we find it uſed for a TENDON itſelf.

APONEUROTICUS *muſculus*, in *Anatomy*, a name given by Spigelius, and ſome others, to a muſcle of the thigh, called by Cowper and Winſlow the *muſculus lati tendinis*, and *muſculus faſciæ latæ.* Winſlow has called it, with more propriety, the *muſculus vaginæ femoris.*

APONIA, from α, and πονος, *labour*, among *Phyſicians*, a ſtate of indolence, or the abſence of pain. In which ſenſe, the word amounts to the ſame with *anodynia.* Hence alſo *opona* is uſed by ſome for medicines which do not excite pain.

APONOGETON, in *Botany*, a name given by Pontedera to a genus of plants, called by Micheli and Linnæus ZANNICHELLIA.

APOPEMPTIC, from αποπεμπω, *I diſmiſs*, in the *Ancient Poetry*, a hymn addreſſed to a ſtranger on his departure from a place to his own country.

The ancients had certain holy days, wherein they took leave of the gods with *apopemptic* ſongs, as ſuppoſing them returning each to his own country.

APOPHASIS, from αποφημι, *I declare*, and *I deny*, in the *Civil Law*, an anſwer or reſcript of the prince.

Among *Logicians* the word is alſo uſed for a negation or denial.

APOPHASIS was alſo uſed for the account given of eſtates, at the exchange of them for the avoiding public employments. When any man would excuſe himſelf from any troubleſome and chargeable truſt, by caſting it on another richer than himſelf, the perſon produced had power to challenge him to make an exchange of eſtates, and thereby compel him to undergo the office he had before refuſed.

APOPHASIS, in *Rhetoric*, a figure whereby we really ſay or adviſe a thing, under a feigned ſhew of paſſing over, or diſſuading it.

Quintilian makes the *apophaſis* a ſpecies of irony. Scaliger holds it the ſame with what is otherwiſe called *occupatio.*

APOPHLEGMATISM, in *Medicine*, the operation of purging phlegm or *pituita* from the head.

APOPHLEGMATIZANTS, denote medicines proper to purge the head and brain of ſuperfluous phlegm, or ſerous humours.

Theſe are alſo, by many writers, denominated *apophlegmatiſms.*—The word is compounded of απο, *from*, and φλεγμα, *phlegm.*

Apophlegmatizants are of two kinds, one adminiſtered by the way of the mouth, and intended to operate by ſpitting; the other given by the noſtrils, to operate by ſneezing, &c.

APOPHORETA, from αποφερω, *I carry away*, in *Antiquity*, preſents made to the gueſts at a feaſt, or other entertainment, which they carried away with them.

APOPHRADES, from αποφρας, *unfortunate*, derived again from απο, and φραζω, *I ſpeak*, in *Phyſic*, denote a ſort of unhappy days, wherein either no *criſis*, or an ill one, is to be expected.

APOPHTHEGM, from απο, and φθεγγομαι, *I ſpeak*, a ſhort, wiſe, and pithy ſaying.

Such is that of Cyrus: *He is unworthy to be a magiſtrate, who is not better than his ſubjects.* Or this: *He that will not take care of his own buſineſs, will be forced to take care of that of others.* Or that of Artaxerxes Mnemon, when reduced to hunger by the loſs of his baggage: *How much pleaſure have I hitherto lived a ſtranger to?* Or that of Cato, *Homines nihil agendo diſcunt male agere.* Or, finally, that of Auguſtus, *feſtina lente.* The *apophthegms* of Plutarch are well known.

APOPHYGE, in *Architecture*, that part of a column where it begins to ſpring out of its baſe, and ſhoot upwards.

The word in its original Greek ſignifies *flight*; whence the French alſo call it *eſcape*, *congè*, &c. and we, ſometimes, the *ſpring* of the column.

The *apophyge*, in its original, was no more than the ring or ferril heretofore faſtened at the extremities of wooden pillars, to keep them from ſplitting; which afterwards was imitated in ſtone-work.

It is properly a large concave or arched member, ſerving either to connect two flat members together, or to join a flat member to another not flat.

In this ſenſe we may diſtinguiſh two *apophyges*, the upper and lower.

APOPHYGIS, *upper*, is that part, or ſweep, whereby a large flat member of the upper part of an order is connected to the lower.

This is alſo called by the French *le congé d' enhaut*, and by the Italians *il cavo di ſopra.*

APOPHYGIS, *lower*, *apophygis inferior*, is a concave member, which connects two flat parts in the lower part of an order. This the French call *le congé d' embas*, and the Italians, *il cavo di baſſo*, ſometimes alſo *il vivo di baſſo.*

APOPHYSIS, in *Anatomy*, a protuberance of a bone; or a part eminent, and jutting out beyond the reſt.

The word literally denotes a production outwards; formed from απο τȣ αποφυεσθαι, *to ariſe from.*

It is the ſame with what we otherwiſe call proceſs, eminence, probole, projecture, protuberance, ecphyſis, head, and the like.

Apophyſes differ from *epiphyſes*, as theſe latter are only appendages adhering or contiguous to a bone; whereas the former are productions or continuations of the bone itſelf, ſhooting out from it like branches from the trunk of a tree.

Apophyſes, with regard to figure, may be reduced to two kinds, round and long.

The former are called by the general name of *heads.* Theſe may be ſubdivided into two ſorts: if the head be large, oblong, and very prominent, it is called ſimply, *caput*; if flat and low, *condylus.*

The long kind are alſo ſubdivided into *acute* and *obtuſe*; the *acute*, terminating in a point, is called *corona.* There are divers ſpecies of this, diſtinguiſhed according to their figure, by different names. The *obtuſe* kind, terminating in a head, is called *cervix*, *collum*, or neck.

The general uſe of *apophyſes* is, 1. For the greater conveniency of articulation, whether it be with or without motion. 2. To afford a more commodious origination and inſertion to the muſcles; and, 3. To defend other parts. Heiſter. Their particular uſes will be indicated under the proper articles of each bone, &c.

APOPHYSES *mammillares* are the beginnings of the olfactory nerves, as far as the *os cribroſum*, where they divide into little fibres, which paſs through thoſe bones, and ſpread themſelves throughout the upper part of the noſe.

APOPHYSIS *mammillaris*, or *maſtoidea*, alſo denotes one of the external eminences of the *os petroſum.*

APOPHYSIS *raviana* denotes the larger proceſs of the MALLEUS of the ear, into which the muſcles of the bone are inſerted.

APOPHYSIS is alſo applied by Hippocrates to certain fleſhy excreſcences, found in moles, and female *fœtuſes* of ſeven months, as appearing rather proceſſes, and origins of members, than diſtinct members, ſuch as he ſays may be found in male *fœtuſes.*

APOPHYSIS, in *Botany*, an excreſcence from the receptacle of the *muſci.*

APOPLANESIS, from αποπλαναω, *I deceive*, in *Oratory*, a kind of fallacious defence, and flurring over, darkening and concealing things, in order to blind the judges, or the audience.

APOPLANESIS, in a more particular ſenſe, denotes a ſort of confutation, wherein the ſpeaker promiſes to anſwer what the adverſary objects in another place, but which being too difficult to anſwer, is afterwards forgot, and left to paſs unanſwered.

APOPLEPTIC, relating to an apoplexy.—Thus we ſay, an *apoplectic* fit, an *apoplectic* water, &c.

APOPLECTIC *veins*, a name ſometimes given to the *jugulars.* Theſe are ſometimes alſo denominated among ancient writers, *ſoporales.*

Some writers reſtrain *apoplectic* to the internal jugular, aſcending by the ſide of the *trachea*.

APOPLECTICA, *apoplectical medicines*, a name uſed by ſome for what we more properly call *antapoplectics*.

APOPLECTICAL *balſams* is a name given by ſome writers to a ſort of ſweet ſcented balms, prepared of diſtilled oils, and uſed by way of perfume.

APOPLEXY, in *Medicine*, a ſudden privation of all the ſenſes, and all the ſenſible motions of the body, excepting thoſe of the heart and lungs; attended with a great depravation, or ſuſpenſion, of the principal faculties of the ſoul.

The word comes from αποπλησσειν, *to ſtrike*, or *aſtoniſh*; this diſtemper ſtriking ſuddenly; and, as it were, like a thunder-bolt.

Hippocrates diſtinguiſhes two kinds of *apoplexies*; the one *ſtrong*, the other *weak*; only differing in the greater or leſs difficulty of reſpiration, and pulſation: in the former the pulſe and breath ſeem almoſt entirely ſtopped; in the latter there are conſiderable remains of them.

The more modern authors diſtinguiſh *apoplexies* from their cauſe, into *ſanguineous* and *ſerous*, to which may be added the *ſpaſmodic*, *ſymptomatic*, &c.

The fit of an *apoplexy* is uſually preceded by a violent pain in the head, a dimneſs and loſs of ſight or memory: ſometimes by an univerſal indolence; and ſometimes by a flux of pituitous matter by the noſe and mouth.—It is attended with a ſnorting and difficulty of breathing; ſometimes with a fever, rarely with a foaming at the mouth, frequently with a ſweat, hæmorrhoids, or diarrhœa.

A multitude of the moſt accurate obſervations have made it appear, that this diſorder ariſes from any cauſe that is capable of preventing either totally, or in part, the influx of the nervous fluid, ſecreted in the *cerebrum*, to the organs of ſenſe and voluntary motion; and the reflux of the ſame fluid from the abovementioned organs to the common ſenſory in the brain: whilſt the progreſs, and perhaps the return of the fluid, ſupplied by the *cerebellum* to and from the heart and organs of reſpiration, is preſerved in a degree ſufficient to ſupport in ſome meaſure their functions.

All theſe cauſes, as obſerved and delivered by authors, may for the greater perſpicuity be reduced to claſſes; in the firſt of which may be reckoned,

1. The natural make of the body: thus, when the head is naturally large, the neck ſhort, and as it ſometimes happens, conſiſting only of ſix *vertebræ*, whereas there ought to be ſeven; this ſtructure diſpoſes to an *apoplexy*, as it favours the congeſtion of blood and humours in the head. Thus alſo, if the body is corpulent, the capillary arteries will in general be ſubject to compreſſions; and in conſequence thereof a greater quantity of blood and humours will flow into the veſſels which convey them to the brain. Thus alſo a plethoric habit, and a redundancy of pituitous humours in the blood, lay a foundation for a ſtagnation of the juices, and a ſubſequent rupture of the veſſels of the brain.

2. To the ſecond claſs belong all thoſe cauſes which induce ſuch a change in the blood, lymph, and nervous fluid, as to render them incapable of circulating freely through their reſpective veſſels in the brain: among which are—polypous concretions in the carotid or vertebral arteries, whether formed originally about the heart, or within the *cranium*; theſe are diſcovered by a palpitation of the heart, an unequal pulſe, a vertigo, and temporary loſs of ſight often recurring, and which are increaſed by motion or heat; an inflammatory ſizineſs of the blood, which may be known by an acute continual fever, an inflammatory pain in the head, eyes, &c. —a thick, glutinous, pituitous, and ſluggiſh diſpoſition of the whole maſs of blood; whence old people, thoſe who are much ſubject to catarrhs, whoſe conſtitutions are cold and moiſt, and who are pale and leucophlegmatic, are very ſubject to *apoplexies*. It is not difficult to preſage an *apoplexy* from this cauſe, as it is generally preceded by an univerſal liſtleſſneſs and dulneſs of the ſenſes, unuſual ſlowneſs of ſpeech, tremors, ſtertors, *incubi* (night-mares), frequent diſcharges of pituitous humours by vomit, vertigos, ſhortneſs of breath on the leaſt motion, with a compreſſion of the cartilages of the noſe.

3. To the third claſs belongs whatever compreſſes the arteries themſelves, or the nervous veſſels of the brain, ſo as to prevent a free circulation of the fluids through them. People who are plethoric and bloated are much ſubject to this ſpecies of *apoplexy*; eſpecially if extraordinary motion or heat increaſe the velocity of the circulation. To ſuch, therefore, high feeding, ſpirituous liquors, acrid medicines, intenſe and long continued thought, are pernicious. All humours ariſing within the *cranium* properly belong to this claſs; as alſo a too great velocity of the blood in the veſſels of the head, determined by ſome impediment to the circulation in the arteries of the inferior parts, which may ariſe from an infinite number of cauſes. Hither alſo may be referred all compreſſions from whatever cauſe, of the veins without the head, which convey the refluent blood from the contents of the *cranium* toward the heart; as alſo effuſions of blood, *pus*, *ichor*, or lymph, which preſs externally on the *dura* or *pia mater*.

4. To the fourth claſs belong all thoſe cauſes, which by any means ſo diſſolve the texture of the arteries, veins, or lympheducts, belonging to the internal parts of the *cerebrum*, as to cauſe an extravaſation of their reſpective fluids, which then preſs upon and injure the medullary origins of the nerves of the *cerebrum*.

5. Some ſorts of poiſons, which are ſuddenly deleterious, may be ranked in the fifth claſs; but theſe may either be reduced to the ſecond, third, or fourth, or may be more properly ſaid to act on the lungs than the brain. Among theſe are the fumes of mineral ſulphurs, of charcoal, or that *gas ſylveſtris*, or incoercible ſpirit which exhales from vegetable juices during fermentation.

The anatomical inſpection of bodies which have died of *apoplexies*, and the hiſtorical obſervation of ſuch circumſtances as occur in the treatment of theſe caſes, furniſh us with a knowlege of their cauſes; and a due reflection upon theſe, naturally leads us to a diſtribution of them into the preceding claſſes, which are admirably adapted to the inveſtigation of the beſt methods of cure.

The part affected in a perfect *apoplexy* is the entire common ſenſory of the brain; but in a *parapoplexia* theſe parts only of the common ſenſory which are more compreſſed than the reſt; whilſt the *cerebellum*, and its dependencies, remain in the beginning of the diſorder unaffected. Boerhaave.

As to the prevention and cure of an *apoplexy*, no invariable rules can be laid down; for as the prediſpoſing and exciting cauſes, together with the parts principally affected, are various, the method of relief muſt alſo vary; and muſt be attempted before the diſorder grows inveterate; otherwiſe ſucceſs will be very precarious.

In general, however, to prevent an *apoplexy*, wine, hard labour, exceſs of eating, and ſleeping after dinner, are to be avoided: exerciſe is to be kept up, and care and chagrin to be reſtrained. To cure an *apoplexy*, medicines muſt be uſed that occaſion large evacuations, and nothing of the opiate or aſtringent kind ſhould be taken — During the fit, if the *apoplexy* be of the *ſanguineous* kind, copious bleeding in the jugulars is to be uſed, and the patient laid on his back; applying ſtrong volatiles to the noſe; alſo blow up ſtrong ſternutatories, and rub the temples with cephalic mixtures.—A mixture of common ſalt, diſſolved in a pint of water, has been ſometimes adminiſtered as the means of recovery.—A hot iron may alſo be applied near the *vertex* or *occiput*; and an epiſpaſtic to the neck; to which are to be added powerful purgatives, clyſters, &c.—Cupping and ſcarification on the head are recommended by ſome, in lieu of veneſection.—In the *ſerous* kind of *apoplexy*, bleeding ſhould rarely be admitted.

Dr. Flemmyng recommends trepanning for the cure of *apoplexies*. Med. Muſ. vol. II. p. 300, &c.

The diſeaſe ſometimes degenerates into a *paralyſis*.—And ſometimes only half the head is affected; in which caſe the diſeaſe is called ſimply a *hemiplegia*.

Apoplexy differs from *carus*, *lethargy*, and *coma*, as in thoſe three diſtempers the *ſtupor* is not ſo profound, nor is all ſenſation quite deſtroyed.

It differs from *ſyncope*, in that there is no ſenſible pulſe in this laſt; whereas in an *apoplexy*, the pulſe is perceptible almoſt till death.

It differs from an *epilepſy*, becauſe all motion is not aboliſhed in that, as in this; and it differs from the *palſy*, inaſmuch as the palſy is not attended with any *ſtupor*, nor does it deprive the patient of ſenſe and perception.

APOPLEXY is alſo reckoned among the diſeaſes of hawks, being a diſtemper which ſeizes their heads, occaſioned by too much greaſe and blood, or their having ſtood too long expoſed to the heat of the ſun, or having taken too long flights in the heat of the day.

Horſes are alſo ſaid to be ſubject to *apoplexies*, occaſioned by want of exerciſe, or too plentiful feeding.

The diſtemper ſhews itſelf by a giddineſs, reeling, trembling, and ſometimes falling ſuddenly down, without ſenſe or motion. The cure is by taking a large quantity of blood from the neck, and applying volatile ſpirits to the noſtrils.

APOPLISTÆ, from απο, and οπλον, *arms*, in *Ancient Laws*, a ſort of officers in the country, appointed to diſarm all private perſons, or thoſe not entitled to have arms; for the prevention of miſchief and violence.

APOPOMPÆ, in *Antiquity*, certain days in which ſacrifices ſices were offered to the gods called *pompæi*. Who theſe deities were is doubtful.

APOPSYCHIA, from αποψυχω, *I expire*, is ſometimes underſtood of effluvia, emitted from the ſun, moon, and other heavenly bodies; to which their influence on ſublunary things was aſcribed by aſtrologers.

APORIA, from αϖορεω, *I doubt*, in *Rhetoric*, denotes a ſtate of doubt or wavering, wherein the orator appears undetermined whether to ſay a thing or not: e. gr. *Eloquar an ſileam?* Shall I ſpeak out, or hold my tongue?

APORON, or Aporime, a problem difficult to reſolve, and which has never been reſolved, though it be not, in itſelf, impoſſible.

The word is derived from αϖορος, which ſignifies ſomething very difficult, and impracticable; being formed from the privative α and ϖορος, *paſſage*.

Such we conceive the quadrature of the circle; the duplicature of the cube; the triſection of an angle, &c.

When a queſtion was propoſed to any of the Greek philoſophers, eſpecially of the ſect of Academiſts; if he could not give a ſolution, his anſwer was, αϖορεω, q. d. *I cannot ſee through it*.

This word is alſo uſed by ſome law writers for an inexplicable ſpeech or diſcourſe.

APORRHOEA, Aporrhoes, in *Philoſophy*, ſulphureous effluvia, or exhalations, emitted from the earth, and ſubterraneous bodies.

The word is formed from αϖοῤῥεω, *defluo*, *to flow from*.

Aporrhoea, in *Phyſic*, is ſometimes particularly uſed for morbid or contagious *miaſmata*, or effluvia from unwholeſome bodies. The word is alſo uſed to denote a ſhedding or falling of the hair. See Alopecia.

APOS, in *Ornithology*. See *Sea*-Swallow.

APOSCEPARNISMUS, a ſpecies of fracture of the ſkull, or other bone, wherein a piece is taken clearly off, as if cut out with a hatchet; from σκεϖαρνον, an *ax*, or *hatchet*.

APOSIOPESIS, in *Rhetoric*, otherwiſe called *reticency*, and *ſuppreſſion*; a figure, by which a perſon really ſpeaks of a thing, at the ſame time that he makes a ſhew as if he would ſay nothing of it. See Preterition.

The word comes from αϖοσιωϖαω, *I am ſilent*.

It is commonly uſed to denote the ſame with ELLIPSIS. Jul. Scaliger diſtinguiſhes them. The latter, according to him, being only the ſuppreſſion of a word; as, *me, me: adſum qui feci*; the former, the omitting to relate ſome part of the action; as

Dixerat, atque illam media inter talia ferro
Collapſam adſpiciunt————————

Where the poet does not mention how Dido killed herſelf. This figure is of uſe to keep up the grandeur and ſublimity of a diſcourſe.

APOSITION, from αϖο and σιτος, *food*, in *Medicine*, an averſion to food. It amounts to much the ſame with *anorexia*; though ſome make a difference; alledging that the latter imports no more than an inappetency, or want of deſire to eat; the former, an averſion or loathing of it.

APOSPASMA, from αϖοσϖαω, *I tear off*, in *Medicine*, denotes a ſolution of continuity in ſome organical part, as a membrane, ligament, or the like.

Apospasma is alſo applied to metalline recrements, as *tutia*, *melanteria*, miſy, ſory, or the like.

APOSPHACELISIS, from αϖοσφακελιζω, à σφακελος, *mortification*, &c. in the *Ancient Phyſic*, denotes a mortification of a fleſhy part, happening in caſes of wounds, and fractures, from too tight a ligature.

APOSPHRAGISMA, from αϖο and σφραγιζω, *I ſeal*, in *Antiquity*, the figure or impreſſion of a ſeal.

It was forbid among the ancients to have the figure or image of God on their rings and ſeals. To this purpoſe the precept of Pythagoras, Εν δακτυλιω εικονα Θεȣ μη ϖεριφερειν! But in proceſs of time, this was little regarded; it was uſual enough to have the figures of Egyptian and other deities, as well as of heroes, monſters, friends, anceſtors, and even brutes, on their *dactyli*, or ring-ſeals. Thus Cæſar had the image of Venus, Pollio of Alexander, Auguſtus of the *ſphinx*, Pompey of a frog, Lentulus of his grandfather, &c.

APOSPONGISMUS, among *Ancient Phyſicians*, the application of a ſponge, whether dry or ſoaked with water, either to cleanſe the filth from a part, or to eaſe pains, allay itching, or refreſh the ſpirits.

APOSTAGMA, from αϖοϛαζω, *I diſtill*, in *Natural Hiſtory*, the muſt or juice which runs from the grapes ere they be trodden or preſſed.

This is otherwiſe called *apoſtalagma*.

APOSTASIS, from αφιϛημι, *I depart*, &c. in *Phyſic*, uſually ſignifies the ſame with abſceſs. See Imposthumation.

In which ſenſe, the word is uſed by Hippocrates and others, promiſcuouſly with αϖοϛημα, *apoſtem*.

Apostasis, in a more particular ſenſe, denotes a departure or removal of the morbid matter, in the criſis or ſolution of a diſeaſe.

Apostasis is alſo uſed by Hippocrates for a fracture of a bone, wherein ſome part is entirely ſeparated or broken off.

APOSTASY, a deſerting, or abandoning of the true religion.

The word is borrowed from the Latin *apoſtatare*, or *apoſtare*, to *deſpiſe*, or *violate*, any thing.—Hence, *apoſtatare leges* anciently ſignified to tranſgreſs the laws.—*Qui leges apoſtabit, terræ ſuæ reus ſit apud regem.* LL. Edw. Conſeſſ. The Latin *apoſtatare*, again, comes from αϖο, *from*, and ιϛημι, *I ſtand*.

Among the Romaniſts, *apoſtaſy* alſo ſignifies the forſaking of a religious order, whereof a man had made profeſſion; without a lawful diſpenſation.

The ancients diſtinguiſhed three kinds of *apoſtaſy*: the firſt, *à ſupererogatione*, is committed by a prieſt, or religious, who abandons his profeſſion, and returns to his lay ſtate; the ſecond, *à mandatis Dei*, by a perſon of any condition, who abandons the commands of God, though he retains his faith; the third, *à fide*, by him who not only abandons his good works, but alſo the faith.

There is this difference betwixt an *apoſtate*, and a *heretic*; that the latter only abandons a part of the faith, whereas the former renounces the whole.

Apoſtaſy is ſaid to have been anciently puniſhable, in England, by burning and tearing to pieces by horſes. Thus Fleta, lib. i. cap. 37. § 2. *Apoſtatæ & ſacrilegi, & hujuſmodi, detractari debent et comburi.* And, § 4. *Si inde convincantur, detractentur, & ſuſpendantur.* Where Du-Cange interprets, *detractari*, by *tirer a quatre chevaux*.

APOSTATA *capiendo*, a writ which anciently lay againſt one, who, having entered and profeſſed ſome order of religion, broke out again, and wandered the country, contrary to the rules of the order.

APOSTATE, in a general ſenſe, ſignifies a deſerter from the true religion.

In which ſenſe, *apoſtate* amounts to much the ſame with lapſed, perverted, &c.

APOSTERIGMA, from αϖο and ϛηριζω, *I ſupport*, in the *Ancient Phyſic*, denotes a reſt or ſupport for a diſeaſed part, without binding.

Such are pillows, cuſhions, and the like.

The word ſeems alſo to have been uſed by Hippocrates for a ſtoppage, or obſtruction of ſome vaſcular part.

A POSTERIORI.—Demonſtration *à poſteriori*. See Demonstration.

APOSTHUME, or Apostem, Apostema, in *Medicine*, a preternatural tumour; called alſo ABSCESS, and IMPOSTHUME.

The word comes from αφιϛημι, *abſcedo*, *I depart from one place*, and *fix in another*; alluding to the manner wherein the tumour is uſually formed of a tranſlated humour.

Aposthume is particularly uſed for a diſeaſe of hawks, which occaſions ſwellings in the head, ariſing from a redundancy of humours, and a preternatural heat of that part.

The *apoſthume* diſcovers itſelf by the ſwelling of the eyes, a moiſture iſſuing from the ears, and their wings extremely ſlothful.

APOSTIL, *apoſtilla*, in *Matters of Literature*, a marginal addition, or note to a book, paſſage, or the like.

APOSTLE, αϖοϛολος, one of the twelve diſciples of Jeſus Chriſt, commiſſioned by him to preach his goſpel, and propagate it to all the parts of the earth. They were limited to the number twelve, in alluſion to the twelve tribes of Iſrael.

The word originally ſignifies a perſon *delegated*, or *ſent*; from αϖοϛελλω, *mitto*; in which ſenſe it occurs in Herodotus, and other profane authors. Hence, in the New Teſtament, the term is applied to divers ſorts of delegates; and to the twelve diſciples by way of eminence.

St. Paul is frequently called the *apoſtle*, by way of eminence; and the *apoſtle of the Gentiles*, becauſe his miniſtry was chiefly made uſe of for the converſion of the Gentile world, as that of St. Peter was for the Jews, who is therefore ſtiled the *Apoſtle of the Circumciſion*.—The ſeveral *apoſtles* are uſually repreſented with their reſpective badges or attributes; St. Peter with the keys; St. Paul, with a ſword; St. Andrew, with a croſs or ſaltier; St. James minor, with a fuller's pole; St. John, with a cup, and winged ſerpent flying from it; St. Bartholomew, with a knife; St. Philip, with a long ſtaff, whoſe upper end is formed into a croſs; St. Thomas, with a lance; St. Matthew, with a hatchet; St. Matthias, with a battle-ax; St. James major, with a pilgrim's ſtaff, and a gourd bottle; St. Simon, with a ſaw; and St. Jude, with a club.

This appellation was alſo given to the ordinary travelling miniſters of the church.—Thus St Paul, in the Epiſtle to the Romans, xvii. 7. ſays, *Salute Andronicus and Jenia, my kinſmen and fellow-priſoners, who are of note among the* APOSTLES.

It was likewiſe a title given to thoſe ſent by the churches to carry their alms to the poor of other churches.—This uſage they borrowed from the ſynagogues, who called thoſe whom they ſent on this meſſage, by the ſame name; and the function or office itſelf αποϛολη, *apoſtole*, q d *miſſion*. —Thus St. Paul, writing to the Philippians, tells them, that Epaphroditus, their *apoſtle*, had miniſtered to his wants, ch. ii. 25. It is applied in like manner to thoſe perſons who firſt planted the Chriſtian faith in any place

Thus Dionyſius of Corinth is called the *apoſtle of France*; Xavier the *apoſtle of the Indies*, &c. In the Eaſt-Indies the Jeſuit miſſionaries are alſo called *apoſtles*.

In ſome ages of the church, the pope was peculiarly denominated the *apoſtle*.

APOSTLE is alſo uſed among the Jews, for a kind of officer anciently ſent into the ſeveral parts and provinces in their juriſdiction, by way of viſitor, or commiſſary; to ſee that the laws were duly obſerved, and to receive the monies collected for the reparation of the temple, and the tribute payable to the Romans.

The Theodoſian code, lib. xiv. *De Judæis*, calls thoſe *apoſtoli, qui ad exigendum aurum atque argentum a patriarcha certo tempore diriguntur*. Julian, the Apoſtate, remitted the Jews the *apoſtole*, αποϛολη; that is, as he himſelf explains it, the tribute they had been accuſtomed to ſend him.

Theſe *apoſtles* were a degree below the officers of the ſynagogues, called *patriarchs*, and received their commiſſions from them. Some authors obſerve, that St. Paul had borne this office; and that it is this he alludes to in the beginning of the Epiſtle to the Galatians: as if he had ſaid, Paul, no longer an *apoſtle* of the ſynagogue, nor ſent thereby to maintain the law of Moſes, but now an *apoſtle* and envoy of Jeſus Chriſt, &c. St. Jerom, though he does not believe that St. Paul had been an *apoſtle* of this kind; yet imagines, that he alludes to it, in the paſſage juſt cited.

APOSTLE, in the Greek *Liturgy*, is particularly uſed for a book containing the Epiſtles of St. Paul, printed in the order wherein they are to be read in churches, through the courſe of the year. Another book of the like kind, containing the Goſpels, is called Ευαγγελιον, *Goſpel*.

The *apoſtle*, of late days, has alſo contained the other canonical Epiſtles, the Acts of the *Apoſtles*, and the Revelations. Hence it is alſo called, *Acts of the Apoſtles*, Πραξαποϛολος; that being the firſt book in it.

APOSTLE is alſo thought by many to have been the original name for biſhops, before the denomination *biſhop* was appropriated to their order. Thus Theodoret ſays expreſly, the ſame perſons were anciently called promiſcuouſly both biſhops and preſbyters, whilſt thoſe who are now called biſhops, were called *apoſtles*.

In the arſenal of Bremen, there are twelve pieces of cannon called the *Twelve Apoſtles*, on a ſuppoſition, that the whole world muſt be convinced, and acquieſce in the preaching of ſuch *apoſtles*.

APOSTLE'S *Creed*, ſee CREED.

APOSTOLÆUM, or APOSTOLIUM, in *Eccleſiaſtical Writers*, denotes a church dedicated to, and called by, the name of an *apoſtle*.

Sozomen ſpeaks of the *apoſtolæum* of St. Peter at Rome, of the *apoſtolæum* of St. Peter and St. Paul at Quercus, near Chalcedon.

In this ſenſe *apoſtolæum* ſtands diſtinguiſhed from *prophetæum*, *martyrium*, &c.

APOSTOLARE, APOSTOLICARE, *apoſtolizing*, in ſome *Middle Age Writers*, denotes the being preferred to the dignity of POPE.

APOSTOLATE, in a general ſenſe, is uſed for miſſion.

In this ſenſe, Olearius has a diſcourſe concerning the *apoſtolate* of Chriſt. Lipſ. 1681. 4to.

APOSTOLATE more properly denotes the dignity or office of an apoſtle of Chriſt; but it is alſo uſed, in ancient writers, for the office of a biſhop.

In this ſenſe, we meet with ſeveral letters, petitions, requeſts, &c. directed to biſhops under the title of your *apoſtolate*, or *apoſtolatus veſter*.

But as the title *apoſtolicus* had been appropriated to the pope, ſo that of *apoſtolate* became at length reſtrained to the ſole dignity of the popedom.

Every biſhop's ſee was anciently dignified with the title of *ſedes apoſtolica*, an apoſtolical ſee, which is now the peculiar denomination of the ſee of Rome.

APOSTOLI, in *Law*, denote thoſe letters miſſive, which are demanded in caſes of *appeal*.

APOSTOLIC, APOSTOLICAL, ſomething that relates to the *apoſtles*, or deſcends from them.

Thus we ſay, the *apoſtolical* age, *apoſtolical* doctrine, *apoſtolical* character, conſtitutions, traditions, &c.

APOSTOLIC, in the *Primitive Church*, was an appellation given to all ſuch churches as were founded by the *apoſtles*; and even to the biſhops of thoſe churches, as being the reputed ſucceſſors of the *apoſtles*.—Theſe were confined to four, viz. Rome, Alexandria, Antioch, and Jeruſalem.

In after-times, other churches aſſumed the ſame quality, on account, principally, of the conformity of their doctrine with that of the churches which were *apoſtolical* by foundation, and becauſe all biſhops held themſelves ſucceſſors of the apoſtles, or acted in their dioceſes with the authority of apoſtles.

The firſt time the term *apoſtolical* is attributed to biſhops, as ſuch, is in a letter of Clovis to the council of Orleans, held in 511, though that king does not there expreſly denominate them *apoſtolical*, but (*apoſtolica ſede digniſſimi*) highly worthy of the *apoſtolical* ſee. In 581, Guntram calls the biſhops, met at the council of Maſon, *apoſtolical* pontiffs, *apoſtolici pontifices*.

In progreſs of time, the biſhop of Rome growing in power above the reſt; and the three patriarchates of Alexandria, Antioch, and Jeruſalem, falling into the hands of the Saracens, the title *apoſtolical* was reſtrained to the pope, and his church alone. Though ſome of the popes, and St. Gregory the Great, not contented to hold the title by this tenure, began, at length, to inſiſt, that it belong to them by another and peculiar right, as being the ſucceſſors of St. Peter. The council of Rheims in 1049 declared that the pope was the ſole *apoſtolical* primate of the univerſal church.

And hence a great number of a *apoſtolicals*; *apoſtolical* ſee, *apoſtolical* nuncio, *apoſtolical* notary, *apoſtolical* brief, *apoſtolical* chamber, *apoſtolical* vicar, &c.

APOSTOLIC *clerks*, ſee JESUATES.

APOSTOLICAL *conſtitutions*, ſee CONSTITUTION.

APOSTOLICAL *traditions*, ſee TRADITION.

APOSTOLICAL *fathers* is an appellation uſually given to the writers of the firſt century who employed their pens in the cauſe of Chriſtianity. Of theſe writers, Cotelerius, and after him Le Clerc, have publiſhed a collection in two volumes, accompanied both with their own annotations, and the remarks of other learned men.

APOSTOOLIANS, a ſect of the Mennonites, which firſt ſprung up in the year 1664, and derived its name from Apoſtool, one of the Mennonite miniſters at Amſterdam. They concurred with them in doctrine, and admitted to their communion thoſe only who profeſſed to believe all the ſentiments which are contained in their public confeſſion of faith.

APOSTOLICI, APOSTOLI, or APOSTLES, was a name aſſumed by three different ſects, on account of their pretending to imitate the manner and practice of the apoſtles. The firſt *apoſtolici*, otherwiſe called *Apotactitæ* and *Apotactici*, roſe out of the Encratitæ, and Cathari, in the third century. They made profeſſion of abſtaining from marriage, and the uſe of wine, fleſh, money, &c.

Gerhard Sagarelli was the founder of the ſecond ſect; he obliged his followers to go from place to place as the *apoſtles* did, to wander about cloathed in white, with long beards, diſhevelled hair, and bare heads, accompanied with women, whom they called their ſpiritual ſiſters. They likewiſe renounced all kinds of property and poſſeſſions, inveighed againſt the growing corruption of the church of Rome, predicted its overthrow, and the eſtabliſhment of a purer church on its ruins. Sagarelli was burnt alive at Parma in the year 1300, and was afterwards ſucceeded by Dulcinus, who added to the character of an apoſtle thoſe of a prophet and a general, and carried on a bloody and dreadful war for the ſpace of more than two years againſt Raynerius, biſhop of Vercelli; he was at length defeated, and put to death in a barbarous manner in the year 1307. Neverthleleſs, this ſect ſubſiſted in France, Germany, and in other countries, till the beginning of the fifteenth century, when it was totally extirpated under the pontificate of Boniface IX.

The other branch of *apoſtolici* were of the twelfth century. Theſe alſo condemned marriage, preferring celibacy, and calling themſelves the chaſte brethren and ſiſters; though each was allowed a ſpiritual ſiſter, with whom he lived in a domeſtic relation; and on this account they have been charged with concubinage: they held it unlawful to take an oath; they ſet aſide the uſe of baptiſm; and in many things imitated the Manichees. —Bernard wrote againſt this ſect of *apoſtolici*.

APOSTOLICUM is a peculiar name given to a kind of ſong or hymn, anciently uſed in churches.

The *apoſtolicum* is mentioned by Greg. Thaumaturgus as uſed in his time. Voſſius underſtands it as ſpoken of the apoſtles creed: Suicer thinks this impoſſible, for that this creed was then unknown in the churches of the Eaſt.

APOSTOLORUM *unguentum*, the *apoſtles ointment*, in *Pharmacy*, is a kind of detergent, or cleanſing unguent, compoſed of twelve drugs, the number of the apoſtles; whence its name.

It was invented by Avicenna, and is otherwiſe called *unguentum veneris*.—The principal ingredients are turpentine, reſin, wax, gum ammoniac, birth-wort roots, olibanum, bdellium, myrrh, and galbanum, opopanax, verdegriſe, litharge, oil of olives, and vinegar.

APOSTROPHE, in *Rhetoric*, a figure, whereby the orator, in an extraordinary commotion, turns his diſcourſe from the audience, and directs it to ſome other perſon, preſent or abſent, living or dead, or to inanimate nature.

The word is formed of *απο*, *ab*, *from*; and ςρεφω, *verto*, *to turn*.

Thus Cicero, in his oration for Milo, addreſſes himſelf to the great patriots who had ſhed their blood for the public; and calls them to the defence of his client. So the ſame orator in his firſt *Catilinarian* directs himſelf to Jupiter the protector of the city and empire, and beſeeches him to repel the parricide, &c.

The *apoſtrophe* is frequently alſo addreſſed to inanimates, as tombs, monuments, defuncts, &c.—Cicero's *apoſtrophe* to Tubero, in his oration for Ligarius, is judged one of the fineſt paſſages in his works.

That *apoſtrophe* of Demoſthenes, wherein he addreſſes himſelf to the Greeks ſlain at the battle of Marathon, is alſo famous. Cardinal Perron ſays, it has procured the orator as much glory, as if he had raiſed them from the dead.

APOSTROPHE, or APOSTROPHUS, in *Grammar*, alſo denotes a note or character placed over a letter, in lieu of a vowel, to denote that the vowel is cut off, and not to be pronounced.

As *ev'n* for *even*; *th' angelic hoſt*, for *the angelic*, &c.——The affectation of frequent *apoſtrophes*, ſo uſual among ſome late Engliſh writers, is a great abuſe.

In proſe, *apoſtrophes* are indefenſible, and tend to vitiate the language; their uſe in poetry is to reduce a line to the proper meaſure.

APOSTROPHE, in *Medicine*, denotes a loathing or averſion for food.

In which ſenſe the word amounts to the ſame with APOSITION.

APOSYRMA, from *αποσυρω*, *I take off*, in *Medicine*, denotes a diſquamation, or ſcaling of the ſkin.

In which ſenſe, the word amounts to much the ſame with ABRASION.

Greek writers uſe the word *apoſyrmata*, for what the Latins calls *abraſa*, viz. a ſuperficial kind of exulcerations, which raiſe the ſkin.

APOTACTITÆ, or APOTACTICI, an ancient ſect, who, affecting to follow the evangelical counſels of poverty, and the examples of the apoſtles, and primitive Chriſtians, renounced all their effects and poſſeſſions.

The word is formed from *αποτασσω*, or, *αποταττω*, *to renounce*.

It does not appear, that they gave into any errors during their firſt ſtate; ſome eccleſiaſtical writers aſſure us, they had divers holy virgins, and martyrs, under the perſecution of Diocleſian, in the fourth century; but they afterwards fell into the opinions of the Encratitæ, and taught, that the renouncing of all riches was not only a matter of counſel and advice, but of precept and neceſſity. And hence the ſixth law in the Theodoſian Code joins the *Apotactitæ* with the Eunomians and Arians.

APOTEICHISMUS, from *αποτειχιζω*, *derived from*, *απο*, and *τειχιζω*, *I raiſe a wall*, *or τειχος*, in the *Ancient Military Art*, a kind of line of circumvallation drawn round a place, in order to beſiege it.

This was alſo called *periteichiſmus*.

The firſt thing the ancients went about, when they deſigned to lay cloſe ſiege to a place, was the *apoteichiſmus*; which ſometimes conſiſted of a double wall, or rampart, raiſed of earth; the innermoſt to prevent ſudden ſallies from the town; the outermoſt to keep off foreign enemies from coming to the relief of the beſieged. This anſwered to what are called lines of contravallation and circumvallation, among the moderns.

APOTELESMA, from *αποτελεω*, *I perform*, in a general ſenſe, denotes an effect of ſome cauſe. It is alſo uſed for a prognoſtic, or natural prediction of an event.

In which ſenſe, Scaliger ſpeaks of the *apoteleſmata* of Hippocrates. The anſwers of aſtrologers deduced from the conſideration of the ſtars are particularly called *apoteleſms*, or *apoteleſmata*; which were the expreſſions they uſed, to denote the effects of the ſtars and planets on ſublunary bodies.

In which ſenſe, *apoteleſmata* amount to the ſame with influences.

APOTELESMATICA, the ſcience of *apoteleſms*, or the art of foretelling future events, from the aſpects and configurations of the heavenly bodies.

In this ſenſe, the word amounts to the ſame with what we otherwiſe call *judicial aſtrology*.

Sozomen denominates this *apoteleſmatical aſtronomy*.

Hence alſo aſtrologers are called *apoteleſmatici*, as ſynonymous with *mathematici*, *genethliaci*, *Chaldæi*, &c.

APOTHECARY, a perſon who profeſſes the practice of pharmacy, or that part of phyſic which conſiſts in the preparation and compoſition of medicines.

The word is derived from *αποθηκη*, *ſhop*, the place where he makes up, and expoſes his medicines to ſale.

The *apothecaries* in England are obliged to make up their medicines according to the formulas preſcribed in the college diſpenſatory.

Their ſhops are ſubject to the viſitation of the cenſors of the college; who are impowered to deſtroy ſuch medicines as they think not good.

The company of *Apothecaries* were incorporated by a charter from James I. procured at the ſolicitation of Dr. Mayerne and Dr. Atkins; till that time they only made a part of the grocers company; plums, ſugar, ſpice, Venice-treacle, mithridate, &c. were ſold in the ſame ſhop, and by the ſame perſon. The reaſon of ſeparating them was, that medicines might be better prepared, and in oppoſition to divers perſons who impoſed unwholeſome remedies on the people. Obſerv. on Caſe of Will. Roſe, ſect. 2.

In the year 1712, the 10th of queen Anne, an act paſſed for reviving and continuing ſeveral acts therein mentioned, one whereof was for exempting the apothecaries from ſerving the offices of conſtables and ſcavengers, and other pariſh and ward offices, and from ſerving upon juries; which act was made perpetual in the ninth year of George I.

They have a hall in Black Friers, where there are two fine laboratories, out of which all the ſurgeons cheſts are ſupplied with medicines for the royal Britiſh navy.

To his majeſty belong two *apothecaries*: the ſalary to the firſt, 320*l.* to the ſecond, 275*l.*—To the houſhold belong alſo two.

Bartholin complains of the too great numbers of *apothecaries* in Denmark; though there are but two allowed in all Copenhagen, and one in every other conſiderable town.

In Muſcovy, we are told, there are no *apothecaries* at all; but then there are no phyſicians neither, except two or three retained by the court, and thoſe rather for ſtate than ſervice.

Travellers ſpeak of a famous *apothecary*'s ſhop at Dreſden, furniſhed with four thouſand ſilver pots, all filled with the choiceſt drugs.

It is ſtrange, to what an height *apothecaries* have found means to carry their favourite polypharmacy, conſidering what a few ſimple eaſy medicines will anſwer all the purpoſes of their vaſt ſhops. The phyſicians of Paris, toward the beginning of the ſeventeenth century, began to oppoſe the growing evil. Patin was one of the warmeſt. They went ſo far, as at length to exclude the miniſtry of the *apothecaries* in almoſt all caſes. A valet, or a chambermaid, prepared and adminiſtered the purges, clyſters, &c. The bookſeller of the *Medecin Charitable* (which they had procured to be written for the purpoſe) made up and ſold moſt of the medicines directed in it; and even the phyſicians, when they wanted, ſent to him for them. Patin, Lett. 17. à Berlin.

The charitable diſpenſation of medicines by the Chineſe is well deſerving notice. They have a ſtone, which is ten cubits high, erected in the public ſquares of their cities; and on this ſtone are engraved the names of all ſorts of medicines with the price of each; and when the poor ſtand in need of any relief from phyſic, they go to the treaſury, where they receive the price each medicine is rated at.

APOTHECARY, *apothecarius*, in *Writers of the middle Age*, denotes a ſhop-keeper, or ware-houſe-keeper.

APOTHECARIUS is alſo uſed to denote a ſtore-keeper, or officer appointed to have the direction of a magazine, GRANARY, &c.

In which ſenſe *apothecarii* is ſometimes rendered by *horrearii* and *rationarii*.

APOTHEOSIS, in *Antiquity*, an heathen ceremony, whereby their emperors and great men, were placed among the gods.

The word is derived from *απο*, and Θεος, *God*.

After the *apotheoſis*, which they alſo called *deification* and *conſecration*, temples, altars, and images, were erected to the new deity; ſacrifices, &c. were offered, and colleges of prieſts inſtituted. Dio 47, 56, 59. Suet. Aug. 5. Tib. 40. Paterc. 1. Ovid. Pont. 4.

Images were erected to them with the attributes of divinity (Lucan 7. Dio 53. Capitolin. Antonin). And to demoliſh them was deemed treaſon (Venul. lib. vi. D. ad leg. Jug. mal) And even the ſenate decreed that oaths ſhould be taken in their names (Dio 44, 59, 60. Tac. Ann. 1.) Vid. Kirchm. de fun. Rom. 4 14.

It was one of the doctrines of Pythagoras which he had borrowed from the Chaldees, that virtuous, perſons, after their death, were raiſed into the order of the gods. And hence the ancients deified all the inventors of things uſeful to mankind; and thoſe who had done any important ſervice to the commonwealth.—Tiberius propoſed to the Roman ſenate the *apotheoſis* of Jeſus Chriſt, as is related by Euſebius, Tertullian, and Chryſoſtom. Juvenal, rallying the frequent *apotheoſes,* introduces poor Atlas, complaining that he was ready to ſink under the burden of ſo many new gods as were every day added to the heavens. Seneca ridicules the *apotheoſis* of Claudius with admirable humour.—Herodian, lib. iv. in ſpeaking of the *apotheoſis* of Servius, gives us a very curious deſcription of the ceremonies uſed in the *apotheoſis* of the Roman emperors. After the body of the deceaſed emperor, ſays he, had been burnt, with the uſual ſolemnities, they placed an image of wax, perfectly like him, but of a ſickly aſpect, on a large bed of ivory, covered with cloth of gold, in the veſtibule of the palace. The greateſt part of the day, the ſenate ſat ranged on the left ſide of the bed, dreſſed in robes of mourning; the ladies of the firſt rank ſitting on the right ſide, in plain and white robes, without any ornaments. This laſted for ſeven days ſucceſſively, during which, the phyſicians came from time to time to viſit the ſick, always making their report, that he grew worſe; till at length they publiſhed it, that he was dead.

This done, the young ſenators and Roman knights took the bed of ſtate upon their ſhoulders, carrying it through the Via Sacra to the Old Forum, where the magiſtrates were uſed to diveſt themſelves of their offices. There they ſet it down, between two kinds of amphitheatres, in the one whereof were the young men, and in the other the maidens of the firſt families of Rome, ſinging hymns ſet to ſolemn airs, in praiſe of the deceaſed. Theſe hymns ended, the bed was carried out of the city into the Campus Martius, in the middle of which place was erected a kind of ſquare pavilion, the inſide whereof was full of combuſtible matters, and the outſide hung with cloth of gold, and adorned with figures of ivory, and various paintings.

Over this edifice were ſeveral others, like the firſt in form and decoration, but leſs; always diminiſhing and growing ſlenderer towards the top. On the ſecond of theſe was placed the bed of ſtate; and a great quantity of aromatic perfumes, and odoriferous fruits and herbs, were thrown all around; after which, the knights made a proceſſion or cavalcade in ſolemn meaſures around the pile; ſeveral chariots alſo ran round it, thoſe who conducted them being clad in purple robes, and bearing the images of the greateſt Roman emperors and generals.

This ceremony ended, the new emperor came to the *catafalco,* or pile, with a torch in his hand; and, at the ſame time, fire was ſet to it on all ſides; the ſpices and other combuſtibles kindling all at once.

While this was doing, they let fly, from the top of the building, an eagle, which, mounting into the air with a fire-brand, carried the ſoul of the dead emperor along with it into heaven, as the Romans believed; and thenceforward he was ranked among the gods. It is for this reaſon, that the medals, wherein *apotheoſes* are repreſented, have uſually an altar with fire upon it; or elſe an eagle taking its flight into the air, and ſometimes two eagles.

APOTHERAPIA, from αποθεραπευω, *I cure,* in *Phyſic,* properly denotes a complete or finiſhed cure.

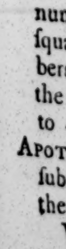
Apotherapia is alſo uſed, in the *Gymnaſtic Art,* for the laſt part of all regular exerciſe, viz. friction or unction with oil, before, as well as after bathing.

The deſign of this was partly to cleanſe the ſkin from any filth or duſt it might have contracted during the exerciſe, and partly to remove wearineſs.

APOTHERMUM, from απο, and θερμος, *hot,* in *Ancient Writers,* a ſharp kind of ſauce, like that prepared of muſtard, oil, and vinegar, or of vinegar alone.

APOTOME, in *Mathematics,* the remainder or difference of two incommenſurable quantities.

The word is derived from αποτεμνω, *I cut off.*



An *apotome,* in *Geometry,* is an irrational reſidue, as CB, ariſing, when from a rational line AC, called *a,* you cut off a rational part AB, called *b,* only commenſurable in power to the whole line AC. It may be expreſſed thus, $a-\sqrt{b}$. Such is the difference between the ſide of an equilateral triangle, and a perpendicular, from the vertex to the baſe.

Euclid makes ſix ſorts of *apotomes.*

Apotome *prima,* is when the greater number is a rational number, and the difference of the ſquares of both numbers is a ſquare number, e. gr. $3-\sqrt{5}$.

Apotome *ſecunda,* is where the leſſer number is a rational number, and the ſquare root of the difference of the ſquares of both numbers has a ratio expreſſible in numbers to the greater number; ſuch is $\sqrt{18}-4$, ſince the difference of the ſquares 18 and 16 is 2, and $\sqrt{2}$ is to $\sqrt{18}$ as 1 to 3, becauſe $\sqrt{18}=3\sqrt{2}$.

Apotome *tertia,* is when both the numbers which are ſubtracted from each other are irrational numbers, and the ſquare root of the difference of their ſquares has a ratio in numbers to the greater. This holds in $\sqrt{24}-\sqrt{18}$, for the difference of their ſquares 24 and 18 is 6, and $\sqrt{6}$ is to $\sqrt{24}$ as 1 is to 2, for $\sqrt{24}=2\sqrt{6}$.

Apotome *quarta,* is when the greater number is a rational number, and the ſquare root of the difference of the ſquares of both numbers has no ratio to it in numbers. Such is $4-\sqrt{3}$, for the difference of the ſquares 16 and 3, is 13. but the ſquare root of 13, viz. $\sqrt{13}$ has no numerical ratio to 4.

Apotome *quinta,* is when the leſſer number is a rational number, and the ſquare root of the difference of the ſquares of both numbers has no ratio in numbers to the greater number. Such is $\sqrt{6}-2$, for the difference of the ſquares 6 and 4, is 2, and $\sqrt{2}$ has to $\sqrt{6}$ no ratio in numbers.

Apotome *ſexta,* is where both numbers are irrational, and the ſquare root of the difference of their ſquares has no ratio in numbers to the greater. Such is the caſe in $\sqrt{6}-\sqrt{2}$, for the difference of the ſquares 6 and 2 is 4, and the root thereof 2 has to the $\sqrt{6}$ no ratio in numbers.

Peter Ramus cenſures Euclid's doctrine of *apotomes,* and even all the reſt delivered in the tenth book concerning irrational lines.

Apotome, in *Muſic,* is the difference of the tone *major* and LIMMA, expreſſed by $\frac{2187}{2048}$.

The Greeks thought, that the greater tone could not be divided into two equal parts; for which reaſon they called the firſt part αποτομη, and the other λιμμα; in this imitating Pythagoras and Plato.

The *apotome* is by ſome authors, as Boethius, called *hemitonium majus*; and the *limma, hemitonium minus.* He alſo calls the difference of theſe two, *comma.* The interval of two ſounds expreſſed by $\frac{125}{128}$, was called by the ancients *apotome major,* and that expreſſed by $\frac{2025}{2048}$, *apotome minor.*

APOTRAGOPOGON, in the *Materia Medica,* a name given by ſome of the old authors to the LADANUM.

APOTROPÆA, from αποτρεπω, *I avert,* in the *Ancient Poetry,* verſes compoſed for averting the wrath of incenſed deities; and the deities invoked for averting any threatened misfortune were called *Apotrepeans*: they were alſo called *Alexicaci,* from αλεξω, *I drive away*; and *averrunci* from *averrunco,* which denotes the ſame.

APOZEM, in *Medicine,* a form of remedy, otherwiſe called a DECOCTION.

The word is derived from αποζεω, *fervefacio, I make hot.*

Apozems are a claſs of liquid medicines, compoſed of the juices of divers plants, roots, woods, flowers, leaves, fruits, and ſeeds, drawn out by boiling in water, and ſweetened and clarified. An *apozem* differs from a *ſyrup,* in thickneſs and conſiſtence; the *ſyrup* being more denſe and viſcous than the *apozem,* from the quantity of ſugar. It differs from a *julap,* in that it is thicker, and more viſcous; and is not made with diſtilled waters, as *julaps* are, but only with common water.

There are purging *apozems,* cephalic *apozems,* hepatic *apozems,* antarthritic, diuretic, ſtyptic, &c. *apozems.*

Apozem differs from *infuſion,* on account of the greater degree of heat made uſe of in preparing the former, whereby the *apozem* becomes more fitly impregnated with thoſe parts of the ſubject which are readily ſoluble in boiling water.

Apozems are medicines of the extemporaneous kind, and therefore the leſs uſed, becauſe that which is once made up will not keep. What is directed in this form, is generally ſent to the patient in the quantity of a quart at a time, to be drank off plentifully as common drink.

APPANAGE, or Appenage. See Apanage.

APPARATOR. See Apparitor.

APPARATUS, from *apparo, I prepare,* properly ſignifies a formal preparation for ſome public and ſolemn action.

We ſay, the *apparatus* of a feaſt, coronation, &c. The prince made his entry with great *apparatus* and magnificence.

Apparatus is alſo uſed for the utenſils and appendages belonging to ſome more conſiderable machine. As, the furniture or *apparatus* of an air-pump, microſcope, &c.

Apparatus is ſometimes alſo uſed in *Chirurgery,* for the bandages, medicaments, and dreſſings of a part; or the ſeveral matters applied for the cure of a wound, ulcer, or the like.

There is no judging of the quality of a hurt, till after taking off the firſt *apparatus,* or coverings.

Apparatus is frequently uſed for the operation of cutting for the ſtone.

For this there are three ſorts of *apparatus,* viz. the *ſmall* (1), *great* (2), and *high apparatus* (3): which ſee deſcribed under the article Lithotomy.

Apparatus is alſo uſed as a title of ſeveral books compoſed in form of catalogues, bibliothecas, dictionaries, &c. for the eaſe and conveniency of ſtudy.

The *apparatus* to Cicero, is a kind of concordance, or collection of Ciceronian phraſes, &c. The *apparatus ſacer* of Poſſevin, is a collection of all kinds of eccleſiaſtical authors printed in 1611, in three volumes.—Gloſſaries, comments, &c. are alſo frequently called *apparatuſes*.

APPARENT, from *appareo*, *I appear*, that which is viſible, or evident to the eye, or the underſtanding.

Apparent *conjunction* of the planets is, when a right line, ſuppoſed to be drawn through the centre of two planets, does not paſs through the centre of the earth, but through the eye of the ſpectator.

Apparent *Altitude*, *Diameter*, *Diſtance*, *Heir*, *Horizon*, *Magnitude*, *Motion*, *Place*, *Time*, &c. See the ſeveral ſubſtantives.

APPARITION, in *Aſtronomy*, denotes a ſtar's or other luminary's becoming viſible, which before was hid.

In which ſenſe the word ſtands oppoſed to OCCULTATION.

The HELIACAL riſing is rather an *apparition* than a proper riſing.

Apparition, *circle of perpetual*. See Circle *of perpetual apparition*.

Apparition, in a general ſenſe, is the appearance or ſemblance of a thing.

Apparition is alſo uſed to denote a ſpectre, or præternatural appearance of ſome ſpirit, or the like.

We read of *apparitions* of angels, genii, dæmons, fairies, witches, departed ſouls, &c. *apparitions* of God, of Chriſt, the Virgin, ſaints, prophets, and of the devil himſelf.

Many of the *apparitions*, we are told of by writers, are doubtleſs mere deluſions of the ſenſe; many others were ſeen but in dreams or deliquiums; many others are fictions contrived merely to amuſe, or anſwer ſome purpoſe. *Apparitions*, it is certain, are machines that on occaſion have been of good ſervice to generals, to miniſters of ſtate, to prieſts, and others. It has been controverted whether an *apparition* be any proof of a future ſtate.

The abbé de St. Pierre has a diſcourſe expreſsly on the phyſical method of ſolving or accounting for *apparitions*; he makes them the effect of feveriſh dreams, diſturbed imaginations, &c.

APPARITOR, or **Apparitour**, or **Apparator**, a BEADLE in an UNIVERSITY, who carries the mace before the maſters, and the faculties.

Apparitor is alſo uſed in ſome ancient Engliſh laws, for a judge or juſtice.

Apparitor *comitatus*. There was formerly an officer called by this name, for which the ſheriffs of Buckinghamſhire had a conſiderable yearly allowance; and in the reign of queen Elizabeth, there was an order of court for making that allowance. But the cuſtom and reaſon of it are now altered.

Apparitors alſo denote meſſengers, who cite men to appear in the eccleſiaſtical courts.

Among the Romans, *apparitors* were the ſame with ſerjeants or tipſtaffs among us; or rather *apparitor* was a general term, and compriſed under it all the miniſters and attendants of the judges and magiſtrates, appointed to receive and execute their orders.—And hence, they ſay, the name was derived, viz. from *apparere*, *to be preſent*, *to be in waiting*.

Under the name *apparitores* were comprehended the *ſcribæ*, *accenſi*, *interpretes*, *præcones*, *viatores*, *lictores*, *ſtatores*, and even the *carnifices* or hangmen.

They were uſually choſen out of the freedmen of the magiſtrates, and their condition was held in ſo much contempt, that as a mark of ignominy, the ſenate appointed a city that had revolted from them to furniſh them with *apparitors*.

There were alſo a kind of *apparitors of cohorts*, called *cohortales*, or *conditionales*, as being attached to a cohort, and doomed to that condition.—The *apparitors* of the prætors, *prætoriani*, were thoſe who attended the prætors, or governors of provinces; and who, on their maſter's birth-day, were always changed, and preferred to better poſts.—Add, that the pontifices had alſo their *apparitors*, as appears from an inſcription of an ancient marble in the *Via Appia*:

APPARATORI
PONTIFICVM
PARMVLARIO.

APPAUMEE, from the French *paume*, *palm of the hand*, in *Heraldry*, denotes one hand extended with the palm appearing, and the thumb and fingers at full length.

APPEAL, in *Law*, ſignifies the removal of a cauſe from an inferior judge to a ſuperior; or the having recourſe to a ſuperior judge to rectify what is amiſs in a ſentence paſſed by an inferior.

Appeals to Rome were firſt introduced into England in the reign of king Stephen; and though they were not ſtrictly regarded in the ſucceeding reigns, they continued till the time of king Henry the Eighth, when they were finally aboliſhed by the 24th H. 8. c. 12. and 25th H. 8. c. 19.

Appeals lie from the archdeacon or his official to the biſhop, and again from the biſhop or his commiſſary to the archbiſhop; and by the 25th H. 8. c. 29. for lack of juſtice in the archbiſhop's courts, the party may *appeal* to the king in chancery, where commiſſioners are named, and by reaſon of this appointment they are called *delegates*; and after the deciſion of this court, a commiſſion of review has been ſometimes appointed.

Appeals lie from all the ordinary courts of juſtice to the houſe of lords, who judge *en dernier reſſort*; i. e. no *appeal* lies from them.

There are *appeals* from eccleſiaſtical juſtice to ſecular.—The firſt inſtance of this is that of Paulus Samoſatenus; who being condemned and depoſed by the ſecond council of Antioch, refuſed to ſurrender the epiſcopal houſe to Domnus, who had been elected his ſucceſſor; and *appealed* to the emperor.

Appeal is alſo uſed in *Common Law* in the ſame ſenſe with *accuſatio* among the *Civilians*. For as, in the *Civil Law*, cognizance of criminal caſes is taken either upon *inquiſition*, *accuſation*, or *denunciation*; ſo, in ours, it is taken either upon *indictment*, or *appeal*.

Indictment comprehends both *inquiſition* and *denunciation*.—*Appeal* or accuſation is a lawful declaration of another man's crime (which, by Bracton, muſt be felony at the leaſt) before a competent judge, by one that ſetteth his name to the declaration, and undertakes to make it good on the penalty that may otherwiſe enſue.

An *appeal* is commenced two ways; either by WRIT, or by BILL.

Appeal by *writ* is, when a writ is purchaſed out of chancery by one to another; to this end, that he *appeal* a third of ſome felony committed by him, finding pledges that he ſhall do it, and deliver this writ to the ſheriff to be recorded.

Appeal by *bill* is, when a man of himſelf gives up his accuſation in writing to the ſheriff or coroner; offering to undergo the burden of *appealing* the perſon therein named.

This practice is drawn from the Normans, as appears from the Grand Cuſtomary, wherein is a ſolemn diſcourſe both of the effects of this *appeal*, viz. the order of the combat, or the trial by inqueſt; which, by our law, was in the choice of the defendant.

Appeal *of mayhem* is an accuſing of one that hath maimed another.—But this being heretofore no felony, the *appeal* thereof was but in manner of an action of treſpaſs; ſo that there was nothing recovered but the damages.

Bracton calls this, *appellum de plagiis mahemio*, and has a whole chapter of it.—In king John's time, there is recorded an *appeal* againſt a Jew, *qui fecit ementulari quendam nepotem ſuum*.

Appeal *of rape* lies where a rape is committed on the body of a woman.

Appeal *of robbery* is a remedy given by the common law, whereby a perſon robbed of his goods may obtain reſtitution of them. But the three laſt kinds of *appeal* are now much out of uſe, becauſe of the intricacy of the pleadings, and the charge of proſecution; and the method of indictment is generally adopted.

Appeal *of wrong impriſonment* is uſed by Bracton for an action of wrong or falſe impriſonment.

Appeal is more particularly uſed for a private accuſation of a murderer, by one who had intereſt in the murdered party; or of any felon by one of his accomplices in the fact.

An *appeal* of death, which is now chiefly in uſe, is a vindictive action, which the law gives to a wife during widowhood, againſt the murderer of her huſband, or to the male heir at law, againſt one who kills his anceſtor. The *appeal* muſt be lodged in a year and a day after the death of the perſon murdered. If the perſon *appealed* be acquitted, the appellant ſhall be impriſoned for a year, reſtore damages to the party, and pay a fine to the king. 13th Ed. 1. ſt. 1. c. 13.

If an *appeal* of murder or felony be uſed by any common perſon againſt a peer; he ſhall be tried by commoners, and not by his peers.

The perſon who brings an *appeal* is called the *appellant*; and the perſon *appealed*, the *appellee*.

In an *appeal*, the king cannot pardon.

APPEARANCE, the exterior ſurface of a thing; or that which firſt ſtrikes the ſenſe, or the imagination.

The Academics maintain, that the ſenſible qualities of bodies are only *appearances*; and the like doctrine is held by ſome later philoſophers.

Our errors ariſe chiefly from a too haſty and precipitate aſſent of the will, which acquieſces too eaſily in the *appearances* of truth.

Appearance, in *Law*, is the defendant's engaging to anſwer a cauſe or action entered againſt him in ſome court of judicature.

Appearance, in the King's Bench, is the defendant's filing either of common or ſpecial bail, if the action be by bill.—It it be by original, the *appearance* muſt be with the PHILAZER of the county where the arreſt was.

Appearance, in the Common Pleas, muſt be entered with the PHILAZER there; but if it be by bill, with the PROTHONOTARY.

APPEARANCE, in *Perſpective*, is the repreſentation or projection of a figure, body, or like object, upon the perſpective plane.

The *appearance* of an objective right line is always a right line. See PERSPECTIVE.—The *appearance* of an opake body and a luminary being given, to find the *appearance* of the ſhadow; ſee SHADOW.

APPEARANCE *of a ſtar* or *planet*. See APPARITION.

APPEARANCES, in *Aſtronomy*, &c. are more uſually called *phænomena* and *phaſes*.

In *Optics* we uſe the term *direct appearance* for the view or ſight of any object by direct rays; without either refraction or reflexion.

APPEARANCES, *to ſave*, is to diſcharge one's duty ſeemingly, or acquit himſelf of the formalities and externals thereof; ſo as to ſave his character, and avoid giving ſcandal or offence.

APPEARANCES, in *Phyſiology*. See PHASMATA.

APPEASING *remedies*, in *Medicine*, are thoſe which aſſuage the pain in a diſeaſe, and give the patient ſome reſt, or reſpite; and at the ſame time contribute to the cure.

Theſe amount to the ſame with what we otherwiſe call PAREGORICS, ANODYNES, &c.

APPELLANT. See APPEAL.

APPELLANTS is particularly uſed in our time, for thoſe among the French clergy, who refuſed to ſubſcribe the conſtitution or bull *unigenitus*, iſſued by Clement XI. in 1713, and appeal from it, either to the pope better informed, or a general council.

The French biſhops, prieſts, monks, and even nuns, are divided into *appellants*, and *non-appellants*. The Janſeniſts and their followers are generally *appellants*.

APPELLATIVE, or *Noun* APPELLATIVE, in *Grammar*, a common name; or a name which belongs or is applicable to things of a certain kind.

The word is formed of *appellare*, *to name a thing*.

Such are the names, *man*, *angel*, *horſe*, *plant*, *tree*, &c.

Appellatives ſtand opppoſed to PROPER names, which belong only to individuals; as *Peter*, *Gabriel*, *Bucephalus*, &c.

APPELLEE, in the *Common Law*. See APPEAL.

In the *Civil Law*, *appellee*, *appellatus*, properly belongs only to the judge before whom an appeal is brought.

APPENAGE. See APANAGE.

APPENDANT, from *appendo*, *I hang by*, in *Law*, is underſtood of ſuch things as by time of preſcription have belonged, appertained, and been joined, to ſome other principal thing.

Thus an hoſpital may be *appendant* to a manor; a common of fiſhing, to a freehold; a ſeat in a church, to a houſe; or the like.

APPENDANT, *advowſon*. See ADVOWSON.

APPENDANT, *common*. See COMMON.

APPENDICULA denotes a little or diminutive APPENDIX.

The word is ſeldom uſed, except by anatomiſts, in the following phraſe:

APPENDICULA *vermiformis*, in *Anatomy*, a name given by ſome to the inteſtine *cæcum*, which they conſider only as an appendage of the *colon*, and not as the true *cæcum* of the ancients.

APPENDICULÆ *aſteriarum*, *wires of aſteriæ*, a name given by the writers on *Natural Hiſtory*, to certain ſmall branches which are placed in a circular order at different diſtances upon the columns of the *aſteriæ*.

APPENDIX, or APPENDAGE, a thing neceſſary to, or dependent on another.

The term is chiefly uſed in matters of literature, for an additional diſcourſe, placed at the end of any piece, or writing; to explain or proſecute ſomething there left deficient, or to draw concluſions therefrom.—In which ſenſe the word coincides with SUPPLEMENT.

APPENDIX, in *Anatomy*, is a part, in ſome meaſure, detached from another part, to which however it adheres, or is contiguous.

There are membranous *appendices*, of various figures, in moſt of the inner parts of the body.

The *cæcum* is by ſome writers called *appendix*, or *appendicula vermiformis*.

Mr. Monro aſſures us, he never ſaw the *appendix vermiformis* of any of the human fœtuſes which he diſſected, diſtended with *meconium*, and therefore he cannot allow it as a reſervoir of the *fæces* during geſtation. From the numerous mucous *lacunæ* in the human *appendix*, and the like ſtructure in the *cæca* of brutes, its uſe ſeems to be to furniſh *mucus* to lubricate the internal ſurface of the great ſac of the *colon*, and to moiſten the *fæces* in it, that they may be more eaſily puſhed forward out of this part of the gut, where there is the greateſt difficulty in their progreſs, and where by ſtagnating too long, they may bring on troubleſome ſymptoms. Witneſs the diſeaſe called PLACENTA *inteſtinalis*. Med. Eſſ. Edinb. vol. iv. art. 12.

APPENDIX is more particularly uſed in the ſame ſenſe with EPIPHYSIS.

APPENSA, or APPENDED *remedies*, ſuch as are outwardly applied, by hanging about the neck.

The word comes from *ad*, and *pendo*, *I hang to*.

Such are divers amulets, necklaces, phylacteries, &c.

APPERCEPTION, or ADPERCEPTION, is uſed by Leibnitz and his followers, for an attribute of the mind, conſidered as conſcious of, or reflecting on its own perceptions.

In which ſenſe the word amounts to the ſame with what Des Cartes and others call CONSCIENCE or CONSCIOUSNESS.

APPERTINANCES. See APPURTENANCES.

APPETITE, APPETITUS, APPETENCY, in *Philoſophy*, a deſire of enjoying ſomething wanted; or a complacency in the fruition of a thing preſent.

The word is formed of *ad*, *to*, and *peto*, *I crave*.

Some philoſophers define *appetite*, more generally, an inclination of the ſoul towards ſome object conſidered as good; or a propenſity to an object, in reſpect of the good that is apprehended in it.

The ſchoolmen diſtinguiſh *appetite* into *voluntary* and *natural*.

The firſt is the will itſelf, acting under a competent knowledge or information of the thing in hand: ſuch is the *appetite* or deſire of being happy. The ſecond is a kind of inſtinct, whereby we are mechanically driven to conſult our own preſervation.

Natural *appetite* is ſubdivided into *concupiſcible*, and *iraſcible*.

Others again divide it into *ſenſitive* and *rational*.

APPETITE, *ſenſitive*, is that which ariſes from a notion of goodneſs in the object, as impreſſed by the impulſe of the *ſenſes*.

APPETITE, *rational*, is that which ariſes from an apprehenſion of good in the object, as conceived by the underſtanding.

APPETITE is reſtrained, by Hutcheſon, to ſuch of our deſires as have a previous painful and uneaſy ſenſation, antecedently to any opinion of good in the object; nay, ſo as that the object is often chiefly eſteemed good only for its allaying this pain or uneaſineſs, or if it give alſo poſitive pleaſure, yet the uneaſy ſenſation is previous to, and independent of this opinion of good in it.

APPETITES are paſſions directed to general objects, in contradiſtinction to paſſions directed to particular objects, which retain their proper name. Thus we ſay, an *appetite* for fame, for glory, for conqueſt, for riches; but we ſay the *paſſion* of love, of gratitude, of envy, &c. *Appetite* may be alſo diſtinguiſhed from *paſſion*, ſince the latter has no exiſtence till a proper object be preſented; whereas the former exiſts firſt, and then is directed to an object. Elem. Crit. vol. i. p. 44.

APPETITE, in *Medicine*, is more particularly uſed to denote a natural periodical call or deſire to eat and drink, in order to repair what had been waſted by the ſeveral excretions of the body.

A loſs or proſtration of *appetite* is called ANOREXIA.—A prepoſterous *appetency* of things not proper for food is called PICA.

An immoderate *appetite* is called BULIMIA, or *fames canina*.—Some, however, diſtinguiſh between the βυλιμια, and canine *appetite*; making it the diſtinguiſhing character of the latter, that it is attended with a lientery, or other cœliacal flux.

APPETITE, *exceſſive*. See OREXIS.

APPETITE, *defective*. The defect of *appetite* is of two kinds, and is uſually divided, by medical writers, under two names, the *anorexia* and *nauſea*.

The *anorexia* is a too great abſtinence from foods, which ſometimes has its origin from depravation of the ſtomach, ſometimes from other cauſes more remote.

The *nauſea* is defined to be a plenary abſtinence from foods, being a complaint of the ſame nature and origin with the *anorexia*, but differing in degree.

The ſigns are very obvious ſo far as a diſtaſte to food, which is common to both; but there is this difference, that in an *anorexia* the patients uſually eat ſomething, though without *appetite*, and are troubled always with a pain and uneaſineſs in the ſtomach after it; but in the *nauſea* there is a greater diſreliſh of food of all kinds, and frequent ſtraining to vomit. Men of idle lives, and ſuch as drink too freely of ſtrong liquors, are ſubject to *idiopathic* defects of *appetite*, from actual injuries in the ſtomach; others labouring under the different diſeaſes before mentioned, are as often ſubject to the *ſymptomatic*. People of a ſanguine habit, when afflicted with a loſs of *appetite*, always find great relief in acids of the milder kind; and thoſe of a leucophlegmatic habit are often cured by taking ſmall doſes of *elixir proprietatis* every day before dinner. Some perſons are very fond of external applications to the ſtomach in thoſe caſes, but theſe are rarely found to be of any great ſervice. The beſt of them is a plaſter of *tacamahaca*, with oil of maſtic.

APPIADES, in *Mythology*, five divinities ſo called becauſe their temples were at Rome near the fountains of Appius; viz. Venus, Pallas, Veſta, Concord, and Peace.

APPIAN *Way*, a great Roman highway, paved by Appius Claudius, cenſor of Rome, in the 444th year of that city. It commenced at the gate Capenna, now called St. Sebaſtian's, and paſſing over the mountain called St. Angeli, croſſes the plain of Valdranus, the *Palus Pontines*, and ends at Capua.

Caius Gracchus placed the ſmall columns called *termini*, which marked the miles.

APPLAUSE, properly ſignifies an approbation of ſomething, witneſſed by clapping of hands.

The word comes from the verb *plaudere*, *to clap the hands*. The ancient way of *applauding* by clapping the hands, is ſcarce retained any where but in colleges and theatres.—Such a tragedy was acted with great *applauſe*; ſuch a ſtudent maintained a theſis with *applauſe*, &c.

There were three ſpecies of *applauſe*, denominated from the different noiſes made in them, viz. *bombus*, *imbrices*, and *teſtæ*; the firſt a confuſed din, made either by the hands or the mouth; the ſecond and third by beating on a ſort of ſounding veſſels placed in the theatres for this purpoſe.

Perſons were inſtructed to give *applauſe* with ſkill; and there were even maſters who profeſſed to teach the art. The proficients in this way let themſelves out for hire to the vain-glorious among the poets, actors, &c. and were properly diſpoſed to ſupport a loud *applauſe*. Theſe they called *laudicoeni*.

At the end of the play, a loud peal of *applauſe* was expected, and even aſked of the audience, either by the chorus, or the perſon who ſpoke laſt. The *formula* was, *ſpectatores plaudite*, or *valete & plaudite*.

The *plauſores*, or applauders, were divided into *chori*, and diſpoſed in theatres oppoſite to each other, like the choriſters in cathedrals; ſo that there was a kind of concert of *applauſes*.

APPLE-*tree*, *malus*, in *Botany*. In the Linnæan ſyſtem, this is a ſpecies of the *pyrus*, and belongs to the genus of *icoſandria pentagynia*. The characters of it are, that the branches ſpread, and are more depreſſed than thoſe of the pear-tree. The flower conſiſts of five leaves, which expand in form of a roſe. The fruit is hollowed about the foot-ſtalk, and is for the moſt part roundiſh, and umbilicated at the top; is fleſhy, and divided into five cells or partitions, in each of which is lodged one oblong ſeed. There are three ſpecies: the *wild apple*, with a very ſour fruit, commonly called *crab*: the *wild crab* of Virginia, with a ſweet-ſcented flower: and the *dwarf apple*, commonly called *Paradiſe apple*.

Apples are no natural fruit, but the mere creatures of art. The way of propagating them, is by ſowing kernels in the ground, which only produce crabs or wildings, different in figure and taſte from the parent fruit. To turn theſe to *apples* of any particular kind, is the buſineſs of engrafting. A cyon of an *apple*-tree inſerted into a crab-ſtock, occaſions the crab-tree from that time to produce *apples* of the ſame quality with thoſe from whence the cyon was taken. Mr. Ray lays it down as a rule, that the fruit always follows the cyon.

In the nurſeries, there are three ſorts of ſtocks generally uſed to graft *apples* upon; the firſt are called *free-ſtocks*, which are raiſed from the kernels of all ſorts of *apples* indifferently, and by ſome theſe are alſo termed crab-ſtocks; for all thoſe trees which are produced from the ſeeds before they are grafted, are termed crabs without any diſtinction. But ſuch ſtocks ſhould always be preferred, as are raiſed from the kernels of crabs, where they are preſſed for verjuice; and ſeveral old writers on this ſubject are of the ſame opinion. Auſten, who wrote a hundred years ago, ſays, "The ſtock which he accounts beſt for *apple* grafts is the crab, which is better than ſweeter *apples* to graft on, becauſe they are uſually free from canker, and will become very large trees, and I conceive will laſt longer than ſtocks of ſweeter *apples*, and will make fruits more ſtrong and hardy to endure froſts."—It is very certain, that by frequent grafting ſome ſorts of *apples* upon free-ſtocks, the fruits have been rendered larger, but leſs firm, poignant, and of ſhorter duration. The ſecond ſort of ſtocks is the *Dutch creeper*; theſe are deſigned to ſtint the growth of trees, and keep them within compaſs for dwarfs or eſpaliers. The third ſort is the *Paradiſe apple*, which is a very low ſhrub; ſo only proper for trees which are kept in pots by way of curioſity, for theſe do not continue long.

For the method of *grafting*, ſee ENGRAFTING.

For the method of planting orchards to the greateſt profit, the ſoil and ſituation is of great import. The beſt ſituation is the aſcent of gentle hills, facing the ſouth or ſouth-eaſt; but this aſcent muſt not be too ſteep, leſt the earth ſhould be waſhed down by heavy rains.

The ground intended to be planted ſhould be well prepared the year before, by thorough plowing. when, if ſome dung be laid on, it will be of great ſervice to the trees. If, in the preceding ſpring, a crop of peaſe or beans is planted on the ground, ſo as that the ground between the rows may be horſe-hoed, it will deſtroy the weeds, looſen the ground, and prove a good preparation for the trees; for the earth cannot be too much wrought or pulverized for this purpoſe. Theſe crops will be off the ground, before the ſeaſon for planting the trees, which is to be performed when they begin to ſhed their leaves.

In chuſing the trees, ſuch as are but of two years growth from the graft are to be preferred; old trees, or ſuch as are grafted upon old ſtocks, ought never to be planted. The diſtance they ſhould be planted at, where the ſoil is good, muſt be fifty or ſixty feet; though forty feet may be ſufficient where the land is not ſo good: nothing can be of worſe conſequence, than the crowding trees too cloſe together.

When the trees are planted, they ſhould be ſtaked, to prevent their being ſhaken or blown out of the ground by ſtrong winds. But in doing this, particular care ſhould be taken to put ſtraw, hay-bands, or woollen cloth between the trees and the ſtakes, to prevent them from being rubbed or bruiſed by the ſtakes; for if their bark ſhould be rubbed off, it will occaſion wounds which will not heal in ſeveral years, if they ever recover from them. If the winter ſhould prove very ſevere, it will be proper to cover the ground about their roots with ſome muck, to prevent the young fibres from being injured.

It is a common practice in many parts of England, to lay the ground down for paſture, after the trees are grown pretty large in the orchards; but this is by no means adviſeable, for trees of above twenty years growth have frequently been almoſt deſtroyed by horſes in the compaſs of one week: and if ſheep are put into the orchards, they will conſtantly rub themſelves againſt the trees, and their greaſe ſticking to the bark, will ſtint their growth, and finally ſpoil them. Therefore, wherever orchards are planted, it will be much better to keep the ground in tillage; but whatever crops are ſown, ſhould not be too near the trees, leſt the nouriſhment ſhould be drawn away from them: nor ſhould the plough come too near the ſtems, leſt the roots and bark ſhould be injured. But it will be of great ſervice to dig the ground about the trees, where the plough does not come, every ſpring and autumn, for five or ſix years after planting; by which time the roots will have extended themſelves to a greater diſtance.

In pruning orchard trees, nothing more ſhould be done, but to cut out all thoſe branches which croſs each other, and which if left would rub and tear off the bark from each other; as alſo decayed branches; but never to ſhorten any of their ſhoots. Branches broken by the wind, ſhould be cut off, either down to the diviſion of the branch, or cloſe to the ſtem from which it proceeds; all ſuckers or ſhoots from their ſtems ſhould be entirely taken of: the beſt time for this work is in November, for it ſhould not be done in froſty weather, nor when the ſap begins to be in motion.

In the planting eſpaliers, if there is an extent of ground in the kitchen-garden, it will be proper to plant in this manner not only ſuch ſorts as are for the uſe of the table, but alſo a quantity of trees to ſupply the kitchen. Where the kitchen-garden is but ſmall, the latter muſt be ſupplied from the ſtandard-trees; but as many of theſe kitchen apples are large, and hang late in the autumn, they are much more expoſed to ſtrong winds on ſtandards than in eſpaliers; for which reaſon, where the ground will admit of it, eſpaliers are to be preferred. The proper diſtance for theſe trees is not leſs than twenty-five or thirty feet, for ſuch ſorts as are of a moderate growth (if upon crab or free ſtocks); but the larger growing ſorts ſhould not be allowed leſs room than thirty-five feet; which will be found near enough, if the ground is good, and the trees properly trained: for, as their branches ſhould not be ſhortened, but trained at their full length, in a few years they will be found to meet.

The next thing to be obſerved, is the making proper choice of ſuch ſorts of fruit as grow nearly alike, to plant in the ſame eſpalier. This is of great conſequence in the diſtance to be allowed them; otherwiſe the eſpalier will make an irregular appearance.

The choice of trees is the next article, which ſhould be but one, or at moſt but two years old from the graft. The ſtocks ſhould be young, ſound and ſmooth, free from canker, which have not been cut down in the nurſery: when taken up, all the ſmall fibres ſhould be entirely cut off from their roots, which, if left on, would turn mouldy, decay, and obſtruct the new fibres in their growth; the extremities of the roots ſhould be ſhortened, and all bruiſed and miſplaced roots ſhould alſo be cut away. As to pruning the heads of theſe trees, nothing more need be done, than to cut off thoſe branches which cannot be trained to the line of the eſpalier. In planting, the roots ſhould not be placed too deep in the ground, eſpecially if the ſoil be moiſt, but rather elevated on a little hill, which it will be neceſſary to allow for the raiſing of the borders afterward. Theſe trees ſhould be ſtaked like thoſe in the orchard, until the eſpalier is put to them,

In pruning theſe trees, the chief point is, never to ſhorten any of the branches, unleſs there is an abſolute want of ſhoots to fill the eſpalier; for where the knife is much uſed, it only multiplies uſeleſs ſhoots, and prevents their fruiting: ſo that the beſt method to manage theſe trees, is to go over them three or four times in the growing ſeaſon, and rub off all ſuch buds and ſhoots as are irregularly produced, training the others down to the ſtakes where they are to remain. If this is carefully minded in the ſummer, there will be little leſt to be done in the winter. The diſtances at which theſe branches ſhould be trained from each other, are, for the larger ſorts of fruit ſeven or eight inches, and for the ſmaller, five or ſix. If, contrary to theſe plain inſtructions, the trees are ſuffered to grow rude in ſummer, there will be much difficulty to bring down the ſtubborn ſhoots afterward, without breaking. All the ſorts of *apples* produce their fruit upon curſons or ſpurs, ſo that theſe ſhould never be cut off, as they will continue fruitful for ſeveral years. The method of making ESPALIERS is exhibited under that article; it need only therefore be obſerved, that it will be beſt to defer making the eſpalier, till the trees have had three or four years growth: for before that time, the branches may be ſupported by a few upright ſtakes, until there is a ſufficiency of them to furniſh the lower part.

The beſt method of preſerving *apples* for winter uſe, is to let them hang upon the trees until there is danger of froſt, to gather them in dry weather, and then to lay them in large heaps to ſweat for a month or ſix weeks They ought then to be carefully looked over, all which have the leaſt appearance of decay taken out, the ſound fruit wiped dry, and packed up in large oil jars, which have been thoroughly ſcalded and dry, and then ſtopped cloſe, to exclude the air. If this plan is duly obſerved, the fruit will keep a long time ſound, and their fleſh remain plump; whereas when expoſed to the air, their ſkins will ſhrivel, and their pulp ſoften. See CYDER, and ORCHARD.

Among the various kinds of *apples*, ſome are uſed for the deſert, ſome for the kitchen, and ſome for cyder-making. Thoſe uſed for the deſert, are the following, placed as they ſucceſſively ripen after one another: the white juncating, the margaret *apple*, the ſummer pearmain, the ſummer queening, the embroidered *apple*, the golden rennet, the ſummer white calville, the ſummer red calville, the ſilver pippen, the aromatic pippen, *la reinette griſe*, *la haute bonte*, the royal ruſſetting, Wheeler's ruſſet, Sharp's ruſſet, the ſpine *apple*, the golden pippen, the nonpareil, the *l'api*, or *pomme d'api*.

Thoſe for the kitchen uſe, in the order of their ripening, are theſe; the codling, the ſummer marygold, the ſummer red pearmain, the Holland pippen, the Kentiſh pippen, the courpendu, Loan's pearmain, the French rennet, the French pippen, the royal ruſſet, the monſtrous rennet, the winter pearmain, the *pome violette*, Spencer's pippen, the ſtone pippen, and the oaken pipen.

Thoſe moſt eſteemed for cyder are, the Devonſhire royal wilding, the redſtreak *apple*, the whitſour, the Herefordſhire under-leaf, and the John *apple*, or *deux annes*, everlaſting hanger, and gennet moyle. Miller.

The *apple* is compoſed of four diſtinct parts, viz. the pill, the *parenchyma*, the branchery, and the core. The pill or ſkin, is only a dilatation of the outermoſt ſkin or rind of the bark of the branch on which it grew. The *parenchyma* or pulp, as tender and delicious as it is found, is only a dilatation, or, as Dr. Grew calls it, a ſwelth or ſuperbience of the inner part of the bark of the branch. This appears not only from the viſible continuation of the bark from the one through the pedicle or ſtalk to the other, but alſo from the ſtructure common to both. The branchery or veſſels, are only ramifications of the woody part of the branch, ſent throughout all the parts of the parenchyma, the greater branches being made to communicate with each other by inoſculations of the leſs. Grew's Anat. of Veget. lib. i. cap. 6. lib. iv. cap. 1.

The *apple* core is originally from the pith of the branch; the ſap of which finding room enough in the parenchyma, through which to diffuſe itſelf, quits the pith, which by this means hardens into core.

The juice of *apples* is a *menſtruum* for iron. A ſolution of iron in the juice of the *apples* called *golden rennets*, evaporated to a thick conſiſtence, proves an elegant chalybeate, which keeps well.

Dr. Lewis obſerves, that the young ſhoots of monk's rhubarb in the ſpring, approach in taſte to ſome ſorts of *apples*, and that of late they have been employed in that early ſeaſon, as a *ſuccedaneum* to *apples* for culinary purpoſes. Neumann's Works, p. 361, w.

Mr. Boyle has given ſeveral experiments on *apples* in the air-pump, and the production of air, &c. thereby. Vide Phil. Works abridg. tom. ii. p. 567, ſeq. 609. 630, ſeq. 645, ſeq.

APPLE is alſo a name given to divers fruits, bearing ſome reſemblance in figure, rotundity, and the like, to the orchard *apple*.

APPLE, *Adam's*. See CITRON, and *Pomum* ADAMI.

APPLE, *bitter*, a name ſometimes given to the fruit of the COLOCYNTHIS.

APPLE, *blad*, *cactus*. See *Melon* THISTLE.

APPLE, *cuſtard*, *annona*, in *Botany*; a genus of the *polyandria polygyna* claſs. Its characters are theſe; the flower hath in ſome ſpecies three, in others ſix petals, three large, and three alternately ſmaller. The *germen* becomes an oval or oblong fruit, having a ſcaly rind and one cell, in which are lodged many oval ſmooth ſeeds. There are eight ſpecies.

Theſe plants, which are natives of the warm parts of America, are too tender to produce fruit in this country, where they are only preſerved for the beauty of their leaves.

APPLE, *dwarf*. See DWARF-*trees*.

APPLE-*fly*, in *Natural Hiſtory*, the name given by authors to a ſmall green fly found ſometimes within an *apple*, and hatched of a worm or maggot, very frequently found infeſting that fruit.

APPLE, *love*. See LYCOPERSICON.

APPLE, *mad*. See MAD *apple*.

APPLE, *male balſam*, *momordica*. See *Male* BALSAM *apple*.

APPLE, *marchaſite*, ſo called by Dr. Grew, on account of its figure, as being round except on one ſide, where it falls in, and has a ſtalk like a young *apple*. Muſ. Reg. Soc. P. 3. § 2. cap. 3.

Among the ancient ornaments of churches, we read of *golden apples*, *poma aurea*; by which it ſhould ſeem, we are to underſtand the globular parts of candleſticks. Du-Cange.

Some ancient cuſtomaries alſo ſpeak of *apples* of wax, POMA *de cera*.

APPLE, *May*. See DUCK'*s foot*.

APPLES, *oak*, are a kind of excreſcences or exudations of the nutritious juice of that tree, joined with ſome degree of putrefaction.

The like are ſometimes alſo found on willows.

APPLE, *of the eye*. See PUPIL.

APPLE, *pine*. See PINE *apple*.

APPLE, *prickle*, is remarkable for the ſeveral tuſſucks or bunches of thorns, with which it is armed all around; each bunch conſiſting of ſix or eight thorns, ſome erect, others couched a little, and crooked outwards, of ſeveral lengths, from one inch to above two.

APPLE, *ſoap*, *ſapindus*. See SOAP *berry tree*.

APPLE, *ſtar*, *chryſophyllum*, in *Botany*; a genus of the *pentandria monogynia* claſs. Its characters are theſe: it hath a bell-ſhaped flower, cut at the brim into ten ſegments, which are alternately ſpread open; and five ſhort *ſtamina*, with a roundiſh *germen*, which becomes a pulpy fruit with ten cells, in four or five of which is lodged a ſingle ſeed. There are two ſpecies, natives of the Weſt-Indies.

APPLE, *thorn*. See THORN *apple*.

APPLICATE, APPLICATA, *Ordinate* APPLICATE, in *Geometry*, is a right line drawn acroſs a curve, ſo as to be biſected by the diameter thereof.

Applicate is the ſame with what we otherwiſe call *ordinate*.

APPLICATE *number*. See CONCRETE.

APPLICATION, the act of *applying* one thing to another, by approaching or bringing them nearer together.

Motion is defined by a ſucceſſive *application* of any thing to different parts of ſpace.

The *application* of a veſicatory to the neck, or other part, produces an irritation of the bladder.

The true and great ſecret in phyſic is, how to *apply* a medicine, not how to make it.

Application is alſo uſed for the adjuſting, accommodating, or making a thing quadrate to another.

Thus we ſay, the *application* of a fable, &c.

Application, in *Theology*, is particularly uſed, by ſome divines, for the act whereby our Saviour transfers, or makes over to us, what he had earned or purchaſed by his holy life, and death.

Accordingly it is by this *application* of the merits of Chriſt, that we are to be juſtified, and intitled to grace and glory.

The ſacraments are the ordinary means, or inſtruments, whereby this *application* is effected.

Application is ſometimes alſo uſed in *Geometry*, for what in *Arithmetic* we call division.

Application alſo ſignifies the fitting or applying of one quantity to another, whoſe areas, but not figures, are the ſame.

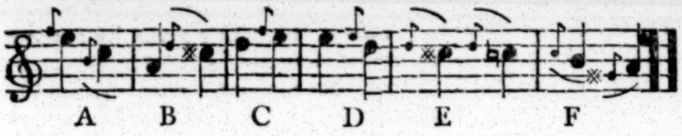
Thus Euclid ſhews how, on a right line given, to *apply* a parallelogram that ſhall be equal to a right-lined figure given.

APPLY, among *Mathematicians*, ſometimes ſignifies to transfer a line given into a circle, moſt commonly, or into any other figure; ſo that its ends may be in the perimeter of the figure.

Apply denotes alſo as much as *divide*, eſpecially among Latin writers; who, as they ſay, *duc* AB *in* CB, draw AB into CB, when they would have AB multiplied by CB; or rather when they would have a right-angled parallelogram made of thoſe lines: ſo they ſay, *applica* AB *ad* CB, *apply* AB to CB, when they would have CB divided by AB;

which is thus expreſſed, $\frac{CB}{AB}$.

APPOGGIATURA, in *Muſic*, according to Graſſineau, is when in any part of a ſong, there are two notes at ſome diſtance from one another, as a third, or fifth; and in ſinging ſuch paſſage, the muſicians put in ſmall intermediate notes, aſcending, or deſcending: as in the example A.



But the *appoggiatura* is not always intermediate, unleſs it be in the order of time (ſee the examples B and C); nor is it confined to diſtant notes. It may be uſed in paſſing from a note to the neareſt ſound either above or below it. See the examples D, E, and F.

The *appoggiatura* is commonly marked by a ſmaller kind of note, as in the examples before given, and is eſſential to muſical taſte and expreſſion.

The word is derived from *appoggiare*, to lean on.

APPOINTEE, a foot-ſoldier in the French army, &c. who for his long ſervice, and bravery, receives pay above private ſentinels.

Theſe have been ſuppreſſed in France, except in the regiment of French guards, where forty *appointees* are ſtill retained to each company of 150 men.

Till the year 1670, they had alſo captains and lieutenants under the appellation of *appointees*, who, without reſiding in the regiment, received their pay. See Anspessades.

Appointee, in *Heraldry*, is when two or more things are placed touching each other at the points or ends.

APPOINTMENT, a penſion or ſalary given by great lords and princes to perſons of worth and parts, in order to retain them in their ſervice.

The term is chiefly uſed among the French.—The king of France gives large *appointments* to ſeveral of the officers in his ſervice.

Appointments differ from wages, in that the latter are fixed and ordinary, being paid by the ordinary treaſurers; whereas *appointments* are annual gratifications granted by *brevet* for a time uncertain, and are paid out of the privy purſe.

APPORTIONMENT, or **Apporcionment**, **Apportionamentum**, in *Law*, a dividing of a rent into two or more parts, or portions, according as the land whence it iſſues is divided among two, or more proprietors.

Thus if a man, having a rent-ſervice iſſuing out of land, purchaſe a part of the land; the rent ſhall be *apportioned*, according to the value of the land.—So if a man let lands for years, reſerving rent, and a ſtranger afterward recover part of the lands, the rent ſhall be *apportioned*.

But a rent-charge cannot be *apportioned*, nor things that are entire; as if one hold land by ſervice, to pay to his lord yearly at ſuch a feaſt a horſe, or a roſe; there, if the lord purchaſe a part of the land, this ſervice is totally extinct; becauſe ſuch things cannot be divided without hurt to the whole.—But if part of the land, out of which a rent-charge iſſues, deſcends to the grantee of the rent, this ſhall be *apportioned*.—A man purchaſes part of the land where he hath common appendant, the common ſhall be *apportioned*: of common appurtenant it is otherwiſe; and if by the act of the party, the common is extinct. Common appendant and appurtenant may be *apportioned* on alienation of part of the land to which it is appendant or appurtenant.—Conditions generally are entire, and cannot be *apportioned* by the act of the party; a contract may not be divided or *apportioned*, ſo as to ſubject a man to two actions. Danv. Abr. 505. 1 Inſt. 149.

APPOSAL *of ſheriffs*, is the charging them with money received on their account in the exchequer, 22 & 23 Car. II.

APPOSER ſignifies an examiner. In the court of exchequer, there is an officer called the foreign *appoſer*.

In the office of confirmation, in the firſt liturgy of Edward VI. the rubric directs the biſhop, or ſuch as he ſhall appoint, to *appoſe* a child; and a biſhop's examining chaplain was anciently called his *poſer*.

APPOSITION, from *ad*, *to*, and *pono*, *I put*, the act of putting or applying one thing to another.

Apposition is uſed in *Phyſics*, in ſpeaking of bodies which derive their growth from the adjunction or union of neighbouring bodies.

Moſt bodies of the foſſil or mineral kingdom are formed by *juxta-poſitions*, or the *appoſitions* of parts, brought to join and adhere to each other.

Apposition, in *Grammar*, denotes the putting two or more ſubſtantives together in the ſame caſe, and without any copulative conjunction between them.

Thus, Flanders, bloody theatre, horrible ſcene of war; love, enemy of human quiet; peace, parent of riches, ſource of faction, &c.

APPOSITORIUM, in *Chemiſtry*, denotes a veſſel made of earthen-ware or glaſs, of a conical figure, whoſe bigger end receives the neck of a retort, while the narrower is inſerted into the receiver.

Its uſe is, where a ſtrong open fire is required, to prevent the red hot retort, by the immediate contact of its neck, from burſting the receiver.

APPRAISER, from *ad*, *to*, and *pretium*, *value*, one who rates, or ſets a value upon goods, &c. He muſt be a ſkilful and honeſt perſon. It is not a buſineſs of itſelf, but is practiſed by brokers of houſehold furniture, to which ſet of men the word is chiefly applied. Yet upholſterers and other brokers are employed, or even any perſon or perſons who are ſuppoſed to be ſkilled in the commodities to be appraiſed or valued. They are employed in caſes of death, executions brought in upon goods, or of ſtock to be turned over from one perſon to another, or divided between copartners; and are called *ſworn appraiſers*, from their taking an oath to do juſtice between party and party.

They ſometimes appraiſe on behalf of both ſides, each party agreeing to have the ſame *appraiſer* or *appraiſers*; ſometimes in oppoſition, each party chuſing one or more of a ſide; and ſometimes by commiſſion or deputation of truſtees, maſters in chancery, &c.

APPREHENSION, in *Logic*, denotes the ſimple attention of the mind to an object preſented either to our ſenſe, or our imagination, without paſſing a judgment, or making any inference.

The word literally denotes the action of the hand, whereby it takes hold of, and graſps any thing; being formed of *ad*, and *prehendo*, *I catch*.

In this ſenſe, *apprehenſion* differs from *notion*, as the act of the mind, whereby a *notion* is formed, differs from an act of the mind, whereby we attend to a *notion* already formed.

Apprehension is likewiſe uſed to expreſs an inadequate and imperfect idea: and thus it is applied to our knowledge of God, in contradiſtinction to *comprehenſion*.

Apprehension, in *Law*, ſignifies the ſeizing a criminal, in order to bring him to juſtice. See Arrest.

APPRENDRE, in our *Ancient Law-Books*, a fee or profit to be taken or received.

APPRENTICE, from *apprendre*, *to learn*, one who is bound by covenant to ſerve a tradeſman or artificer a certain time; uſually ſeven years; upon condition of the maſter's inſtructing him in his art or myſtery.

Apprentices may likewiſe be bound to huſbandmen, or even to gentlemen; and they, as well as tradeſmen, are compellable to take the children of the poor, whom the overſeers, with the conſent of two juſtices, may bind till the age of twenty-four years. *Apprentices* may be diſcharged on reaſonable cauſe; but if any, whoſe premium has been leſs than ten pounds, run away from their maſters, they are compellable to ſerve out the time of abſence, or give ſatisfaction for it, at any period within ſeven years after expiration of the original contract. *Apprentices* gain a ſettlement in that pariſh where they laſt ſerved forty days; and by the 5th of Elizabeth,

c. 4. they have an excluſive right to exerciſe the trade in which they have been inſtructed, in any part of England. However, the reſolutions of the courts have in general rather confined than extended the reſtriction of this ſtatute. See Blackſtone's Com. vol. i. p. 426, &c.

In France, the ſons of tradeſmen, living in their father's houſe till ſeventeen years of age, are reputed to have ſerved an *apprenticeſhip*. In that country, the times of ſerving are different in the different profeſſions, from three years to eight.—After ſerving out an *apprenticeſhip*, the perſon becomes what they call an *aſpirant*, or candidate for maſter-ſhip, and is to be examined by proper officers as to his ſkill and proficiency, and alſo to exhibit a *chef d'oeuvre* or maſter-piece in the art he has been bred to, before he be ſuffered to ſet up to practiſe for himſelf. And the cuſtom of France in regard to *apprentices*, is not unworthy the imitation of other nations.

Anciently, benchers in the inns of court were called *apprentices of the* LAW, in Latin *apprenticii juris nobiliores*; as appears by Mr. Selden's note on Forteſcue: and ſo the learned Plowden ſtiles himſelf. See BENCHER.

Sir Henry Finch, in his *Nomotechnia*, writes himſelf, *apprentice de ley:* Sir Edward Coke, in his Inſt. ſays, *apprenticii legis*, in pleading, are called, *homines conſiliarii, & in lege periti*; and in another place, *apprentices* and other counſellors of law.

APPROACH. See ACCESS and APPROXIMATION.

The *curve of equable approach, acceſſus æquabilis*, firſt propoſed by M. Leibnitz, has given the analyſts ſome trouble.—The buſineſs is to find a curve, wherein a body deſcending by the ſole power of gravity ſhall approach the horizon equally in equal times.—This curve has been found by Bernouilli, Varignon, Maupertuis, and others, to be the ſecond cubical parabola, ſo placed as that its point of regreſſion is uppermoſt. Vide Hiſt. Acad. R. Sciences, an. 1699, p. 82. Idem, an. 1730, p. 129. Mem. p. 333.

APPROACH, in *Gardening*, is uſed in ſpeaking of the method of inarching or INOCULATING, which is called GRAFTING by *approach*.

Some phyſicians alſo ſpeak of a method of curing diſeaſes by touching or *approach*. See APPROXIMATION.

APPROACHES, in *Fortification*, the ſeveral works made by the beſiegers for advancing or getting nearer to a fortreſs, or place beſieged. See *Tab. Fortif. fig.* 21.

Such are trenches, mines, ſaps, lodgments, batteries, galleries, epaulments, &c.

APPROACHES, or *Lines of* APPROACH, are particularly uſed for trenches dug in the ground, and their earth thrown up on the ſide next the place beſieged; under ſhelter or defence whereof the beſiegers may approach, without loſs, to the parapet of the covered way; and plant guns, &c. wherewith to cannonade the place.

The lines of *approach* are to be connected by parallels or lines of communication.

The beſieged frequently make COUNTER-*approaches*, to interrupt and defeat the enemies *approaches*.

The ancients made their *approaches* towards the place beſieged, much after the ſame manner as the moderns. M. de Follard ſhews, that they had their trenches, their ſaps, parallels, &c. which though uſually held of modern invention, appear to have been practiſed long before, by the Greeks, Romans, Aſiatics, &c. In Polyb. t. ii. p. 161.

APPROACHING, in *Fowling*, a term uſed to expreſs ſuch devices as are contrived for the getting within ſhot of ſhy birds. It is principally uſed in marſhy low places.

The beſt method of *approaching* is by means of three hoops, tied together at proper diſtances, according to the height of the man that is to uſe it, and having boughs of trees tied all round it, with cords to hang it over his ſhoulders; a man getting into this, conceals himſelf, and approaches by degrees towards his game in the form of a moving buſh.

Geeſe, ducks, and teal, quit the waters in the evening, and paſs the night in the fields, but at the approach of morning they return to the water again, and even when on the water they will retire to great diſtances, on the approach even of a horſe or cow, ſo that the buſineſs of the ſtalking horſe is of little uſe; but this device of *approaching* by the moving buſh, ſucceeds tolerably well with them.

APPROBATION, a ſtate or diſpoſition of the mind wherein we put a value upon, or become pleaſed with, ſome perſon or thing. Moraliſts are divided on the principle of *approbation*, or the motive which determines us to approve and diſapprove. The Epicureans will have it to be only SELF-*intereſt*; according to them, that which determines any agent to approve his own action, is its apparent tendency to his private happineſs; and even the *approbation* of another's action flows from no other cauſe but an opinion of its tendency to the happineſs of the approver, either immediately or remotely. Others reſolve *approbation* into a moral ſenſe, or a principle of benevolence, by which we are determined to approve every kind affection either in ourſelves or others; and all publicly uſeful actions, which we imagine to flow from ſuch affection, without any view to our own private happineſs.

Dr. Adam Smith thinks it needleſs to introduce any new power of perception, in order to account for the principle of *approbation*; and apprehends, that *ſympathy* is ſufficient to account for all the effects aſcribed to this peculiar faculty. This ſyſtem places virtue in utility, and accounts for the pleaſure with which the ſpectator ſurveys the utility of any quality from *ſympathy* with the happineſs of thoſe who are affected by it. This *ſympathy*, he obſerves, is different both from that by which we enter into the motives of the agent, and from that by which we go along with the gratitude of the perſons who are benefited by his actions: and he ſays, it is the ſame principle with that by which we approve of a well-contrived machine.

According to others, reaſon or the underſtanding, the ſame faculty by which we diſtinguiſh between truth and falſehood, enables us to diſtinguiſh between what is fit and unfit, amiable and odious, both in actions and affections: and they argue, that ſuch are the natures of certain actions, that when perceived, as they are, by a reaſonable being, there muſt reſult in him certain emotions and affections. An excellent writer adds, that in contemplating the actions and affections of moral agents, we have both a perception of the underſtanding and a feeling of the heart; and the latter, or the effects in us accompanying our moral perceptions, are deducible from two ſprings. They partly depend on the poſitive conſtitution of our natures; but the moſt ſteady and univerſal ground of them is the eſſential congruity between the object and the faculty.

Hutcheſon's Inquiry, &c. Tract 2. ſect 4. and Eſſ. on Paſſ. p. 207. Smith's Theory of Mor. Sent. Parts 4. and 6. Cudworth's Immut. Mor. B. 1. Price's Review, &c. ch. 2.

APPROBATION, in *Civil Law*. It is a maxim among civilians, *Approbare dicitur qui non improbat. He is judged to approve who does not diſapprove.*

By the civil law, a mere approbation of a crime after commiſſion, does not make a perſon guilty, but an *approbation* attended with fact, is equivalent to a command.

APPROBATION is more particularly uſed, in ſpeaking of recommendations of books, given by perſons qualified or authorized to judge of them.

Thoſe appointed to grant licences, and imprimaturs, frequently expreſs their *approbations* of books.

Books were formerly ſubjected to a licenſer in England, ſee 13th Car. 2. c. 33. which act is long ſince expired; and being incompatible with the noble principles of the REVOLUTION, has never ſince, and we hope never will be, revived.

APPROPRIARE *ad honorem*, in *Law*, ſignifies to bring a MANOR within the extent and liberty of ſuch an HONOUR.

APPROPRIARE *communam*, in *Law*, ſignifies to diſcommon, i. e. to ſeparate and incloſe any parcel of land, which before was open common.

APPROPRIATE, APPROPRIATED, in *Philoſophy*, is underſtood of ſomething which is indeed common to ſeveral; yet, in ſome reſpects, is peculiarly attributed to one.

APPROPRIATE, in *Law*, is underſtood of a church or benefice, the patronage whereof is annexed to ſome church-dignitary, who appoints a vicar to ſerve the cure; the patron receiving the chief produce of it.

There are computed to be in England 3845 churches *appropriate* and *impropriate*.

APPROPRIATION, the act of *appropriating*, i. e. of applying a church-benefice, which of its own nature is *juris divini*, and no perſon's patrimony, to the proper and perpetual uſe of ſome religious community, to enjoy for ever.

This contrivance ſeems to have ſprung from the intereſted policy of the monaſtic orders, who begged and bought, for maſſes and obits, and ſometimes even for money, all the *advowſons* within their reach, and then *appropriated* the benefices to their own corporation. By a clauſe in the ſtatutes of the 27th of Hen. 8. c. 28. and the 31ſt of Hen. 8. c. 13. which diſſolved the monaſteries, the *appropriations* of the ſeveral parſonages were given to the king, in as ample a manner as they were before held by the abbots, &c. The *alien* PRIORIES had in former reigns been diſſolved, and aſſigned to the crown: and from theſe two ſources have ariſen all the lay *appropriations* or ſecular parſonages now in the kingdom; theſe having been afterwards granted from time to time by the crown.

Appropriation is where the advowſon of a parſonage is given or belongs to any biſhoprick, religious houſe, college, &c. and to their ſucceſſors; ſo that the houſe or body is both patron and parſon, and ſome one of the members officiates as vicar.

It is called *appropriation*, becauſe the profits of the living are appropriated to the uſe of the patrons; ſo that parſons, though they are not ordinarily accounted *domini uſufructuarii*, having no right of fee-ſimple; yet, by reaſon of the perpetuity of their ſucceſſion, are here reputed owners of the fee-ſimple, and are therefore called *proprietarii*.

To make an *appropriation*, after licence obtained of the king in chancery, the conſent of the dioceſan, patron, and incumbent, is neceſſary, if the church be full; if it be void, the dioceſan and the patron, upon the king's licence, may conclude it.

To diſſolve an *appropriation*, it is enough to preſent a clerk to the biſhop, and for him to inſtitute and induct him: for, that once done, the benefice returns to its former nature. This is called DISAPPROPRIATION. See Blackſtone's Com. vol. I. p. 385, &c. ed. 4.

APPROVEMENT, APPROVEAMENTUM, or APPROVIAMENTUM, is ſometimes uſed in ancient writers for an improvement, or riſe of the VALUE and worth of a thing.

Thus to *approve*, *approbare*, is to make the beſt benefit of a thing, by increaſing the rent, &c. *Cum omnibus approviamentis, & aliis pertinentiis ſuis, &c.*

Hence, in ſome ancient ſtatutes, bailiffs of lords in their franchiſes are called their *approvers*.

A bailiff is not to think it below him to *approve*, *approvare*, his maſter's goods; but of his barley to make malt, of his wool to make cloth, &c.

APPROVEMENT is more particularly uſed where a man hath common in the lord's waſte, and the lord incloſeth part of the waſte for himſelf; leaving ſufficient common, with egreſs and regreſs, for the commoner. Reg. Jud. 8, 9

APPROVER, in our *Laws*, one who, confeſſing felony in himſelf, appealeth or impeacheth another or more of his accomplices.

He is ſo called from the French *approuver*, *comprobare*, becauſe he muſt prove what he hath alledged in his appeal. This proof was anciently either by battle, or by the country, at the choice of the appellee: and the form of this accuſation may be found in Crompt. Juſt. 250. See alſo Bracton, lib. 3. Staundf. Pl. Cor. 52.

APPROVERS of the king, are thoſe who have the letting of the king's DEMESNES in ſmall manors, &c.

In the ſtatute of the 1ſt of Ed. 3. c. 8. ſheriffs are called the king's *approvers*.

It being in the diſcretion of the court to ſuffer one to be an *approver*, this method of late hath ſeldom been practiſed. But we have in caſes of burglary and robbery on the highway, what ſeems to amount to the ſame by ſtatute; it being ordained, that where perſons charged with ſuch crimes out of priſon, diſcover two others concerned in the crime, they ſhall have a pardon, &c. Stat. 5th Anne, c. 31.

APPROVER is particularly uſed in *Ancient Law Writers*, for a bailiff or land ſteward, appointed to have the care of a manor, franchiſe, or the like, and improve and make the moſt of it for the benefit of his maſter.

In this ſenſe, the word is alſo written *appruare*.

APPROVERS are called, in *Middle-age Writers*, *probatores* and *approbatores*.

APPROXIMATION, from *ad*, and *proximus*, *near to*, in *Arithmetic* and *Algebra*, a continual approach ſtill nearer and nearer to a root or quantity ſought, without a poſſibility of ever arriving at it exactly.

We have divers methods of *approximation* delivered by Wallis, Raphſon, Halley, &c. all of them being no other than ſerieſes infinitely converging, or approaching ſtill nearer to the quantity required, according to the nature of the ſeries.

It is evident, that if a number propoſed be not a true ſquare, it is in vain to hope for a juſt quadratic root thereof, explicable by rational numbers, integers or fractions; whence, in ſuch caſes, we muſt content ourſelves with *approximations*, ſomewhat near the truth, without pretending to accuracy: and ſo for the cubic root, of what is not a perfect cube; and the like for ſuperior powers.

This the ancients were aware of, and accordingly they had their methods of *approximation*; which, though ſcarce applied by them beyond the quadratic, or perhaps the cubic root, are yet equally applicable, by due adjuſtments, to the ſuperior powers alſo: as is ſhewn in the Philoſoph. Tranſact. Nº 215. or Ph. Tr. ab. vol. i. p. 98. ib. vol. iv. p. 80.

If there be a non-quadratic or non-cubic number; the former being expreſſed by $aa+b$, and the latter by $aaa+b$, where aa and aaa are the greateſt ſquare and cube in the propoſed numbers; then $\sqrt{aa+b} = a + \frac{ab}{2aa+\frac{1}{2}b} = a + \frac{b}{2a} - \frac{bb}{8a^3}$, &c. and $\sqrt{a^3+b} = a + \frac{ab}{3aaa+b} = \frac{1}{2}a + \sqrt{\frac{1}{4}aa + \frac{b}{3a}} = a + \frac{b}{3a^2} - \frac{b^2}{9a^5}$, &c. will be eaſy and expeditious *approximations* to the ſquare and cube root.

To extract the root of an equation by APPROXIMATION.—1°. For a quadratic equation ſuppoſe the equation $x^2-5x-31=0$; let the root be $8+y$, ſo that y may denote the fraction, whereby the aſſumed number either exceeds or comes ſhort of the root: then

$$\begin{array}{l} x^2=64+16y+y^2 \\ -5x=-40-5y \\ -31=-31 \\ \hline -7+11y+y^2=0 \end{array}$$

Since the powers of fractions are continually decreaſing; and we only here want a root nearly true; y^2 is caſt away: upon which,

$$\begin{array}{l} -7+11y=0 \\ \hline y=\frac{7}{11}=\frac{6}{10} \text{ nearly } =0.6 \end{array}$$

Wherefore $x=8+0.6=8.6$

Suppoſe $x=8.6+y$. Then

$$\begin{array}{l} x^2=73.96+17.2y+y^2 \\ -5x=-43-5y \\ -31=-31 \\ \hline 73.96-43-31+17.2y-5y=0 \\ -0.04+12.2y=0 \\ \hline 12.2y=0.04 \\ \hline y=0.04\div12.2=0.0032 \end{array}$$

Therefore $x=8.6+0.0032=8.6032$

Suppoſe $x=8.6032+y$; then will

$$\begin{array}{l} x^2=74.01505024+17.2064+y^2 \\ -5x=-43.0160-5y \\ -31=-31.00000000 \\ \hline -0.00094976-12.2004y=0 \\ \hline y=0.000094976\div12.20640000 \\ \quad =0.000077808 \end{array}$$

Therefore $x=8.6032+0.000077808=8.603277808$.

Suppoſe, again, the root of a cubic equation $x^3+2x^2-23x-70=0$ be required by *approximation*; here let the root be $5+y$, ſince the terms are omitted wherein y^2 and y^3 are found; there is no neceſſity for expreſſing them in the transformation of the equation. Wherefore, we find

$$\begin{array}{l} x^3=125+75y\ldots \\ +2x^2=50+20y\ldots \\ -23x=-115-23y \\ -70=-70 \\ \hline -10+72y=0 \\ \hline y=\frac{10}{72}=0.1 \text{ nearly.} \end{array}$$

Therefore $x=5+0.1=5.1$

Suppoſe $x=5.1+y$: Then will

$$\begin{array}{l} x^3=132.651+78.03y\ldots \\ +2x^2=52.02+20.4y \\ -23x=-117.3-23y \\ -70=-70 \\ \hline -2.629+75.43y=0 \\ 75.43y=2.629 \\ \hline y=2.629\div75.43=0.0348 \end{array}$$

Wherefore $x=5.1+0.0348=5.1348$.

And after the ſame manner might one proceed to infinity, *approximating* by every ſucceſſive operation nearer to the exact value of the root of the propoſed equation. The *rectification* and *quadrature* of the circle, together with many other problems both in geometry and algebra, afford inſtances of *approximation*. See EQUATION.

APPROXIMATION, in *Medicine*, denotes a magnetical kind of cure, or method of tranſplanting a diſeaſe into ſome other ſubject, whether animate or vegetable, by bringing it in immediate contact with the patient.

APPUI, in the *Manege*, q. d. reſt or ſtay upon the hand, is the reciprocal effort between the horſe's mouth and the bridle-hand; or the ſenſe of the action of the bridle on the hand of the horſeman.

A juſt *appui* of the hand is the nice bearing up or ſtay of the bridle; ſo that the horſe, being awed by the ſenſibility and tenderneſs of his mouth, dares not reſt too much upon the bit-mouth, nor check or beat upon the hand to withſtand it.

A dull *appui*, is when a horſe has a good mouth, but his tongue is ſo thick, that the bit cannot work, or bear upon the bars; the tongue not being ſo ſenſible as the bars: though the like effect is ſometimes owing to the thickneſs of his lips.—A horſe is ſaid to have no *appui*, when he dreads the bit-mouth; is too apprehenſive of the hand, and cannot bear the bit.—He is ſaid to have too much *appui*, when he reſts or throws himſelf too much or too hardily, upon the bit—Horſes deſigned for the army, ought to have a full *appui* upon the hand.

APPULSE, from *ad*, and *pulſo*, *I act on*, in a general ſenſe, a thing's being brought to, or in contact with another.

Articulation is either by *appulſe*, i. e. when one of the moveable organs touches and reſts on ſome of thoſe which are immoveable; or without *appulſe*, only by inclination of the moveable organ to the immoveable.

APPULSE *of cattle*, *appulſus pecoris*, in the *Civil Law*, the right of driving them to water.

APPULSE, in *Aſtronomy*, the approach of any planet to a conjunction with the ſun, or a ſtar.

It is a ſtep towards a tranſit, occultation, conjunction, eclipſe, &c.

M. Flamſted, M. de la Hire, and others, have given obſervations of the moon's *appulſes* to the Pleiades. Phil. Tranſ. Nº 76. p. 361. M. Acad. Scienc. an. 1708.

The *appulſes* of the planets to the fixed ſtars have always been of great uſe to aſtronomers, in order to fix the places of the former. The ancients, wanting an eaſy method of comparing the planets with the ecliptic, which is not viſible, had ſcarce any other way of fixing their ſituations, but by obſerving their tract among the fixed ſtars, and remarking their *appulſes* to ſome of thoſe viſible points. Hiſt. Acad. Science. an. 1710. p. 417.

Dr. Halley has publiſhed a method of determining the places of the planets, by obſerving their near *appulſes* to the fixed ſtars. Phil. Tranſ. Nº 369.

The beſt method of diſcovering the longitude at ſea, is by obſervations of the *appulſes* of the moon to the fixed ſtars. See LONGITUDE.

Of all the celeſtial obſervations hitherto made, none are capable of ſo perfect an exactneſs, as the near *appulſes* of the moon and planets to the fixed ſtars; for though the places of the ſtars have not as yet attained their ultimate preciſion, yet ſuch obſervations are ever good. the places of the planets being thereby aſcertained in proportion to the correctneſs of any catalogues that may be made hereafter. But the ordinary number of ſtars, with which the planets may be thus compared, being ſmall, the opportunities of obſerving are conſequently rare; whence appears the great uſe of a full catalogue of all the teleſcopal ſtars within the zodiac, viz. that thereby opportunities of obſerving *appulſes* may be more frequent. Since the royal obſervatory at Greenwich was put under Dr. Halley's care, he endeavoured to put himſelf in a condition to ſupply the many and great vacancies to be met with in the preſent zodiac; and for the ſervice of aſtronomy publiſhed a map, or planiſphere of the ſtarry zodiac; wherein are accurately laid down all the ſtars, to which the moon's *appulſe* has ever been obſerved in any part of the world. Phil. Tranſ. abr. vol. vi. p. 170.

APPURTENANCES, or APPERTINANCES, in *Common Law*, ſignify things belonging to ſome other as their principal.

The word is formed of *ad*, *to*, and *pertinere*, *to belong*.

Appurtenances may either be things corporeal, as hamlets belonging to a chief manor; or incorporeal, as liberties and ſervices of tenants. See APPENDANT.

APRICOT, *Armeniaca*, or *Præcocia mala*, in *Botany*, a well-known fruit. The characters of this tree are, that the flower is compoſed of five large roundiſh petals, which ſpread open, whoſe baſe is inſerted in the empalement. In the center is placed a round *germen*, attended by upwards of twenty awl-ſhaped *ſtamina*. The *germen* afterwards becomes a roundiſh pulpy fruit, having a longitudinal furrow, incloſing a roundiſh nut, which is a little compreſſed on the ſides. The ſpecific title given by Linnæus to the *apricot*, is *prunus floribus ſubſeſſilibus foliis ſubcordatis:* and he ranges it in the claſs of plants, intitled *icoſandria monogynia*.

There are ſeven varieties; the Maſculine, Orange, Algier, Roman, Turkey, Breda, and Bruſſels, APRICOTS: and they ripen in the order here enumerated.

The method of cultivating and propagating the ſeveral ſorts of this fruit, is this: they are all to be propagated by GRAFTING them on plum-ſtocks, and will readily take with almoſt any ſpecies of plum, provided that the ſtock be in a thriving condition.

The Breda and Bruſſels *apricots*, are beſt to be made ſtandard-trees; all the reſt are to be propagated againſt walls, and ſhould have an eaſt or weſt aſpect. The borders under theſe walls ſhould be ſix feet wide at leaſt, and ſhould be two feet deep in earth. If the place where they are planted be a loamy ſoil, the beds are to be raiſed pretty high above the level of the ground, and if chalk or gravel, it muſt be removed to a conſiderable width, to make room for freſh ſoil to be put in, but it need not be dug more than two feet deep. The beſt ſoil for them is freſh earth from a paſture ground, taken to ten inches deep, and laid with the turf among it to rot together, for a twelvemonth before it is uſed.

Such trees ſhould be choſen for planting as are but of one year's growth from the budding; and where the ſoil is dry, or moderately ſo, October is the beſt ſeaſon for planting. For the manner of planting, ſee PLANTING.

No part of the head ſhould be cut off at this time, unleſs there are ſome foreright ſhoots which will not come near the wall. In a good ſtrong ſoil, or againſt a low wall, theſe trees ſhould be planted at eighteen feet aſunder; the ſtem is to be placed four inches from the wall, and the head inclined toward the wall; the branches ſhould be then nailed up to the wall, and the ſurface over the earth muſt be covered with rotten dung, to keep out the froſts. In February the dung is to be removed, and the tree being held very ſteady, the top is to be cut off to about three eyes above the bud, leaving the ſloping ſide towards the wall. If the weather proves dry after this, they muſt be gently watered, and ſome turf or mulch laid round the root to keep off the ſun's heat: and what branches are produced muſt be nailed up, except ſuch as are produced foreright, which muſt be cut off.

At Michaelmas, when the trees have done growing, the branches muſt be again unnailed, and cut off to a proper length, the ſtronger ſhoots being left of nine or ten inches long, the weaker five or ſix inches After they are thus ſhortened, they muſt be again nailed up, and that as much in an horizontal direction as poſſible. The ſecond and third ſummer the ſame rules muſt be obſerved, all the foreright ſhoots muſt be diſplaced as they are produced, nailing in the others horizontally to the wall; ſo that the middle of the tree may be kept open; and never ſhorten any of the ſhoots in ſummer, unleſs to furniſh branches for ſome vacant ſpaces on the wall; and this ſhould never be done later that April. The *apricot* produces its bloſſom buds not only on the laſt year's wood but alſo on the curſons or ſpurs from the two years old wood; great care muſt therefore be taken not to injure or diſplace theſe.

The Bruſſels and Breda *apricots* being planted for ſtandards, require very little management, only in autumn or ſpring cut away all the dead wood, and ſuch branches as croſs one another. The Bruſſels *apricot* is the fineſt of all the kinds: it is ripe in the middle of Auguſt. Miller.

APRICOT-*water*. To a quart of water, put ſix or eight *apricots* ſliced, and the kernels bruiſed; boil the whole, to extract the taſte; and when cold, add four or five ounces of ſugar. When that is diſſolved, ſtrain it.

APRIL, the fourth month of the YEAR, according to the common computation; but the ſecond, according to that of the aſtronomers.

The word is derived from *Aprilis*, of *aperio*, *I open*; becauſe the earth, in this month, begins to open her boſom for the production of vegetables

In this month the ſun travels through the ſign Taurus.

A PRIORI, *Demonſtration*. See DEMONSTRATION.

APRON, in *Naval Architecture*, is a piece of curved timber fixed behind the lower part of the ſtern, immediately above the foremoſt end of the keel.

APRON is alſo a name given to a platform or flooring of plank, raiſed at the entrance of a dock, againſt which the dock-gates are ſhut.

APRON, in *Gunnery*, a piece of lead, which caps or covers the vent or touch-hole of a great gun.

APSINTHATUM, in *Phyſic*, a kind of potion to ſtrengthen the ſtomach. See ABSINTHIATUM.

APSIS, or ABSIS, ſignifies the bowed or arched roof of a houſe, room, or oven, &c. as alſo the ring or compaſs of a wheel.

APSIS, in *Eccleſiaſtical Writers*, denotes an inner part in the ancient churches, wherein the clergy ſat, and where the altar was placed.

It is ſuppoſed to have been thus called, becauſe covered with an arch or vault of its own, by the Greeks called αψις, and by the Latins *abſis*. Iſidore, with leſs probability, imagines it ſo called as being the moſt luminous part; from απτειν, *to give light*.

Apſis, in this ſenſe, amounts to the ſame with what is otherwiſe called *choir*, *concha*, *camera*, and *preſbyterium*; and ſtands oppoſite to the *nave*, or body of the church.

Apsis is more particularly uſed for the biſhop's ſeat, or throne, in ancient churches.

This was more peculiarly called *apſis gradata*, becauſe raiſed on ſteps above the ordinary ſtalls.—It was alſo denominated *exedra*, and in latter times *tribune*.

Apsis is alſo uſed for a reliquary, or caſe, wherein the relics of ſaints were anciently kept.

It took the name *apſis*, from its being round, or arched at the top; or perhaps from the place where it was kept.

The *apſis* was commonly placed on the altar: it was uſually of wood, ſometimes, alſo of gold and ſilver, with ſculptures, &c.

Apsis, in *Aſtronomy*, is applied to two points in the orbits of planets, wherein they are at the greateſt, and the leaſt, diſtance from the ſun, or earth.

The *apſis* at greateſt diſtance is called the *higher* or *ſumma apſis*; that at leaſt diſtance, the *lower*, *ima apſis*, or *inſima*.

The two *apſides* are alſo called *auges*.

The higher *apſis* is more particularly denominated the *aphelion*, or *apogee*; the lower, the *perihelion*, or *perigee*.

The diameter which joins theſe two points is called the *line of the apſides*, and this paſſes through the centre of the orbit of the planet, and the centre of the earth or ſun. In the modern aſtronomy this line makes the longer axis of the elliptical orbit.—Such is the line AP (*Tab. Aſtron. fig.* 1.) drawn from the aphelion A to the perihelion P.

The eccentricity is reckoned in the line of the *apſides*; being the diſtance between the center of the orbit of the planet, C, and the center of the ſun or earth, S, according as the Copernican, or the Ptolemaic ſyſtem is followed. For the motion of the line of the *apſides*, ſee **Apogee.**

The motion of a planet from one *apſis* to another, e. gr. of the moon, from apogee to perigee, and back again from perigee to apogee, are conſidered by mechanical philoſophers as oſcillations, and accounted for from the laws of the pendulum; conſequently they muſt one day ceaſe, when the equilibrium is reſtored. Vid. Horreb. Clav. Aſtronom. cap. 20.

Others apprehended ſomething immechanical in the motion; and propoſe, as inſoluble queſtions, How the equilibrium was firſt deſtroyed; why not reſtored again; and whence the breach is continually renewed? Vid. Mem. de Trev. Avril 1730. p. 709, ſeq.—But theſe are perſons unacquainted with the ſecrets of the Newtonian philoſophy. Vid. Newt. Prin. lib. i. ſeq. 9. Herman. Phoron. lib. i. cap. 4. See alſo Distance, Gravitation, Orbit, Period, and Planet.

APSYCHIA, from α privative, and ψυχη, *ſoul*, in *Medicine*, a ſwooning or fainting away, called alſo *lypopſychia* and *apopyſchia*.

APSYCTOS, from α, and ψυχω, *I cool*, a word uſed by the ancients, as the name of a ſtone found in Arcadia, and of the colour of iron, the quality of which they ſay was, that when once heated red-hot, it would never grow cold again. It is eaſy to ſee that this is an impoſſibility; and that ſome errors among the ancients, and miſunderſtandings of their works by later writers, have given the occaſion for propagating ſo idle an opinion.

We have ſome ſtones indeed in England, that when once heated will retain a warmth a long time, but all the other accounts ſeem groundleſs; our warming ſtone, uſed in Cornwall and Yorkſhire to lay at the feet of people's beds, will retain warmth eight or ten hours; and there is a ſort of red ſtone cut out of the ſalt mountains near Cordova, and formed into broad tiles called *ruggiolos* by the Italians, which being once well heated, will retain a ſenſible warmth twenty-four hours; but theſe do not at all come up to the qualities of this imaginary ſtone of the ancients. See Asbestos.

APSYRTUS, in the *Materia Medica* of the ancients, a name given to the common *marrubium*, or horehound, a plant at that time as well as now eſteemed very good in coughs, and other complaints of the breaſt.

APTERIA, from α, and πτερον, *wing*, in the *Hiſtory of Inſects*, a claſſical name, comprehending all thoſe inſects which have no wings.

They are of the ſeventh order in the claſs of inſects in the Linnæan ſyſtem.

This ſeries is divided into two claſſes: 1. Such as have neither wings nor limbs, called APTERIA ANARTHRA. And, 2. Such as have limbs, but no wings, called APTERIA PODARIA.

AP-THANES, an ancient term for the higher nobility in Scotland. See Thane.

APTITUDE, from *aptus*, *fit*, the natural diſpoſition any thing hath to ſerve for ſuch or ſuch a purpoſe.—Thus, oil hath an *aptitude* to burn, and water to extinguiſh fire.

Aptitude, or **Aptness**, is often uſed in ſpeaking of the talents of the mind, for a promptitude, or diſpoſition to learn things with eaſe and expedition.

In which ſenſe *aptneſs* amounts to the ſame with what the Greeks call ευμαθια, and the Latins *bona indoles*, and we ſometimes *docility*.

Charlton divides *aptneſs* into theſe parts, viz. *acuteneſs*, *ſagacity*, and *memory*.

APTOTE, in *Grammar*, a noun indeclinable, or which is without any variation of caſe.

The word is derived from the privative α, and πτωσις *caſus*.

Such are the words, *fas*, *nefas*, &c.

APUA, in *Zoology*, the name of a ſmall ſea-fiſh, ſuppoſed by many to be produced of the ſlime and mud of the ſhores. But ſuch opinions are all groundleſs. There are two ſpecies of this fiſh, 1. the *apua vera*, 2. the *apua phalerica*.

Apua *membras*, in *Zoology*, a name by which ſome have called the PILCHARD.

APUS, *Avis Indica*, in *Aſtronomy*, a conſtellation of the ſouthern hemiſphere placed near the pole, between the *triangulum auſtrale*, and the chameleon, ſuppoſed to repreſent the bird of paradiſe.

The *apus* is ſuppoſed one of thoſe birds called APODES, as having no feet.

The ſtars contained in his conſtellation, according to Sharp's catalogue annexed to the Britiſh, are the following eleven.

Situation of the Stars.	Signs	Longitude			Latitude			Magnitude
		°	′	″	°	′	″	
In the head	♐	21	6	38	44	32	55	5
In the neck		21	24	49	46	52	22	6
In the root of the tail, northern		19	2	3	54	31	7	4
Middle		17	31	2	55	59	9	5
Southern		18	43	32	56	0	22	4

Apus, in *Ornithology*, a ſpecies of the *ſwallow*.

Apus, likewiſe denotes a ſpecies of the *monoculus* genus of inſects,

APUTTASY, in *Botany*, a name given by the people of Guinea to a tree, a decoction of which is in great uſe among them for waſhing the mouth to cure the ſcurvy in the gums, and preſerve the teeth. Phil. Tranſ. N° 232.

APYCNI, in the *Ancient Muſic*, was uſed for ſuch chords or ſounds of the ſcale, as could never enter the SPISSUM. They were fixed, or STABILES.

APYCNON, from α, and πυκνος, *non ſpiſſimum*, *rarum*, in the *Ancient Muſic*, was applied to thoſe two conjunct intervals of a tetrachord, which taken together were greater than the third.

This happened only in the two diatonic genera.

APYRENOS, properly ſignifies without kernels. The Greek writers, however, did not always keep up rigidly to the ſenſe of this word, but ſometimes applied it to ſuch fruits as had fewer and ſofter kernels than others of the ſame kind.

APYREXY, in *Medicine*, the intermiſſion of a fever, or ague.

The word is formed of the privative α, and πυρ, *ignis*, *heat*.

APYROI, in *Antiquity*, a denomination given to ALTARS whereon ſacriſice was offered without fire.

In which ſenſe, the word ſtands contradiſtinguiſhed from EMPYROI.

APYROMETALLUM, in *Metallurgy*, a name by which ſome authors have called gold, from its reſiſting the force of fire.

APYRON, ſomething that has not undergone the fire.

In this ſenſe, *ſulphur vivum*, or native ſulphur, is particularly denominated *apyron*.

Some authors alſo give the denomination *apyron*, to a modern proceſs for making *æthiops* mineral without fire, by trituration alone.

APYROUS, in *Chemiſtry*, is a word applied to denote that property in ſome bodies, by which they reſiſt the moſt violent fire, without any ſenſible alteration.

Apyrous bodies ought to be diſtinguiſhed from thoſe which are *refractory*.

Refractory ſubſtances, are thoſe which cannot by violent heat be fuſed, whatever other alteration they may ſuſtain.

AQUA, in *Natural Hiſtory*, *Phyſics*, *Chemiſtry*, *Medicine*, WATER, &c. which ſee.

The word is Latin, and ſuppoſed to be compounded of *a* and *qua*, q. d. *from which*; alluding to the opinion that water is the baſis, or matter, of all bodies.

AQUA *alexiteria ſimplex*, the name now given in the London diſpenſatory to the ſimple water commonly called milk water. It is ordered to be made in the following manner: take mint a pound and an half, tops of ſea-wormwood, and leaves of angelica, all freſh and green, of each a pound; add as much water as is neceſſary to prevent burning, and diſtil off three gallons.

AQUA *alexiteria ſpirituoſa*, the name of a compound or cordial water, brought into uſe by the London diſpenſatory. It is ordered to be made of half a pound of green mint, and four ounces of angelica leaves, with the ſame quantity of tops of ſea-wormwood, and a gallon of proof ſpirit; adding water enough to prevent burning, and diſtilling off a gallon.

This with a double proportion of the angelica, and the addition of a pint of vinegar after the diſtillation, makes what is called the AQUA *alexiteria ſpirituoſa cum aceto*, which is intended to ſupply the place of the treacle-water, of the former diſpenſatories.

AQUA *aluminoſa bateana*, a form of medicine in the London Pharmacopœia, compoſed in the following manner: take alum and white vitriol of each half an ounce, water a quart; boil the whole together, that the ſalts may be diſſolved; and then letting it ſettle, filtre it through paper.

Quincy gives another proceſs for making alum water; as alſo its uſe in medicine; for which ſee ALUMINOUS.

AQUA *chryſulca*, a ſubtle kind of *aqua regia*, called alſo *aqua pugilum*. Three parts of *ſal ammoniac*, and two of nitre, injected into a tubulated retort made red-hot, yield this acid compound ſpirit. Neumann, p. 225.

AQUA *fortis* is a corroſive liquor prepared from nitre and vitriol; and ſerving as a menſtruum wherewith to diſſolve ſilver, and all other metals, except gold; whence its name. See ACID *nitrous*.

Aqua fortis is made by diſtilling purified nitre with calcined vitriol, or rectified oil of vitriol, in a ſtrong heat: the liquor, which riſes in blood-red fumes, being collected, is the *aqua fortis*.

In preparing compound *aqua fortis*, ſome mix either ſand, or clay, or aſhes, with the calcined vitriol and nitre, in order to hinder their melting too readily; and thus prevent the too haſty evaporation: when the fuſion is thus prevented, the parts of the ſalts receive more violent impreſſions from the fire, and are better converted into a volatile ſpirit, which is the *aqua fortis*.

If to the ſpirit of nitre, &c. thus diſtilled, ſea-ſalt, or ſal ammoniac, be added, it commences *aqua regia*; and will no longer diſſolve ſilver, but will now diſſolve gold. Hence, to try whether or no *aqua fortis* be pure; put a grain of a ſolution of ſilver in *aqua fortis*, into a like quantity of the water in queſtion; and, if the ſolution remains without either the water's turning milky, or the ſilver precipitating, the *aqua fortis* is pure. If theſe conſequences happen, the *aqua fortis* is bad.

The fault of ſuch *aqua fortis* happens either from the uſe of too violent and long continued a fire, or becauſe the mixture of the vitriol and the nitre have been careleſsly made, or too large a proportion of the former uſed; in this caſe, when the diſtillation draws towards the end, there appear white milky fumes in the recipient; theſe are vitriolic; and this phænomenon plainly ſhews the fault of the menſtruum, and might ſerve to prognoſticate the before mentioned precipitation. This calx of ſilver ſeldom proves fluid in the fire, but runs into a kind of *luna cornea*, and ſhews that the nitre has been impure, and has contained ſome portion of ſea-ſalt. Cramer.

It is a liquor of various and extenſive uſe.—It is very ſerviceable to refiners for parting or ſeparating of ſilver from gold.—To the workers in moſaic, for ſtaining and colouring their woods. See MARQUETRY.—To dyers, in their colours, and particularly in ſcarlet.—To other artiſts, for the colour of bone and ivory; which is done by ſteeping the matter therein, after firſt tinging it with copper and verdegriſe, &c.

Aqua fortis converted into *aqua regia*, by diſſolving in it a fourth of its weight of ſal ammoniac, is uſed for ſtaining ivory hafts, and bones, of a fine purple colour.—Bookbinders throw it on leather, and thereby made marbled covers for books.—Diamond-cutters uſe it to ſeparate diamonds from metalline powders.—It is, farther, of ſervice in etching copper, or braſs plates. See ETCHING.

Silver is very nicely and finely purified by means of this menſtruum in the following manner: diſſolve ſilver that has been copelled in a clean glaſs body, with a ſufficient quantity of *aqua fortis*; if the ſolution is at all turbid, filtre it through paper into another clean glaſs; pour into this ſolution by little and little ſpirit of ſalt, or a ſolution of common ſalt, or ſal ammoniac, enough to produce a perfect *aqua regia*. The limpid ſolution will now immediately become milky: let it reſt for ſome hours, and all the ſilver will ſubſide to the bottom in form of a white powder, which may be ſooner effected, by pouring a large quantity of pure water on the ſolution if highly charged. Waſh the powder with many freſh waters, or with the phlegm of ſpirit of ſalt or *aqua fortis*, till the calx and water are both perfectly inſipid; then ſeparate the remaining water by a filtring paper, and dry the calx. Put this into a crucible well rubbed over on the inſide with ſoap, and cover it with about one half of any fixed alkaline ſalt, very dry and beaten to a fine powder; ſqueeze the whole well down with a finger; cover the crucible with a tile, and ſet it in a wind furnace; make at firſt a middling fire, only to make the veſſel grow red-hot, and then increaſe it to a higher degree; when the fuſion is completed take out the crucible, and let the ſilver either cool in it, or elſe pour it into an ingot. Cramer.

The beſt *aqua fortis* is often-tinged with a greeniſh colour, which happens, if to *aqua fortis*, having been expoſed ſome days to the air, and having loſt its red fuming ſpirit, there be poured ſome freſh ſtrong *aqua fortis* ſtill emitting its fumes, or if *aqua fortis* be diluted with water. As this colour may however proceed from copper diſſolved in it, to be certain that it does not, a little is to be poured into a cucurbit, and as much of ſome alkaline liquor to be added to it as will ſaturate the acid. Then if there be ever ſo little copper in it, the colour becomes a deep blue, and there is a cloudy precipitation made, becauſe the nitre has been regenerated by this proceſs, and does not diſſolve copper ſo much as *aqua fortis* does; but if there be no copper in the *aqua fortis*, the colour diſappears.

The nice aſſayer, after having carefully proved his *aqua fortis*, muſt concentrate it to a certain degree; for, if too weak, it often retards the ſolution, and ſometimes does not even affect the ſilver; but this concentration is only to be in a certain degree; for, if it be carried too far, and the *aqua fortis* be made too ſtrong by it, it vaniſhes into fumes, which ruſh violently out of the receiver, or veſſel, in which the ſolutions are made, though ſufficiently high, and carries away a part of the ſilver with it in vapours; and if there is any thing of gold in the ſilver, it will be corroded into a fine duſt, which it is very difficult afterwards to collect together.

When *aqua fortis* is too weak, it is to be put into a deep cucurbit, and the watry part is to be drawn from it, by a gentle fire, till yellow fumes begin to ariſe. To find out whether it be too ſtrong, the following method is to be uſed: Melt together one part of gold, and four parts of ſilver; of this make a flat plate, which cut into three or more parts; roll up each part, that it may be conveniently put into the neck of a crucible; when rolled up, and gently heated at a fire, put it into a cucurbit, and pour upon it three times its weight of *aqua fortis*, ſetting it in a gentle heat: if the ſilver is eroded from the gold, and the gold retain the ſame figure of a piece of plate rolled up, and there appear no reddiſh duſt at the bottom of the veſſel, then the *aqua fortis* has its proper degree of ſtrength: but if the diſſolution has been made with ſo much violence, that the gold was eroded, or the plate almoſt broken, then the *aqua fortis* was too ſtrong. It muſt then be diluted with a tenth, or an eighth part, of *aqua fortis* phlegm, or, if that is not at hand, with the ſame quantity of common water. This done, the trial is to be repeated, by the diſſolution of a like plate rolled up; and this ſeveral times over, till the ſilver be diſſolved, without the leaſt diminution of the gold. By this the aſſayer is aſſured of a due degree of ſtrength in his menſtruum, for all the purpoſes he requires.

Aqua fortis is better than in the common ſtate, when it is recovered by fire from a metal which had been diſſolved by it. It may be almoſt entirely recovered by fire, from ſuch ſolutions. Lemery, in his curious account of the *arbor martis*, obſerves, that the experiment ſucceeds much better with *aqua fortis*, drawn once from a diſſolution of iron, than with the common kind; and Cramer gives a very accurate and ready way of obtaining ſuch a revived *aqua fortis*, in any quantity, in this manner: put into a glaſs alembic, a pound or more of any metalline ſolution in *aqua fortis*; diſtil it into a large recipient, over a gentle fire, ſo that the drops may follow one another, at the interval of ſome ſeconds. When the liquor of this quantity is thus drawn off, let ſuch another quantity be put warm into the ſame cucurbit, to the reſiduum of the former; let this be diſtilled in the ſame manner, till all its liquor is drawn off, and then more added, till the whole quantity intended to be diſtilled is thus diveſted of its liquor. After all this, when the yellowiſh vapours begin to appear from the remainder, a dram of ſuet muſt be put into the veſſel, leſt the diſſolved metal ſhould, when dried up, adhere ſo faſt to the ſides of the veſſel, as to give great trouble in ſeparating it; and when, at laſt, the calx ſhall be quite dry, let it be ſeparated and fuſed with pot-aſhes; thus will the metal be recovered, and the receiver will contain the *aqua fortis* revived from it.

AQUA *marina*, AQUE *marine*, in *Natural Hiſtory*, a gem, or precious ſtone, of a ſea-green colour; whence its name.

It is of about the ſame hardneſs with the amethyſt.

Some of the critics contend for its being the fixth ſtone in the *rationale* of the Jewiſh high-prieſt. Others will have this ſtone a *turquoiſe*; and Leo de Juda, and Hutterus, tranſlate it *hyacinthus*.

Several of the lapidaries take it, however, to be the BERYL; which coincides with the firſt opinion; the *beryl* being only another name for the *aqua marina.*—Pliny repreſents this as related to the *ſmaragdus*, but of a colour leſs briſk, and imitating a pure ſea-water green.

This gem may be imitated, by adding at ſeveral different times to it twenty pounds of cryſtal glaſs, made without magneſia, and well purified from glaſs-gall, ſix ounces of calcined braſs or copper, and a quarter of an ounce of prepared zaffre.

AQUA *mercurialis*, a preparation of *aqua regia*, and ſublimate of mercury, with a little mercury, placed in a ſand-heat till the ſolution of the mercury be made.

It is a mark of perfection of the *aqua mercurialis*, if it turn a piece of copper caſt into it, of a ſilver colour.

It is by this water, that the alchemiſts pretend, all metalline bodies may be reduced to their firſt matter, or mercury.

AQUA *naphæ*, is a name given to the diſtilled water of orange-flowers.

AQUA *omnium florum*, in *Pharmacy*, ſignifies the diſtilled water of cows-dung, when they are at graſs.—Some alſo call cows urine by this name. And, in Engliſh, *all-flower-water*.

AQUA *pugilum*. See AQUA *chryſulca*.

AQUA *regia*, or AQUA *regalis*, an acid corroſive ſpirit, or water, ſerving as a menſtruum to diſſolve gold.

It is thus called, becauſe it diſſolves gold, which is vulgarly eſteemed the king of metals.—It is ſometimes alſo called *aqua chryſulca*, and *ſtygia.*—The baſis, or eſſential ingredient of *aqua regia*, is common, or ſea-ſalt; which is the only ſalt in nature that will operate on gold.

By mixing nitrous and marine acids in various ways, *aqua regia* is made, and a menſtruum is obtained, capable of acting upon certain bodies, which no pure acid can diſſolve, or but imperfectly.

In making common *aqua regia*, the ſalt ſhould be previouſly pulveriſed, in a glaſs or ſtone mortar, and a gentle warmth applied to promote its ſolution in the ſpirit. Neumann, p. 220.

GOLD and PLATINA, in their aggregated ſtate, cannot be diſſolved by any other acid; and TIN and REGULUS of *antimony* are better and moſt eaſily diſſolved by it. The only difference between the ſeveral ſorts of *aqua regia* prepared in different manners, is this, that when it is made by merely diſſolving *ſal ammoniac*, or common ſalt, in nitrous acid, it then contains *ammoniacal*, or cubic nitre; but theſe neutral ſalts do not exiſt in the *aqua regia* made by the mixture of the two acids, or by diſtillation.

The diſſolving power of *aqua regia* is not injured by its containing theſe neutral ſalts; and as the *aqua regia* in which they remain is moſt eaſily and moſt cheaply prepared, it is more generally uſed than any of the other preparations of it.

It is neceſſary, however, to obſerve, that the *ammoniacal* nitre in the *aqua regia* may occaſion conſiderable differences in the nature of the precipitates made from ſolutions of metals in this menſtruum, by ſeparating from theſe precipitates any of thoſe metallic ſubſtances, which it is capable of diſſolving, and alſo by a portion of it adhering to PRECIPITATES. For inſtance, gold precipitated by a fixed alkali from an *aqua regia* made by mixing the pure nitrous and marine acids, does not *fulminate*; but if it be precipitated from an *aqua regia* made by diſſolving *ſal ammoniac* in nitrous acid, it does *fulminate*. See AURUM *fulminans*.

As to the proportions of nitrous and marine acids, or of *ſal ammoniac*, which ought to be employed in the preparation of *aqua regia*, there are no eſtabliſhed rules. Common *aqua regia* is made by diſſolving four ounces of *ſal ammoniac* in ſixteen ounces of nitrous acid; but theſe proportions ought to be varied, according to the nature of the ſolutions intended. To diſſolve, for example, the greateſt quantity of regulus of antimony, the *aqua regia* ought to be compoſed of four parts of nitrous acid to one of marine. To diſſolve the greateſt poſſible quantity of PLATINA, the beſt proportion is equal parts of the two acids. In general, the greater proportion of marine acid, or of *ſal ammoniac* that there is in *aqua regia*, the imperfect metals, and TIN in particular, are the leſs calcined and precipitated by it.

An *aqua regia* compoſed of two parts of ſpirit of nitre, and one part of ſpirit of ſalt, or of *ſal ammoniac*, makes a clear ſolution of nearly an equal weight of TIN, without forming any precipitate; but for this purpoſe, the operation muſt be performed ſlowly, and heat muſt be avoided as much as poſſible.

The mixture of the nitrous and marine acids, in order to make *aqua regia*, preſents a very ſingular and remarkable phenomenon. For the vapours of this mixture are more expanſive, and more difficult to be confined, than the vapours of either of the acids, before mixing them; which proves a reaction of theſe acids upon each other. This phenomenon is but very little ſenſible, when the acids employed contain much ſuperabundant water, but is more manifeſt in proportion as theſe are more concentrated. M. Macquer obſerved, that upon mixing moderately ſmoaking nitrous and marine acids, which had remained without occaſioning any diſturbance in their bottles, an *aqua regia* has been formed infinitely more ſmoaking, and which has made the ſtopper fly out of the containing bottle, particularly in weather ſomewhat warm. Mr. Beaumé, when diſtilling a pretty ſtrong nitrous acid upon *ſal ammoniac*, obſerved, that the vapours which paſſed were ſo elaſtic, that notwithſtanding every precaution, it was impoſſible to continue the diſtillation.

Aqua regia does not diſſolve ſilver; but when the quantity of marine acid contained in the *aqua regia* is very ſmall, the acid of nitre does then diſſolve ſilver, which is immediately afterwards attacked by the marine acid, without which it forms the metallic ſalt called LUNA *cornea*, and is precipitated. An exact ſeparation of gold and ſilver is therefore better made by *aqua fortis*, than by this acid; as the former can never diſſolve gold, whereas the latter may, and very frequently does, more or leſs, corrode and diſſolve ſilver. *Aqua regia* diſſolves a greater quantity of lead than marine acid. All the other metals it perfectly diſſolves.

According to Gellert's Table, the ſubſtances which *aqua regia* diſſolves, are placed in the following order, beginning with thoſe with which it moſt powerfully unites. *Phlogiſton, zinc, iron, regulus of cobalt, copper, tin, arſenic, biſmuth, mercury, lead, regulus of antimony, gold.*

In this Table, copper is erroneouſly placed before tin, as the latter metal readily precipitates the former. Macquer's Dict.

Dr. Prieſtley has found, that an *aqua regia*, of much greater power in the ſolution of gold than the common ſort, may be prepared by the impregnation of ſpirit of ſalt with the nitrous vapour. Exp. and Obſ on Air, vol. iii. p. 219.

AQUA *ſecunda*. This is nothing elſe but *aqua fortis* diluted with much pure water. It is employed in ſeveral arts, to clean the ſurface of metals, and of certain ſtones, and for various other purpoſes.

AQUA *ſicca philoſophorum*, a cant term, invented by ſome alchemiſts for the flowers of zinc, called by ſeveral other as unmeaning names, by theſe writers; as *ſericum*, philoſophic cotton, and TALC.

A preparation of theſe flowers, by means of vinegar, has alſo been called oil of talc, and many great properties aſcribed to it; but it is truly no other than the oil of the grape, from which the vinegar was made, and has no title to any thing that has been ſaid of it.

AQUA *ſulphurata*, *ſulphur water*, a new name for what was originally called *gas ſulphuris* by Van Helmont.

It is water impregnated with the fumes of burning ſulphur; and is conveniently prepared in the following manner: Take a quart of water, and half a pound of brimſtone; put the water into a large glaſs receiver; place it with its mouth ſideways, and then let the ſulphur be ſet on fire, in an iron ladle fixed to a wooden plug, made to go freely into the neck of the receiver, which ſhould be pretty long. This plug will then keep the ladle up horizontally, that it ſhall not dip into the water, and a cloth is to be thrown ſlightly over the mouth of the receiver, to confine the fumes. Let the burning of the ſulphur be repeated as often as the fumes from the laſt ſubſide, till the whole is burnt away. See GAS.

AQUA *vitæ* is commonly underſtood of what we otherwiſe call *brandy*, or the diſtilled *ſpirit of wine*, either ſimple, or prepared with aromatics, differently, according to the different intentions.

Some, however, diſtinguiſhed between them; appropriating the term *brandy* to what is procured from wine, or the grape; and *aqua vitæ* to that drawn after the ſame manner from malt, &c.

The common *aqua vitæ* is made by diſtilling wine in large copper ſtills, fitted with worms, ſo that the liquor flows out of the beak of the ſtill in a conſtant ſtream, and the diſtillation is continued till the liquor ceaſes to be inflammable. To make pure ſpirit, it ſhould be again diſtilled and rectified.

AQUA *vitriolica cærulea*, a form of medicine in the London Pharmacopœia, made in the following manner: take blue vitriol three ounces; alum and ſtrong ſpirit of oil of vitriol, of each two ounces; water a pint and a half; boil the ſalts in water till they are diſſolved, and then add the oil of vitriol, and finally, ſtrain the whole through paper.

Neumann gives a different account of the *aqua cærulea*, or ſapphirina of the ſhops. He ſays, that ſal ammoniac, quick-lime, and water, kept for a night in a copper or braſs veſſel, or along with pieces of copper, diſſolve a part of the metal, by which the liquor is tinged blue, and is called *aqua cærulea*. In this compoſition the copper is diſſolved by the volatile alkali of the *ſal ammoniac*, extricated by the quick-lime. Neumann's Works, p. 220.

AQUA *& igni interdictio*. See INTERDICTION.

AQUÆ *bajalus*, an ancient name for the clerk officiating under the chief miniſter, whoſe buſineſs was to aſſiſt him in carrying the holy water. The office correſponding to it at preſent is that of the PARISH-*clerk*.

AQUÆ *hauſtus*, in the *Civil Law*, a right of drawing water, and carrying it through another's ground.

AQUÆ *pavor* is uſed by ſome to denote the *hydrophobia*. Phil. Tranſ. Nº 147.

AQUÆDUCT, AQUÆDUCTUS, q. d. *ductus aquæ*, *a conduit of water*, is a conſtruction of ſtone or timber, built on an uneven ground, to preſerve the level of water, and convey it, by a canal, from one place to another.—There are *aquæducts* under ground, and others raiſed above it, ſupported by arches.—The Romans were very magnificent in their *aquæducts*; they had ſome that extended an hundred miles. Frontinus, a man of conſular dignity, and who had the direction of the *aquæducts* under the emperor Nerva, tells us of nine that emptied themſelves through 13,594 pipes, of an inch diameter. Vigenere has obſerved, that, in the ſpace of twenty-four hours, Rome received from theſe *aquæducts* no leſs than five hundred thouſand hogſheads of water.—The three chief *aquæducts* now in being are thoſe of the Aqua Virginea, Aqua Felice, and Aqua Paulina. The firſt was repaired by pope Paul IV. The ſecond was conſtructed by pope Sixtus V. and is called from the name which he aſſumed before he was exalted to the papal throne. The third was repaired by pope Paul V. in the year 1611.—The *aquæduct* built by Lewis XIV. near Maintenon, for carrying the river Bure to Verſailles, is perhaps the greateſt in the world. It is 7000 fathoms long, and its elevation 2560 fathoms; containing 242 arcades. Vid. Phil. Tranſ. ap. Lowth. i. p. 594.

AQUÆDUCT, AQUÆDUCTUS, in *Anatomy*, denotes a bony kind of canal, or paſſage, in the *os petroſum*, ſuppoſed to contribute to the purpoſes of hearing.—It is called *aquæduct* not only on account of its form, but, as ſome alſo imagine, from its ſerving to diſcharge any foreign matters collected in the inner cavities of the ear.—It is ſometimes alſo called *aquæductus Fallopii*, from the name of its firſt diſcoverer.—Several authors confound it with the *tuba Euſtachiana*.

The *aquæductus Fallopii* is ſometimes alſo called *meatus cæcus*; by others *meatus cochlearis*, and *meatus capreolaris*; by others *canalis particularis*, *meatus auditorius internus*, and *foramen auditorum internum*, called alſo *hydroparaſtates*.

AQUÆMANILIS, from *aqua*, *water*, and *manus*, *hand*, is particularly uſed, in *Eccleſiaſtical Writers*, for a kind of baſon or laver, anciently placed in the veſtibles of churches, ſerving to waſh the hands in.

Aquæmanilis ſtood contradiſtinguiſhed from *urceolus*, as the former was placed under the hands, the latter above them, from whence the water trickled down by a cock. The prieſt alſo, after celebrating maſs, waſhed his fingers in an *aquæmanilis*.

In the inventories of church plate, we frequently find mention of *aquæmaniles*, *aquaminilia*, *aquiminalia*, of ſilver gilt, wrought, &c. Du-Cange.

AQUAGE, a water-courſe.

AQUALICULUS, in *Anatomy*, a name given by ſome to the region of the body, wherein the trunk terminates, and the thighs commence, and in which alſo the privities are placed.

The *aqualiculus* is the ſame with what others call PUBES, others the *hypogaſtrium*, *ſumen*, *imus venter*, &c.

AQUARIANS, AQUARII, a ſect toward the cloſe of the ſecond century, who, inſtead of wine, uſed nothing but water in the ſacrament.

It is ſaid the occaſion of the abuſe was owing to the perſecution which prevailed in thoſe times: for the Chriſtians, being then obliged to celebrate the ſacrament in the night, found it neceſſary to make uſe of water, leſt the ſmell of the wine ſhould betray them to the heathens. But they afterwards went farther, and actually forbid the uſe of wine in the euchariſt, even when it might be uſed with ſafety.

Epiphanius tells us, the *Aquarians* were the followers of Tatian; and were ſo called from the word *aqua*, *water*, becauſe they abſtained wholly from wine, and did not uſe it even in the euchariſt.

AQUARIUS, in *Aſtronomy*, the eleventh ſign in the ZODIAC, reckoning from Aries; from which alſo the eleventh part of the ecliptic takes its name.

The ſun moves through *Aquarius* in the month of January; it is marked thus, ♒.

The poets feign, that *Aquarius* was Ganymede, whom Jupiter raviſhed under the ſhape of an eagle, and carried away into heaven, to ſerve as a cup-bearer, in the room of Hebe and Vulcan; whence the name.—Others hold, that the ſign was thus called, becauſe, when it appears in the horizon, the weather uſually proves rainy.

The ſtars in the conſtellation *Aquarius*, in Ptolemy's catalogue, are 45; in Tycho's 41; in Hevelius's 47; in Flamſtead's Britannic Catalogue 108; the longitudes, latitudes, &c. whereof, according to the former, are given by Hevelius: according to the laſt, they are as follows; to which are added the *informes*.

AQUARTIA, in *Botany*, a genus of the *tetrandria monogynia* claſs; with a bell-ſhaped calyx, and a round corolla, with linear ſegments, and a many-ſeeded berry.

AQUATIA, in *Middle Age Writers*, a right of fiſhing three days in the year. Du-Cange.

In ancient deeds, we find divers grants of this privilege of *aquatia*, or *aquatura*, ſometimes alſo called *aquaria*.

In ſome writings *aquatia* ſeems alſo to have ſignified a fee, or other ſervice, paid for the privilege of fiſhing.

AQUATIC, ſomething which lives, breeds, or grows, in or about the water.

Thus we have *aquatic* plants, and *aquatic* animals.

Trees which grow peculiarly on the banks of rivers, or in marſhes, &c. are alſo called *aquatics*.

The ancient Romans had alſo their *aquatic*, or *aquatile* gods, *dii aquitales*, called by Catullus, *dii littorales*; concerning whom we have an inſcription in Reineſius, NEPTVNNO ET DIS AQVITILIBVS

To this claſs belonged the Tritons, the miniſters of Neptune.

AQUATIC *inſects*, ſee INSECTS.

AQUATIC *road*, ſee ROAD.

AQUATIC *ſpider*, in *Zoology*. See SPIDER.

AQUATICUM, in *Middle Age Writers*, is a right of uſing a water. Hence *aquaticum in foreſta*, &c. Du-Cange.

AQUATUM, in ſome *Phyſical Writers*, denotes a thing diluted with water.

AQUATUM *ovorum* is uſed by ſome naturaliſts, for what is otherwiſe called GRANDO, but more uſually CHALAZA.

AQUEOUS, AQUOSUS, ſomething that partakes of the nature of WATER, or abounds therewith.

Thus milk is ſaid to conſiſt of an *aqueous* or ſerous, and a butyrous part.

The chemiſts ſeparate the *aqueous* part or phlegm from all bodies by diſtillation.

AQUEOUS *bath*. See BATH.

AQUEOUS *humour*, is the firſt or outermoſt, and the rareſt of the three humours of the eye.

It lies immediately above the *tunica aranea*, and ciliary ligament, and under the *cornea*, which it cauſes to protuberate a little; and is ſuppoſed to be furniſhed by certain ducts provided for the purpoſe.—It is found ſo ſpirituous, that it will not freeze in the ſevereſt froſt.

Anatomiſts are divided about the origin and conveyance of this humour.—It is certain, the ſource muſt be pretty plentiful, inaſmuch as, if by any accident the coats it is contained in be wounded, ſo that the humour runs out, and the *cornea* collapſes, the wound readily heals, by only cloſing the eye, and the humour recruits: of which we have numerous inſtances among phyſicians.

Dr. Nuck thinks he has diſcovered the ducts in the ſclerotica, whereby this humour is furniſhed.

Others, denying the reality of thoſe ducts, ſuppoſe it immediately derived from the arteries. Dr. Drake admits the ducts, and takes them to be only branches of the excretory ducts of the grandula innominata, and lachrymalis; which piercing the tunics of the eye, deliver their liquor by ways hitherto unknown.

Mr. Warner obſerves, that this humour is ſecreted by the extremities of the moſt minute lymphatic arteries of the iris; and that a proper quantity of it is received, and occaſionally returned again, into the larger veins, and courſe of general circulation, by means of minute lymphatic, or abſorbent veins, correſponding to thoſe arteries.

AQUETTA, a name for a kind of poiſon made much uſe of by the Roman women, under the pontificate of Alexander VIII.

AQUIFOLIUM. See HOLLY, and BIRD-*Lime*.

AQUILA, in *Natural Hiſtory*, &c. See EAGLE.

AQUILA, in *Aſtronomy*, a conſtellation of the northern hemiſphere; uſually joined with Antinous.

The ſtars in the conſtellation *Aquila* and Antinous, in Ptolemy's Catalogue, are 15; in Tycho's, 19; in Hevelius's 42; in the Britannic Catalogue, 71: the longitudes, latitudes, magnitudes, &c. whereof, according to the two firſt, are given by Hevelius; according to the laſt, they are as follow.

Aquila, in *Chemiſtry*, has ſeveral ſignifications, according to the epithets joined with it.

Aquila *alba*, is a name given to a combination of corroſive ſublimate, with freſh mercury, called *mercurius dulcis*.

Aquilæ *arbor*, in *Botany*, a name given, by ſome authors, to the tree whoſe wood is the *agallochum*, or lignum aloes of the ſhops.

AQUILEGIA, in *Botany*. See Columbine.

AQUILICIUM, or Aquælicium, in *Antiquity*, a ſacrifice, celebrated among the Romans, in time of exceſſive droughts, to obtain rain of the gods.

Danet calls this *aquiliciana*. The prieſts who officiated at it were denominated *aquilices, quia aquam eliciebant*, becauſe they brought down water: but where he finds this new order of prieſts, he does not tell us.

AQUILIFER, from *aquila, eagle*, and *fero, I bear*, among the Romans, an enſign-bearer, who carried the ſtandard on which the eagle was repreſented.

AQUILINE, Aquilinus, ſomething belonging to an eagle. Hence, *aquiline* noſe denotes a hooked noſe, or ſuch as is like the beak of an eagle; called alſo a hawk's noſe.

AQUILO, is uſed by Vitruvius for the north-eaſt wind; or that which blows at 45° from the north towards the eaſt point of the horizon.

The poets gave the name *aquilo* to all ſtormy winds dreaded by the mariners.

AQUILUS, among the *Ancients*, a dark, or duſky colour, approaching to black.

Hence ſome of the heathen gods were called *dii aquili*, q. d. *nigri*.

Aquilus, in *Ornithology*, a ſpecies of pelican.

AQUIMINARIUM, in *Antiquity*, a kind of luſtral veſſel wherein the Romans carried their holy water for expiation, and other religious offices.

AQUIQUI, in *Natural Hiſtory*, the name of a particular ſpecies of monkey, called by the people of Braſil, the king monkey, as being much larger than all the other monkies.

AQUO, in *Zoology*, a name by which ſome authors have called the agonus, a fiſh much approaching to the nature of the alausa, or shad.

AQUOSE *ducts, ductus* Aquosi *Nuckii*. See Aqueous. *Humour*.

AQUULA, the name of a diſorder of the eyes, called alſo *hydatis*.

ARA *thuribuli*, the *Altar of incenſe*, in *Aſtronomy*, a ſouthern conſtellation, not viſible in our hemiſphere, conſiſting, according to Ptolemy, of ſeven ſtars; and according to Sharp's Catalogue, annexed to that of Mr. Flamſtead, of nine ſtars, as in the following table.

Situation of the ſtars.	Signs.	Longitud.	Latitude.	Magnitude
		° ′ ″	° ′ ″	
In the baſe, the northern.	♐	21 35 52	23 5 26	5

Ara *parva, the little altar*, a denomination, in the *Ancient Surgery*, given to an elegant kind of bandage, ſaid to have been invented by Soſtratus.

ARAB, or Arabian *horſe*, is ſaid to be nurſed with camel's milk: there are many ſtrange reports of this beaſt. The duke of Newcaſtle aſſures us, that the ordinary price of one is 1000, 2000, or 3000 pounds; and that the Arabs are as diligent in keeping the genealogies of their horſes, as princes of their families. They ſtrike medals on every occaſion to keep up the pedigree. The fortune the Arabians give their ſons, when arrived at manhood, is, two ſuits of arms, with two ſcimeters, and a horſe; which always lies in the next room to them.—Yet of thoſe of the breed brought into England few have proved very extraordinary.

ARABANT, from *aro, I plough*, in *Law, ad curiam domini*, was intended of thoſe who held by the tenure of ploughing and tilling the lord's lands within the manor.

ARABESQUE, or Arabesk, ſomething done after the manner of the Arabians.

Arabeſque, Grotesque, and *Moreſque*, are terms applied to ſuch paintings, ornaments of freezes, &c. wherein there are no human or animal figures, but which conſiſt wholly of imaginary foliages, plants, ſtalks, &c.

The words take their riſe from hence, that the Moors, Arabs, and other Mahometans, uſe theſe kinds of ornaments; their religion forbidding them to make any images or figures of men, or other animals.

Arabeſc is uſed by Stephen Riou, Eſq. in his book on Architecture, to denote that ſtyle of building which is vulgarly called *Modern Gothic*, which he alſo terms *Saracenic* and *Moreſc*; the introduction of which he aſcribes to the Moors, or, which he ſays is the ſame thing, to the Arabians or Saracens, who have expreſſed, he adds, in their architecture, the ſame taſte as in their poeſy, which are both ſalſely delicate, crowded with ſuperfluous ornaments, and often very unnatural. This manner of building, he ſays, was introduced into Europe through Spain. The Cruſades gave the Chriſtians an idea of *Saracenic* architecture, which they afterwards imitated. Sir C. Wren diſtinguiſhes the heavy *Gothic* as *Anglo-Saxon*, the lighter as *Arabeſc*.

ARABIC, or Arabian, ſomething that relates to Arabia, or the Arabs.

Arabic *figures*, or *characters*, are the numeral characters commonly made uſe of in arithmetical computations.

The *Arabic* characters ſtand contradiſtinguiſhed to the Roman.

The learned are generally of opinion, that the *Arabic* figures were firſt taught us by the Saracens, who borrowed them from the Indians.—Scaliger was ſo ſatisfied of their novelty, that he immediately pronounced a ſilver medallion he was conſulted about, modern; upon his being told that the numeral figures 234, 235, were upon it. The common opinion is, that Planudes, who lived towards the cloſe of the thirteenth century, was the firſt Chriſtian who made uſe of them. Father Mabillon even aſſures us, in his work *de Re Diplomatica*, that he has not found them any where earlier than the fourteenth century. Yet Dr. Wallis inſiſts on their being of a much older ſtanding; and concludes they muſt have been uſed in England, at leaſt as long ago as the time of Hermannus Contractus, who lived about the year 1050, if not in ordinary affairs, yet at leaſt in mathematical ones, and particularly in the aſtronomical tables. Vide Wall. Algebr. c. 4.

The ſame author gives us an inſtance of their antiquity in England, from a mantle-tree of a chimney, in the parſonage-houſe of Helmdon in Northamptonſhire, wherein is the following inſcription in *baſſo relievo*, M° 133, being the date of the year 1133. Philoſ. Tranſact. N° 154.

Mr. Luffkin furniſhes a yet earlier inſtance of their uſe, in the window of a houſe, part of which is a Roman wall, near the market-place in Colcheſter; where, between two carved lions, ſtands an eſcutcheon, containing the figures 1090. Philoſ. Tranſact. N° 255.

Mr. Huet is even of opinion, that theſe characters were not borrowed from the Arabs, but from the Greeks; and that they were originally no other than the Greek letters, which we all know that people made uſe of to expreſs their NUMBERS by.

ARABIC, *gum*. See GUM.

ARABIC, or ARABIAN *learning*, is divided into two ſtates, or periods, viz. Ante-Mahometan, and Mahometan.

The *Arab* learning in this firſt period, conſiſted, according to Abulpharagius, in the knowledge of their language, the propriety of diſcourſe, the compoſition of verſe, and the ſcience of the ſtars: but their chief attention ſeems to have been directed to *oratory* and *poetry*. Hiſt. Dynaſt. Renaudot de Barbar. Ariſt. verſ Fabricii Bibl. Græca, lib. vi. cap. 5. § 6.

The ſecond period is more diſtinguiſhed, at leaſt from the time of Al-Mamon, the ſeventh caliph of the family of the Abaſſides, who flouriſhed about the year 820, and has the honour of being the founder of the modern *Arabian* learning. He ſent for all the beſt books out of Chaldea, Greece, Egypt, and Perſia, relating to phyſic, aſtronomy, coſmography, muſic, chronology, &c. and penſioned a number of learned men, ſkilled in the ſeveral languages and ſciences, to tranſlate them into *Arabic*. By this means, divers of the Greek authors, loſt in their own country and language, have been preſerved in *Arabic*. Elmac. Hiſt. Sar. lib. ii. cap. 8. Leo Africanus de Viris illuſt. ap. Arabes, cap. 1. Fabricii Bib. Græc. lib. vi. cap. 9. Græv. in Præf. ad Tab. Geog. Voſſ. de Sect. Phil. cap. 3. § 17.

From that time *Arabia* became the chief ſeat of *learning*; and we find mention by Abulpharagius, Pococke, D'Herbelot, and Hottinger, of learned men, and books without number.

The revival of *learning* in the tenth century, by Gerbert, known after his elevation to the pontificate by the title of Silveſter II. and afterwards among the Europeans in general, may be aſcribed to the inſtructions and writings of the *Arabian* doctors and philoſophers, and to the ſchools which they founded in ſeveral parts of Spain and Italy. And in the twelfth century, the inquiſitive of different countries frequented the ſchools of the Saracens in Spain, and diſſeminated the knowledge which they obtained there after their return. At this time, many of the learned productions of the *Arabians* were tranſlated into Latin, which facilitated the general progreſs of ſcience.

ARABIC, or ARABIAN *logic*, was that of Ariſtotle, as explained by Aviſenna and Averrhoes.

ARABIC *marble*, *Arabicum marmor*, a name given by the ancient Greeks, to a ſpecies of marble brought from Egypt and Arabia, and remarkable for its beautiful whiteneſs.

ARABIC, or ARABIAN *oratory*, according to Renaudot, conſiſted in a luxuriancy of quaint, high-flown words, epithets, and deſcriptions.

ARABIC, or ARABIAN *philoſophy*, before Mahomet, was Sabian, and included the ſyſtem and ceremonies of that ſect of idolaters. This it was that Mahomet ſet himſelf to decry; and he is even ſaid by ſome, to have carried his oppoſition ſo far, as to prohibit, if not puniſh, all ſtudy of *philoſophy*. But his followers, by degrees, got over this reſtraint; the love of learning increaſed; till, under the memorable caliphate of Al-Mamon, Ariſtotle's *philoſophy* was introduced and eſtabliſhed among them; and from them propagated, with their conqueſts, through Egypt, Africa, Spain, and other parts.

As they choſe Ariſtotle for their maſter, they chiefly applied themſelves to that part of philoſophy called *logic*, and thus became proficients in the knowledge of words, rather than things. Whence they have been ſometimes denominated, *Maſters of the wiſdom of words*; ſometimes the *Talking ſect*. Their *philoſophy* was involved in quaint arbitrary terms and notions, and their demonſtrations drawn from thence, as from certain principles, &c. Walch Hiſt. Logic. lib. ii. ſec. 2. § 1.

ARABIC, or ARABIAN *phyſic* and *phyſicians*, ſucceeded the Grecian, and handed down the art to us, having made conſiderable improvements, chiefly in the pharmaceutical and chemical parts.

It is certain we owe to them moſt of our ſpices and aromatics, as nutmegs, cloves, mace, and other matters of the produce of India. We may add, that moſt of the gentler purgatives were unknown to the Greeks, and firſt introduced by the *Arabs*, as manna, ſena, rhubarb, tamarinds, caſſia, &c. They likewiſe brought ſugar into uſe in *phyſic*, where, before, only honey was uſed. They alſo found the art of preparing waters and oils, of divers ſimples, by diſtillation and ſublimation.

The firſt notice of the ſmall-pox, and the meaſles, is likewiſe owing to them. Laſtly, the reſtoration of *phyſic* in Europe took its riſe from their writings.

M. Le Clerc has given a ſketch, and Dr. Freind, an ample hiſtory of the *Arabian phyſic*. We have alſo a *notitia* of all the *Arabian phyſicians*, by Fabricius.

ARABIC, or ARABIAN *poetry*, may be divided into two ages. The ancient, according to Voſſius, was no other than rhiming; was a ſtranger to all meaſure, and rule; the verſes looſe and irregular, confined to no feet, number of ſyllables; or any thing elſe, ſo that they rhimed at the end; oftentimes all the verſes in the poem ended with the ſame rhime. It is in ſuch verſe that the ALCORAN is ſaid to be written.

The modern *Arabian poetry* takes its date from the caliphate of Al Raſchid, who lived toward the cloſe of the eighth century. Under him *poetry* became an art, and laws of *proſody* were laid down. Clark, Proſod. Arab. cap. 1.

Their compariſons, in which they abound, are taken, with little choice, from tents, camels, hunting, and the ancient manners of the *Arabs*.

ARABIC, or ARABIC *tongue*, is a branch or dialect of the Hebrew.

F. Angelo de St. Joſeph ſpeaks much of the beauty and copiouſneſs of the *Arabic*. He aſſures us it has no leſs than a thouſand names for a ſword; five hundred for a lion; two hundred for a ſerpent; and eighty for honey.

ARABIC *verſions*. See BIBLES.

ARABIC *year*. See YEAR.

ARABICI, a ſect who ſprung up in Arabia, about the year 207, whoſe diſtinguiſhing tenet was, that the ſoul died with the body, and alſo roſe again with it.

Euſebius, lib. vi. c. 38. relates that a council was called to ſtop the progreſs of this riſing ſect; and that Origen aſſiſted at it; and convinced them ſo thoroughly of their error, that they abjured it.

ARABACUS *coſtus*. See COSTUS.

ARABIS, in *Botany*, a genus of the *tetradynamia ſiliquoſa*; *baſtard tower* MUSTARD.

ARABISM, ARABISMUS, an idiom, or manner of ſpeaking peculiar to the Arabs, or the Arabic language.

R. Martin maintains, that the ו ſometimes expreſſes an oath in the Hebrew as well as the Arabic.

ARABIST, a perſon curious of, and ſkilled in the learning and languages of the Arabians: ſuch were Erpenius and Golius. The ſurgeons of the 13th century are called *Arabiſts* by Severinus. Freind. Hiſt. Phyſ. tom. ii. p. 301.

ARABLE *land*, anciently called ARALIA, in ſuch as is fit for tillage, or ploughing; or which is actually ploughed up from time to time.

It is thus called from the Latin *arare*, of *aratrum*, a PLOUGH.

ARABUM *lepra*. See LEPROSY.

ARABUM *ſandaracha*. See SANDARACHA.

ARAC, or ARRAC, a ſpirituous liquor, imported from the Eaſt Indies; chiefly uſed by way of dram, and in punch. The nature and compoſition of this celebrated liquor has been much controverted.—The name *arac*, Mr. Lockyer aſſures us, is an Indian word for ſtrong waters of all kinds; for that they call our ſpirits and brandy, *Engliſh arac*.—But what we underſtand by the name *arac*, is really no other than a ſpirit procured by diſtillation, from a vegetable juice called *toddy*, which flows by inciſion out of the cocoa-nut tree, and ſome other trees, like the birch-juice procured among us

The *toddy*, Mr. Lockyer adds, is a pleaſant drink of itſelf, when new, but purges thoſe not uſed to it; and, when ſtale, is heady; and finally makes good vinegar. The Engliſh at Madraſs uſed it as leaven to raiſe their bread with.

Others are of opinion, that the *arac* or *arrac*, is a vinous ſpirit obtained by diſtillation, in the Eaſt Indies, from rice or ſugar, fermented with the juice of cocoa nuts.

The *Goa arac* is made from the *toddy*, the *Batavia arac* from rice and ſugar. There is likewiſe a kind of ſhrub from which *arac* is made.

Goa and Batavia are the chief places for *arac*.—At Goa there are divers kinds; ſingle, double, and treble diſtilled. The double diſtilled, which is that commonly ſent abroad, is but a weak ſpirit in compariſon with Batavia *arac*; yet on account of its peculiar and agreeable flavour, is preferred to all the other *aracs* of India. This is attributed to the earthen veſſels, which they uſe at Goa to draw the ſpirit; whereas at Batavia they uſe copper ſtills.

The *Parier arac*, made at Madraſs, and the *Columbo*, and *Quilone arac*, at other places, being fiery hot ſpirits, are little valued by the Europeans, and therefore rarely imported; though highly prized among the natives. In the beſt *Goa arac*, the ſpirits of the cocoa juice do not make above a ſixth or eighth part.

The manner of making the *Goa arac* is this. The juice of the trees is not procured in the way of tapping, as we do; but the operator provides himſelf with a parcel of earthen pots, with bellies and necks like our ordinary bird-bottles: he makes faſt a number of theſe to his girdle, and any way elſe that he commodiouſly can about him. Thus equipped, he climbs up the trunk of a cocoa-tree; and when he comes to the boughs, he takes out his knife, and cutting off one of the ſmall knots, or buttons, he applies the mouth of the bottle to the wound, faſtening it to the bough with a bandage; in the ſame manner he cuts off other buttons, and faſtens on his pots, till the whole number is uſed: this is done in the evening, and deſcending from the tree, he leaves them till the next morning; when he takes off the bottles which are moſtly filled, and empties the juice into the proper receptacle. This is repeated every night, till a ſufficient quantity is produced, and the whole being then put together, is left to ferment, which it ſoon does.

When the fermentation is over, and the liquor or waſh is become a little tart, it is put into the ſtill, and a fire being made, the ſtill is ſuffered to work as long as that which comes over has any conſiderable taſte of ſpirit.

The liquor thus procured is the low wine of *arac*, and this is ſo poor a liquor, that it will ſoon corrupt and ſpoil, if not diſtilled again, to ſeparate ſome of its phlegm; they therefore immediately after pour back this low wine into the ſtill, and rectify it to that very weak kind of proof-ſpirit, in which ſtate we find it.

The *arac* we meet with, notwithſtanding its being of a proof-teſt, according to the way of judging by the crown of bubbles, holds but a ſixth, and ſometimes but an eighth part of alcohol, or pure ſpirit; whereas our other ſpirits, when they ſhew that proof, are generally eſteemed to hold one half pure ſpirit. Shaw's Eſſay on Diſtilling.

There is a paper of obſervations on *arac*, in the Melanges d'Hiſtoire Natur. tome V. p. 302. By fermenting, diſtilling, and rectifying the juice of the American maple, which has much the ſame taſte as that of the cocoa, the author ſays, he made *arac* not in the leaſt inferior to any that comes from the Eaſt Indies; and he thinks the juice of the ſycamore and of the birch trees would equally anſwer the end.

Beſide the common ſorts of Goa and Batavia *arac*, there are two others leſs generally known; theſe are the bitter *arac*, and the black *arac*.

By ſtat. 11th Geo. 1. c. 30. *arac* on board a ſhip within the limits of any port of Great Britain, may be ſearched for and ſeized, together with the package; or if found unſhipping or unſhipped, before entry, may be ſeized by the officers of exciſe, in like manner as by the officers of the cuſtoms.

Upon an exciſe officer's ſuſpicion of the concealment of *arac*, and oath made of the grounds of ſuch ſuſpicion, before the commiſſioners, or a juſtice of peace; they may empower him to enter ſuch ſuſpected places, and ſeize the liquors, with the caſks, &c. If the officers are obſtructed, the penalty is 100*l*.

Arac is not to be ſold but in warehouſes, entered as directed in the 6th of Geo. 1. c. 21. upon forfeiture, and the caſks, &c. If permits are not returned which are granted for the removal of *arac*, or if the goods are not ſent away within the time limited, the penalty is treble the value. If the permits are not returned, and the decreaſe is not found to be ſufficient, the like quantity is forfeited. Permits are not to be taken out, but by direction in writing of the proprietor of the ſtock, or his known ſervant, upon forfeiture of 50*l*. or three months impriſonment.

By ſtat. 9th Geo. 2. c. 35. if *arac* is offered to ſale without a permit, or by any hawker, pedlar, &c. with a permit; the perſon to whom it is offered, may ſeize and carry it to the next warehouſe belonging to the cuſtoms or exciſe, and bring the perſon offering the ſame before any juſtice of the peace, to be committed to priſon, and proſecuted for the penalties incurred by ſuch offence. The perſon ſeizing ſuch goods may proſecute in his own name; and on recovery is intitled to one third part of the groſs produce of the ſale: and the commiſſioners are, if deſired, upon a certificate from the juſtice of the offender's being committed to priſon, to advance to the ſeizer 15*s*. per gallon for the *arac* ſo ſeized.

Arac (except for the uſe of ſeamen, two gallons each) found in any ſhip or veſſel arrived from foreign parts, at anchor, or hovering within the limits of any port, or within two leagues of the ſhore; and not proceeding on her voyage (unleſs in caſe of unavoidable neceſſity and diſtreſs of weather, notice whereof muſt be given to the collector or chief officer of the port, upon the ſhip's arrival) is forfeited; with the boxes, caſks, or other package, or the value thereof.

ARACARI, in *Zoology*, the name of a Braſilian bird, of the WOODPECKER kind. It is of the ſize of our common green woodpecker, and has a very large, ſharp, and ſomewhat hooked beak. Marggrave. See PICUS, and *Tab. Birds*, N° 14.

ARACHIS, in *Botany*, *arachidna*, *arachinoides*, and *arachidnoides*. See EARTH-NUT.

ARACHNOIDES, in *Anatomy*, a fine, thin, tranſparent membrane, which lying between the *dura* and *pia mater*, is ſuppoſed to inveſt the whole ſubſtance of the brain, *medulla oblongata*, and ſpinal marrow.

The word is borrowed from αραχνη, *a ſpider*, or *ſpider's web*, and ειδος, *form*; in regard to the fineneſs of the part, which is ſuppoſed to reſemble that of a ſpider's web.

Many anatomiſts deny the exiſtence of ſuch third *meninx*, or membrane; and contend that it ought rather to be regarded as the external *lamina* of the *pia mater*, which ſends its internal *lamella* between the folds of the cortical part of the brain.

ARACHNOIDES, or ARANEA *tunica*, is likewiſe uſed for a fine ſlender tunic, wherewith the cryſtalline humour is encompaſſed.

This, others call *cryſtalloides*, and *tunica cryſtallina*, or *capſula cryſtallina*.—Many have even doubted of its exiſtence; which is the more extraordinary, ſince Galen ſpeaks of it, and compares it to a pellicle of an onion; Veſalius repreſents it as reſembling fine tranſparent horn.—It is eaſily found in quadrupeds, eſpecially the ſheep, ox, and horſe; and though it be a little more difficult to diſcover in man, yet after a perſon has once been ſhewn it, he will readily find it.

What is ſurpriſing, Briggs ſays not a word of it; and ſo able an anatomiſt as Ruyſch, was long in ſuſpenſe about it: it was only by means of his injections that he diſcovered it in man; though ſo eaſy to diſcern in a ſheep.

The *arachnoides* adheres by its poſterior part to the vitreous tunic.—In man it is about twice as thick as a ſpider's web, at leaſt the fore-part of it; in an ox it is as thick again as in man; and in an horſe it is thicker than in an ox.

It has three uſes: firſt, to retain the cryſtalline in the collet of the vitreous humour, and prevent its changing ſituation: ſecondly, to ſeparate the cryſtalline from the aqueous humour, and prevent its being continually moiſtened therewith: thirdly, the lymphatics furniſh a liquor which they diſcharge into its cavity, wherewith the cryſtalline is continually refreſhed, and kept in right order; inſomuch that when this liquor is wanting, the cryſtalline ſoon dries, grows hard, and opake, and may even be reduced to powder. *Vide* Petit, in Mem. Acad. R. Scienc. an. 1730. p. 622, ſeq.

ARACHNOIDES, in *Natural Hiſtory*, the name of one of the genera of the ECHINI *marini*; the diſtinguiſhing characters of which are, that it is of a circular circumference, but variouſly broken in at the edges. The mouth is round, and placed in the center of the baſe, and the aperture for the *anus* is quadrangular, and ſituated in one of the ſides, on the upper ſuperficies, but near the edge. Klein. See *Tab. of Teſtaceous and Cruſtaceous* Animals, N° 8.

ARACUS, in *Botany*; *ſtrangle* TARE, or *wild* VETCH. A plant which grows in hedges, on banks, and among corn. It is a herb in uſe, and has the ſame qualities with the other ſpecies of the VICIA.

ARACUS *aromaticus*, in the *Materia Medica*, a name given by ſome authors to the VANILLA uſed in chocolate-making.

ARADOS, in *Hippocrates*, ſignifies that perturbation which is excited in the ſtomach by concocting meats of different qualities. *Arados* alſo ſignifies any internal perturbation cauſed by purging medicines, vehement exerciſes, or other cauſes.

ARÆOMETER, ARÆOMETRUM, an inſtrument wherewith to meaſure the denſity or gravity of fluids.

The word is formed of *αραιος*, *thin*, and *μετρον*, *meaſure*.

The *aræometer*, or water-poiſe, is uſually made of glaſs; conſiſting of a round hollow ball, which terminates in a long ſlender neck, hermetically ſealed at top; there being firſt as much running mercury put into it, as will ſerve to balance or keep it ſwimming in an erect poſition.

The ſtem is divided into degrees (as repreſented *Tab. Pneumatics*, *fig.* 18.); and by the depth of its deſcent into any liquor, the lightneſs of that liquor is concluded; for that fluid in which it ſinks leaſt, muſt be heavieſt; and that in which it ſinks loweſt, lighteſt.

M. Homberg has invented a new *aræometer*, deſcribed in Philoſ. Tranſact. N° 262. thus: *A* (*fig.* 19.) is a glaſs bottle or matraſs, with ſo ſlender a neck, that a drop of water takes up in it about five or ſix lines, or half of an inch. Near that neck is a ſmall capillary tube *D*, about ſix inches long, and parallel to the neck.—To fill the veſſel, the liquor is poured in at the mouth *B* (which is widened to receive a tunnel), till it run out at *D*; that is, till it riſe in the neck to the mark *C*, by which means you have always the ſame bulk or quantity of liquor; and conſequently, by means of the balance, can eaſily tell, when different liquors fill it, which weighs moſt, or is moſt intenſely heavy.

Some regard, however, is to be had in theſe trials to the ſeaſon of the year, and degree of heat and cold in the weather: becauſe ſome liquors rarefy with heat, and condenſe with cold, more than others; and accordingly take up more or leſs room.

By means of this inſtrument, the ingenious author has made a table, to ſhew the different weights of the ſame bulk of the moſt conſiderable chemical liquors, both in ſummer and winter; as follows:

The *aræometer* full of	Weighed in ſummer.			In winter.		
	oz.	*dr.*	*gr.*	*oz.*	*dr.*	*gr.*
Quick-ſilver,	11	00	06	11	00	32
Oil of tartar,	01	03	08	01	03	31
Spirit of urine,	01	00	32	01	00	43
Oil of vitriol,	01	03	58	01	04	03
Spirit of nitre,	01	01	40	01	01	70
——— ſalt,	01	00	39	01	00	47
Aqua fortis,	01	01	38	01	01	55
Vinegar,	00	07	55	00	07	60
Spirit of wine,	00	06	47	00	06	61
River water,	00	07	53	00	07	57
Diſtilled water,	00	07	50	00	07	54

The inſtrument itſelf weighed, when empty, one drachm twenty-eight grains. See HYDROMETER.

ARÆOPAGUS. See AREOPAGUS.

ARÆOPAGITIC. See AREOPAGITIC.

ARÆOSTYLE, ARÆOSTYLOS, in the *Ancient Architecture*, a ſort of INTERCOLUMNATION, wherein the columns were placed at the diſtance of eight, or, as ſome ſay, ten modules from one another. See *Tab. Archit.* E *fig.* 40.

In the *aræoſtyle*, the columns were the wideſt and openeſt they were ever planted at; whence the name—from the Greek *αραιος*, *rarus*, and *ϛυλος*, *column*.

The *aræoſtyle* is chiefly uſed in the Tuſcan order; at the gates of great cities, and fortreſſes.

ARÆOTICS, in *Medicine*, ſuch remedies as tend to open the pores of the ſkin, and render them large enough for the morbific matter's being carried off by ſweat, or inſenſible perſpiration.

To the claſs of *aræotics* belong diaphoretics, ſudorifics, &c.

ARAF, or AL-ARAF, in the *Mahometan Theology*, a kind of ſeparation or partition-wall between paradiſe and hell. Sale's Koran.

ARAHUM, or HARAHUM, in *Ancient Writers*, denotes a place conſecrated or ſet apart for holy purpoſes. Du-Cange.

Hence the phraſe, in *araho jurare*, or *conjurare*, to make oath in the church; becauſe, by the Ripuarian laws, all oaths were to be taken in the church, on the relics of the ſaints.

ARAIGNEE, in *Fortification*, ſometimes denotes a branch, return, or gallery, of a mine.

ARAIRE, the name of a ſmall plough uſed in Provence and Languedoc, in France.

ARAIS ALNIL, in *Botany*, the name given by the people of Ægypt, to the FABA *Ægyptia*, or heads of the NILUFAR. Proſper Alpin.

ARALIA, in *Botany*, a genus of the *pentandria digynia* claſs; berry-bearing *angelica*. The characters are, that it is an umbelliferous plant with a globular umbel, having a ſmall *involucrum*; the flower hath five oval petals, and five ſhort ſtyles. The *germen* afterward turns to a roundiſh channeled berry, having five cells, each containing one oblong hard ſeed. There are three ſpecies; the Canada *berry-bearing angelica*; the *berry-bearing angelica* with a naked ſtalk; and the *angelica-tree*.

The inhabitants of Canada, and thoſe of Virginia, call the firſt ſpecies of *aralia* by the name of *ſarſaparilla*; becauſe its roots have almoſt the ſame figure and virtues. M. Sarrazin writes from thence, that he had a patient who had been cured of an *anaſarca*, about two years before, by a drink made of theſe roots: and aſſures us that the roots of the ſecond ſpecies, well boiled and applied by way of cataplaſm, are very excellent for curing old ulcers; as alſo the decoction of them, with which they bathe and ſyringe wounds: and he does not at all doubt but the virtues of the third ſpecies are the ſame with thoſe of the ſecond. Phil. Tranſ. abr. vol. V.

ARALIA, in *Ancient Law Writers*, denotes arable or ploughing lands.

This is otherwiſe denominated *aratoria*, *araturia*.

In Domeſday, for Eſſex, we meet with *decem acras prati, duos runcal. quatuor aralia*.—Where *aralia* ſeems to denote land fit for ploughing or tillage, by way of contradiſtinction to *runcalia*, which was over-run with briars and thorns. Du-Cange.

ARALIASTRUM, in *Botany*; ſee GINSENG.

ARANEA, a genus of the *aptera* inſects of Linnæus. See SPIDER.

ARANEA *concha*, in *Natural Hiſtory*, the name of a kind of ſea-ſhell, of which there are ſeveral ſpecies: we call them in Engliſh the ſpider-ſhells; they are of the family of the MUREX, and their peculiar character is the having digitated lips. The ſeveral ſpecies have different numbers of fingers, from the lip of the ſhell, as four, five, ſix, ſeven, or eight.

ARANEA *tunica*; ſee ARACHNOIDES.

ARANEUS *marinus*, the *ſea-ſpider*, a name by which ſome authors have called the fiſh more uſually known by the name of DRACO *marinus*, and ſuppoſed to have ſomething venomous in the ſpines of its back-fin. Aldrovand.

ARANNEA, a ſilver ore found only in the mines of Potoſi, or in the ſingle mine there of Catamito. It owes its name to ſome reſemblance it bears to a cobweb, being compoſed of threads of pure ſilver, which to the ſight appear like a ſilver lace when burned to ſeparate the ſilk from it. It is the richeſt of all kinds of ſilver ore.

ARAPABACA, a name given by Plumier to the *ſpigelia* of Linnæus, or the *worm*-GRASS.

ARARAUNA, in *Zoology*, the name of a Braſilian bird, of the MACAW kind. Marggrave.

ARATEIA, in *Antiquity*, a yearly feſtival celebrated at Sicyon, on the birth-day of Aratus, wherein divers honours were paid by a prieſt conſecrated to this ſervice, who for diſtinction's ſake wore a ribband beſpangled with white and purple ſpots.

The *arateia* were ſolemnized with much pomp of muſic, the choiriſters of Bacchus attending. Potter, Archæol. l. ii. c. 20.

ARATO-BAFABEN, a fixed ſtar of the ſecond magnitude in the head of the DRAGON.

ARATRUM *terræ*, in our *Ancient Law-Books*, as much land as can be yearly tilled with one plough.—*Hoc manerium eſt* 30 *aratrorum*.

ARATURA *terræ*, an ancient ſervice which the tenant was to do his lord, by plowing his land.

ARBALET. See BOW, and BALISTA.

ARBITER, in the *Civil Law*, a judge nominated by the magiſtrate, or choſen voluntarily by two contending parties, on whom they confer a power by compromiſe, of deciding their differences according to law.

The Romans ſometimes ſubmitted to a ſingle *arbiter*; but ordinarily they choſe ſeveral; and thoſe always in an uneven number.

In matters wherein the public was concerned, as crimes, marriages, affairs of ſtate, &c. it was not allowed to have recourſe to *arbiters*.—Nor was it permitted to appeal

peal from an *arbitral* ſentence; the effect of an appeal being to ſuſpend the authority of a juriſdiction, not of a compact.

Among the moderns, there are properly divers kinds of *arbiters*; ſome obliged to go by the rigour of the law; and others are authorized by the contending parties to relax, or give way to natural equity; theſe are properly called ARBITRATORS.

ARBITRARY, in a general ſenſe, that which is not defined, or limited by any certain, expreſs law, or conſtitution, but is left ſolely to the judgment and diſcretion of another.—The puniſhment of ſuch a crime is *arbitrary.*—*Arbitrary* fines or mulcts are uſually called *amercements.*

The word is formed from *arbitrium, will*; whence alſo *arbiter, arbitrator.*

ARBITRARY *power.* See DESPOTISM, MONARCHY, &c.

ARBITRATION, or ARBITRAGE, the referring of a cauſe or quarrel to the deciſion of one or more indifferent perſons, under the quality and denomination of *arbiters* or *arbitrators.*

An *arbitration* is either general, that is, including all actions, quarrels, and demands; or ſpecial, which includes one or more matters, or facts ſpecified.

By ſtat. 9th and 10th W. 3. c. 15. ſec. 1. after May 11th, 1698, all merchants and others deſiring to end any controverſy, for which there is no remedy but by perſonal action, or ſuit in equity, by *arbitration*, may agree that their ſubmiſſion of the ſuit to the award or umpirage of any perſons, ſhall be made a rule of any of his Majeſty's courts of record, which the parties ſhall chuſe; and may inſert ſuch their agreement in their ſubmiſſion, or the condition of the bond or promiſe: and upon producing an affidavit of ſuch agreement, and upon reading and filing ſuch affidavit in the court ſo choſen, the ſame may be entered of record in ſuch court, and a rule of court ſhall be thereupon made, that the parties ſhall ſubmit to, and finally be concluded by, ſuch *arbitration* or umpirage; and in caſe of diſobedience thereto, the party neglecting or refuſing, ſhall be ſubject to all the penalties of contemning a rule of court, and proceſs ſhall be iſſued accordingly; which ſhall not be ſtopped or delayed by any order, &c. of any other court, either of law or equity, unleſs it appear on oath, that the *arbitrators* or umpire miſbehaved themſelves, and that ſuch award was corruptly or unduly procured.

Sec. 2. Any *arbitration* or umpirage procured by corruption or undue means ſhall be void, and ſet aſide by any court of law or equity, ſo as ſuch corruption or undue practice be complained of in the court where the rule is made for ſuch *arbitration*, before the laſt day of the next term after ſuch *arbitration* made and publiſhed to the parties.

The power of *arbitrators* is to be regulated by the compromiſe between the parties, as to what concerns the differences they are to determine; and whatever they decree beyond that, is of no effect.

ARBITRATOR, an extraordinary judge or commiſſioner, in one or more cauſes between party and party, choſen by their mutual conſent.

Among us, two *arbitrators* are uſually choſen by the contending parties: and in caſe theſe cannot agree, a third is added, and is called an *umpire*; in whoſe deciſion both ſides are bound to acquieſce.

The civilians make a difference between *arbiter* and *arbitrator*: though both ground their power on the compromiſe of the parties, yet their liberty is diverſe: for an *arbiter* is tied to proceed and judge according to the forms of law; whereas an *arbitrator* is permitted wholly to uſe his own diſcretion, without ſolemnity of proceſs, or courſe of judgment, to hear and accommodate the controverſy committed to him; ſo it be *juxta arbitrium boni viri.*

ARBITREMENT. See ARBITRATION.

ARBOR, in *Natural Hiſtory, Botany*, &c. See TREE.

ARBOR, in *Chemiſtry.*—ARBOR *philoſophica* is a name common to ſeveral metalline cryſtallizations; thus called from their ramifications reſembling a tree.

Of this kind, is the ARBOR *Dianæ*, ſometimes alſo called ARBOR *Lunæ*, a kind of effloreſcence or cryſtallization, in which *aqua fortis* incorporated with ſilver and mercury, being put in water, expands and ſhoots itſelf into an appearance of a tree, with branches, leaves, and flowers.

The *arbor* DIANÆ is properly a precipitation of ſilver with mercury: the operation of making it belongs to the head of AMALGAMATION. It has its name from the ſilver which chemiſts call *Diana*, or the *Moon.* The experiment is generally conſidered merely as curious and amuſing.

Albertus Magnus is ſaid to have produced a tree before the king of France, while he ſat at dinner: this paſſed at that time for a palingeneſia, or reſuſcitation; but it may more naturally be referred to the ſpecies of germinations we are ſpeaking of.

The method of preparing the *arbor* DIANÆ, according to Lemery, is as follows. "Diſſolve an ounce of fine "ſilver in a ſufficient quantity of ſpirit of nitre, very "pure and moderately ſtrong; mix the ſolution in a "matraſs, with about twenty ounces of diſtilled water; "add two ounces of mercury, and let the whole remain "at reſt. In about forty days, a kind of ſilver tree will "be formed on the mercury, with branches reſembling "vegetable ramifications."

This proceſs is very long; the following, by M. Homberg, is much ſhorter. "Make an AMALGAM without "heat, of four drams of filings of ſilver, or rather of "ſilver-leaf, and of two drams of mercury; diſſolve "this in four ounces, or a ſufficient quantity of ſpirit "of nitre, pure and moderately ſtrong; dilute this ſolution in about a pound and a half of diſtilled water; "ſhake the mixture, and preſerve it in a bottle with a "glaſs ſtopper. When the preparation is to be uſed, an "ounce of it is to be put in a phial together, with "about the ſize of a pea of an *amalgam* of gold, or of "ſilver, which ought to be as ſoft as butter, and the "whole is to remain at reſt. Some ſmall filaments are "to be ſeen iſſuing from the ſmall *amalgam*, which "quickly increaſe, branch out on both ſides, and take "the form of ſhrubs."

Another kind of artificial vegetation may be produced, ſays Dr. Lewis, by ſpreading a few drops of ſolution of ſilver upon a glaſs plate, and placing in the middle a ſmall piece of any of the metals that precipitate ſilver, as particularly of iron. The ſilver quickly concretes into curious ramifications all over the ſurface of the plate. Neumann's Works, p. 47.

ARBOR *Martis* is a germination of iron, reſembling a natural plant.

The *arbor Martis* is but of late invention; we owe it to the younger Lemery.

The manner of the diſcovery was this: on a diſſolution of iron filings in ſpirit of nitre contained in a glaſs, he poured oil of tartar *per deliquium*: upon this the liquor ſoon ſwelled very conſiderably, though with very little fermentation; and was no ſooner at reſt, than there aroſe a ſort of branches adhering to the ſurface of the glaſs, which, continuing to grow, at length covered it all over.

The form of the branches was ſo perfect, that one might even diſcover a kind of leaves and flowers thereon; ſo that this vegetation has as good a title to the appellation of *arbor* MARTIS, as the former has to that of *arbor* DIANÆ. See Hiſtoir. Acad. Royal. an. 1706.

ARBOR *genealogica, tree of conſanguinity*, ſignifies a lineage drawn out, under the figure or reſemblance of root, ſtock, branches, &c.

ARBOR *porphyriana*, among the ſchoolmen, denotes a ſcale of beings; or a figure conſiſting of three rows or columns of words; the middlemoſt whereof contains the ſeries of genera and ſpecies, and bears ſome analogy to the trunk; and the extremes, containing the differences, to the branches of a tree.

	SUBSTANCE	
Thinking		Extended
	BODY	
Inanimate		Animate
	ANIMAL	
Irrational		Rational
	MAN	
This		That
	PLATO.	

The *arbor porphyriana* is otherwiſe called SCALA *predicamentalis.*

ARBOR is alſo figuratively uſed in *Mechanics*, for the principal part of a machine, which ſerves to ſuſtain the reſt. —It is alſo uſed for a ſpindle, or axis, whereon a machine turns; thus, *arbor* of a CRANE, a MILL, a windmill, &c.

ARBOREOUS, ARBOREUS, is applied by ſome naturaliſts to ſuch excreſcences, funguſes, moſſes, and other paraſites, as grow on trees; in contradiſtinction to ſuch as grow on the ground: ſuch are the *lichenoides* and *agarics.*

ARBORESCENT, a term uſed to denote any thing that ſhoots or grows up in form of a tree.

Botaniſts ſpeak of *arboreſcent* ſhrubs and plants; the SEDUM *arboreſcens*, &c. Mineraliſts treat of *arboreſcent* metals, *arboreſcent* ſilver, *arboreſcent* iron, *arboreſcent* ſtones, &c. The *fungus marinus* is ranked by ſome in the claſs of *arboreſcent* fluors; the chemiſts produce *arboreſcent*

boreſcent cryſtallizations, which they call philoſophical trees. Phil. Tranſ. N° 198. N° 111. and N° 129.

Zoologiſts give inſtances of *arboreſcent* animals, particularly fiſhes.

The *arboreſcent* STAR-*fiſh*, *ſtella arboreſcens*, is one of the curioſities of nature found in ſeveral cabinets of natural rarities.

ARBORIBONZES, in *Modern Hiſtory*, prieſts of Japan, who live an erratic life, and ſubſiſt on alms. They dwell in caverns, and cover their heads with bonnets made of the bark of trees.

ARBORIS *pecten*. See PECTEN.

ARBORIST, ARBORISTA, a perſon ſkilled in trees, their kinds, forms, natures, &c.

Arboriſt is an appellation of leſs extent than *botaniſt*.

ARBOR *ſcientiæ*, a general diſtribution or ſcheme of ſcience or knowledge.

Arbor *vine*. See CONVOLVOLUS.

Arbor *vitæ*. See THUYA.

ARBOUR, among *Gardeners*, &c. a kind of ſhady bower or cabinet, contrived to take the air in; yet to keep out the ſun and rain.

Arbours are now gone much into diſuſe; being apt to be damp, and unwholſome.—They are diſtinguiſhed into *natural* and *artificial*.

Arbours, *natural*, are formed only of the branches of trees, interwoven artfully, and borne up by ſtrong lattice-work, poles, hoops, &c. which make galleries, halls, porticoes, and green viſtas, naturally covered.

The trees wherewith theſe *arbours* are formed, are uſually the female elm, or lime-tree; becauſe they eaſily yield, and, by their great quantity of ſmall boughs, form a thick bruſh-wood; the lower parts are uſually filled up with horn-beam, or the like.

Arbours, *artificial*, and cabinets, are made of lattice-work, borne up by ſtandards, croſs-rails, circles and arches of iron. For theſe *arbours*, they make uſe of ſmall fillets of oak, which being planted, and made ſtraight, are wrought in chequers, and faſtened with wire.

ARBUSCULA is uſed by Bradley, to denote a little, or dwarf tree, above the rank of ſhrubs, but below that of trees, ſuch, e. gr. as the elder.

ARBUSTIVA, in *Botany*, an order of plants in the *Fragmenta Methodi Naturalis* of Linnæus.

ARBUSTUM implies a number or multitude of trees, planted for the fruit ſake.

Such are *oliveta*, *avellaneta*, *vineta*, &c.

The word was more peculiarly applied to a place planted with trees for faſtening vines to, which are hence called by Columella *arbuſtivæ*.

Arbustum is ſometimes alſo uſed to denote an orchard, or field wherein trees are planted at ſuch diſtance, that there is room for ploughing, and growing corn between.

ARBUTUS, in *Botany*, a genus of the *decandria monogynia* claſs; the STRAWBERRY-*tree*. The characters are, that the flower hath a ſmall obtuſe empalement, which is cut into five parts, upon which the *germen* ſits. The flower is of one leaf, ſhaped like a pitcher; at the bottom of the flower is ſituated the globular *germen*, which afterward becomes an oval or round berry, having five cells, which are filled with hard ſeeds. There are five ſpecies.

The common ſtrawberry-tree is one of the greateſt ornaments in the months of October, November, and frequently great part of December; that being the ſeaſon when the trees are in flower, and the fruit of the former year is ripe; for the fruit is a whole year growing to perfection.

The beſt method to propagate the *arbutus*, is from ſeeds: therefore when the fruit is perfectly ripe, they ſhould be gathered and mixed with dry ſand, to preſerve them till the middle or latter end of March, which is the proper ſeaſon for ſowing them, in order to have ſtrong plants before winter. They muſt be ſown in pots, which ſhould be plunged into a moderate hot-bed, which will greatly forward their vegetation; and if they are properly managed, they will grow eight or ten inches high before winter.

Theſe trees are tolerably hardy, and are ſeldom hurt, except in extreme hard winters, which many times kill the young and tender branches, but rarely deſtroy the trees: therefore, however dead the trees may appear after a hard winter, yet they ſhould be ſuffered to remain till the ſucceeding ſummer has ſufficiently demonſtrated what are living and what are dead.

The beſt ſeaſon for tranſplanting the *arbutus* is in September, at which time the bloſſoms are beginning to appear; and at that ſeaſon, if they ſhould prove very dry, and they are kept moiſt, they will take root very ſoon: but toward the beginning of November their roots ſhould be well covered with mulch, to keep out the froſt. Miller.

ARC; ſee ARK.

The words are formed from *arcus*, *a bow*.

ARCA, in *Zoology*, a genus of the *teſtacea* worms in the Linnæan ſyſtem.

Arca *cordis* is uſed by ſome anatomiſts, to denote the PERICARDIUM.

ARCADE, in *Architecture*, is uſed to denote any opening in the wall of a building formed by an ARCH. See *Tab. Archit. fig.* 40.

ARCADIANS, a literary ſociety eſtabliſhed at Rome in 1690. See ACADEMIES.

ARCÆ *cuſtos*, a title anciently given to the archdeacon, on account of his having the cuſtody of the church's cheſt, or treaſure.

ARCANGIS, in the *Turkiſh Armies*, an inferior kind of infantry, which ſerve as *enfans perdus*, and to harraſs and pillage the enemies frontiers.

The *Arcangis* are an order inferior to the *Janiſaries*; and, when any of them diſtinguiſh themſelves, are uſually preferred into the *Janiſaries* order.—They have no pay, but are to ſubſiſt on their plunder.

ARCANNA, a kind of red chalk, called by phyſiologiſts RUBRICA *fabrilis*, as being uſed by carpenters to colour their lines, for marking timber, &c.

ARCANUM literally ſignifies a *ſecret*; and is therefore very pertinently applied by quacks and impoſtors in medicine, who conceal their ignorance and fraud under a pretence of ſecrecy.—Hence a multitude of *arcana*.

There are alſo ſtanding officinal compoſitions, under the denomination of *arcana*.—Such are the

Arcanum *corallinum*, a preparation of red precipitate; made by diſtilling it with the ſpirit of nitre, and repeating the diſtillation again and again, till a fine red powder be procured. This powder is boiled in water, and the water poured off, and tartarized ſpirit of wine put to the powder: two or three cohobations are made; which leave a powder, much like the prince's powder, and ſaid to be of good uſe in the gout, dropſy, ſcurvy, &c. It operates chiefly by ſtool. It is, therefore, in fact nothing elſe but *red* PRECIPITATE, on which ſpirit of wine has been two or three times burnt, with an intention of rendering it milder.

Arcanum *duplicatum* is prepared of the *caput mortuum* of *aqua fortis*, by diſſolving it in hot water, filtrating, and evaporating it to a cuticle; and then leaving it to ſhoot. It is entirely the ſame in compoſition and effect with *vitriolated* TARTAR; and is ſometimes called *ſal catholicum*, and *ſal de duobus*.

The *arcanum duplicatum*, or *panacea duplicata*, is extolled as a diuretic, and ſudorific.—The recipe was purchaſed at the expence of 500 dollars, by that great virtuoſo the duke of Holſtein. Schroder, that prince's phyſician, writes wonders of its great uſes in hypochondriacal caſes, and in continued and intermitting fevers, ſtone, ſcurvy, &c. Mixed with the paſte employed in binding books, it ſecures them effectually againſt all injury from that miſchievous inſect, the BOOK-*worm*.

Arcanum *duplicatum catholicum*, in *Medicine*, a name given by Wedelius, to a compound medicine adminiſtered by him and others of the ſame time, with great ſucceſs, in a peſtilential fever, attended with a dyſentery, which raged for many years together in Germany, and yielded ſo well to nothing as to this medicine. It was compoſed of bezoar, plantane-root, and the root of *colchicum*. This laſt root has generally been eſteemed a poiſon of late times, though the authors of the greateſt antiquity have ſhewn a much greater reſpect for it, and called it the ſacred root, or *hierobulbus*.

Arcanum *Joviale* is made of an *amalgama* of mercury and tin, digeſted in ſpirit of nitre; the ſpirit being drawn off, the remaining matter is wetted with ſpirit of wine, and the ſpirit burnt away; and this for ſeveral times, till the pungent taſte is wholly gone: what remains is uſed much with the ſame intentions as the *antihecticum Poterii*, and is recommended by ſome as a ſudorific.

Arcanum *tartari*, is a neutral ſalt ſoluble in water and ſpirit of wine, formed from the combination of vinegar with fixed alcalies.

ARC-Boutant, in *Building*, a kind of flat arch, or part of an arch, abutting againſt the feet of an arch, or reins of a vault, to ſupport, and prevent their giving way.

The name is French; formed of *arc* and *bouter*, *to abut*.

Arc-boutants are only arched BUTTRESSES.

ARCEUTUM is uſed, in ſome *Ancient Law-Writers*, for a procuration due to a biſhop, abbot, or archdeacon, from their clergy, in time of entertainment.

ARCH, Ark, Arcus, a part of any curve line; e. gr. of a circle, an ellipſis, or the like.

Arch *of a circle* is a part of the circumference thereof, leſs than a half, or ſemicircle.—Such is AEB (*Tab. Geometry*, *fig.* 6.)

The baſe or line AB, that joins the two extremes of the arch,

arch, is called the CHORD; and AD half of the chord biſected by the diameter at right angles, is the SINE of half the ſaid *arch*, viz. AE.

All angles are meaſured by *arches*.—To know their quantity, an *arch* is deſcribed, having its centre in the point of the ANGLE.

Every circle is ſuppoſed to be divided into 360 degrees; and an *arch* is eſtimated according to the number of thoſe degrees it takes up. Thus an *arch* is ſaid to be of 30, of 80, of 100 degrees. See DEGREE.

ARCHES, *concentric*. See CONCENTRIC.

ARCHES, *equal*, are ſuch *arches* of the ſame or equal circle, as contain the ſame number of degrees. See EQUAL.—Hence,

In the ſame or equal circles, equal chords ſubtend equal *arches*.—And hence, again, *arches* intercepted between parallel chords are equal.

A radius, CE, *fig*. 6. which biſects the chord in D, does alſo biſect the *arch* in E; and is perpendicular to the chord; and on the contrary. And hence the problem, to *biſect an arch*, is ſolved, by drawing a line CE from the center perpendicular to the chord in D.

ARCHES, *ſimilar*, are thoſe which contain the ſame number of degrees of unequal circles. See SIMILAR, and LIKE.—Such are the *arches* AB and DE, *fig*. 87.

Two radii being drawn from the centre of two concentric circles, the two *arches* intercepted between them bear the ſame ratio to their reſpective peripheries; and alſo the two ſectors to the areas of their reſpective circles. See ANGLE.

To find the CENTER *of gravity* of an *arch* of a circle; ſee CENTER *of gravity*, &c.

For the ſines, tangents, &c. of *arches*; ſee SINE, TANGENT, &c.

ARCH, in *Aſtronomy*.—*Diurnal* ARCH of the ſun is part of a circle parallel to the equator, deſcribed by the ſun in his courſe betwixt riſing and ſetting. See DAY, DIURNAL, &c.

His *nocturnal arch* is of the ſame kind; excepting that it is deſcribed betwixt his ſetting and riſing. See NIGHT, NOCTURNAL, RISING, &c.

The latitude and elevation of the pole are meaſured by an *arch* of the meridian; and the longitude, by an *arch* of a parallel circle. See ELEVATION, LATITUDE, LONGITUDE, &c.

ARCH *of progreſſion*, or *direction*, is an *arch* of the ecliptic, which a planet ſeems to paſs over, when its motion is according to the order of the ſign. See DIRECTION.

ARCH *of retrogradation* is an *arch* of the ecliptic, deſcribed while a planet is retrograde, and moves contrary to the order of the ſign. See RETROGRADATION.

ARCH *of ſtation*. See STATION, and STATIONARY.

ARCH *between the centres* is an *arch*, as AI (*Tab. Aſtronomy, fig*. 35.) paſſing from the centre of the moon's ſhadow, A, perpendicular to her orbit OB. See ECLIPSE.

If the aggregate of the *arch* between the centres AI, and the apparent ſemidiameter of the moon, be equal to the ſemidiameter of the ſhadow, the eclipſe will be total without any duration; if leſs, total with ſome duration; and if greater, yet leſs than the ſum of the ſemidiameters of the moon and the ſhadow, partial.

ARCH *of viſion* is the ſun's depth below the horizon, at which a ſtar, before hid in his rays, begins to appear again.

TABLE exhibiting the *Arch* of *Viſion* of the PLANETS and FIXED STARS.

Planets.		°	′

4	-	15
5	-	16
6	-	17

However, the quantity of this *arch* is not always the ſame; but varies with the latitude, declination, right aſcenſion or deſcenſion, and diſtance of any planet or ſtar. Ricciol. Alm. v. i. p. 42.

See *Poetical* RISING.

ARCH, in *Architecture*, is a concave ſtructure, raiſed with a mould bent in form of the *arch* of a curve, and ſerving as the inward ſupport of any ſuperſtructure.—See *Tab. Archit. fig*. 40. E.

An *arch*, ſays Sir Henry Wotton, is nothing but a narrow or contracted *vault*; and a VAULT is a dilated *arch*.

Arches are uſed in large intercolumnations of ſpacious buildings; in porticoes, both within and without temples; in public halls, as cielings, the courts of palaces, cloiſters, theatres, and amphitheatres.

They are alſo uſed as buttreſſes and counter-forts, to ſupport large walls laid deep in the earth, for foundations of bridges and aqueducts, for triumphal arches, gates, windows, &c.

Arches are ſuſtained by piers, impoſts, &c.

Arches are either circular, elliptical, or ſtraight.

ARCHES, *circular*, are of three kinds; viz.

ARCHES, *ſemicircular*, thoſe which make an exact ſemicircle; and have their centre in the middle of the chord of the *arch*; called alſo by the French builders, *perfect arches*, and *arches en plein centre*.

ARCHES, *ſcheme*, from the Italian *ſumo*, *imperfect*; thoſe which are leſs than a ſemicircle, and conſequently are flatter *arches*; containing, ſome 90 degrees, others 70, and others only 60; called alſo *imperfect* and *diminiſhed arches*.

ARCHES *of the third and fourth point*, as ſome of our workmen call them, though the Italians call them *di terzo* and *quarto acuto*, becauſe they always concur in an acute angle at top.—Theſe conſiſt of two *arches* of a circle meeting in an angle at the top, and are drawn from the diviſion of the chord into three or four, or more parts, at pleaſure. Of this kind are many of the *arches* in old Gothic buildings; but on account both of their weakneſs and unſightlineſs, they ought, according to Sir Henry Wotton, to be for ever excluded out of all buildings.

ARCHES, *elliptical*, conſiſt of a ſemi-ellipſis; and were formerly much uſed inſtead of mantle-trees in chimneys. Theſe have commonly a key-ſtone, and chaptrels or impoſts.

ARCHES, *ſtrait*, are thoſe, whoſe upper and under edges are ſtraight; as in the others they are curved; and thoſe two edges alſo parallel, and the ends and joints all pointing towards a centre.—Theſe are principally uſed over windows, doors, &c.

The doctrine and uſe of ARCHES is well delivered by Sir Henry Wotton, in the following theorems.—Firſt; All matter, unleſs impeded, tends to the centre of the earth in a perpendicular line.

Secondly; All ſolid materials, as bricks, ſtones, &c. in their ordinary rectangular form, if laid in numbers, one by the ſide of another, in a level row, and their extreme ones ſuſtained between two ſupporters; thoſe in the middle will neceſſarily ſink, even by their own gravity, much more if preſſed down by any ſuperincumbent weight.—To make them ſtand, therefore, either their figure or their poſition muſt be altered.

Thirdly; Stones, or other materials, being figured *cuneatim*, i. e. wedge-wiſe, broader above than below, and laid in a level row, with their two extremes ſupported as in the preceding theorem, and pointing all to the ſame centre; none of them can ſink, till the ſupporters or butments give way, becauſe they want room in that ſituation to deſcend perpendicularly. But this is a weak ſtructure; becauſe the ſupporters are ſubject to too much impulſion, eſpecially where the line is long; for which reaſon the form of ſtraight *arches* is ſeldom uſed, excepting over doors and windows, where the line is ſhort.—In order to fortify the work, therefore, we muſt not only change the figure of the materials, but alſo their poſition.

Fourthly; If the materials be ſhaped wedge-wiſe, and be diſpoſed in form of a circular *arch*, and pointing to ſome centre; in this caſe, neither the pieces of the ſaid *arch* can ſink downwards, for want of room to deſcend perpendicularly; nor can the ſupporters or butments ſuffer much violence, as in the precedent platform: for the convexity will always make the incumbent weight rather reſt upon the ſupporters, than heave them outwards: whence this corollary may be fairly deduced, that the ſecureſt of all the *arches* above mentioned is the ſemicircular; and of all vaults, the hemiſpherical.

Fifthly; As ſemicircular vaults, raiſed on the whole diameter, are the ſtrongeſt; ſo thoſe are the moſt beautiful, which, keeping to the ſame height, are yet diſtended one fourteenth part longer than the ſaid diameter: which addition of width will contribute greatly to their beauty, without diminiſhing any thing conſiderable of their ſtrength.

It is, however, to be obſerved, that, according to geometrical ſtrictneſs, to have the ſtrongeſt *arches*, they muſt not be portions of circles, but of another curve, called the CATENARIA, whoſe nature is ſuch, that a number of ſpheres diſpoſed in this form will ſuſtain each other, and form an *arch*.

Dr. Gregory even ſhews, that *arches*, conſtructed in other curves, only ſtand, or ſuſtain themſelves, by virtue of the *catenaria* contained in their thickneſs; ſo that were they made infinitely ſlender or thin, they muſt tumble of courſe; whereas the *catenaria*, though infinitely ſlender, muſt ſtand, becauſe no one point thereof tends downward more than any other. See Philoſoph. Tranſact. Nº 231.—See farther of the theory of *arches* under the article VAULT.

Arch is particularly uſed for the ſpace between the two piers of a bridge.

The chief or *maſter-arch* is that in the middle; which is wideſt, and uſually higheſt, and the water under it deepeſt: being intended for the paſſage of boats, or other veſſels.—We read of bridges in the Eaſt, which conſiſt of 300 *arches*.

Arch-*ſtone*. See Key-*ſtone*, and Voussoir.

Arch, *triumphal*, is a gate or paſſage into a city, built of ſtone or marble, and magnificently adorned with architecture, ſculpture, inſcriptions, &c. ſerving not only to adorn a triumph, at the return from a victorious expedition, but alſo to preſerve the memory of the conqueror to poſterity.

The moſt celebrated *triumphal arches*, now remaining of antiquity, are that of Titus, of Septimius Severus, and of Conſtantine, at Rome, of which we have figures given us by Des Godetz. —One of the gates of Orange is a *triumphal arch* of C. Marius.—The gates, Peyro at Montpelier, and of St. Denis, St. Martin, and St. Antoine, at Paris, may alſo be reckoned *triumphal arches* of the moderns.

Arch, *mural*. See Mural.

Arch, in the ſcripture-ſenſe. See Ark.

Arch, or **Archi**, is alſo a term without any meaning of itſelf, but which becomes very ſignificant in compoſition with other words; as it heightens and exaggerates them; and has the force of a ſuperlative, to ſhew the greateſt degree, or eminence of any thing.

The word is formed of αϱχη, *beginning*; whence αϱχος, *princeps*, *chief*.

Thus we ſay, *arch*-treaſurer, *arch*-angel, *arch*-biſhop, *arch*-heretic, &c. to denote ſuch as have a pre-eminence over others. So alſo *arch*-fool, *arch*-rogue, &c. to expreſs folly, and knavery, in the utmoſt degree.

In Engliſh, we uſually cut off the final *i*, from *archi*, though with very ill effect; as the words with which it is joined, ſound much harſher on that account, than they would do, were it preſerved entire, as it is in moſt other languages.

ARCHÆUS. See Archeus.

ARCHANGEL, an intellectual ſubſtance or angel, placed in the ſecond order among the bleſſed ſpirits which compoſe the celeſtial HIERARCHY.

The word is compounded of the Greek αρχος, *prince*, and αγγελος, *angel*.

Archangel, in *Botany*, *lamium*, a genus of the *didynamia gymnoſpermia*; *dead* NETTLE. The characters are, that the flower hath a permanent empalement, which is cut into five equal ſegments at the top, which end in beards. The flower is of the lip kind, with one petal, ſwollen at the chops, and compreſſed; the upper lip is arched, obtuſe, and entire; the under is heart-ſhaped, and indented at the end. It hath four awl-ſhaped *ſtamina*, two of which are longer than the other. It hath a four-cornered *germen*, which afterwards becomes four three-cornered ſeeds, ſitting in the open empalement. There are ſeveral ſpecies; but as many of them are weeds, there are few who care to admit them into their gardens.

The common ſort grows naturally in moſt parts of England, under hedges and by the ſides of highways: it is alſo a troubleſome weed in gardens; but as it ſtands in moſt diſpenſaries as a medicinal plant, it is therefore inſerted. Its flowers are reputed ſoft and lubricating, and as ſuch adminiſtered in ſome female weakneſſes, as the whites, and difficulty of urine. A conſerve of them is alſo made in the ſhops, but ſeldom preſcribed.

Archangel, *baum-leaved*. See Melittis.

Archangel, *yellow*. See Galeopsis.

ARCHBISHOP, Archiepiscopus, a metropolitan prelate, having ſeveral ſuffragan biſhops under him.

Archbiſhops were not known in the Eaſt, till about the year 320; and though there were ſome ſoon after this, who had the title, yet that was only a perſonal honour, by which the biſhops of conſiderable cities were diſtinguiſhed.—It was not till of late that *archbiſhops* became metropolitans, and had ſuffragans under them.

Athanaſius appears to be the firſt who uſed the title *archbiſhop*, which he gave occaſionally to his predeceſſor; Gregory Nazianzen, in like manner, gave it to Athanaſius; not that either of them were intitled to any juriſdiction, or even any precedence, in virtue of it.

Among the Latins, Iſidore Hiſpalenſis is the firſt that ſpeaks of *archbiſhops*. He diſtinguiſhes four orders or degrees in the eccleſiaſtical hierarchy, viz. *patriarchs*, *archbiſhops*, *metropolitans*, and *biſhops*.

England is divided into two *archbiſhopricks*, or *provinces*.

ARCHBISHOPRICK, Archiepiscopatus, the dignity of *archbiſhop*; or the province under his juriſdiction.

There are now two *archbiſhopricks* in England; viz. of Canterbury, and York; the prelates whereof are called *primates*, and *metropolitans*; with this only difference, that the former is called primate of *all* England, and the latter ſimply, primate of England.

The *archbiſhop*, beſide the inſpection of the biſhops and inferior clergy in the province over which he preſides, exerciſes epiſcopal juriſdiction in his own dioceſe. He is guardian of the ſpiritualities of any vacant ſee in his province, as the king is of the temporalities; and exerciſes eccleſiaſtical juriſdiction in it. He is intitled to preſent by lapſe to all the eccleſiaſtical livings in the diſpoſal of his dioceſan biſhop, if not filled within ſix months. He has likewiſe a cuſtomary prerogative, upon conſecrating a biſhop, to name a clerk or chaplain to be provided for by ſuch biſhop; in lieu of which it is now uſual to accept an OPTION. He is ſaid to be *inthroned* when veſted in the *archbiſhoprick*; whereas biſhops are ſaid to be *inſtalled*.

The *archbiſhop* of Canterbury had anciently, viz. till the year 1152, juriſdiction over Ireland as well as England, and was ſtyled a *patriarch*, and ſometimes *alterius orbis papa*, and *orbis Britannici pontifex*. Matters were done and recorded in his name thus, *anno pontificatus noſtri primo*, &c. The firſt *archbiſhop* of Canterbury was Auſtin, appointed by king Ethelbert, on his converſion to chriſtianity, about the year 598.

He was alſo *legatus natus*. See Legate.

He even enjoyed ſome ſpecial marks of royalty; as, to be patron of a biſhoprick, which he was of Rocheſter; and to make knights, coin moneys, &c.—He is ſtill the firſt peer of England, and the next to the royal family; having precedence of all dukes, and all great officers of the crown. It is his privilege, by cuſtom, to crown the kings and queens of this kingdom. He may retain and qualify eight chaplains; whereas a duke is by ſtatute allowed only ſix.

He has, by common law, the power of probate of wills and teſtaments, and granting letters of adminiſtration.

He has alſo a power to grant licences and diſpenſations in all caſes formerly ſued for in the court of Rome, and not repugnant to the law of God. He accordingly iſſues ſpecial licences to marry, to hold two livings, &c. and he exerciſes the right of conferring degrees.

He is addreſſed with the title of *Grace*, and *Moſt Reverend Father in God*; and writes himſelf by *Divine Providence*; whereas biſhops only uſe by *Divine Permiſſion*.

He alſo holds ſeveral courts of judicature; as court of arches, court of audience, prerogative court, and court of peculiars.

The *archbiſhop* of York has the like rights in his province, as the *archbiſhop* of Canterbury. He has precedence of all dukes not of the royal blood; and of all officers of ſtate, except the lord high chancellor. He has alſo the rights of a count palatine over Hexamſhire. The firſt *archbiſhop* of York was Paulinus, appointed by pope Gregory about the year 622. He had formerly juriſdiction over all the biſhops of Scotland; but in the year 1470, pope Sextus IV. created the biſhop of St. Andrew's, archbiſhop and metropolitan of all Scotland.

ARCH-BUTLER, Archipincerna, the great butler or ſkinker of the empire.

The king of Bohemia is *arch-butler*: and his buſineſs as ſuch is to preſent the firſt cup at an imperial entertainment; but he is not obliged to officiate with his crown on. He has for vicar or deputy the hereditary prince of Limbourgh.

ARCH-CHAMBERLAIN, Archicamerarius, an officer of the empire; much the ſame with what in England we call *great chamberlain*.

The elector of Brandenbourg is *arch-chamberlain* of the empire, being ſo appointed by the golden bull; and, in that quality, he bears the ſceptre before the emperor, walking on the left-hand of the elector of Saxony. At ſome ſolemnities he alſo ſerves on horſeback like other electors, carrying a baſon with a towel in his hands: which, alighting, he ſets for the emperor to waſh.—He has his vicar, or ſub-*arch-chamberlain*, who is prince of Hohenzollern, of the houſe of Brandenbourg.

ARCH-CHANCELLOR, Archicancellarius, a great chancellor, who anciently preſided over the notaries, that is, the ſecretaries of a court.

This office chiefly obtained in France, under the two firſt races of their kings; and afterwards under the empire: as they had three ſeveral territories, Germany, Italy, and Arles; they had three *arch-chancellors*: and hence the three *arch-chancellors* ſtill ſubſiſting in Germany; the archbiſhop of Mentz being *arch-chancellor* of Germany, the archbiſhop of Cologn of Italy, and the archbiſhop of Treves of Arles.

Bern. de Mallincrot, in an expreſs treatiſe *de Archichancellariis*

chancellariis Imperii Romani, ſhews, that theſe three archbiſhops were *arch-chancellors* before they were electors.—We alſo read of *arch-chancellors* of Burgundy, &c.

ARCH-CHANTOR, ARCHICANTOR, the chief or preſident of the chantors of a church.

ARCHDEACON, ARCHIDIACONUS, a church-officer veſted with a juriſdiction over the laity and clergy, next after the biſhop, either through the whole dioceſe, or only a part of it.

The *archdeacon*, ſometimes alſo called *arch-levite*, was originally the firſt and eldeſt of the deacons who attended on the biſhop: whence his name.

But as the *archdeacons*, in their original inſtitution, had no relation to the dioceſe, but only to the epiſcopal ſee, ſo it was by ſeveral ſteps and degrees that they attained to the power they now enjoy. At their firſt inſtitution, their proper buſineſs was, to attend the biſhop at the altar, to direct the deacons and other inferior officers in their ſeveral duties, for the orderly performance of divine ſervice, to attend the biſhop at ordinations, and to aſſiſt him in the management of the revenues of the church; but without any thing that could be called juriſdiction in the preſent ſenſe of the word, either in the cathedral or out of it. Gibſon.

An *archdeacon* was not known before the council of Nice: his function is ſince become a dignity; and even ſet above that of prieſt: though anciently it was quite otherwiſe. The *archdeacon* was the biſhop's chief miniſter for all external concerns, and particularly the adminiſtration of the temporalities. He took care that order and decency were obſerved in divine ſervice; looked to the ornaments and utenſils of the church; had the direction of the poor, and the inſpection of the manners and behaviour of the people: for which reaſon he was called the *biſhop's heart, and eye*; *oculus epiſcopi, & cor epiſcopi.*

Theſe advantages ſoon gained him ſuperiority over prieſts, who had only ſpiritual functions. But he had no juriſdiction over them till the ſixth century; though by that time he was become ſuperior to the archimandrite, or rural dean.

In the tenth century, *archdeacons* were conſidered as having juriſdiction in their own right, or attached to their office; with a power of delegating it to others. But from that time meaſures were taken to leſſen their power, by increaſing their number.—He whoſe diſtrict lay in the capital city, took the quality of *great-archdeacon.*

We have ſixty *archdeacons* in England: their office is to viſit every two years in three, to inquire into the reparations and moveables belonging to the church, reform abuſes in eccleſiaſtical matters, and bring the more weighty affairs before the biſhop; beſides which, they have alſo a power to ſuſpend, excommunicate, and in many places to prove wills, and in ſome to inſtitute to benefices.

It is one part of the *archdeacon*'s office to induct all clerks into their benefices within his juriſdiction; and, by the act of uniformity, he is now obliged to be in prieſts orders.

Many *archdeacons*, in old foundations, have, by preſcription, their courts and officials, as biſhops have.

Archdeaconries are commonly given by biſhops, who do therefore prefer to the ſame by collation: but if an *archdeaconry* be in the gift of a layman, the patron doth preſent to the biſhop, who inſtitutes in like manner as to another benefice; and then the dean and chapter do induct him, that is, after ſome ceremonies, place him in a ſtall in the cathedral church to which he belongeth, whereby he is ſaid to have a place in the choir.

ARCH-*ſubdeacon*, *archiſubdiaconus*, the firſt or chief among the ſubdeacons, as the archdeacon is among the deacons.

In ſome copies of the Roman ordinal, he is called *ſub-archidiaconus.*

ARCH-DRUID, ARCHIDRUIDA, the chief or pontiff of the ancient DRUIDS in a nation.

ARCHDUKE, ARCHIDUX, a duke veſted with ſome quality, pre-eminence, and authority, above other dukes.

The *archduke* of Auſtria is a very ancient title. There have alſo formerly been *archdukes* of Lorrain and Brabant. Auſtria was erected into a marquiſate by Otho, or Henry I. and into a duchy by Frederic I. in 1156; but we do not well know when, or why, the title *archduchy* was given it.—It is commonly held, that duke Frederic IV. firſt aſſumed the quality: others ſay, it was firſt given by the emperor Maximilian I. in 1459, and ample privileges annexed to it.

The principal privileges of this ſtate are, that the *archduke* ſhall diſtribute juſtice in his own dominions, without appeal; that he ſhall be judged to have received the inveſtiture of his ſtates, after having demanded it three times; and that he cannot be deprived of his countries, even by the emperor, and the ſtates of the empire: that no affair of the empire can be concluded without his participation; and that he have a power of creating counts, barons, and gentlemen, throughout the whole empire: which are privileges to which the other dukes of the empire are entire ſtrangers.

ARCH-*count*, *archicomes*, a title anciently given to the earl of Flanders, on account of his great power and riches.

ARCH-*monaſtery*, *archimonaſterium*, an appellation ſometimes given to the greater monaſteries, and abbies.

ARCH-*notary*, *archinotarius*, the *primicerius*, or chief of the notaries.

This officer is ſuppoſed by ſome to have differed from the *arch-chancellor*, though wherein the difference conſiſted does not appear.

ARCHÆOGRAPHIA, the art of deſcribing or explaining ANTIQUITIES. See ANTIQUE.

ARCHÆOTA, a keeper of ancient records.

ARCHAISM, properly denotes a phraſe or diction now obſolete, and out of uſe, though anciently deemed good, or paſſable.

ARCHAISM, *etymologic*, *archaiſmus etymologicus*, is when either an obſolete word, declenſion, or conjugation is uſed.

ARCHAISM, *ſyntactic*, *archaiſmus ſyntacticus*, is an unuſual and obſolete conſtruction in diſcourſe.

ARCHARD, in *Commerce*, a kind of green fruit, pickled in vinegar, much valued throughout the Eaſt Indies.

The beſt are thoſe brought from Perſia, in bottles, much like ſmall cucumbers among us.

ARCHE, *ἀρχη*, is a Greek word, importing the *beginning.*

ARCHE, among *Phyſicians*, is the beginning or firſt period of a diſeaſe.

ARCHED *fountain*. See FOUNTAIN.

ARCHED *ſkene*, or *ſcheme*, in *Architecture*, is uſed to denote a flat *arch*, leſs than a ſemicircular one.

ARCHED *legs*, is an imperfection in a horſe, when being in his natural poſition he has his legs bent forwards; ſo that his whole leg makes a kind of arch or bow.

This uſually ariſes from exceſſive labour, whereby the back-ſinews are made to ſhrink up, ſo that the legs remain *arched*, and naturally tremble after a little riding; though the diſorder is natural to ſome horſes.

ARCHEMY, *archemia*, is uſed by ſome to denote the art of tranſmuting leſs perfect metals into the more perfect. In which ſenſe, *archemy* differs from *alchemy*, as a part from the whole.

ARCHENDA, in the *Ancient Phyſic*, a kind of powder prepared of *alcanna* and leaves of the Egyptian LIGUSTRUM, wherewith the people ſmeared their feet after bathing, as a preſervative againſt ſweating and ſtench.

ARCHERS, a kind of militia or ſoldiery, armed with bows and arrows.

The word is formed of *arcus, a bow*; whence *arcuarius*, and even *arquis*, and *arquites*, as they are alſo denominated in the corrupt ſtate of the Latin tongue.

Archers were much in uſe in former times; but they are now laid aſide, excepting in Turkey, and ſome of the eaſtern countries; where there are companies of *archers* ſtill ſubſiſting in their armies; and with which they did terrible execution at the battle of Lepanto.

The name *archer*, however, is ſtill retained even where the thing is loſt: thus in France, the officers who attend the lieutenants de police, and provoſts, to make captures, ſeizures, arreſts, &c. are called *archers*; though their arms be only halberds or carabines.—In this ſenſe they ſay, the *archers* of the *grand prevot de l'hotel*; of the *prevot des marchands*; the city *archers*; the *archers du guet*, or of the watch, &c.—Small parties of *archers*, called alſo *gens de marechauſſée*, are continually patrolling on the great roads, to ſecure them againſt robbers.—The carriages of Lyons, &c. are always eſcorted by a party of *archers.*

To the diligence of theſe *archers*, or marſhals men, it is partly owing, that perſons now travel in all parts of France in the utmoſt ſecurity; there being fewer robberies on the highway in that whole kingdom in a year, than about London in a week.

They have alſo their *archers des pauvres*, *archers of the poor*; whoſe office it is to ſeize ſuch beggars as they find in the ſtreets, and carry them to the hoſpitals.

ARCHERY, the art or exerciſe of ſhooting with bow and arrow.

Archery was greatly encouraged among our anceſtors, and many ſtatutes were made for the regulation thereof: whence it was that the Engliſh *archers* became the beſt in Europe. See 3d H. 8. c. 3. 6th H. 8. c. 2. 33d H. 8. c. 9. 8th Eliz. c. 10.

It was forbid, by ſtatute, to ſhoot at a ſtanding mark; unleſs it be for a rover, where the *archer* is to change his mark at every ſhot.—Any perſon above twenty-four years old is alſo forbid to ſhoot with any prick-ſhaft, or flight, at a mark of eleven ſcore yards or under. 33d H. 8. c. 9.—The former was a proviſion for making good markſmen at ſight; the latter for giving ſtrength and ſinews.

ARCHERY, in our ancient cuſtoms, a ſervice of keeping a bow for the uſe of the lord, to defend his caſtle.

ARCHES, or *Court of* ARCHES. See COURT *of Arches*.

ARCHES, among *Navigators*, is particularly uſed for the Archipelago.

ARCHETYPE, ARCHETYPUS, the firſt pattern, or model, by which any work is formed, or which is copied after, to make another like it.

The word is compounded of αρχη, *beginning*, and τυπος, TYPE.

In this ſenſe the word coincides with *original*, or *prototype*; and ſtands oppoſed to *copy*.

Among minters, &c. *archetype* is peculiarly uſed for the ſtandard or original weight, by which the other weights are to be adjuſted and examined.

Philoſophers, particulary the Platoniſts, talk of an *archetypal* world; meaning, the world, ſuch as it exiſted in the Divine Mind, or in the idea of God, before the viſible creation.

ARCHEUNUCH, ARCHIEUNUCHUS, the chief of the eunuchs.

The *archeunuch* was one of the principal officers in Conſtantinople, under the Greek emperors.

ARCHEUS, an obſcure term, uſed chiefly among the *Ancient Chemiſts*, to expreſs ſome occult principle of life and motion, the cauſe of all the effects which we obſerve in nature.

The word is derived from αρχη, *principle*.

As the chemiſts differ in their ideas of a vital cauſe; the term *archeus* becomes applied to very different things: though moſt of them conceive it of the nature of fire.

Some uſe *archeus*, to denote the fire lodged in the centre of the earth; to which they aſcribe the generation of metals and minerals, and which they believe to be the principle of life in vegetables.

Others, by the word *archeus*, mean a certain univerſal ſpirit, diffuſed throughout the whole creation, the active cauſe of all the phænomena in nature.

Others, inſtead of *archeus*, chooſe to call this the *anima mundi*; and others, the *Vulcan* or *heat* of the earth.

They add, that all bodies have their ſhare of this *archeus*; and that, when this is corrupted, it produces diſeaſes, which they call *archeal diſeaſes*.

They likewiſe attribute ideas to it; which for this reaſon they call *archeal ideas*.

Helmont is a great aſſertor of the dogma of an *archeus*.

It is likewiſe uſed to ſignify that peculiar fluid among the vegetable claſſes, which determines every particular plant to its odour, taſte, and other qualities.

The fruit of a plant is the part in which the ſeed is conceived and formed, the ſeed is the embryo of the plant, with a *placenta* or *cotyledon*, to which it is faſtened by an umbilical ſtring. The cotyledons uſually contain a balſam, which appears to be the laſt and higheſt preparation of the moiſt kind, which nature here lays up for the uſe of the offspring. In this is an oily tenacious matter, which repels all other moiſt things, defends the embryo, and, by its tenacity, retains and fetters the thin pure ſpirit, which is the ultimate bounds and object of the actions of nature in plants, and which would elſe eaſily fly away; this the chemiſts call the *archæus* and *ſpiritus rector*; the oil is too groſs ever to enter the fine veſſels of the embryo. But this ſpirit being invigorated by a vegetable power, breathes, it is ſaid, a vital principle, and impreſſes the ſpecific character on the food deſtined for the embryo, by which means every thing afterwards turns to the proper nature of the plant; in this ſpirit the fragrant odour, and peculiar taſte of the plant is lodged, and even its colour has a near dependance on it. Boerhaave's Chem.

ARCHIACOLYTHUS, an ancient dignity, in cathedral churches: the miniſters whereof were divided into four orders, or degrees, viz. *prieſts*, *deacons*, *ſubdeacons*, and *acolythi*; each of which had their chiefs. The chief of the *acolythi* was called *archiacolythus*. Du-Cange.

ARCHIATER, ARCHIATRUS, properly denotes the chief phyſician of a prince who retains ſeveral.

The word is formed of αρχη, *principium*, *chief*; and ιατρος, *medicus*, a *phyſician*.

ARCHIDAPIFER, or chief ſewer, is a great officer of the empire.

The elector of Bavaria is *archidapiſer*.—The palatine of the Rhine at one time pretended this office was annexed to his palatinate; but he has ſince deſiſted.

ARCHIEROSYNES, in the Grecian *Antiquity*, a high-prieſt veſted with authority over the reſt of the prieſts, and appointed to execute the more ſacred and myſterious rites of religion.

ARCHIGALLUS, in *Antiquity*, the high-prieſt of Cybele, or the chief of the eunuch-prieſts of that goddeſs, called Galli.

ARCHIGERONTES, in *Antiquity*, the chiefs or maſters of the ſeveral companies of artificers at Alexandria. Some have miſtaken the *archigerontes* for the arch-prieſts, appointed to take the confeſſions of thoſe who were condemned to the mines.

ARCHIGUBERNUS, ARCHIGUBERNETA, or ARCHIGUBERNITES, in *Antiquity*, the commander of the imperial ſhip, or that which the emperor was aboard of. Some have confounded the office of *archigubernus* with that of *præfectus claſſis*, or admiral, but the former was under the command of the latter.

Potter takes the proper office of the *archiguberneta* to have been, to manage the marine affairs, to provide commodious harbours, and order all things relating to the failing of the fleet, except what related to war.

ARCHIL, *Archilla*, *Rocella*, or *Orſeille*, is a white moſs, which grows on the rocks in many parts of the Archipelago, and in the Canary and Cape de Verd iſlands; and, according to Linnæus's account, on the weſtern coaſt of England. It belongs to the third of Dillenius's genus of *coralloides*, and to the *lichenes fruticuloſi* of Linnæus. This moſs is imported as it is gathered, and the demand for it is ſo great, that, as M. Hellot informs us, no leſs than 2600 quintals, or 130 ton weight of it, is annually collected in different places. Thoſe who prepare it for the uſe of the dyer grind it betwixt ſtones, ſo as to bruiſe it thoroughly without reducing it to powder, and then moiſten it occaſionally with ſtrong ſpirit of urine, or urine itſelf mixed with quicklime. In a few days it acquires a purpliſh red, and at length a blue colour. The dyers ſeldom uſe this drug by itſelf, becauſe of its dearneſs, and the periſhableneſs of its beauty; but they chiefly employ it to give a bloom to other colours, as pinks, &c. and this is done by paſſing the dyed cloth, or ſilk, through hot water lightly impregnated with the *archil*. However, the bloom thus communicated ſoon decays upon being expoſed to the air; though, M. Hellot ſays, that by adding a ſmall quantity of the ſolution of tin, the colour obtained from this drug changes towards a ſcarlet, and gives a durable dye. Prepared *archil* will readily yield its colour to water, to volatile ſpirits, and to ſpirit of wine; and it is accordingly uſed to colour the ſpirits of thermometers; but being confined from the air, the ſpirits loſe their colour, and, as M. l'Abbé Nollet obſerves, regain it, upon being again expoſed to the air. He repeated the experiment ſeveral times with ſucceſs. A ſolution of *archil* in water gives a durable ſtain of a beautiful violet, or purpliſh blue colour, to marble. M. du Fay informs us, that he has ſeen pieces of marbles ſtained with it, that preſerved their colour for two years, without any ſenſible change. It ſinks deep into the marble, and makes it more brittle. The dye yielded by this ſubſtance, it is ſuppoſed, was known as early as the days of Theophraſtus. Linnæus apprehends, that there are ſeveral other common moſſes, from which valuable colours might be extracted. The French dyers uſe a cruſtaceous moſs growing upon rocks in Auvergne, and prepared with lime and urine, as a ſuccedaneum to the Canary *archil*. Dr. Lewis's Ed. of Neumann's Chem. Works, p. 438. Phil. Tranſ. vol. li. p. 652. Raii Hiſt. Plant. i. p. 74. Micheli Nova Plant. p. 78. See LICHEN.

ARCHILOCHIAN, a term in *Poetry*, applied to a ſort of verſes, whereof *Archilochus* was the inventor.

Theſe conſiſt of ſeven feet; the four firſt whereof are ordinarily *dactyls*, though ſometimes *ſpondees*; the three laſt *trochees:* for inſtance:

> *Solvitur acris hyems grata vice veris & Favoni.* Hor.

It is uſual to mix *iambic* verſes of ſix feet, abating a ſyllable, with *Archilochian* verſes; this Horace himſelf has done in the ODE now cited.

Theſe verſes are called *dactylic*, on account of the *dactyls* at the beginning.

ARCHI-LUTE. See ARCILEUTO.

ARCHIMAGUS, in the *Ancient Perſian Religion*, the chief prieſt or head of the order of magi.

The *archimagus* anſwered to the high-prieſt among the Jews, or the pope now among the Romaniſts, being the head of the whole religion.

The *archimagus* reſided in the fire temple, a place held in the ſame veneration among them, as the temple of Mecca among the Mahometans; every perſon of the ſect being under a kind of obligation to make a pilgrimage to it once in their lives. Zoroaſter is ranked as the firſt *archimagus*.

ARCHIMANDRITE, the ſuperior of a monaſtery; amounting to what we now call ABBOT.

Covarruvias obſerves, that the word literally denotes the chief or leader of a flock; in which ſenſe it may be applied to any eccleſiaſtical ſuperior; and accordingly, we find the name ſometimes attributed to archbiſhops. But among the Greeks, where it is chiefly uſed, it is always reſtrained to the chief of an abbey.

ARCHIMEDES's *Screw.* See SCREW *of Archimedes.*

ARCHIMEDES's *Burning-glaſs.* See BURNING-*glaſs.*

ARCHIMIME, ARCHIMIMUS, is the ſame thing, in effect, with arch-buffoon, or mimic.

The *archimimes*, among the Romans, were perſons who imitated the manners, geſtures, and ſpeech, both of people living, and thoſe who were dead.

At firſt they were only employed on the theatre; but were afterwards admitted to their feaſts, and at laſt to their funerals; where they walked after the corpſe, counterfeiting the geſtures and behaviour of the perſon who was carried to the funeral pile; as if he were ſtill alive.

ARCHIPELAGO, in *Geography*, a ſea interrupted by a great number of iſlands.

The word is formed by corruption of *Ægeopelagus*, q. d. *Ægean ſea*, which, again, is formed of Αιγαιον Πελαγος, a name originally given it by the Greeks; but for what reaſon is not agreed on.

The moſt celebrated *Archipelago*, and that to which the name is in ſome meaſure appropriated, is that between Greece, Macedonia, and Aſia; wherein are the iſlands of the Ægean ſea; which is called the *White Sea*, in contradiſtinction to the Euxine, which they call the *Black Sea.*

All theſe iſlands lie between the 35th and 40th degrees of north latitude. Some of them are called *Cyclades*, becauſe they form, as it were, a crown or circle round the iſle of Delos; the others are called *Sporades*, as being diſperſed without any order between Aſia, and the iſle of Candia.

The modern geographers mention other *Archipelagos*; as, that of Lazarus, near the coaſt of Malabar and Malacca; the *Archipelago* of Mexico; and that of the Caribbees, wherein are many iſlands; that of the Philippines, called, by ſome, the *great Archipelago*, containing ſeveral iſlands; and all thoſe of the Moluccos, of Celebes, &c.

ARCHIPHERACITÆ, miniſters in the Jewiſh ſynagogues appointed to read and interpret the Perakim, or titles and heads of the law, and the prophets.

The *archipheracita* was not the ſame with the *archiſynagogus*, as Grotius, and others, have miſtakenly imagined; but rather the chief or principal of theſe appointed to read, explain, and profeſs the law, in their ſchools.—And hence the name, which is formed of αρχος, *chief*; and the Hebrew or Chaldee, פרק, *diviſion*, or *chapter.*

ARCHIPRESBYTER. See ARCH-PRIEST.

ARCHISTRATEGUS, the generaliſſimo, or captain-general of an army. See STRATEGUS.

ARCHISYNAGOGUS, in the Jewiſh *Hiſtory*, the chief or ruler of the ſynagogue.

Theſe are ſometimes alſo called the angels or princes of the ſynagogues: the Jews alſo called them *chachamim*, i. e. *wiſe.*

Archiſynagogues were perſons of authority in each ſynagogue, who preſided in aſſemblies held therein, invited thoſe to ſpeak whom they judged capable of it; and decided all diſputes relating to money, &c. They had a power to have thoſe whipped who were convicted of acting contrary to the law; alſo a right of excommunicating or caſting out of the ſynagogue, thoſe whom they found to merit this puniſhment. Their number was different according to the extent of the city, or the number of perſons that came to the ſynagogue; in ſome there were ſeventy, in others eight or ten, and in others not above one. Vitringa de Synagog.

ARCHITECT, a perſon ſkilled in architecture, or the art of BUILDING: who forms plans and deſigns for edifices, conducts the work, and directs the ſeveral artificers employed in it.

The word is derived from αρχος, *princeps*, and τεκτων, *faber*, *workman*; q. d. the principal workman.

The moſt celebrated *architects* are Vitruvius, Palladio, Scamozzi, Serlio, Vignola, Barbaro, Cataneo, Alberti, Viola, Inigo Jones, De Lorme, Perrault, S. Le Clerc, Sir Chriſtopher Wren, and the earl of Burlington.

Vitruvius enumerates twelve qualities requiſite to conſtitute a good *architect*; that he be docile and ingenious; well educated; ſkilled in deſigning; in geometry; optics; arithmetic; hiſtory; philoſophy; muſic; medicine; law; and aſtronomy.

Cloſe application to the ſtudy of ancient maſters, and the remaining works of the ancients, together with judgment and taſte to ſelect, and properly to apply the hints which ſuch examples afford, joined to a particular genius for the ſtudy of this art, are abſolutely neceſſary to render an *architect* eminent in his profeſſion.

ARCHITECTOGRAPHIA, the deſcription of ancient buildings, temples, theatres, arches, pyramids, baths, gates, aquæducts, tombs, and the like.

ARCHITECTONIC, that which builds a thing up regularly, according to its nature and intentions.

ARCHITECTURE, ARCHITECTURA, the art of BUILDING, i. e. of erecting edifices, proper for habitation or defence, as houſes; for domeſtic concerns, as ſtabling, barns, and all out-offices; for devotion, as temples, churches, &c. for ſtate, as public offices, halls, theatres, &c. for monuments and mauſoleums, and for trade.

Architecture is ſcarce inferior to any of the arts in point of antiquity.—Nature and neceſſity taught the firſt inhabitants of the earth to build themſelves huts, tents, and cottages; from which, in courſe of time, they gradually advanced to more regular and ſtately habitations, with variety of ornaments, proportions, &c. See Vitruvius's account of the origin of *architecture*, under ORDER.

The ancient writers repreſent the Tyrians as the firſt among whom *architecture* was carried to any tolerable pitch; and hence it was that Solomon had recourſe thither for workmen to build his temple.

To what a degree of magnificence the Tyrians and Egyptians carried *architecture*, before it came to the Greeks, may be learned from Iſaiah xxiii. 8. and from Vitruvius's account of the Egyptian Oeci; their pyramids, obeliſks, &c.

Yet, in the common account, *architecture* ſhould be almoſt wholly of Grecian original: three of the regular orders or manners of building are denominated from them, viz. Corinthian, Ionic, and Doric; and there is ſcarce a ſingle member, or moulding, but comes to us with a Greek name.

Be this as it will, it is certain the Romans, from whom we derive it, borrowed what they had entirely from the Greeks; among whom it was in its greateſt glory under Pericles.

Under Auguſtus, *architecture* arrived at its higheſt perfection. Tiberius neglected it, as well as the other polite arts. Nero, amongſt a number of horrible vices, ſtill retained an uncommon paſſion for building; but luxury and diſſoluteneſs had a greater ſhare in it, than true magnificence.—Apollodorus excelled in *architecture*, under the emperor Trajan, by which he merited the favour of that prince; and it was he who raiſed the famous Trajan column, ſubſiſting to this day; though robbed of its ornaments, in order to decorate the arch of Conſtantine.

After this, *architecture* began to decline again; and though the care and magnificence of Alexander Severus ſupported it for ſome time, yet it fell with the weſtern empire, and ſunk into a corruption, from whence it was not recovered for the ſpace of twelve centuries.

The ravages of the Viſigoths, in the fifth century, deſtroyed all the moſt beautiful monuments of antiquity; and *architecture* thenceforward became ſo coarſe and artleſs, that their profeſſed architects underſtood nothing at all of juſt deſigning, wherein its whole beauty conſiſts; and hence a new manner of building took its riſe, which is called the *Gothic.*

Charlemagne did his utmoſt to reſtore *architecture*; and the French applied themſelves to it with ſucceſs, under the encouragement of H. Capet: his ſon Robert ſucceeded him in this deſign; till by degrees the modern *architecture* was run into as great an exceſs of delicacy, as the Gothic had before done into maſſiveneſs. To theſe may be added, the Arabeſk and Moriſk, or Mooriſh *architecture*, which were much of a piece with the Gothic, only brought in from the ſouth by the Moors and Saracens, as the former was from the north by the Goths and Vandals.

The church built by Helen over the ſuppoſed ſepulchre of our Saviour, is in this ſtyle, ornamented with foliage and figures of angels in the capitals, and on the impoſts. This ſeems to have been the firſt corruption of the ancient architecture; and it was ſucceeded by the Gothic, which ſtyle of building has a fine effect in places of devotion; ſuch are many of our cathedrals and old churches.

The architects of the 13th, 14th, and 15th century, who had ſome knowledge of ſculpture, ſeemed to make perfection conſiſt altogether in the delicacy and multitude of ornaments, which they beſtowed on their buildings, with exceſſive care and ſolicitude; though frequently without any conduct or taſte.

In the two laſt centuries, the *architects* of Italy and France were wholly bent upon retrieving the primitive ſimplicity and beauty of ancient *architecture*; in which they did not fail of ſucceſs: inſomuch that our churches, palaces, &c. are now wholly built after the antique.

The rules of *architecture* require, that, in a fabric judiciouſly and elegantly erected, there ſhould be ſolidity, conveniency, and beauty; to which, according to the taſte of ſome of the moſt refined maſters, are added order, diſpoſition, proportion, decorum, and oeconomy. Theſe eight requiſites are eſteemed by the beſt judges, to conſtitute the neceſſary parts of *architecture*.

Solidity, implies the choice of a good foundation, and good materials to work with, properly applied. Convenience conſiſts in ſo diſpoſing the various parts of a ſtructure, that they may not croud and embarraſs each other, or appear diſagreeable to the inſpector. Beauty, is that engaging form, and pleaſing appearance, which captivate at one glance, as it were, the ſight of the ſpectator. Order, gives each part of the building a proportionate extent, adapted to the magnitude of the whole. Diſpoſition, is the due ranging, and agreeable union of all the parts, in order to render the whole agreeable at all times, and, in general, means the proper and convenient arrangement of the apartments. Proportion, is the relation that the whole work has to its conſtituent parts; and which each part hath to the complex idea of the whole: for among buildings that are perfect in their kind, from any particular part, we may form a judgment of the taſte of the whole. For example, the diameter of a column, or the dimenſions of a triglyph, gives us a right idea of the whole with which they have connexion. To expreſs the relation which many things have to each other, as to their magnitude, and the variety of their parts, Vitruvius, the great architect, indifferently uſes the words proportion, eurythmy, and ſymmetry; the two laſt whereof are nearly ſynonymous with the firſt. *Decorum*, or decency, conſiſts in making the whole aſpect of the fabric ſo correct, that nothing ſhall appear but what is founded on the principles of geometry, and delicacy of judgment. Theſe have regard to deſign, cuſtom, and nature. Deſign induces to chuſe other diſpoſitions for a church than a palace. The regard we pay to cuſtom inclines us to decorate the elevations of ſuch houſes which are ſumptuous and magnificent within. The regard we have to the nature of places, from an inherent taſte, perhaps natural to mankind, makes us pitch upon different proſpects, for different parts of an edifice. Thus we chuſe to expoſe bed-chambers, and libraries, to the morning ſun; winter apartments to the weſt; and galleries of paintings to the north; they requiring an equal light. Oeconomy, inſtructs the artiſt to have regard to the expence to be made of his deſign, the quality of the materials near the places where he builds; and to take his meaſures judiciouſly for the order and diſpoſition.

Architecture is commonly divided into *civil*, *military*, and *naval*, or *marine*.

ARCHITECTURE, *civil*, is the art of deſigning edifices of every kind for the uſes of civil life in every capacity; as habitations for dwelling, churches, meetings, ſynagogues, colleges, halls, palaces, &c.

Civil architecture may be diſtinguiſhed, with regard to the ſeveral periods, or ſtates thereof, into the *antique*, *Gothic*, *modern*, &c.

Another diviſion of *civil architecture* ariſes from the different proportions which the different kinds of buildings rendered neceſſary, that we might have ſome proper for every purpoſe, according to the bulk, ſtrength, delicacy, richneſs, or ſimplicity required.

Hence aroſe five orders or manners of building, all invented by the ancients at different times, and on different occaſions, viz. *Tuſcan*, *Doric*, *Ionic*, *Corinthian*, and *Compoſite*; the hiſtory, characters, &c. of each whereof, ſee under their reſpective articles, COMPOSITE, CORINTHIAN, DORIC, IONIC, and TUSCAN.

What forms an order is, the column with its baſe and capital; ſurmounted by an entablature, conſiſting of architrave, frieze, and cornice; and ſuſtained by a pedeſtal.

For a general view of the elements of *architecture*, with the rules which obtain with reſpect to the matter, form, proportion, ſituation, foundation, diſtribution, covering, apertures, &c. ſee BUILDING.

For particulars, ſee CEILING, DOOR, FOUNDATION, ROOF, WALL, WINDOW, &c.

There are ſeveral arts ſubſervient to *architecture*, as carpentry, maſonry, paving, joinery, ſmithery, glazing, plumbing, plaſtering, gilding, painting, &c. See CARPENTRY, GILDING, JOINERY, MASONRY, PAINTING, PAVING, PLUMBING, SCULPTURE, &c. See alſo BRICK, GLASS, LEAD, MORTER, STONE, TILE, TIMBER, &c.

We have no Greek authors at this time extant on *architecture*.—The firſt who wrote of it was Agatharchus the Athenian, who was ſeconded by Democritus and Theophraſtus.—Among the Latins, Fuſſitius, Terentius Varro, Publius Septimius, Ruſus, and Epaphroditus, all wrote *De Re Architectonica*.

But, of all the ancients, Vitruvius is the only entire author whoſe works we have; though Vegetius relates, that there were 700 architects at Rome in his time.—He lived in the reigns of Julius Cæſar, and of his ſucceſſor Auguſtus, and compoſed a complete ſyſtem of *architecture*, in ten books, which he dedicated to that prince.

M. Perrault has extracted all the rules out of Vitruvius's prolix work, and has methodized and publiſhed them in a little abridgment.—Several authors have alſo endeavoured to explain the text of Vitruvius, particularly Philander, Barbaro, and Salmaſius, in notes added to their ſeveral Latin editions; Rivius and Perrault, in the notes to their German and French verſions; and Baldus, in his *Lexicon Vitruvianum* enlarged by De Laet.—The ſame M. Perrault has alſo compoſed an excellent treatiſe of *the five orders*, which may be eſteemed a ſupplement to Vitruvius, who left the doctrine of the orders defective.

The authors upon *architecture*, ſince Vitruvius, are—Leon Baptiſta Alberti, who, in 1512, publiſhed ten books of the art of building, in Latin, deſigned to outvie Vitruvius; in which, however, he has not ſucceeded. His work has abundance of good things; but it is deficient in the doctrine of the orders.—Seb. Serlio, who wrote ſeven books of *architecture*, five of which, concerning the five orders, were made public in 1502, throughout all which, he ſtrictly adheres to Vitruvius's rules: the ſeventh was ſince publiſhed in 1575; but the ſixth, concerning private buildings, has not yet appeared.—And. Palladio, who wrote four books of *architecture*, containing the fundamental rules of the art, with various inſtances of all the kinds of works, publiſhed in Italian in 1575; the two firſt books are rendered into High Dutch, and enlarged with annotations by Boeckler.—Phil. de Lorme, who publiſhed nine books of *architecture* in French in 1567; J. Barozzi de Vignola, who, in 1631, made public his rules of the five orders, in Italian; this work has been ſince tranſlated, with large additions, by Daviler, under the title of *Cours d'Architecture*, &c. and ſince alſo in High Dutch, with notes.

To theſe are to be added Vincent Scamozzi, in his Idea of univerſal Architecture, publiſhed in 1615, in Italian; Car. Phil. Dieuſſart, in his Theatre of Civil Architecture, publiſhed in High Dutch in 1697, wherein he not only delivers the rules of *architecture*, but explains and compares the five orders, as laid down by Palladio, Vignola, Scamozzi, and others; which ſame deſign was alſo executed in French by R. Freart de Cambray, in a Parallel of the ancient Architecture with the modern, publiſhed in French in 1650, and ſince tranſlated into Engliſh, with additions, by Mr. Evelyn. Fr. Blondel, director of the Royal Academy of *Architecture*, in 1698, gave a Courſe of Architecture, in French; being a collection from all the celebrated writers upon the ſubject of the orders, &c. Nic. Goldman, in a treatiſe *De Stylometris*, publiſhed in Latin and High Dutch, in the year 1661, has done good ſervice, by reducing the rules and orders of *architecture* to a farther degree of perfection, and ſhewing, how they may be eaſily delineated by means of certain inſtruments invented by him.

Laſtly, the Elements of Architecture are very ingeniouſly laid down by Sir H. Wotton.—The ſame are alſo reduced by Sturmius, and Wolfius, to certain rules and demonſtrations; and thus is *architecture* brought into the form of a mathematical art; by the firſt, in his *Matheſis Juvenilis*, and by the ſecond, in his *Elementa Matheſeos*, tom. ii. an 1715.

ARCHITECTURE, *counterfeit*, is that which has its projectures painted either in black or white, or coloured after the manner of marble; as is ſeen practiſed in the frontiſpieces and palaces in Italy, and in the pavilions of Marly.

This painting is done in freſco, upon plaiſtered walls; and in oil, on walls of ſtone.

Under the name of *counterfeit architecture*, which we otherwiſe call *ſcene-work*, is likewiſe comprehended, that painted on ſlight boards or planks of wood, whereon the columns, pilaſters, and other parts of building, ſeem to ſtand out, with a relievo; the whole being coloured in imitation of various marbles, metal, &c. and ſerving in the decorations of theatres, triumphal arches, public entries, funeral pomps, &c.

ARCHITECTURE, *military*, is the art of ſtrengthening and fortifying places, to ſcreen them from the inſults of enemies, and the violence of arms.

This we more uſually call FORTIFICATION.

The buſineſs of *military architecture* is to erect forts, caſtles, and other fortreſſes, with ramparts, baſtions, &c.

Thoſe who have excelled in *military architecture*, are Coehorn, Pagan, Vauban, Scheiter, and Blondel; from whom all who have wrote ſince have chiefly derived what they have communicated to the world. See FORTIFICATION.

ARCHITECTURE, *naval*, or *Ship* BUILDING, is that which teaches the conſtructions of ſhips, gallies, and other floating veſſels for the water; with ports, moles, docks, &c. on the ſhore.

How it was eſteemed in the days of Homer, may be ſeen in his Odyſſ. V. 244. See SHIP, and the articles there referred to.

ARCHITECTURE *in* PERSPECTIVE, is a ſort of building, wherein the members are of different meaſures and modules, and diminiſh in proportion to their diſtances; to make the work appear longer and larger to the view than really it is.

Such is the celebrated pontifical ſtair-caſe of the Vatican, built under pope Alexander VII. by the cavalier Bernino.

ARCHITHALASSUS, in *Conchyliology*, a name given by ſome authors to a very beautiful and precious ſhell of the *voluta* kind, called by us the admiral.

The curious in Holland have three ſpecies of this ſhell, which they call *archithalaſſus primus*, *ſecundus*, and *aurantius*, the admiral, the vice-admiral, and the orange ADMIRAL.

ARCHITRAVE, in *Building*, that part of a column, or order of column, which lies immediately upon the capital. See *Tab. Archit. fig.* 24, 25, 26, 27, 28.

The Greeks call it *epiſtyle.*

The *architrave* is the loweſt member of the entablature.

The *architrave* is ſuppoſed to repreſent the principal beam in timber buildings; whence the name, which is formed of αρχος, *chief*, and *trabs*, *beam.*

The *architrave* is different in the different orders. In the Tuſcan it only conſiſts of a plain face, crowned with a fillet; and is half a module in height.

In the Doric and Compoſite, it has two faces, or *faſciæ*; and three in the Ionic and Compoſite; in which laſt order it is $\frac{10}{12}$ of a module high, though but half a module in the reſt. See a table of the meaſures of the ſeveral parts of the *architrave* in the different orders, under COLUMN.

Architects, however, allow themſelves a great latitude in this part; ſome uſing more members than others; and many of them having two or three forms of *architraves*. The proportions here laid down are taken from Vignola. *Architrave* is ſometimes alſo called the *reaſon-piece*, or *maſter-beam* in timber-buildings, as porticos, cloiſters, &c. In chimneys it is called the *mantle-piece*, and over the jaumbs of doors, or lintels of windows, the HYPERTHYRON.

ARCHITRAVE *corniche*. See CORNICHE.

ARCHITRAVE *doors*, as thoſe which have an *architrave* on the jaumbs, and over the door, upon the cap-piece, if ſtrait; or on the arch, if the top be curved.

ARCHITRAVE-*windows*, of timber, are commonly an OGEE raiſed out of the ſolid timber, with a liſt over it; though ſometimes the mouldings are ſtruck, and laid on; and ſometimes they are cut in brick.

The upper *faſcia* is called the *header*, or *heading architrave*; and the lower the *jack.*

ARCHITRICLINUS, in *Antiquity*, the maſter or director of a feaſt, charged with the order and œconomy of it, the covering and uncovering of the tables, the command of the ſervants, and the like.

The word *architriclinus* properly imports the chief or maſter of a *triclinium*, or dining room. His office properly differed from that of *modimperator*, or *arbiter bibendi*, as the latter was appointed by the gueſts, the *architriclinus* by the perſon who gave the feaſt.

The *architriclinus* was ſometimes alſo called *ſervus tricliniarcha*, and by the Greeks προγευστης, i. e. *prægustator*, or *fore-taſter*. Potter alſo takes the *architriclinus* for the ſame with the SYMPOSIARCHA.

ARCHITYPE. See ARCHETYPE.

ARCHIVAULT, in *Architecture*, the inner *contour* of an ARCH; or a band or frame adorned with mouldings, running over the faces of the arch-ſtones, and bearing upon the impoſts.—See this repreſented in the lines that bound the arch over E. See *Tab. Archit. fig.* 40.

The word is French, *archivolte*; where it ſignifies the ſame thing; formed of *arcus volutus.*

It is different in the different orders.—In the Tuſcan, it has only a ſingle face; it has two faces crowned, in the Doric and Ionic; and the ſame mouldings with the ARCHITRAVE in the Corinthian and Compoſite.

ARCHIVE, or ARCHIVES, a chamber or apartment wherein the records, charters, and other papers and evidences, of a ſtate, houſe, or community, are preſerved, to be conſulted occaſionally.

The word comes from *arca*, a *cheſt*; or the Greek αρχαιον, which Suidas uſes in the ſame ſenſe. In ſome Latin writers we meet with *archarium.*

We ſay, the *archives* of a college, of a monaſtery, &c. The *archives* of ancient Rome were in the temple of Saturn; the *archives* of the court of chancery are in the rolls office.—In the code we meet with *archivum publicum, vel armarium publicum, ubi acta & libri exponebantur. Cod. de fid. inſtrum. auth. ad hæc* xxx. q. I. Trev.

ARCHIVIST, *archiviſta*, a keeper of an ARCHIVE.

Under the emperors, the *archiviſt* was an officer of great dignity, held equal to the proconſuls, veſted with the quality of a count, ſtyled *clariſſimus*, and exempted from all public offices, and taxes. Among the ancient Greeks and Perſians, the truſt was committed to none but men of the firſt rank; among the Franks, the clergy being the only men of letters, kept the office among themſelves.

Since the erection of the electoral college, the archbiſhop of Mentz has had the direction of the ARCHIVES of the empire.

ARCHIZUPANUS, a title given to the prince or deſpot of Servia.

The word is compounded of αρχι and ζυπανος, *governor.* In an epiſtle of pope Innocent III. he is called *Magnus Jupanus.*

ARCH-MARSHAL, ARCHIMARISCALLUS, the grand marſhal of the empire.

The elector of Saxony is *archmarſhal* of the empire; and in that quality he goes immediately before the emperor, bearing a naked ſword.

ARCH-MINISTER, the prime miniſter of a prince, or ſtate.

Charles the Bald having declared Boſon his viceroy in Italy, under the title of duke, made him alſo his firſt miniſter under that of *archiminiſter.*

The word is derived from the Greek αρχος, and the Latin *miniſter.*

ARCHON, in *Antiquity*, the chief magiſtrate of the city and commonwealth of Athens.

The word is Greek, αρχων; which literally ſignifies *a commander.*

After the Athenians had aboliſhed monarchy, they created *archons*, who were obliged to render an account of their adminiſtration to the people.

Some of theſe were annual, and others perpetual. Medon, the ſon of Codrus, was the firſt of the latter, and Creon of the former.—The occaſion of their inſtitution was this: Codrus, king of Athens, having devoted himſelf, for the good of his people, in the war with the Heraclidæ; his ſons, Medon and Nileus, diſputed the crown betwixt them: the Athenians took this occaſion of diſſolving their monarchy, and, in lieu of kings, created perpetual governors, under the name of *archons.*—Medon, ſon of Codrus, was he who firſt had this charge; and his deſcendants (from him called *Medontidæ*) enjoyed it for 287 years. But a perpetual magiſtracy ſeemed to this free people too lively an image of royalty, the very ſhadow whereof they were reſolved to aboliſh. Accordingly, the adminiſtration of an *archon*, which had before been perpetual (viz. in the firſt year of the ſeventh olympiad), they now reduced to ten years, and, about ſeventy years after, to one year; with a view of recovering, as oft as poſſible, the authority into their own hands, which they never transferred to the magiſtrates, but with regret.—There were, in all, thirteen perpetual, and ſeven decennial *archons*; the firſt of whom was eſtabliſhed in the 24th olympiad.

Under the Roman emperors, ſeveral other Greek cities had two *archons*, for chief magiſtrates; which were the ſame with the *duumviri* in the colonies, and *municipia.*

ARCHON is alſo applied, by ſome authors, to divers officers, both civil and religious, under the eaſtern or Greek empire.

Thus, biſhops are ſometimes called *archontes*; and the ſame may be ſaid of the lords of the emperor's court. We alſo read of the *archon of the antimenſia*, *archon of archons*, *grand archon*, *archon of churches*, *archon of the goſpel*, *archon of the walls*, &c.

ARCHONTICI, in *Church Hiſtory*, a ſect which aroſe towards the cloſe of the ſecond century; thus called from the Greek αρχοντες, q. d. *principalities*, or *hierarchies of angels*; becauſe they held the world to have been created not by the Supreme God, but by certain ſubordinate powers, called *archontes*, or *angels*. The *archontici* were a branch of VALENTINIANS.

ARCHONTIUM, αρχοντιον, denotes a dignity in the Greek church.

ARCH-PRIEST, ARCHPRESBYTER, a prieſt, or preſbyter, eſtabliſhed in ſome dioceſes, with a pre-eminence over the reſt.

Anciently, the *arch-prieſt* was the firſt perſon after the biſhop: he was ſeated, in the church next after the biſhop; and even acted as his vicar, in his abſence, as to all ſpiritual concerns.

In the ſixth century, there were found ſeveral *arch-prieſts* in the ſame dioceſe; from which time ſome will have them to have been called *deans.*

In the ninth century, they diſtinguiſhed two kinds of cures or pariſhes: the ſmaller, governed by ſimple prieſts; and the baptiſmal churches, by *arch-prieſts*; who, beſide the immediate concern of the cure, had the inſpection of the other inferior prieſts, and gave an account of them to the biſhop, who governed the chief, or cathedral church, in perſon.

There are *arch-preſbyters* ſtill ſubſiſting in the Greek church; veſted with moſt of the functions and privileges of *chorepiſcopi*, or rural deans.

ARCH-PRIOR, was a name ſometimes given to the maſter of the order of TEMPLARS.

ARCH-TREASURER, *architheſaurarius*, the great treaſurer of the German empire.

This office was created with the eighth electorate, in favour of the elector Palatine, who had loſt his former electorate, which was given to the duke of Bavaria, by the emperor Ferdinand II. who took it away from Frederic V. elector Palatine, after the battle of Prague, where he was defeated in maintaining his election to the crown of Bohemia.

The dignity of *arch-treaſurer* was conteſted between the elector of Brunſwic, now king of Great Britain, who claimed it in virtue of his deſcent from the elector Frederic, and the elector Palatine.

ARCILEUTO, ARCHILUTE, a long and large lute, having its baſs ſtrings lengthened after the manner of the theorbo, and each row doubled, either with a little octave or an uniſon.—It is uſed by the Italians for playing a thorough baſs.

ARCION, in *Botany*, a name given by ſome of the ancient writers on medicine, to the plant we call TUSSILAGO, or COLT'S-FOOT.

ARCIVÆ *aves*, in *Antiquity*, birds which gave bad omens, either by their flight, noiſe, or manner of eating.

They were called *arcivæ*, ſometimes alſo *arculæ*, *quia arcebant ne quid fieret*, prevented or forbad things being done.

ARCTAPELIOTES, in *Coſmography*, the wind which blows at the 45° from the north, towards the eaſt.

In this ſenſe *arctapeliotes* amounts to the ſame with what we call a north-eaſt wind.

ARCTATIO, a ſtreightneſs; in particular, it is applied to the inteſtines conſtipated from an inflammation; and to a preternatural ſtreightneſs of the *muliebre pudendum*, or *uterus*. It is alſo called *arctitudo*.

ARCTIC, in *Aſtronomy*, an epithet given to the north pole, or the pole raiſed above our horizon.

It is called the *arctic* pole, on occaſion of the conſtellation of the *Little Bear*, in Greek called αρκτος, the laſt ſtar in the tail whereof nearly points out the north POLE.

ARCTIC *circle* is a leſſer circle of the ſphere, parallel to the equator, and 23° 30′ diſtant from the north pole; from whence its name.

This, and its oppoſite, the *antarctic*, are called the two *polar circles*; and may be conceived to be deſcribed by the motion of the poles of the ecliptic, round the poles of the equator, or of the world.

ARCTIUM, in *Botany*. See BURDOCK.

ARCTOMYS *Palæſtinorum*, in *Zoology*, the name of an animal of the rat kind, but very large, being of a middle ſize between the rat and the rabbit: it lives in caves, and feeds on vegetables, and is a fierce and bold creature. It uſes its fore-feet as hands, and has a cuſtom of ſitting on the buttocks, and in this poſture looks very like a bear.

ARCTOPHYLAX, in *Aſtronomy*, a conſtellation, otherwiſe called BOOTES.

ARCTOPUS, in *Botany*, a genus of the *polygamia dioecia*.

ARCTOTHECA. See ARCTOTIS.

ARCTOTIS, or ANEMONOSPERMOS, in *Botany*, belongs to the *ſyngeneſia polygamia neceſſaria* claſs. The characters are, that the common empalement is ſcaly and ſilvery; the flower is compoſed of many female florets, which are ranged round the border; the germen afterwards becomes a ſingle roundiſh ſeed, covered with a ſoft down. The middle or diſk of the flower is compoſed of hermaphrodite florets; in the centre is placed a ſmall germen, ſupporting a cylindrical ſtyle with a ſingle ſtigma. Theſe flowers are abortive. There are eight ſpecies.

Theſe plants are natives of the country about the Cape of Good Hope, from whence they have been brought to ſome curious gardens in Holland and England. They ſhould be frequently renewed by cuttings, becauſe the old plants are ſubject to decay in winter; therefore, if young plants are not annually raiſed, the ſpecies may ſoon be loſt.

ARCTURUM *infra*, a ſmall ſtar of the ſeventh or eighth magnitude, to the ſouth of *arcturus*, obſerved by Mr. Flamſtead, and ſo named by him, whoſe place is not determined in the Britiſh Catalogue.

ARCTURUS, in *Aſtronomy*, a fixed ſtar, of the firſt magnitude, in the conſtellation of ARCTOPHYLAX, or BOOTES. The word is formed of αρκτος, *bear*; and ουρα, *tail*; q. d. *bear's tail*; as being very near it.

This ſtar was known to the ancients, as in the following verſe of Virgil:

Arcturum, pluviaſque Hyades, geminoſque Triones.

See alſo Job. ix. 9. xxxviii. 32.

Mr. Hornſby concludes, that *arcturus* is the neareſt ſtar to our ſyſtem viſible in the northern hemiſphere, becauſe the variation of its place, in conſequence of a proper motion of its own, is more remarkable than that of any other of the ſtars; and by comparing a variety of obſervations reſpecting both the quantity and direction of the motion of this ſtar, he infers, that the obliquity of the ecliptic decreaſes at the rate of 58″ in one hundred years; a quantity which nearly correſponds to the mean of the computations framed by Mr. Euler, and M. de la Lande, upon the principles of attraction. Phil. Tranſ. vol. lxiii. p. i. N° 14.

ARCTUS, αρκτος, in *Aſtronomy*, a name given by the Greeks to two conſtellations of the northern hemiſphere; by the Latins called URSA *major* and *minor*, and by us the *greater* and *leſſer* BEAR.

ARCUALIA *oſſa*, in *Anatomy*, a name uſed by ſome for the *oſſa ſyncipitis*, by others for the *oſſa temporum*.

ARCUALIS *ſutura*, among *Surgeons*, denotes the coronal SUTURE.

ARCUATION is uſed, by ſome writers in *Surgery*, for an incurvation of the bones; ſuch as we ſee in the caſe of rickets, &c.

ARCUATION, in *Gardening*, denotes a method of raiſing trees by layers.

This, Switzer obſerves, is now the general method of raiſing ſuch trees as cannot be raiſed from ſeed; as the *platanus*, elm, *abele*, lime, alder, willow, &c.

The firſt thing here done is, to procure large and ſtrong mother-plants called *ſtools*. Theſe, being planted in a trench, will throw out twenty, thirty, forty, or fifty, plants apiece; which may be begun to be laid about the Michaelmas following; at which time, if the ſtools have been carefully managed, they will have ſhot five, ſix, or more, main branches out of the root; and on every one of theſe, as many ſide or collateral branches.

Theſe main branches are to be bent down to the ground; and, when thus laid quite round the ſtool, and pegged faſt down, the ſmall ones may be ſerved in the ſame manner: thus the main branches are to be covered over, all except the top; and the ſmall, or ſide branches, to be covered over two or three inches thick upon the joints. This done, they may be treaded, to make them take root the better,

About the middle of September they may be opened; when, it is probable, they will have taken root: otherwiſe they may lie till next ſpring; and then, taking them up, they are to be planted in the nurſery. Miller.

ARCUBALISTA, in the *Military Art*, a kind of *baliſta*, probably made after the faſhion of a bow.

It is mentioned by Vegetius; but the deſcription of it omitted by him, as too well known then, though now hard to be gueſſed at.

Thoſe who fought with this weapon were called *arcubaliſtarii*, ſometimes *manubaliſtarii*.

ARCUCCIO, ſee ARCUTIO.

ARCUTIO, a machine made of a board covered with pieces of hoops, like the tilt of a waggon; uſed in Italy to prevent children from being overlaid and ſmothered by nurſes, or others.

Every nurſe in Florence is obliged to lay her child in an *arcutio*, under pain of excommunication.—See a figure and deſcription of the *arcutio*, given by Mr. St. John, in Phil. Tranſ. N° 442. Abridg. vol. vii. part 4. p. 46.

ARDAMON, or ARDAMA, in *Antiquity*, a veſſel of water placed at the door of a perſon deceaſed, till the time of burial, as a token that the family was in mourning, and to ſerve to ſprinkle and purify perſons as they came out of the houſe.

ARDASSES, in *Commerce*, the coarſeſt of all the ſilks of Perſia; and, as it were, the refuſe of each kind. In this ſenſe, they ſay, the *legis*, the *houſets*, the *chouſs*, and the *payas ardaſſes*, to ſignify the worſt of thoſe four ſorts of Perſian ſilks.

ARDASSINES, in *Commerce*, called in France *ablaques*; a very fine ſort of Perſian ſilks, little inferior in fineneſs to the *ſourbaſtis*, or rather *cherbaſſis*, and yet it is little uſed in the ſilk manufactures of Lyons and Tours, becauſe that kind of ſilk will not bear hot water in the winding.

ARDEA, in *Zoology*, a genus of the order of *grallæ*, belonging to the claſs of *aves*, in the Linnæan ſyſtem.

ARDENT, ARDENS, ſomething hot, and, as it were, burning. The word is formed of *ardere*, *to burn*.

ARDENT *fever* is a violent burning FEVER, otherwiſe called CAUSUS.

ARDENT *ſpirits* are thoſe diſtilled from fermented vegetables; thus called, becauſe they will take fire, and burn.

Such are, brandy, ſpirit of wine, rum, arrack, &c.

ARDENTES, in *Middle Age Writers*, an appellation given to thoſe afflicted with the *ignis ſacer*, or ERYSIPELAS.

They were thus called, as ſeeming to be ſcorched or burnt with the diſeaſe.

Hence alſo the abbey of St. Genevieve at Paris is called *domus ardentium*, becauſe, as it is ſaid, great numbers were cured of that diſtemper at the ſhrine of this ſaint, in the reign of Lewis VI.

ARDEOLA, in *Zoology*, the name of a very beautiful bird, of the Braſils, of the heron kind, but no larger than a pigeon.

ARDERS, fallowings, or ploughings of grounds. See Fallow, Ploughing, &c.

ARDESIA. See *Iriſh* Slate.

ARDOR *ventriculi*, a heat in the ſtomach, uſually expreſſed by the term HEART-*burn*, or CARDIALGY.

ARDUINA, *baſtard* LYCIUM, in *Botany*, a genus of the *pentandria monogynia* claſs: the corolla of which has a ſingle petal; the ſtigma is bifid, and the fruit is a double-celled berry with a ſingle ſeed.

ARE, or A-LA-MIRE, one of the eight NOTES in the ſcale of muſic.

AREA, in general, denotes any plain ſurface, whereon we walk, &c.

The word is Latin, importing more properly, a threſhing-floor; and is derived from *arere*, *to be dry*.

Area, in *Architecture*, denotes the ſpace or ſcite of ground on which an edifice ſtands. It is alſo uſed for inner courts, and thoſe portions of ground.

Area, in *Geometry*, denotes the ſuperficial content of any FIGURE.

Thus, if a figure, e. gr. a field, be in form of a ſquare, and its ſide be 40 feet long, its *area* is ſaid to be 1600 ſquare feet: or it contains 1600 little ſquares, each a foot every way. Hence, to find the *area* of a triangle, ſquare, parallelogram, rectangle, trapezium, rhombus, polygon, circle, or other figure, is to find the magnitude or capacity thereof in ſquare meaſure.—To do which, ſee the article Triangle, &c.

To find the *area* of fields, and other incloſures, they firſt ſurvey or take the angles thereof, then plot them on paper, and thus caſt up their contents in acres, roods, &c. after the uſual manner of other plain figures.

The law by which the planets move round the ſun, is this; that a line, or radius, drawn from the centre of the ſun to the centre of the planet, always ſweeps or deſcribes elliptic *areas* proportional to the times. Thus, the ſun being ſuppoſed in S, and a planet in A (*Tab. Aſtronomy*, *fig.* 61. Nº 2.); and letting it proceed, in any given time, to B; in ſuch progreſs, its radius AS will have deſcribed the *area* ASB. Suppoſe, again, the planet to be arrived to P; then the elliptic ſpace PSD being drawn equal to the other ASB, the planet will move through the arch PD in the ſame time as through the arch AB.

Sir I. Newton demonſtrates, that whatever bodies do obſerve ſuch law in their motions about any other body, do gravitate towards ſuch body.

Area is alſo uſed, in *Medicine*, for a diſeaſe which makes the hair fall.

The *area* is a general kind of depilation; and is diſtinguiſhed into two ſpecies, ALOPECIA, and OPHIASIS.

Area, in *Optics*. See Field.

AREB, a kind of imaginary money, uſed in the dominions of the great mogul.

Four *arebs* are equal to one *crou*, or 100 *lacs*; one *lac* to 100,000 *roupees*.

ARECA, or Areck, a fruit of the Eaſt Indies, wherein they drive an incredible trade, and of which they make a prodigious conſumption; there being ſcarce any perſon from the richeſt to the pooreſt, who does not make uſe of it. See *Table of Microſpical Objects*, Claſs 2.

The tree which bears the *areck*, is tall, ſtrait, thin, and round. It is of the palm kind, and has no branches; but its leaves are beautiful to the ſight. They form a round tuft on the top of the trunk, which is as ſtrait as an arrow. It grows ſometimes to the height of thirty-five feet, and is a great ornament in gardens.

The ſhell which contains the fruit is yellowiſh, ſmooth without, but rough and hairy within, in which it pretty much reſembles the ſhell of the cocoa-nut. Its ſize is equal to that of a large walnut; its kernel is as big as a nutmeg, to which it bears a great reſemblance without; and when cut, has the ſame whitiſh veins within. In the centre of the fruit, when it is ſoft, is contained a greyiſh and almoſt liquid ſubſtance, which grows hard, in proportion as it ripens. The fruit when ripe is aſtringent, but not unpalatable.

The chief uſe that is made of *areck*, is to chew it with leaves of betle, mixing with it a chalk in a red paſte, made of ſea-ſhells. In order to chew it, they cut the *areck* into four quarters, and take one quarter of it, which they wrap in a leaf of betle, over which they lay a little of that chalk; afterward they tie it by twiſting it round. This bit thus prepared is called *pinang*, which is a Malayan word uſed all over the Eaſt Indies. The *pinang* promotes ſpitting very much; the ſpittle is red, which colour the *areck* gives it. This maſtigation cools the mouth, and faſtens the teeth and gums. Some pretend that *areck* ſtrengthens the ſtomach, when the juice of it is ſwallowed, and moſt of the Indians do ſwallow it. Another property aſcribed to it, is the curing, or carrying off, all that might be unwholſome or corrupt in the gums. Of this fruit the extract is made, which in our ſhops is called *terra japonica*. To this extract they ſometimes join that of another plant, named *lycium*, and alſo calcined ſhells; it is generally adulterated. Geoffroy.

AREM, or Al-Arem, a vaſt mound, or dam, which formed a ſtupendous reſervoir above the city Saba, whoſe rupture cauſed an inundation, famous in eaſtern writers. Sale's Prel. Diſc.

The word *arem* is Arabic, and literally ſignifies any mound, or dam, for the containing of water.

ARENA, among the Romans, ſometimes ſignified the ſame with an *amphitheatre*; viz. a place where the GLADIATORS had their combats.

The word is Latin, and ſignifies *ſand*; becauſe the place was always ſtrewed with ſand, to conceal from the view of the people the blood ſpilt in the combat.

Properly ſpeaking, *arena* was only the pit or ſpace in the middle of thoſe places, where the athletæ and gladiators performed.

The *arena* was the ſame thing, with regard to the gladiators, that the *campus*, or field, was to ſoldiers and armies; viz. the place where they fought.—He who fought in the *arena*, was called *arenarius*. Nero is ſaid to have ſtrewed the *arena* with gold-duſt.

Arena, in *Architecture*, is the middle or body of a temple, and comprehends the whole ſpace between the *antæ*, and the extreme wall of the building.

ARENARIA, in *Botany*. See *ſea*-CHICKWEED.

Arenaria, in *Zoology*, the name of a bird, called in Engliſh the *ſanderling*, and in ſome places, particularly in Cornwall, the *curwillet*.

It is a water-bird, of the long-legged, and open-footed, not webbed, kind, and is a little larger than the *tringa minor*, or *ſand*-PIPER.—Theſe birds are common about the ſea-ſhore, and generally fly in large flocks.

Arenaria, in *Ancient Writers*, is uſed for ſand-pits, or ground out of which ſand is dug. Vitruvius.

ARENARII, in *Antiquity*, gladiators who combated with beaſts in the *arena*, or amphitheatre. The *arenarii* were ſlaves of the loweſt rank, ſo that though manumitted, they were not capable of being Roman citizens. They were the ſame with what were otherwiſe called BESTIARII.

ARENARIUM, in *Eccleſiaſtical Writers*, denotes a cemetery or burying-ground.

The *aneraria* were properly a kind of pits, or holes, under ground, wherein the ancient Chriſtians, not only buried their dead, but held their religious aſſemblies, in times of perſecution. Baron. Annal. and Du-Cange.

ARENATION is uſed, by ſome *Phyſicians*, for a kind of dry bath, in which the patient only ſits with his feet on hot ſand.

AREOLA, or Areola *mamillaris*, in *Anatomy*, the coloured circle which ſurrounds the nipple. See Breast.

AREOPAGUS, or Aræopagus, in *Antiquity*, a ſovereign tribunal at Athens; famous for the juſtice and impartiality of its decrees; to which the gods themſelves are ſaid to have ſubmitted their quarrels.

Authors are divided, as to the reaſon and origin of the name: ſome imagine *areopagus* the proper name of the court of juſtice, which was ſituate on a hill, in Athens; and that in this court the ſenate of that illuſtrious city aſſembled.—Others ſay, that *areopagus* was the name of the whole ſuburbs of Athens, wherein ſtood the hill on which the court was built; and the name *areopagus* ſeems to countenance this laſt opinion; for it ſignifies literally, the hill or rock of Mars; from ϖαγος, *hill*; and αρειος, belonging to Mars. In effect, the denomination might either ariſe hence, that the *areopagus* was built in a place where had been a temple of Mars; or, becauſe the firſt cauſe pleaded there was that of this god, who was accuſed of killing Halirrhotius, the ſon of Neptune, and tried here before twelve gods, and acquitted by a majority of voices: or, finally, becauſe the Amazons, whom the poets feign to have been the daughters of Mars, when they beſieged Athens, pitched their tents, and offered ſacrifices to the god of war in this place.

This tribunal was in great reputation among the Greeks; and the Romans themſelves had ſo high an opinion of it, that they truſted many of their difficult cauſes to its deciſion. Authors are not agreed about the number of the judges who compoſed this auguſt court. Some reckon thirty-one, others fifty-one, and others five hundred: in effect, their number ſeems not to have been fixed, but to have been more or leſs in different years.—By an inſcription quoted by Volaterranus it appears, they were then three hundred.

At firſt this tribunal only conſiſted of nine perſons, who had all diſcharged the office of archons, had acquitted themſelves with honour in that truſt, and had likewiſe given an account of their adminiſtration before the *logiſtæ*, and undergone a very rigorous examination. Their ſalary was equal, and paid out of the treaſury of the republic: they had three *oboli* for each cauſe.

The *areopagites* were judges for life.—They never ſat in judgment but in the open air, and that in the night-time; to the intent that their minds might be more preſent and attentive; and that no object, either of pity or averſion, might make any impreſſion upon them. However, ſome maintain, that the building in which the *areopagites* aſſembled, was not wholly uncovered; and they obſerve, that among the ruins, large ſtones have been found, whoſe joints are in the ſame angle with the pediment that muſt have been uſed for a covering.—All pleadings before them were to be in the ſimpleſt and moſt naked terms; without exordium, epilogue, or appeal to the paſſions.

At firſt they only took cognizance of criminal cauſes; but in courſe of time their juriſdiction became of greater extent.—Mr. Spon, who examined the antiquities of that illuſtrious city, found ſome remains of the *areopagus* ſtill exiſting in the middle of the temple of Theſeus, which was heretofore in the middle of the city, but is now without the walls.—The foundation of the *areopagus* is a ſemicircle, with an eſplanade of 140 paces round it, which properly made the hall of the *areopagus*. There is a tribunal cut in the middle of a rock, with ſeats on each ſide of it, where the *areopagites* ſat, expoſed to the open air.

This court is ſaid by ſome to have been inſtituted by Solon; but others carry it much higher, and aſſert it to have been eſtabliſhed by Cecrops, about the time that Aaron died; viz. in the year of the world 2553, maintaining withal, that Solon only made ſome new regulations in it, increaſed its power and privileges, and made it ſuperior to the *ephetæ*, another celebrated court inſtituted by Draco.—In effect, Demoſthenes himſelf, in his oration againſt Cteſiphon, owns himſelf at a loſs on the point: *The inſtitutors of this tribunal*, ſays he, *whatever they were, whether gods or heroes*, &c.

AREOMETER. See ARÆOMETER.

AREOSTYLE. See ARÆOSTYLE.

AREOTICS. See ARÆOTICS.

ARES, a term framed by Paracelſus, to expreſs a hidden diſpoſer, in the three principles of things, from which each being receives its proper form and ſubſtance, and aſſumes its own ſpecific nature, not that of any other being.

Paracelſus diſtinguiſhes the *ares* into *archeical*, which is *natural*; and *chemical*, which is *artificial*. See ARCHÆUS.

ARETALOGI, in *Antiquity*, a ſort of philoſophers, chiefly of the Cynic or Stoic tribe, who having no ſchool or diſciples of their own, haunted the tables of great men, and entertained them in their banquets with diſputations on virtue, vice, and other popular topics. Pitiſcus Lex. Theſe are ſometimes alſo denominated *circulatores philoſophi*. Calvin Lex. Jur.

ARETHUSA, in *Botany*, a genus of the *gynandria diandria* claſs; with a tubular *nectarium* within the bottom of the corolla, and a ſtyle connected with the lower lip.

ARETIA, in *Botany*, a genus of the *pentandria monogynia* claſs; the corolla is ſhaped like a ſalver, and divided into five ſegments, with an oval tube; the ſtigma is depreſſed above, and the capſula is globular and ſingle celled.

ARETOLOGY, ARETOLOGIA, that part of moral philoſophy which treats of virtue, its nature, and the means of arriving at it.

ARGAL, or ARGEL, the hard lees ſticking to the ſides of wine-veſſels; more frequently called TARTAR.

ARGEA, or ARGEI, in *Antiquity*, human figures made of ruſhes, thrown annually by the veſtals into the river Tiber, on the day of the ides of May.

This ceremony we learn from Feſtus and Varro; the latter of whom, however, ſays, they were caſt by the prieſts, unleſs by *ſacerdotibus* we ſuppoſe he meant *prieſteſſes*. He adds, that the number of figures was thirty. Plutarch, in his Roman Queſtions, inquires, why they were called *argea?* There are two reaſons aſſigned: the firſt, that the barbarous nation, which firſt inhabited theſe parts, caſt all the Greeks they could meet with into the Tiber; for *Argians* was a common name for all Grecians; but that Hercules perſuaded them to quit ſo inhuman a practice, and to purge themſelves of the crime, by inſtituting this ſolemnity.—The ſecond, that Evander, an Arcadian, and a ſworn enemy of the *Argians*, to perpetuate that enmity to his poſterity, ordered the figures of *Argians* to be thus caſt into the river.

ARGEMON, or ARGEMA, in *Medicine*, an ulcer about the *iris* of the eye, comprehending part of the white, and part alſo of the black.

The *argemon* appears of a red colour, on the outſide of the *iris*, and white within it. When it ſpreads far, and eats deep, it ſometimes occaſions the UVEA to fall.

ARGEMONE, in *Botany*. See *Prickly* POPPY.

ARGEMONION, in *Botany*, a name given by ſome of the later Greek writers, to the plant called SARCOCOLLA by the other writers of their times.

ARGENT, in *Heraldry*, ſignifies the colour white, uſed in the coats of gentlemen, knights, and baronets. Barons, and all nobles, have the white colour called *pearl*; and ſovereign princes have theirs called *luna*.—Without either *argent* or *or*, the heralds ſay, there can be no good armory.

Argent is expreſſed, in engraving, by the parts being left plain, without any ſtrokes from the graver.

The word is French, derived from the Latin *argentum*, SILVER; this colour being ſuppoſed the repreſentation of that metal: whence the Spaniards call this field *campo de plata*, a *ſilver field*.

In the doubling of mantles, where the white is ſuppoſed to repreſent a fur, and not a metal, it may be blazoned *white*.

ARGENTARIA *creta*, *ſilver chalk*, in *Natural Hiſtory*, a name given to an earth, not properly a chalk, but a kind of TRIPELA. It is a very beautiful earth, of a looſe friable texture, and perfectly pure white. It is dug in Pruſſia, and is much eſteemed for cleaning plate. It has alſo been found in France, and of late in Ireland. There are many white chalks of various hues, which are dug in Germany, America, Italy, and other countries. That dug in the duchy of Mantua in Italy, is much uſed by painters, and at Rome vulgarly called *geſſo*.

ARGENTARIUS is frequently uſed in *Roman Writers*, for a money-changer or banker.

The *argentarii* were monied people, who made a profit either by the changing, or lending of money at intereſt. Theſe had their *tabernæ*, or offices, in the *forum Romanum*, built there as early as the reign of L. Tarquinius Priſcus. The *argentarii* and *fæneratores* were much hated, on account of their covetouſneſs and extortion. Du-Cange and Pitiſcus.

ARGENTARIUS, in *Writers of the Middle Age*, an officer entruſted with the cuſtody of money.

In this ſenſe *argentarius* amounts to the ſame with the Greek αργυροφυλαξ, and our *caſhier*. Du-Cange.

ARGENTARIUS *miles*, in our *Old Writers*, an officer of the exchequer, whoſe buſineſs it was to carry up the bag of money from the lower exchequer to the higher, in order to its being examined or told. Spelman.

ARGENTARII is alſo applied, in the *Civil Law*, to thoſe who adorned military arms with ſilver or gold.

In which ſenſe the word amounts to the ſame with BARBARICARII.

ARGENTATI *milites*, in *Antiquity*.—Livy, l. 6. ſpeaks of *argentati milites*, as diſtinguiſhed from *aurati*. Aquinas ſuppoſes theſe to have been ſimilar to the ARGYRASPIDES and CHRYSASPIDES; but the deſcriptions do not quadrate. Livy only repreſents the *argentati* as cloathed in white linen coats. Aquin. Lex. Mil. See ARGYRASPIDES.

ARGENTEUM *os*, in *Natural Hiſtory*. See OS *argenteum*.

ARGENTICOMUS, among *Ancient Aſtrologers*, denotes a kind of ſilver-haired comet, of uncommon luſtre, ſuppoſed to be the cauſe of great changes in the planetary ſyſtem.

ARGENTIL, an old Engliſh name for the plant called *percipier Anglorum*; in Engliſh, PARSLEY *piert*, or PARSLEY *break-ſtone*. See APHANES.

ARGENTINA, in *Ichthyology*, the name of a genus of fiſh, of the MALACOPTERYGIOUS kind; and in the Linnæan ſyſtem, of the order of *abdominales*: the characters of which, according to Artedi, are theſe: the body is oblong and cylindric; the teeth are placed on the tongue and palate. Artedi mentions only one ſpecies of this genus; this has large eyes, and the tail is forked. It is caught about the ſhores of Italy.

Mr. Ray deſcribes the *argentina* to be a ſmall fiſh of the harengiform kind, caught in the Mediterranean, and common in the markets of Rome.

ARGENTINA, a medicinal plant, nearly reſembling CINQUEFOIL, of ſome uſe as a cooler and aſtringent.

ARGENTUM. See SILVER.

ARGENTUM *album*, mentioned in Domeſday Book, ſignifies, according to Spelman, bullion, or ſilver uncoined. In thoſe ancient days, ſuch metal paſſed as money from one to another in payment. *Sumitur pro ipſo hoc metallo penſili non ſignato.*

ARGENTUM *Dei*, *God's penny*, anciently ſignified *earneſt-money*, or money given to bind a bargain; in ſome places called *erles*, or *arles*, and by the civilians and canoniſts, ARRHÆ. *Et cepit de prædicto Henrico tres denarios de* argenti *Dei præ manibus.*

ARGENTUM *Moſaicum*, or *muſivum*, is an amalgam or metalline paſte, which may be eaſily bruiſed into ſilver-like flakes of powder, and is uſed for colouring plaſter figures, and for other purpoſes, as a pigment. It conſiſts of equal parts of tin, biſmuth, and mercury, melted together. The powder is mixed with white of eggs, or ſpirit varniſh, and then applied to the intended work, which is afterwards burniſhed. See GILDING and SILVERING.

ARGESTES, is uſed by Vitruvius for the wind which blows from that quarter of the horizon, which is 75° from the ſouth, and weſtward.

Ricciolus uſes the term to denote the wind which blows at 22° 30′ from the weſt towards the north, coinciding with that which is otherwiſe called *Weſt-North-Weſt*. Aſt. Reform.

ARGETENAR, in *Aſtronomy*, a ſtar of the fourth magnitude, in the flexure of the conſtellation ERIDANUS.

ARGILLA, or ARGIL, *clay*; a general name for all earths uſed in pottery, brick, and tile-making, and for the like purpoſes. See CLAY.

ARGILLACEOUS *earths*, ſuch as form with water a tenacious paſte, or ſoft ſtones; they burn hard, are corroded by ſtrong coction in the concentrated mineral acids, but not acted on by moderate digeſtion. They are the baſis of earthen wares. They vitrify with ſalts, with arſenic, with gypſum, and difficultly with lead. See Neumann's Works; and Dr. Lewis's Additions, p 21 & ſeq.

ARGO, in *Antiquity*, a ſhip or veſſel celebrated among the poets; being that wherein the Argonauts, of whom Jaſon was the chief, made their expedition, in queſt of the golden fleece.

The occaſion of this expedition is thus repreſented by Greek writers. Phryxus, flying with his ſiſter Helle from the rage of their ſtep-mother Ino, the daughter of Cadmus, went on board a ſhip, whoſe enſign was a *golden ram*, and ſailed to Colchic (now Mingrelia, part of Georgia.) Helle was drowned by the way, in that ſea which from her was called the Helleſpont, now the Dardanelles. This was the ground of the poetical fable, that a *ram with a golden fleece* ſwam away with them to Colchis; and that the Argonauts undertook their famed expedition, in order to find that fleece.

Sir Iſaac Newton thinks that this expedition was really an embaſſy ſent by the Greeks, during the inteſtine diviſions of Egypt, in the reign of Amenophis, to perſuade the nations upon the coaſts of the Euxine and Mediterranean ſeas, to take that opportunity of ſhaking off the yoke of Egypt, which Seſoſtris had laid upon them: and that fetching the golden fleece, was only a pretence to cover their true deſign.

Jaſon, having happily accompliſhed his enterpriſe, conſecrated the ſhip *Argo* to Neptune; or, as others ſay, to Minerva, in the Iſthmus of Corinth; where, they add, it did not remain long before it was tranſlated into heaven, and made a conſtellation.

The generality of authors repreſent the ſhip *Argo* as of a long make, reſembling the modern galleys; and furniſhed with thirty benches of rowers. It could not however be of any great bulk, ſince the Argonauts were able to carry it on their backs from the Danube to the Adriatic ſea.

ARGO *navis*, or the *ſhip*, in *Aſtronomy*, is a conſtellation of fixed ſtars, in the ſouthern hemiſphere, whoſe ſtars, in Ptolemy's catalogue, are 45; in Tycho's, 11; in the Britannic catalogue, and Sharp's Appendix, 64: the longitudes, latitudes, magnitudes, &c. whereof are as follow:

Situation of the ſtars.	Bayer's Cha.	Signs.	Longitud.			Latitude.			Magnit.

ARGOL, the ſame with TARTAR.

ARGOL. See ARCHIL.

ARGONAUTA, a genus of worms of the *teſtacea* order.

ARGONAUTIC, ſomething belodging to the ARGONAUTS.

The *argonautic* expedition is one of the greateſt *epochas*, or periods of hiſtory, which Sir Iſaac Newton endeavours to ſettle, and from thence to rectify the ancient CHRONOLOGY. This he ſhews, by ſeveral authorities, to have been one generation, or about thirty years earlier than the taking of Troy; and forty-three years later than the death of SOLOMON.

Dr. Bryant rejects the hiſtory of the *Argonautic* expedition as a Grecian fable, founded indeed on a tradition derived from Egypt, and ultimately referring to Noah's preſervation, &c. in the ark. Anc. Myth. vol. ii. p. 473.

ARGONAUTICA, in *Literary Hiſtory*, denote poems on the ſubject and expeditions of the ARGONAUTS. We have the *Argonautics* of Orpheus in epic verſe, publiſhed by H. Stephens; the *Argonauticon* of Valerius Flaccus, in eight books of Latin heroics, in imitation of Apollonius, with reſpect to which Burman obſerves, that the imitator has often ſurpaſſed the original; the *Argonautics* of Apollonius Rhodius, an heroic poem, conſiſting of four books, *opus*, as Quintilian calls it, *non contemnendum*.

ARGONAUTS, in *Antiquity*, a company of fifty-one, according to Valerius Flaccus, or, according to Apollonius Rhodius, forty-four heroes, who embarked along with Jaſon, in the ſhip *Argo*, for Colchis, with a deſign to obtain the golden fleece.

Hercules, Theſeus, Caſtor, Orpheus, &c. were of the number of the *Argonauts*.

ARGONAUTS *of St. Nicholas*, was the name of a military order, inſtituted by Charles III. king of Naples, in the year 1382, for the advancement of navigation, or, as ſome ſay, merely for preſerving amity among the nobles.

They wore a collar of ſhells, incloſed in a ſilver creſcent, whence hung a ſhip with this device, *Non credo tempori, I do not truſt time.* Hence theſe *Argonaut* knights came to be called *knights of the ſhell.* They received the order of St. Baſil, archbiſhop of Naples; and held their aſſemblies in the church of St. Nicholas, their patron.

ARGOS, αργος, from α negative, and εργον, *work*, or *buſineſs*; as if it were αεργος. So αργος αργυρος is *ſilver not worked*; αργοι πυροι, in Hippocrates, is *crude wheat, not prepared, but ſuch as it is, taken from the floor.*

ARGUMENT, in *Rhetoric*, is ſome reaſon, or ſeries of reaſoning, by which we eſtabliſh the proof, or ſhew the probability, of ſome given propoſition.

Logicians, ſomewhat more ſcientifically, define *argument*, a *medium*, from whoſe connection with two extremes, the connection of the two extremes themſelves is inferred.

Arguments are termed *grammatical*, *logical*, *phyſical*, *metaphyſical*, *moral*, *mechanical*, *theological*, &c. according to the art, ſcience, or ſubject, from whence the middle term is borrowed. Thus, if we prove that no man ſhould ſteal from his neighbour, becauſe the ſcripture forbids it; this is a *theological argument:* if we prove it from the law of the land; it is *political:* but if we prove it from the principles of reaſon and equity; the *argument* is *moral.*

Arguments are either *certain* and *evident*, or *doubtful* and merely *probable*. *Probable arguments* are thoſe whoſe concluſions are proved from ſome probable medium. *Evident* and *certain arguments*, are thoſe which prove their concluſions by clear media and undoubted principles: theſe are called *demonſtrations*.

In reaſoning, Mr. Locke obſerves, that men ordinarily uſe four ſorts of *arguments*. The firſt is to alledge the opinions of men, whoſe parts and learning, eminency, power, or ſome other cauſe, have gained a name; and ſettled their reputation in the common eſteem, with ſome kind of authority: this may be called *argumentum ad verecundiam*. Secondly, another way is to require the adverſaries to admit what is alledged, as a proof; or to aſſign a better: this he calls *argumentum ad ignorantiam*. A third way, is to preſs a man with conſequences, drawn from his own principles or conceſſions: this is known by the name of *argumentum ad hominem*. Fourthly, the uſing proofs drawn from any of the foundations of knowledge or probability: this he calls *argumentum ad judicium*; and obſerves, that it is the only one of all the four, that brings true inſtruction with it; and advances us in our way to KNOWLEDGE. For, 1. it argues not another man's opinion to be right, becauſe I out of reſpect, or any other conſideration but that of conviction, will not contradict him. 2. It proves not another man to be in the right way, nor that I ought to take the ſame with him, becauſe I know not a better. 3. Nor does it follow, that another man is in the right way, becauſe he has ſhewn me that I am in the wrong: this may diſpoſe me perhaps for the reception of truth, but helps me not to it. That muſt come from proofs and arguments, and light ariſing from the nature of things themſelves; not from my ſhamefacedneſs, ignorance, or error. See REASON, and REASONING.

Beſides theſe, there are other *arguments* enumerated by different writers; as the *argumentum ab amore*, which is uſed to engage the reaſon by the affections; the *argumentum ad ignaviam*, called by the Greeks αργος λογος, which always concludes in favour of inaction; the *argumentum ab invidia*, which is made uſe of to render an adverſary's opinion odious; M. le Clerc has a diſſertation on this *argument* as applied to theology; and alſo the *argumentum a tuto*, drawn from the conſideration of its being ſafer to chooſe one ſide of the queſtion than the other, when the evidence is equal on both ſides. This has been much uſed againſt atheiſts and infidels: it was firſt ſtarted by Arnobius, and adopted by ſeveral advocates for chriſtianity, as Paſchal, Tillotſon, Gaſtrel, &c. Lord Shaftſbury and others have endeavoured to explode it: Clarke and Leibnitz only allow it a moral force. Moſheim has a diſſertation on this *argument*, viz. De Vi Argumenti quod *a tuto* dicitur in Theologia. Wolfem. 1723. 4°.

Logicians divide their *arguments*, with regard to their form, into *ſyllogiſms*, *enthymemes*, *inductions*, &c.

An *argument in form*, is a *ſyllogiſm* framed according to the ſtrict rules of *logic*.—According to Ariſtotle, the *enthymeme* is the *argument* of *rhetoric*, as the *ſyllogyſm* is that of *logic*.—*Rhetoric* is defined by ſome, the art of finding *arguments* adapted to perſuade, or gain belief.

Rhetoricians divide *arguments*, with reſpect to the places they are drawn from, into *intrinſic* or *artificial*; and *extrinſic* or *inartificial*, or *remote*.

ARGUMENTS, *artificial*, or *intrinſic*, by the Greeks called εντεχνα, by Cicero *inſita*, are the proper invention of him who ſpeaks: or they are thoſe which are taken from the ſubject treated of; of which there are ſeveral kinds, viz. genus and ſpecies, form, cauſe, and effect, &c. See each in its place, GENUS, &c.

To theſe ſome add two other places of *argument*, viz. the manners, and the paſſions.

ARGUMENTS, *inartificial*, or *extrinſic*, ατεχνα, by Cicero called *aſſumpta*, are thoſe which are borrowed from abroad, and are only applied by the orator to the point in hand; ſuch are laws, common report, books, oaths, torture, and witneſſes.

The places, or general heads of *arguments*, with regard to their end, may be divided into, 1. Thoſe intended to perſuade or diſſuade, which are chiefly drawn from the conſiderations of profit, honour, and equity: 2. Thoſe intended to praiſe, or diſpraiſe: and, 3. Thoſe intended to accuſe and defend.

ARGUMENT, *dialectical*. See DIALECTICAL.

ARGUMENT is alſo uſed for a ſyllabus, or abridgment of the ſubject of a book, hiſtory, comedy, or the like.

We have almoſt loſt the original uſe of prologues, which was to give the *argument* of the play.

ARGUMENT, in *Aſtronomy*, is an arch whereby we ſeek another unknown arch proportional to the firſt.

Hence

ARGUMENT *of inclination* is an arch of a planet's orbit, intercepted between the aſcending node, and the place of the planet from the ſun, numbered according to the ſucceſſion of the ſigns. See INCLINATION.

ARGUMENT, *menſtrual*, *of latitude*, is the diſtance of the moon's true place from the ſun's true PLACE.

By this we find the quantity of the real obſcuration in eclipſes, or how many digits are darkened in any place. See ECLIPSE.

ARGUMENT *of the moon's menſtrual longitude*, or *Menſtrual* ARGUMENT *of the longitude*, is an arch of her eccentric, LP (*Tab. Aſtron. fig.* 32.) intercepted between her true place once equated L; and a right line PQ, drawn through the centre of the eccentric B, parallel to the menſtrual line of the apſides.

The *annual argument* of longitude is repreſented by the angle DAH.

ARGUMENTATION, the act of inventing or framing *arguments*, of making inductions, and drawing concluſions. See INDUCTION, &c.

Argumentation, according to Cicero, is the delivering or unfolding of an argument.—The matter of *argumentations* is propoſitions; the form, their due diſpoſition, with regard to one another, ſo as a concluſion may be drawn from them. See ENTHYMEME, PROPOSITION, RATIOCINATION, SORITES, SYLLOGISM, &c.

ARGUS, a kind of animal full of eyes, called in Iceland *oſcabicorn*; of which Wormius has given a deſcription, and Jacobus has given an account. It is of the teſtaceous kind, of an oblong form, reſembling a crab's tail, and about two fingers breadth in length.

ARGUS, a ſpecies of pheaſant in the Chineſe Tartary.

ARGUS-*ſhell*, in *Conchyliology*, a ſpecies of porcelain-ſhell, beautifully variegated with ſpots, reſembling in ſome meaſure thoſe in a peacock's tail.

ARGUTIÆ, witty and acute ſayings, which commonly ſignify ſomething further than what their mere words at firſt ſight ſeem to import.

Writers on rhetoric ſpeak of divers ſpecies of *argutiæ*, viz.

ARGUTIÆ *ab alieno*, when ſomething is ſaid, which ſeems repugnant either to the nature and property of a thing, or to common cuſtom, the laws, &c. which yet in reality is conſiſtent therewith; or when ſomething is given as a reaſon of another, which yet is not the reaſon of it. For inſtance, *ſi Caius nihil didiciſſet, erraſſet minus:* again, *aureum hoc ſæculum eſt, quia plurimus jam auro bonos venit.*

ARGUTIÆ *ab alluſione*, thoſe wherein alluſion is made to ſome hiſtory, fable, ſentence, proverb, or the like; e. gr. *multi umbram captant & carnem amittunt.*

ARGUTIÆ *a comparatis*, when two things are compared together, which yet at firſt ſight appear very different from each other, but ſo as to make a pretty kind of *ſimile* or *diſſimile*; e. gr. *par eſt pauper nil cupiens principi omnia habenti.*

ARGUTIÆ *a repugnantibus*, when two things meet in a ſubject, which yet regularly cannot be therein; or when two things are oppoſed to each other, yet the epithet of the one is attributed to the other; e. gr. *dum tacent clamant.*

ARGYRASPIDES, or ARGYROASPIDES, in *Antiquity*, perſons armed with ſilver bucklers, or BUCKLERS ſilvered.

The *argyraſpides*, according to Quintus Curtius, made the ſecond corps of Alexander's army; the firſt was the *phalanx*.

According to Juſtin's account, lib. xii. c. 7. Alexander having penetrated into India, and extended his empire as far as the ocean; for a monument of his glory, ordered the armour of his ſoldiers, and the houſings of his horſes, to be adorned with ſilver.—And hence commanded them to be called *argyraſpides*, from the Greek *αργυρος*, *ſilver*, and *ασπις*, *buckler*.

By this author it ſhould ſeem, that Alexander's whole army were called *argyraſpides.*—After that prince's death, the *argyraſpides* deſpiſed all other chiefs of the army, diſdaining to obey any other, having borne arms under Alexander.

ARGYRITÆ *agonis*, in *Antiquity*, games in which money was the prize. Potter.

ARGYRITIS, in *Natural Hiſtory*, a name given by the ancients to a ſubſtance reſembling ſilver.

In this ſenſe, *argyritis* was uſed to ſignify ſuch litharge as was of a white colour, by way of diſtinguiſhing it from that which was yellow, which they dignified with the name *chryſitis*, as we do at preſent with that of litharge of gold.

The *argyritis* of late writers, ſeems to have been the ſame with the *lapis magnetis* of the ancients, mentioned by Theophraſtus, and diſtinguiſhed from the MAGNET.

ARGYRODAMAS, in *Natural Hiſtory*, a ſort of ſilver-coloured TALC, which bears the fire, and neither burns, melts, nor changes its hue. Plott's Hiſt. Staff.

Hence its denomination among the ancients of *argyrodamas, quaſi argentum indomitum.*

ARGYROGONIA is uſed by ſome alchemiſts for a kind of argentific, or ſilver-making ſeed, of a white colour, pretended to be procurable from a ſolution of that metal perfectly concocted.

Argyrogonia ſtands contradiſtinguiſhed from *chryſogonia.*

ARGYROLIBANOS, in the *Materia Medica* of the *Ancient Greeks*, a word uſed to expreſs the white kind of *olibanum.*

ARGYROPOEIA, in *Alchemy*, the art of making ſilver, out of other more imperfect metals.

The word is formed of αργυρος, *ſilver*, and ποιεω, *I make.*

ARIADNIA, in *Antiquity*, ſolemn feſtivals held at Naxos in honour of *Ariadne.*

The *ariadnia* are ſaid to have been inſtituted by Theſeus, in atonement for his cruelty in expoſing *Ariadne*, big with child, on that coaſt. They were of a mournful caſt; one part of the ceremony was for a young woman to lie down, and counterfeit all the agonies of a woman in labour. Plut. in Theſ. and Potter's Arch.

ARIANS, followers of *Arius*, a preſbyter of the church of Alexandria about the year 315; who owned Chriſt to be God, yet maintained him inferior to the Father even as to his deity, and his eſſence to be different from that of the Father, and that he was neither co-eternal nor co-equal with him: alſo that the Holy Ghoſt was not God.

The *Arians* owned, that the ſon was the word, but denied that word to have been eternal; aſſerting, that it had only been created before all other beings.—They held, that Chriſt had nothing of man in him, but the fleſh, with which the λογος or *word* was joined, which ſupplied the reſt.

The *Arians* were firſt condemned and anathematized by a council at Alexandria in 320, under Alexander, biſhop of that city; who accuſed *Arius* of impiety, and cauſed him to be expelled from the communion of the church: and afterwards by 380 fathers in the general council of Nice, aſſembled by Conſtantine in the year 325. But, notwithſtanding that, it was not extinguiſhed: on the contrary, it became the reigning religion, eſpecially in the Eaſt, where it obtained much more than in the Weſt. *Arius* was recalled from baniſhment by the emperor Conſtantine, in two or three years after the council of Nice; and the laws that had been enacted againſt him were repealed. In the year 335, Athanaſius, his zealous opponent, was depoſed and baniſhed into Gaul; and *Arius* and his followers were reinſtated in their privileges, and received into the communion of the church: in little more than a year after this, he fell a victim to the reſentment of his enemies, and died a tragical death, occaſioned probably by poiſon, or ſome other violence. The *Arian* party found a protector in Conſtantius, who ſucceeded his father in the empire of the Eaſt; and the zeal with which he abetted them, produced many animoſities and tumults to the time of his death, in the year 362. They underwent various revolutions, perſecuting and oppreſſed, under ſucceeding emperors, according to the degree of intereſt they had in the civil power; till, at length, Theodoſius the Great exerted every poſſible effort to ſuppreſs and diſperſe them.

The *Arians* were divided into various ſects, of which ancient writers give an account under the names of *Semi-Arians*, *Euſebians*, *Aetians*, *Eunomians*, *Acacians*, *Pſathyrians*, and others. But they have been commonly diſtributed into three claſſes, viz. the genuine *Arians*, *Semi-Arians*, and *Eunomians.*

Arianiſm was carried in the fifth century into Africa under the Vandals; and into Aſia under the Goths: Italy, the Gauls, and Spain, were alſo deeply infected with it: and towards the commencement of the ſixth century, it was triumphant in many parts of Aſia, Africa, and Europe. But it ſunk almoſt all at once, when the Vandals were driven out of Africa, and the Goths out of Italy, by the arms of Juſtinian. However, it revived again in Italy under the protection of the Lombards, in the ſeventh century.

Eraſmus ſeems to have aimed, in ſome meaſure, to reſtore *Arianiſm*, at the beginning of the ſixteenth century, in his commentaries on the New Teſtament: accordingly, he was reproached by his adverſaries, with *Arian* interpretations and gloſſes, *Arian* tenets, &c. To which he made little anſwer, ſave that there was no hereſy more thoroughly extinct than that of the *Arians: Nulla hereſis magis extincta quam Arianorum.* But the face of things was ſoon changed: Servetus, a Spaniard by nation, publiſhed in 1531, a little treatiſe againſt the Trinity; which once more ſet the hereſy of the *Arians* on foot in the Weſt.—Indeed he rather ſhewed himſelf a *Photinian*, than an *Arian*; only that he made uſe of the ſame paſſages of ſcripture, and the ſame arguments againſt the divinity of our Saviour, with the proper *Arians.*

It is true, Servetus had not, properly ſpeaking, any diſciples; but he gave occaſion, after his death, to the forming of a new ſyſtem of *Arianiſm* in Geneva, much more ſubtil and artful than his own; and which did not a little perplex Calvin.—From Geneva, the new *Arians* removed to Poland, where they gained conſiderable ground; but at length became SOCINIANS.

The appellation *Arian* has been indiſcriminately applied, in more modern times, to all thoſe who conſider Jeſus Chriſt as inferior and ſubordinate to the Father; and whoſe ſentiments cannot be ſuppoſed to coincide exactly with thoſe of the ancient *Arians.* Mr. Whiſton was one of the firſt divines, who revived this controverſy in the beginning of the eighteenth century. He was followed by Dr. Clarke, who publiſhed his famous book, intitled, "The Scripture Doctrine of the Trinity," &c. in conſequence of which, he was reproached with the title of *Semi-Arian.* He was alſo threatened by the convocation, and combated by argument. Dr. Waterland, who has been charged with verging towards *Tritheiſm*, was one of his principal adverſaries. The hiſtory of this controverſy, during the preſent century, may be found in a pamphlet, intitled, "An Account of all the conſiderable Books and Pamphlets that have been wrote "on either Side, in the Controverſy concerning the "Trinity, from the Year 1712; in which is alſo con-"tained, an Account of the Pamphlets written this laſt "Year, on each Side, by the Diſſenters, to the End of "the Year 1719." Publiſhed at London, 1720.

ARIANISM, the doctrine of *Arius*, who lived in the beginning of the fourth century. See UNITARIAN.

ARIDED, in *Aſtronomy*, a fixed ſtar of the ſecond magnitude, in the extremity of the ſwan's tail.

This is alſo called HIEREZIM, ADIGEGE, and ARIDEF.

ARIDELOSIS, αριδηλωσις, in *Rhetoric*, is ſometimes uſed for the figure commonly called SYNONYMIA.

ARIDULLAM, in *Natural Hiſtory*, the name of a foſſile ſubſtance, uſed in the Eaſt Indies in intermittent fevers. It is of a greeniſh yellow colour, and coarſe texture, and, when burnt, emits fumes ſmelling like arſenic. It is properly of the ZARNIC kind, though ſomewhat different from all the European kinds.

ARIDURA, in *Phyſic*, a dryneſs, or want of juice and moiſture in the parts.

ARIDURA is alſo uſed by ſome for an *aridity*, or conſumption.

ARIDURA is more particularly uſed to denote a hectic fever.

ARIDURA is more frequently uſed, by *Modern Writers*, to denote a particular atrophy, or waſting of ſome ſingle member of the body.

In which ſenſe, it amounts to the ſame with what we otherwiſe call WITHERING.

ARIES, or the *ram*, in *Aſtronomy*, the firſt of the twelve ſigns of the zodiac; from which alſo a twelfth part of the ecliptic takes its denomination.

The ſtars in the conſtellation *Aries*, in Ptolemy's catalogue, are 18; in Tycho's, 21; in Hevelius's, 27; in the Britannic catalogue, 66: the longitudes, latitudes, magnitudes, &c. whereof, are as follow:

Names and ſituations of the ſtars.	Bayer's Cha.	Signs.	Longitud.	Latitude.	Magnitude.
			° ′ ″	° ′ ″

Aries alſo denotes a *battering ram*; or a military engine with an iron head, much in uſe among the ancients, to batter and beat down the walls of places beſieged.

Of this there were three kinds; the firſt rude and plain, the others artificial and compound.

The firſt ſeems to have been no more than a great beam, which the ſoldiers bore in their arms, and with one end of it, by main force, aſſailed the walls. This required a great force to work it; yet produced but a ſmall effect.

The ſecond or compound ram is deſcribed by Joſephus (*de Excid. Hieroſol.* 3.) thus: "The ram is a vaſt long "beam, like the maſt of a ſhip, ſtrengthened at one end "with a head of iron, ſomething reſembling that of a "ram, whence it took its name. This is hung by the "middle, with ropes, to another beam, which lies acroſs "a couple of poſts; and hanging thus equally balanced, "is, by a great number of men, violently thruſt for-"ward, and recoiled backward, and ſo ſhakes the wall "with its iron head. Nor is there any tower or wall ſo "thick or ſtrong, as to reſiſt the repeated aſſaults of "this forcible machine."

The third only differed from the former, in that it was covered with a χελωνη or ſcreen to guard the ſoldiers, whence it is alſo called *teſtudo arietaria.*

M. Felibien deſcribes a fourth ſort of *battering ram*, which ran on wheels; and was the moſt perfect and effectual of them all. Vitruvius affirms, that the *battering ram* was firſt invented by the Carthaginians, while they laid ſiege to Cadiz: theirs was the ſimple kind firſt mentioned: Pephaſmenos, a Tyrian, afterwards contrived to ſuſpend it with ropes; and finally, Polydus, the Theſſalian, to mount it on wheels, at the ſiege of Byzantium, under Philip of Macedon. Yet Pliny aſſures us, the *ram* was invented at the ſiege of Troy; and that it was this that gave occaſion to the fable of a wooden horſe.

The *engine* oppoſed to the *ram* was called *lupus, the wolf.*—Plutarch tells us, that Mark Antony, in the Parthian war, uſed a *ram* of 80 feet long; and Vitruvius aſſures us, they were ſometimes made 106, and ſometimes 120 feet long; to this great length, perhaps, the force of the engine was in great meaſure owing.

The *ram* was managed at once by a whole century of ſoldiers; ſo that it played continually, and without intermiſſion; being uſually covered with a *vinca*, to protect it from the attempts of the enemy.

ARIETATION. See **Earthquake.**

ARIETUM *levatio*, an ancient kind of ſportive exerciſe, probably the ſame with what of later times is called *running at the quintain.*

ARILLUS, in *Botany*, the exterior coat or tunic of the ſeed, which comes off of itſelf.

ARIMANIUS, one of the chief deities of Perſia. This deity, according to the philoſophy of Zoroaſter revived by the Manichæans, is the principle of evil, which at laſt will be totally vanquiſhed by Oroſmades, the author of good.

ARINGA, in *Ichthyology*, a name given by Paulus Jovius and others to the HERRING.

ARIOLI, in *Antiquity*, a kind of prophets, or religious conjurers, who by abominable prayers, and horrible ſacrifices at the altars of idols, procured anſwers to their queſtions concerning future events. Iſid. Orig. l. viii. c. 9.

Theſe are alſo called *barioli*, and their operation, *bariolation.*

Sometimes they were denominated *aruſpices*, or *haruſpices.*

The *arioli* were diſtinguiſhed by a ſlovenly dreſs, diſorderly and matted beards, hair, &c.

ARISARUM, or **Arum**, in *Botany*. See **Wake** *robin.*

ARISE.—*Licence to* **Arise.** See **Licence.**

ARISH, a Perſian long meaſure, containing 3197 Engliſh feet. Arbuth. Tab. 32.

The Perſian *ariſh*, according to Mr. Greaves, is a long meaſure equal to $38\frac{364}{1000}$ Engliſh inches.

ARISI, *rice*, an Indian word, which does not properly ſignify the plant which produces the rice, but the ſeed itſelf, when cleanſed from its huſk, and rendered fit for uſe. The Indians call it *ariſi* in this ſtate; but in the huſk, and upon the plant, they call it *nellon.*

ARISTA, in *Ichthyology*; ſee **Atherina.**—In *Aſtronomy*, the ſame as **Spica Virginis.**

Arista, in *Botany*, a long needle-like beard, that grows out from the huſk of corn, or graſs; called alſo the *awn.*

ARISTARCHUS, in its original Greek, ſignifies *beſt prince*; but in its ordinary uſe among the learned, denotes a very ſevere *critic*; there having been a learned grammarian of that name, who criticized on the verſes of the very beſt poets, as Homer, &c.

Hence we derive the title of ſeveral books; as *Ariſtarchus ſacer*, the name of Heiniſius's notes on the New Teſtament; *Ariſtarchus Anti-Bentleianus*, &c.

ARISTIDA, in *Botany*, a genus of the *triandria digynia* claſs: the calyx of which is a bivalve ſubulated glume, of the length of the corolla; the corolla is a glume of one valve, opening longitudinally, hairy at the baſe, and terminated by three ſub-equal patulous *ariſtæ*: the fruit is a connivent glume, containing a naked filiform ſingle ſeed, of the length of the corolla.

ARISTOCRACY, in *Politics*, a form of government, where the ſupreme power is lodged in the hands of the optimates, i. e. of a council, or ſenate compoſed of the principal perſons of a ſtate, either in reſpect of nobility, capacity, or probity.

The word is derived from αριστος, *optimus*, and κρατεω, *impero, I govern.*

The ancient writers of politics prefer the *ariſtocratical* form of government to all others.—The republic of Venice is an *ariſtocracy.*

Ariſtocracy ſeems to coincide with *oligarchy*; which, however, is more ordinarily uſed to ſignify a corruption of an *ariſtocratical* ſtate, where the adminiſtration is in the hands of too few; or where ſome one or two uſurp the whole power.

ARISTOLOCHIA, popularly called BIRTHWORT; a medicinal plant, uſed as an ingredient in Venice treacle, and many other compoſitions.

Cicero derives its name from its inventor *Ariſtolochus*: others from its virtues.—Theſe laſt ſuppoſe it formed from αριστος, *optimus*, and λοχεια, *lochia*, or *purgations*, becauſe it is found of excellent uſe in bringing down the lochia, or diſcharges of women newly delivered.

Some alexipharmic qualities are alſo aſcribed to them; on which account they have a place in the compoſition of the *theriaca*, and ſome other medicines of the ſame tribe. Externally applied, they are reckoned detergent and ſuppurative, and, for that reaſon, make a part of the ſtyptic plaſters of Crollius and Paracelſus. Taken internally, they are great reſolvers of viſcidities, and therefore much recommended againſt the gout, aſthma, &c. They allay the exceſſive pains after child-birth, and are very ſerviceable for the neceſſary purgations on that occaſion.

Some of the ſpecies are uſed in America, particularly one in Virginia, whoſe roots are uſed againſt the bites of venomous beaſts, in malignant fevers, and the ſmall-pox. Its alexipharmic virtue has occaſioned it to be called *Viperinum Virginiæ*, and *Serpentaria Virginiana*, otherwiſe SNAKE-*root*.

ARISTOPHANEUM, in the *Ancient Phyſic*, a name given to a kind of emollient plaſter, prepared of pitch, wax, opopanax, apochyma, and vinegar.

ARISTOTELIA, in *Antiquity*, annual feaſts, celebrated by the citizens of Stagiris, in honour of *Ariſtotle*, who was born there; and in gratitude for his having procured from Alexander the rebuilding, and re-peopling of that city, which had been demoliſhed by king Philip. Ammon. in Viti *Ariſtot.* Stanley's Hiſt. of Philoſ. P. vi. c. 8.

ARISTOTELIAN, ſomething that relates to the philoſopher *Ariſtotle.*—Thus we ſay, an *Ariſtotelian* dogma, the *Ariſtotelian* ſchool, &c.

The philoſopher from whom the denomination ariſes, was the ſon of Nicomachus, phyſician of Amyntas king of Macedonia, born in the year of the world 3566, before Chriſt 348, at Stagira, a town of Macedonia, or, as others ſay, of Thrace; whence he is alſo called the *Stagirite.*

At ſeventeen years of age he entered himſelf a diſciple of Plato, and attended in the academy till the death of that philoſopher. Repairing afterwards to the court of king Philip, at his return he found that Xenocrates, during his abſence, had put himſelf at the head of the academic ſect; upon which he choſe the Lyceum for the future ſcene of his diſputation.

It being his practice to philoſophize walking, he got the appellation *Peripateticus*; whence his followers were alſo called *Peripatetics.*

In the ſchools, *Ariſtotle* is called the *Philoſopher*; and the *prince of Philoſophers.* Such was the veneration paid to him, that his opinion was allowed to ſtand on a level with reaſon itſelf; nor was there any appeal from it admitted, the parties, in every diſpute, being obliged to ſhew, that their concluſions were no leſs conformable to *Ariſtotle*'s doctrine than to truth.

Laertius, in his life of *Ariſtotle*, enumerates his books, to the number of 4000; of which, ſcarce above 20 have ſurvived to our age: they may be reduced to five heads; the firſt, relating to poetry and rhetoric; the ſecond, to logics; the third, to ethics and politics; the fourth, to phyſics; and the fifth, to metaphyſics. In all which, as there are many things excellent, particularly what relate to poetry, rhetoric, and the paſſions; ſo there are others, which the improvements of later ages have taught us to explode and deſpiſe.

ARISTOTELIAN *philoſophy*, the philoſophy taught by *Ariſtotle*, and maintained by his followers.

The *Ariſtotelian* is otherwiſe called the *Peripatetic philoſophy*; the riſe and fate whereof, ſee under PERIPATETICS.

ARISTOTELIANS, a ſect of philoſophers, otherwiſe called *Peripatetics.*

The *Ariſtotelians* and their *dogmata* prevailed for a long while, in the ſchools and univerſities; even in ſpite of all the efforts of the Carteſians, Newtonians, and other corpuſcularians. But the ſyſtems of the latter have at length gained the pre-eminence; and the Newtonian philoſophy in particular is now very generally received.

The principles of *Ariſtotle*'s philoſophy, the learned agree, are chiefly laid down in the four books *de Cœlo*: the eight books of *Phyſical Auſcultation*, φυσικης ακροασεως, belonging rather to logics, or metaphyſics, than to phyſics. Inſtead of the more ancient ſyſtems, he introduced *matter*, *form*, and *privation*, as the principles of all things; but he does not ſeem to have derived much benefit from them in natural philoſophy. His doctrines are, for the moſt part, ſo obſcurely expreſſed, that it has not yet been ſatisfactorily aſcertained what were his ſentiments on ſome of the moſt important ſubjects. He attempted to refute the Pythagoræan doctrine concerning the twofold motion of the earth; and pretended to demonſtrate, that the matter of the heavens is ungenerated, incorruptible, and ſubject to no alteration: and he ſuppoſed that the ſtars were carried round the earth in ſolid orbs.

The reader will find a diſtinct and candid account of the logical part of his philoſophy, by Dr. Reid, Profeſſor of Moral Philoſophy in the Univerſity of Glaſgow, in the ſecond volume of Lord Kaimes' Sketches of the Hiſtory of Man. Edinb. 4to. 1774. p. 165.

J. Harris, Eſq. has publiſhed a ſenſible commentary on his Categories, under the title of *Philoſophical* ARRANGEMENTS.

See a more particular account of the principles of the *Ariſtotelian* philoſophy, under the articles ACCIDENT, ANTIPERISTASIS, ELEMENT, FUGA VACUI, FORM, PRINCIPLE, QUALITY, SYMPATHY, &c.

ARISTOTELICA *rota.* See ROTA.

ARISTOTUS, in *Ichthyology*, a name given by Albertus and others to the fiſh which we call the SHAD, or the mother of herrings. See THRISSA and CLUPEA.

ARITHMANCY; ſee ARITHMOMANCY.

ARITHMETIC, ARITHMETICA, the art of numbering; or, that part of mathematics, which conſiders the powers and properties of numbers, and teaches how to compute or calculate truly, and with expedition and eaſe.

Some authors chooſe to define *arithmetic*, the ſcience of diſcrete quantity.

Arithmetic conſiſts chiefly in the four great rules or operations of ADDITION, SUBTRACTION, MULTIPLICATION, and DIVISION.

It is true, for the facilitating and expediting of computations, mercantile, aſtronomical, &c. divers other uſeful rules have been contrived; as, the rules of proportion, of alligation, of falſe poſition, extraction of ſquare and cube roots, progreſſion, fellowſhip, intereſt, barter, rebate, reduction, tare and tret, &c.—But theſe are only applications of the firſt four rules. See theſe rules under their ſeveral heads, ADDITION, &c.

We have very little intelligence about the origin and invention of *arithmetic*: hiſtory neither fixes the author, nor the time.—In all probability, however, it muſt have taken its riſe from the introduction of commerce; and conſequently it ſhould be of Tyrian invention.

From Aſia it paſſed into Egypt (Joſephus ſays, by means of Abraham). Here it was greatly cultivated and improved; inſomuch that a large part of the Egyptian philoſophy and theology ſeems to have turned altogether upon numbers. Hence thoſe wonders related by them about unity, trinity; the numbers, ſeven, ten, four, &c. In effect, Kircher, in his Oedip. Ægypt. tom. ii. p. 2. ſhews, that the Egyptians explained every thing by numbers; Pythagoras himſelf affirming, that the nature of numbers goes through the whole univerſe; and that the knowledge of numbers is the knowledge of the Deity.

From Egypt *arithmetic* was tranſmitted to the Greeks, who handed it forward, with great improvements, which it had received by the computation of their aſtronomers, to the Romans; from whom it came to us.

The ancient *arithmetic*, however, fell far ſhort of that of the moderns: moſt of what they did, was to conſider the various diviſions of numbers; as appears from the treatiſes of Nicomachus, written in the third century of Rome, and that of Boethius, ſtill extant. A compendium of the ancient *arithmetic*, written in Greek, by Pſellus, in the ninth century from our Saviour, was given us in Latin by Xylander, in 1556.—A more ample work of the ſame kind was written by Jordanus, in the year 1200, publiſhed with a comment by Faber Stapulenſis in 1480. A treatiſe of *arithmetic* was alſo written by Johannes de Sacro Boſco, who died about the year 1256.

Arithmetic, under its preſent ſtate, is variouſly divided into different kinds; *theoretical*, *practical*, *inſtrumental*, *logarithmical*, *numerous*, *ſpecious*, *decimal*, *dynamical*, *tetractycal*, *duodecimal*, *ſexageſimal*, &c.

ARITHMETIC, *theoretical*, is the ſcience of the properties, relations, &c. of numbers, conſidered abſtractedly;

with the reaſons and demonſtrations of the ſeveral rules. Euclid furniſhes a *theoretical* ARITHMETIC, in the ſeventh, eighth, and ninth books of his Elements.—Barlaamus Monachus has alſo given a theory for demonſtrating the common operations, both in integers and broken numbers, in his Logiſtica, publiſhed in Latin by J. Chambers, an Engliſhman, in 1600.—To which may be added, Lucas de Borgo, who, in an Italian treatiſe publiſhed in 1523, gives the ſeveral diviſions of numbers from Nicomachus, and their properties from Euclid; with the algorithm, both in integers, fractions, extractions of roots, &c.

Arithmetic, *practical*, is the art of numbering or computing; that is, from certain numbers given, for finding certain others, whoſe relation to the former is known.

As, if a number be required equal to two given numbers 6 and 8.

The firſt entire body of *practical arithmetic*, was given by Nic. Tartaglia, a Venetian, in 1556, conſiſting of two books; the former, the application of *arithmetic* to civil uſes; the latter, the grounds of algebra. Something had been done before by Stifelius, in 1544, where we have ſeveral particulars concerning the application of irrationals, coſſics, &c. no where elſe to be met with.

We omit other mere practical authors, which have come ſince, the number whereof is almoſt infinite; as Gemma Friſius, Metius, Clavius, Ramus, Buckley, Diggs, Record, Wingate, Cocker, Leybourn, Malcolm, &c. &c. The *theory* of *arithmetic* is joined with the *practice*, and even improved in ſeveral parts, by Maurolycus, in his *Opuſcula Mathematica*, 1575; by Heneſchius, in his *Arithmetica Perfecta*, 1609, where the demonſtrations are all reduced into the form of ſyllogiſms; and by Taquet, in his *Theoria & Praxis Arithmetices*, 1704.

Arithmetic, *harmonical*, is ſo much of the doctrine of numbers, as relates to the making the compariſons, reductions, &c. of muſical intervals.

Arithmetic, *inſtrumental*, is that where the common rules are performed by means of inſtruments contrived for eaſe and diſpatch; ſuch are ſeveral ſorts of ſcales, and ſliding-rules; ſuch, more particularly, are Napier's bones, deſcribed under their proper article: Sir Sam. Morland's inſtrument, the deſcription whereof was publiſhed by himſelf, in 1666; that of M. Leibnitz, deſcribed in the Miſcellan. Berolin. and that of Polenus, publiſhed in the Venetian Miſcellany, 1709.

The Chineſe have little regard to any rules in their calculations; inſtead of which, they uſe an inſtrument already deſcribed. See Abacus and Shwan-pan.

To theſe may be added,

Arithmetic, *logarithmetical*, performed by tables of logarithms.

The beſt piece on this ſubject, is Hen. Brigg's Arithmetica Logarithmica, 1624.

To this head may alſo be added, the Univerſal Arithmetical Tables of Proſthaphæreſes, publiſhed in 1610, by Herwart ab Hohenburg; whereby multiplication is eaſily and accurately performed by addition, and diviſion by ſubtraction.

Arithmetic, *logiſtical*. See Logistical.

Arithmetic, *numerous*, is that which gives the calculus of numbers, or indeterminate quantities; and is performed by the common numeral, or Arabic characters.

Arithmetic, *ſpecious*, is that which gives the calculus of quantities; uſing letters of the alphabet inſtead of figures, to denote the quantities.

Specious arithmetic coincides with what we uſually call *algebra*, or *literal arithmetic*.

Dr. Wallis has joined the numeral with the literal calculus; and by means hereof, demonſtrated the rules of fractions, proportions, extractions of roots, &c. a compendium of which is given by Dr. Wells, under the title of Elementa Arithmeticæ, an. 1698.

Arithmetic, *decimal*, or *decadal*, is that performed by a ſeries of ten characters, ſo that the progreſſion is from 10 to 10.

Such is the common *arithmetic* among us, which makes uſe of the ten Arabic figures, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9; after which we begin 10, 11, 12, &c.

This method of computation is not very ancient, being utterly unknown to the Greeks and Romans.—It was introduced into Europe by Gerbert, who was afterwards pope, under the name of Sylveſter II. who borrowed it from the Moors of Spain.—No doubt it took its origin from the ten fingers of the hands, which were made uſe of in computations before *arithmetic* was brought into an art.

The Eaſtern miſſionaries aſſure us, that to this day the Indians are very expert at computing on their fingers, without any uſe of pen and ink. Let. Edif. & Cur.—Add, that the natives of Peru, who do all by the different arrangement of grains of maiſe, outdo any European, both for ſureneſs and diſpatch, with all his rules.

Arithmetic, *decimal*, is alſo uſed for the doctrine of decimal fractions.

Arithmetic, *binary*, or *dyadic*, is that wherein only two figures, unity, or 1, and 0, are uſed. See Binary *Arithmetic*.

M. Dangicourt, in the Miſcell. Berol. gives us a ſpecimen of the uſe hereof in arithmetical progreſſions; where he ſhews, that the laws of progreſſion may be more eaſily diſcovered hereby, than in any other method where more characters are uſed.

Arithmetic, *tetractic*, is that wherein only the figures 1, 2, 3, and 0, are uſed.

We have a treatiſe of this *arithmetic*, by Erhard Weigel; but both *binary*, and this, are little better than curioſities, eſpecially with regard to practice; inaſmuch as the numbers may be much more compendiouſly expreſſed by *decadal arithmetic*, than by either of them.

Arithmetic, *vulgar*, is that converſant about integers and vulgar fractions.

Arithmetic, *ſexageſimal*, or *ſexagenary*, is that which proceeds by ſixties; or the doctrine of ſexageſimal fractions; ſuppoſed to have been invented by Ptolemy, in the ſecond century. In this notation, the integral numbers from 1 to 59 were expreſſed in the common way; then *ſixty* was called a *ſexagena prima*, and marked I′; twice *ſixty*, or 120, II′; and ſo on to 59 times 60, or 3540, which is LIX′. *Sixty* times *ſixty*, or 3600, was called *ſexagena ſecunda*, and marked with two daſhes, I″; twice 3600, I″; and ten times 3600, X″, &c. And in this way the notation was continued. But if a number leſs than *ſixty* was joined with any of the *ſexageſimal* integers, their proper expreſſion was annexed without the daſh; e. g. four times 60 and 25 is IV′ XXV; the ſum of twice 60, ten times 3600, and 15, is X″ II′ XV, &c. So near did the inventor of this method approach to the Arabic notation: inſtead of *ſexageſimal* progreſſion, he had only to ſubſtitute *decimal*; to make the ſigns of numbers from 1 to 9 ſimple characters, and to introduce a character which ſignifies nothing by itſelf, ſerving only to fill up places. The *ſexagenæ integrorum* were ſoon laid aſide, after the introduction of the Arabic notation; but the *ſexageſimal* fractions continued till the invention of *decimals*. See Sexagesimal.

Sam. Reyher has invented a kind of ſexagenal rods, in imitation of Napier's bones, by means whereof the *ſexagenary arithmetic* is eaſily performed.

Arithmetic, *political*, is the application of *arithmetic* to political ſubjects; as, the ſtrength and revenues of princes, number of inhabitants, births, burials, &c. See Political *Arithmetic*.—To this head may be referred the doctrine of Chances, Gaming, &c.

Arithmetic *of infinites*, is the method of ſumming up a ſeries of numbers conſiſting of infinite terms; or of finding the ratios thereof.

This method was firſt invented by Dr. Wallis; as appears from his Opera Mathematica, where he ſhews its uſe in geometry, in finding the areas of ſuperficies, and the contents of ſolids, and their proportions.—But the method of FLUXIONS, which is an univerſal *arithmetic* of infinites, performs all this much more eaſily; and multitudes of other things, which the former will not reach.

Arithmetic *of rationals* and *irrationals*. See Rational, &c.

ARITHMETICAL *complement* of a logarithm, is what the logarithm wants of 10.0000000.

Thus the *arithmetical complement* of 7.1079054, is 2.8920946, where each figure but the laſt is ſubtracted from 9, and that from 10.

It is ſometimes alſo uſed in trigonometrical calculations, when radius or 10.0000000 is the firſt term, to ſave the labour of ſubtraction. It is diſtinguiſhed by placing a point before, and another after the index; thus, .2.8920946.

Arithmetical *medium*, or *mean*. See Medium.

Arithmetical *progreſſion*. See Progression.

Arithmetical *proportion*. See Proportion.

Arithmetical *ratio*. See Ratio.

ARITHMOMANCY, a kind of divination, or method of foretelling future events, by means of numbers.

The word is compounded of *αριθμος*, *number*, and *μαντεια*, *divination*.

The GEMATRIA, which makes the firſt ſpecies of the Jewiſh CABBALA, is a ſort of *arithmomancy*.

ARK, or Arc, *arcus*, in *Geometry*, *Aſtronomy*, &c. See Arch.

Ark, Arca, in the ſcripture-language, denotes a kind of floating veſſel built by Noah, for the preſervation of the ſeveral ſpecies of animals from the deluge.

The *ark* has afforded ſeveral points of curious inquiry among the critics and naturaliſts, relating to its form, capacity, materials, time of building, place of reſting after the flood, &c.

Noah is computed to have been an hundred years in building the *ark*, viz. from the year of the world 1555, to the flood, which happened in the year 1656; at leaſt this is the common opinion of the learned. Origen, lib. iv. contra Celſ. St. Auſtin, de Civit. Dei, lib. xv. c. 27. and contra Fauſtum, lib. xii. c. 18. and in his Queſt. 5. and 23. on Gen. Rupert, lib. iv. in Gen. xx. aſſert as much; and are followed by Salian, Torniel, Spondeus, Pelletier, &c.

Yet Beroſus affirms, that Noah only began to build the *ark* ſeventy-eight years before the flood: Solomon Jarchi, on the other hand, will have it to have been an hundred and twenty years in building, Tanchuma fifty-two, and the Mahometans only two years. See the texts, Gen. vi. &c. F. Fournier, in his Hydrography, gives into the opinion of the fathers; noting, that the hands employed in it were only Noah and his three ſons. To this purpoſe he alledges the inſtance of Archias of Corinth, who, with the help of three hundred workmen, built Hiero's great ſhip in one year. Add, that Noah's eldeſt ſon was not born till about the time when the *ark* was begun, and the younger after; ſo that it was a long time before they could do their father any ſervice.—However, for ſo large a building, a prodigious number of trees muſt have been required, which would employ a great number of workmen to fell and hew, were it poſſible for three men to have laid them.

The wood whereof the *ark* was built, is called in ſcripture עצי גפר, *etſe gopher, gopher wood:* and in the LXX. *ξυλα τετραγωνα, ſquare timbers.* Onkelos and Jonathan render *gopher* by קדרום, *kedros, cedar:* St. Jerom, in the Vulgate, by *ligna lævigata, planed wood*; and elſewhere, *ligna bituminata*, q. d. *pitched wood.* Kimchi tranſlates it, *wood moſt proper to float*; Vatable, *light wood*, which ſwims in the water without corrupting: Junius Tremellius, and Buxtorf, a kind of cedar, by the Greeks called κεδρελατη; Avenarius and Munſter, *pine*; Fuller and Bochart, *cypreſs*; others, *fir*; Caſtalio, *turpentine*, &c.—Pelletier prefers the opinion of thoſe who hold the *ark* made of cedar: his reaſons are, the incorruptibility of that wood; the great plenty thereof in Aſia, whence Herodotus and Theophraſtus relate, that the kings of Egypt and Syria built whole fleets of it in lieu of deal; and the common tradition throughout the Eaſt imports, that the *ark* is preſerved entire to this day on mount Ararat.

The dimenſions of the *ark*, as delivered by Moſes, are three hundred cubits in length, fifty in breadth, and thirty in height; which, compared with the great number of things it was to contain, ſeem to many to have been too ſcanty. And hence an argument has been drawn againſt the authority of the relation. Celſus long ago laughed at it, calling it *κιβωτον αλλοκοτον, the abſurd ark.* To ſolve this difficulty, many, both of the ancient fathers, and later critics, have been put to very miſerable ſhifts. Origen, St. Auguſtine, and others, maintain, that by the cubits here ſpoken of, we are to underſtand the Egyptian geometrical cubits, equal, according to them, to ſix vulgar cubits, or nine feet. But the truth is, it does not appear there ever was any ſuch meaſure as a geometrical cubit, either among Egyptians or Jews.—Others account for it, by aſſerting the ſtature of mankind, in the firſt ages, to have been much greater than in our days; and, conſequently, the cubit, which is taken for a part of the human body, proportionably larger. But this does not avail, ſince the ſame reaſon will infer an equal augmentation of the ſize of other animals.—Others ſuppoſe the ſacred cubit to be that here ſpoken of, which was a hand's breadth longer than the civil one: but this only affords a ſmall ſupply; beſide, the ſacred cubit does not appear to have been ever uſed, except in ſacred edifices, as the temple and tabernacle.

This difficulty is much better ſolved by Buteo and Kircher, who, ſuppoſing the common cubit of a foot and a half, prove geometrically, that the *ark* was abundantly ſufficient for all the animals ſuppoſed to be lodged therein. The capacity of the *ark* will be doubled, if we admit, with Cumberland, &c. that the Jewiſh cubit was 21.888 inches.—Snellius computes the *ark* to have been above half an acre in area. Cuneus, and others, have alſo calculated the capacity of the *ark*.—Dr. Arbuthnot computes it to have been 81062 tuns.—Father Lamy ſays, that it was an hundred and ten feet longer than the church of St. Mary at Paris, and ſixty-four feet narrower; to which his Engliſh tranſlator adds, that it muſt have been longer than St. Paul's church in London, from weſt to eaſt, broader than that church is high in the inſide, and about fifty-four feet in height, of our meaſure.

The things contained in the *ark* were, beſides eight perſons of Noah's family, one pair of every ſpecies of unclean animals, and ſeven pair of every ſpecies of clean animals, with proviſions for them all, during the whole year.—The former appears, at firſt view, almoſt infinite; but if we come to a calculus, the number of ſpecies of animals will be found much ſmaller than is generally imagined; out of which, in this caſe, are to be excepted ſuch animals as can live in the water; and biſhop Wilkins imagines, that only ſeventy-two of the quadruped kind needed a place in the *ark*.

It appears to have been divided into three ſtories; and it is agreed on, as moſt probable, that the loweſt ſtory was deſtined for the beaſts, the middle for the food, and the upper for the birds, with Noah and his family; each ſtory being ſubdivided into different apartments, ſtalls, &c. Though Joſephus, Philo, and other commentators, add a kind of fourth ſtory, under all the reſt; being, as it were, the hold of the veſſel, to contain the ballaſt, and receive the filth and fæces of ſo many animals.

Drexelius makes three hundred apartments; father Fournier, three hundred and thirty-three; the anonymous author of the Queſtions on Geneſis, four hundred; Buteo, Temporarius, Arias Montanus, Wilkins, Lamy, and others, ſuppoſe as many partitions as there were different ſorts of animals.—Pelletier only makes ſeventy-two, viz. thirty-ſix for the birds, and as many for the beaſts: his reaſon is, that if we ſuppoſe a greater number, as three hundred and thirty-three, or four hundred, each of the eight perſons in the *ark* muſt have had thirty-ſeven, forty-one, or fifty ſtalls to attend and cleanſe daily, which he thinks impoſſible. But there is not much in this; to diminiſh the number of ſtalls, without a diminution of the animals, is vain; it being, perhaps, more difficult to take care of three hundred animals in ſeventy-two ſtalls, than in three hundred.

Buteo computes, that all the animals contained in the *ark* could not be equal to five hundred horſes; he even reduces the whole to the dimenſions of fifty-ſix pair of oxen. Father Lamy enlarges it to ſixty-four pair, or an hundred and twenty-eight oxen; ſo that ſuppoſing one ox equal to two horſes, if the *ark* had room for two hundred and fifty-ſix horſes, there muſt have been room for all the animals. And the ſame author demonſtrates, that one floor of it would ſuffice for five hundred horſes, allowing nine ſquare feet to an horſe.

As to the food in the ſecond ſtory, it is obſerved by Buteo from Columella, that thirty or forty pounds of hay ordinarily ſuffices an ox for a day; and that a ſolid cubit of hay, as uſually preſſed down in our hay-racks, weighs about forty pounds; ſo that a ſquare cubit of hay is more than enough for one ox one day.—Now it appears that the ſecond ſtory contained 150,000 ſolid cubits; which, divided between two hundred and ſix oxen, will afford each more hay by two thirds than he can eat in a year.

Biſhop Wilkins computes all the carnivorous animals equivalent, as to the bulk of their bodies, and their food, to twenty-ſeven wolves; and all the reſt to two hundred and eighty beeves. For the former he allows the ſuſtenance of 1825 ſheep, and for the latter 109,500 cubits of hay: all which will be eaſily contained in the two firſt ſtories, and much room to ſpare.—As to the third ſtory, no body doubts of its being ſufficient for the fowls, with Noah, his ſons and daughters.

Upon the whole, the learned biſhop remarks, that of the two, it appears much more difficult to aſſign a number and bulk of neceſſary things to anſwer the capacity of the *ark*, than to find ſufficient room for the ſeveral ſpecies of animals already known to have been there.—This he attributes to the imperfection of our liſts of animals, eſpecially thoſe of the unknown parts of the earth; adding, that the moſt expert mathematician, at this day, could not aſſign the proportions of a veſſel better accommodated to the purpoſe, than is here done; and hence finally concludes, that "the capacity of the "*ark*, which had been made an objection againſt ſcrip- "ture, ought to be eſteemed a confirmation of its divine "authority; ſince, in thoſe ruder ages, men, being leſs "verſed in arts and philoſophy, were more obnoxious "to vulgar prejudices than now; ſo that had it been an "human invention, it would have been contrived ac- "cording to thoſe wild apprehenſions which ariſe from a "confuſed and general view of things; as much too "big, as it has been repreſented too little."

Ark *of the Covenant*, in ſcripture, denotes a kind of cheſt, wherein, by God's command, Exod. xxv. 16. were kept the two tables of ſtone, whereon God had engraven the ten commandments, given to Moſes on the mount, and held in high veneration among the Hebrews. It contained likewiſe the golden pot that had manna and Aaron's rod, and the tables of the covenant. Heb. ix. 4.

The *ark* was repoſited in the holieſt place of the tabernacle.—It was taken by the Philiſtines, and detained twenty, ſome ſay forty years, at Kirjath Jearim; but the people being afflicted with emrods on account of it, returned it with divers preſents.—It was afterwards placed in the temple.

The lid, or covering of the *ark*, was called the *propitiatory*, or mercy-ſeat; over which were two figures placed, called *Cherubim*, with expanded wings of a peculiar form. Here the Schechinah reſted both in the tabernacle and temple in a viſible cloud; hence were iſſued the divine oracles by an audible voice; and the high prieſt appeared before this mercy-ſeat once every year on the great day of expiation; and the Jews, wherever they worſhipped, turned their faces towards the place where the *ark* ſtood. In the ſecond temple there was alſo an *ark*, made of the ſame ſhape and dimenſions with the firſt, and put in the ſame place, but without any of its contents and peculiar honours. It was uſed as a repreſentative of the former, on the day of expiation, and a repoſitory of the original copy of the holy ſcriptures, collected by Ezra and the men of the great ſynagogue, after the captivity. And in imitation of this, the Jews, to this day, have a kind of *ark* in their ſynagogues, wherein their ſacred books are repoſited. This they call *aron*. Leo of Modena gives a deſcription thereof, in his account of the Cuſtoms and Ceremonies of thoſe of his Nation: "The Jews, ſays "he, in the eaſtern ſide of all their ſynagogues, have an "*ark*, or armory, called *aron*; in memory of the *ark* of "the covenant. In this are preſerved the five books of "Moſes, written on vellum, with ink made on purpoſe," &c. Some have ſuppoſed that the figure of this *ark* is ſtill remaining on the triumphal arch of Titus at Rome; though Villalpandus and others, with greater reaſon, are of opinion, that it is the table of ſhew-bread. Prideaux's Conn. vol. i. p. 209.

Tertullian calls this *ark*, *Armarium Judaicum*; whence the phraſe, *to be in the armory of the ſynagogue*, q. d. in the number of canonical writings.

A cheſt or coffer, very nearly reſembling the Jewiſh *ark*, and called the *houſe of the God*, was found in Huaheine, one of the iſlands in the Southern ſea. Mr. Banks could obtain no other information concerning it, than what the name imports. Hawkeſworth's Account, &c. vol. ii. p. 252.

Ark is uſed for a large cheſt, in which corn and fruit are depoſited.

ARLYNG, in *Zoology*, a name by which the common OENANTHE is called, in many parts of England.

ARM, *brachium*, a part of the human body, terminating at one end in the ſhoulder, and at the other in the hand.

Among *Phyſicians* and *Anatomiſts*, ARM only includes that part between the ſhoulder and the elbow; the reſt, from the elbow to the wriſt, being taken into the greater HAND; by others called the *fore-arm*.

The *arm*, in this latter acceptation, has only one large bone, called the HUMERUS, or ſhoulder-bone.

It has five ſorts of motions, which are effected by five pair of muſcles; upwards, by the *deltoides*, *ſupraſpinatus*, and *coracobrachialis*; downwards, by the *teres*, *rotundus major*, and *latiſſimus dorſi*; forwards, by the *pectoralis*; backwards, by the *infraſpinatus*; and, circularly, by the *tranſverſalis*, *ſubſcapularis*, and *infraſpinatus*. See each muſcle deſcribed under its proper article.

The other part conſiſts of two bones, called FOCILS; viz. the *radius*, and *cubitus*, or *ulna*.

The muſcles whereby this part is moved, are the *biceps*, *brachiæus internus*, *gemellus*, *brachiæus externus*, *anconæus*, *pronator radii teres*, and *quadratus*; *ſupinator longus*, and *brevis*.—See each in its place.—The uſual venæſections are in the *arm*.

We have an account of a man whoſe *arm*, with the *ſcapula*, was torn off by a mill, and who was cured without any hæmorrhage. Phil. Tranſact. Nº 449. ſec. 5.

Arm, in the *Manege*, is applied to a horſe, when he endeavours to defend himſelf againſt the bit; to prevent obeying, or being checked thereby.

A horſe is ſaid to *arm* himſelf, when he preſſes down his head, and bends his neck, ſo as to reſt the branches of the bridle upon his briſket; in order to withſtand the effort of the bit, and guard his bars, and his mouth.

A horſe is ſaid to *arm himſelf with the lips*, when he covers the bars with his lips, and deadens the preſſure of the bit.—This frequently happens in thick-lipped horſes.—The remedy is by uſing a bit-mouth, forged with a canon or ſcratch-mouth, broader near the bankers than at the place of its preſſure, or reſt upon the bars.

For *arming againſt the bit*, the remedy is, to have a wooden ball covered with velvet, or other matter, put on his chaul; which will ſo preſs him between the jawbones, as to prevent his bringing his head ſo near his breaſt.

Arm, in *Geography*, is uſed for a branch of a ſea, or river. Italy and Sicily are only parted by an *arm* of the ſea.—St. George's *arm*, in the Mediterranean, is the Thracian Boſphorus.

Arm, among *Gardeners*, is ſometimes uſed in reſpect of cucumbers and melons, in the ſame ſenſe as branch, of other plants.

Arm is alſo uſed figuratively for *power*.—The ſecular *arm* is the lay or temporal authority of a ſecular judge; to which recourſe is had for the execution of the ſentences paſſed by eccleſiaſtical judges.

The church ſheds no blood: even the judges of inquiſition, after they have found the perſon guilty, ſurrender him to the ſecular *arm*.

The council of Antioch, held in 341, decrees, that recourſe be had to the ſecular *arm* to repreſs thoſe who refuſe obedience to the church: for ſecular *arm*, they here uſe exterior power.

Arm, in the *Military Art*, *Heraldry*, &c. See ARMS and ARMOUR.

Arm, in *Sea-Language*.—A ſhip is ſaid to be *armed*, when fitted out, and provided, in all reſpects, for war.

Armed ſhip more peculiarly denotes a veſſel that is occaſionally taken into the ſervice of government in time of war, and employed to guard ſome particular coaſt, or attend on a fleet. All ſhips of this ſort are commanded by an officer of the navy, and are upon the ſame eſtabliſhment with the king's ſloops.

Alſo, a croſs-bar ſhot is ſaid to be *armed*, when ſome rope-yarn, or the like, is rolled round about one end of the iron bar which runs through the ſhot, both that the ſhot may be the better rammed down into the gun, and leſt the ſharp end of the bar ſhould catch into any honeycombs within the cylinder of the piece.

Arm, *yard*. See YARD.

Arm, in reſpect of the *Magnet*.—A load-ſtone is ſaid to be *armed*, when it is capped, caſed, or ſet in iron or ſteel; in order to make it take up the greater weight; and alſo to diſtinguiſh readily its poles.

It is ſurpriſing, that a little iron faſtened to the poles of a MAGNET, ſhould ſo vaſtly improve its force, as to render it 150 times ſtronger than when naked. Mr. Butterfield told Dr. Liſter, that ſome load-ſtones would gain much more, and others vaſtly leſs, by *arming*, than one would expect; and he has obſerved, that there are ſome magnets, which ſeem to act more powerfully *unarmed*, than *armed*. Whether the magnetic force of ſome paſſes more eaſily through iron than that of others; or whether the effect depends on the different quality of iron, experiments have not yet aſcertained.—A ſtrong load-ſtone ought to have thick irons, and a weak one but thin ones: ſo that a ſtone may be eaſily overſhod.

The uſual armour of a LOAD-*ſtone*, in form of a right-angled *parallelepipedon*, conſiſts of two thin pieces of ſteel or iron, of a ſquare figure, and a thickneſs proportionable to the goodneſs of the ſtone: if a weak ſtone have a ſtrong armour, it will produce no effect; and if the armour of a ſtrong load-ſtone be too thin, its effect will not be ſo conſiderable as when thicker.—The proper thickneſs is found by filing it thinner and thinner, till its effect is found at the greateſt poſſible ſtrength.

The armour of a ſpherical LOAD-*ſtone*, conſiſts of two ſteel ſhells faſtened to one another by a joint, and covering a good part of the convexity of the ſtone. This alſo is to be filed away till the effect is found the greateſt.

Kircher, in his book *de Magnete*, tells us, that the beſt way to *arm* a load-ſtone, is, to drill a hole through the ſtone from pole to pole, and in that, to place a ſteel rod of a moderate length; which rod, adds he, will take up more weight at the end, than the ſtone itſelf *armed* the common way can do.

Gaſſendus and Cabæus preſcribe the ſame method of *arming* a load-ſtone: but Muſchenbroek has found, by repeated trials, that the uſual armour already mentioned is preferable to that obtained in this way; and he gives the following directions for preparing it. When the poles of the magnet have been diſcovered, by means of ſteel filings and a ſmall needle, he directs that thoſe parts where the poles lie ſhould be rubbed or ground into parallel planes, without ſhortening the polar axis; and the magnets may be afterwards ſhaped into the figures of cubes or parallelopipeds, or any other that may be found moſt convenient. Plates of the ſofteſt iron ſhould then be prepared, of the ſame length and breadth with the whole polar ſides of the propoſed magnet. The thickneſs of theſe plates, ſo as that they may admit and convey the greateſt quantity of the magnetic virtue, is to be previouſly determined by experiment, in a manner which he preſcribes for the purpoſe: a thicker piece of iron is to be annexed at right angles to theſe plates, which is called *pes armaturæ*, the foot or baſe of the armour: the plates, accurately ſmoothed and poliſhed, are to be applied and firmly tied to each of the polar ſides, whilſt the thicker part or baſe is made cloſely to touch the lower part of the magnet. In this way, he ſays, almoſt all the magnetic virtue iſſuing from the poles enters into the armour, is directed to the baſe, and condenſed by means of its roundneſs, ſo as to ſuſtain the greateſt weight of iron. Phyſ. Exper. and Geom. Diſſert. 1729. p. 131. See MAGNET *armed*.

ARMA *dare*, to give arms, in ſome ancient charters, ſignifies to dub, or make a knight.

ARMA *deponere*, to lay down arms, was a puniſhment anciently enjoined when a man had committed an offence. Leg. Hen. I.

ARMA *mutare*, q. d. to change arms, was a ceremony uſed to confirm a league or friendſhip.

ARMA *moluta* were ſharp weapons: Fleta calls them *arma emolita*.

ARMA *reverſata*, inverted arms, was a puniſhment when a man was convicted of treaſon or felony.

ARMADA, a Spaniſh term, ſignifying a fleet of men of war. The *armada* which attempted to invade England in the time of queen Elizabeth, is famous in hiſtory; it was partly ſcattered by the wind, and partly ſubdued by the Engliſh fleet. On which occaſion a medal was ſtruck with this motto, *Afflavit Deus, et diſſipantur*.

ARMADILLA, in the Spaniſh America, denotes a ſquadron of men of war, to the number of ſix or eight, from twenty-four to fifty pieces of cannon, which the king maintains, to prevent foreigners from trading with the Spaniards and the Indians, both in time of war, and peace.

The veſſels of this *armadilla* are thoſe that have been ſo much talked of, under the name of *guarda coſtas*.

They have even power to take all Spaniſh merchantſhips they meet with on the coaſts, that have not licences from the king.

The South ſea has its *armadilla*, as well as the North ſea. The ordinary abode of the former are at Calao, a port of Lima; that of the latter, at Carthagena.

ARMADILLO, in *Zoology*, the name of an animal ſomewhat approaching to the *hedge*-HOG kind, and called by the Latin authors the ECHINUS *Braſilienſis*. It is alſo called *tatou*; and by Linnæus, *dalypus cingulis novem, palmis tetradactylis, plantis pentadactylis*.

We have ſeveral ſpecies of this creature deſcribed to us; but the moſt uſual, is of the figure and ſize of a large pig, and has a bony covering, which extends over the whole body, the head and the tail. This is compoſed of a number of very elegant ſcales, which have two junctures near the hinder part of the head, by means of which the creature is able to move its neck. On the back there are ſeven diviſions, with a thick membrane between; and in all other parts of the body the ſhell is whole. The legs, ſo far as they come in ſight, are in the ſame manner defended by a bony covering. The feet are made like hands; each has five toes, and the nails are round. Its colour is a ſort of reddiſh tawny. It digs up the ground with its noſe, in the manner of a hog, but much more nimbly; the tail is thick at the inſertion, and tapers to the extremity. The creature feeds on roots and fruits, as potatoes, melons, and the like; but will eat meat alſo if it comes in its way. It is uſually found in dry places. Ray.

This creature gathers himſelf up, when he pleaſes, head, feet, and tail, within his ſhell, and becomes as round as a ball; and this he does, not only when purſued, but every time he ſleeps. He is ſo good at digging, that, unleſs tied up, he will make his way out under the walls of a houſe. He is extremely valued among the Braſilians, for the whiteneſs and delicacy of his fleſh, and furniſhes a principal diſh at their beſt feaſts. The plates of his ſhell, powdered and given in a doſe of a dram, are eſteemed a ſudorific, and a remedy for the *lues venerea*. See *Tab. of Quadrupeds*, N° 21.

See a deſcription and drawing of one of theſe animals, in Phil. Tranſ. vol. LIV. N° 97.

ARMAMAXI, in *Antiquity*, a kind of Scythian chariots, or carriages, compoſed of two wheels, variouſly adorned with crowns, ſhields, breaſt-plates, and other ſpoils, carried in proceſſion after the images of the gods and great men. The word is compoſed of the Latin *arma*, and the Greek *αμαξα*, *plauſtrum*, *carriage*.

Theſe were ſometimes called *amaxi*, or *amaxæ*. Pitiſc. Lex. Ant.

ARMAMENT, a large body of forces, raiſed and provided with the furniture of war, either for land or ſea ſervice.

ARMAN, among *Farriers*, a confection of great efficacy to prevent a total loſs of appetite in horſes.

ARMARIUM *unguentum*, among *Hermetical Philoſophers*, a SYMPATHETIC ointment, or weapon-ſalve, whereby wounds are ſaid to have been cured at a diſtance, by only dreſſing the weapon.

ARMATIUM, in *Ancient Phyſic*, a deterſive kind of *collyrium*, of great value in removing aſperities of the eye-lids. Its chief ingredients were *æs uſtum*, gum ammoniac, and the roots of the tree *thus*. The preparation is deſcribed by Galen, Aëtius, Paulus, and Scribonius.

ARMATURE, ARMATURA, in a general ſenſe, is the ſame with what we otherwiſe call armour.

ARMATURA is more particularly uſed in the *Ancient Military Art*, for a kind of exerciſe, performed with miſſive weapons, as darts, ſpears, arrows, and the like.

In this ſenſe, *armatura* ſtands contradiſtinguiſhed from *palaria*; the latter being the exerciſe of the heavy-armed, the former of the light-armed.

The *armatura* was practiſed with great diligence among the Romans: they had their *campidoctores*, on purpoſe to inſtruct the *tyrones*, or young ſoldiers, in it. Under it were included, the throwing of the ſpear or javelin, ſhooting with bows and arrows, &c.

ARMATURA is alſo an appellation given to the ſoldiers who were light-armed.

Aquinus ſeems, without reaſon, to reſtrain *armatura* to the *tyrones*, or young ſoldiers, under diſcipline or tutorage in the exerciſe above mentioned.

ARMATURA is alſo a denomination given to the ſoldiers in the emperor's retinue. Du-Cange.

Of theſe we find two ſchools, mentioned in the *notitia imperii*, called the *armaturæ ſeniores*, and *armaturæ juniores*. Their commander was entitled TRIBUNUS *armaturarum*.

ARMED, in SEA-*Language*, &c. See ARM.

ARMED, in *Heraldry*, is uſed in reſpect of beaſts and birds of prey, when their teeth, horns, feet, beak, talons, or tuſks, are of a different colour from the reſt.—He bears a cock, or a falcon, *armed*, or, &c.

ARMENA, in *Botany*, a name given by Pliny to a kind of wild aſparagus; but the ancient Greeks have uſed the ſame word to expreſs the young ſhoots of the common aſparagus, at the time when they are eaten; and not only theſe, but the young ſprouts of the cabbage, and of all other eſculent plants.

ARMENIACA, in *Botany*; ſee APRICOT.

ARMENIAN *bole*; ſee BOLE.

ARMENIAN *ſtone*, *lapis* ARMENUS, a mineral ſtone, or earth, of a blue colour, ſometimes ſpotted with green, black, and yellow. It is a very ſcarce foſſil, anciently brought only from Armenia, but is now found very pure, though in ſmall quantities, in the mines at Goſſelaer in Saxony.

The *Armenian ſtone*, in its harder ſtate, bears a near reſemblance to *lapis lazuli*, from which it ſeems only to differ in degree of maturity: they are diſtinguiſhed by this, that the *lapis armenus* is ſofter, and inſtead of ſparks of gold, is often ſpeckled with green.

Boerhaave ranks it among ſemi-metals; and ſuppoſes it compoſed of a metal and earth. Woodward ſays, it owes its colour to an admixture of copper.

Its chief uſe is in Moſaic work, though it has ſome place alſo in phyſic. It is a very valuable ſubſtance in painting, being a bright and florid blue. It was in ſo high eſteem as a paint, among the ancients, that counterfeits were continually attempted to ſerve in its place.

Both this and the *lapis lazuli* are ORES of copper.

ARMENIANS, in reſpect of religion, a diviſion among the eaſtern Chriſtians; thus called from *Armenia*, the country anciently inhabited by them.

Some have ſuppoſed, that Chriſtianity was eſtabliſhed in *Armenia* by the apoſtle St. Bartholomew; but this is certain, that in the beginning of the fourth century, the *Armenian* Chriſtians were in a very flouriſhing ſtate.

The *Armenian* church, in the ſixteenth century, was governed by three patriarchs, the chief of whom reſided in a monaſtery at Echmiazin. There were other biſhops among them, who aſſumed the title of patriarchs, without prerogatives annexed to it; though, by authority derived from the chief patriarch, they were allowed to conſecrate biſhops, and every third year to make and diſtribute the holy chriſm, or ointment, which is the privilege of the patriarchs alone.

The *Armenians*, ſince the conqueſt of their country by Scha Abbas, king of Perſia, have had no fixed place of habitation, but are diſperſed in divers parts of Perſia, Turky, and Tartary, and even ſome parts of Europe, particularly Poland.—Their chief employment is merchandize, in which they excel.—The cardinal de Richelieu, we are told, had a deſign to make an eſtabliſhment of them in France, for promoting the commerce of that country. And the chancellor Seguier granted them a printing-houſe at Marſeilles.

With regard to religion, there are two kinds of *Armenians*; the one catholics, and ſubject to the pope, having a patriarch in Perſia, and another in Poland. The other make a peculiar ſect, having two patriarchs in Natolia. The *Armenians* are generally accuſed of being Monophyſites, and only allowing of one nature in Jeſus Chriſt. As to the Euchariſt, they agree with the Greeks, except in this, that they mix no water with their wine, and uſe unleavened bread after the manner of the Latins.

The *ark* was repoſited in the holieſt place of the tabernacle.—It was taken by the Philiſtines, and detained twenty, ſome ſay forty years, at Kirjath Jearim; but the people being afflicted with emrods on account of it, returned it with divers preſents.—It was afterwards placed in the temple.

The lid, or covering of the *ark*, was called the *propitiatory*, or mercy-ſeat; over which were two figures placed, called *Cherubim*, with expanded wings of a peculiar form. Here the Schechinah reſted both in the tabernacle and temple in a viſible cloud; hence were iſſued the divine oracles by an audible voice; and the high prieſt appeared before this mercy-ſeat once every year on the great day of expiation; and the Jews, wherever they worſhipped, turned their faces towards the place where the *ark* ſtood. In the ſecond temple there was alſo an *ark*, made of the ſame ſhape and dimenſions with the firſt, and put in the ſame place, but without any of its contents and peculiar honours. It was uſed as a repreſentative of the former, on the day of expiation, and a repoſitory of the original copy of the holy ſcriptures, collected by Ezra and the men of the great ſynagogue, after the captivity. And in imitation of this, the Jews, to this day, have a kind of *ark* in their ſynagogues, wherein their ſacred books are repoſited. This they call *aron*. Leo of Modena gives a deſcription thereof, in his account of the Cuſtoms and Ceremonies of thoſe of his Nation: "The Jews, ſays "he, in the eaſtern ſide of all their ſynagogues, have an "*ark*, or armory, called *aron*; in memory of the *ark* of "the covenant. In this are preſerved the five books of "Moſes, written on vellum, with ink made on pur"poſe," &c. Some have ſuppoſed that the figure of this *ark* is ſtill remaining on the triumphal arch of Titus at Rome; though Villalpandus and others, with greater reaſon, are of opinion, that it is the table of ſhew-bread. Prideaux's Conn. vol. i. p. 209.

Tertullian calls this *ark*, *Armarium Judaicum*; whence the phraſe, *to be in the armory of the ſynagogue*, q. d. in the number of canonical writings.

A cheſt or coffer, very nearly reſembling the Jewiſh *ark*, and called the *houſe of the God*, was found in Huaheine, one of the iſlands in the Southern ſea. Mr. Banks could obtain no other information concerning it, than what the name imports. Hawkeſworth's Account, &c. vol. ii. p. 252.

Ark is uſed for a large cheſt, in which corn and fruit are depoſited.

ARLYNG, in *Zoology*, a name by which the common OENANTHE is called, in many parts of England.

ARM, *brachium*, a part of the human body, terminating at one end in the ſhoulder, and at the other in the hand.

Among *Phyſicians* and *Anatomiſts*, ARM only includes that part between the ſhoulder and the elbow; the reſt, from the elbow to the wriſt, being taken into the greater HAND; by others called the *fore-arm*.

The *arm*, in this latter acceptation, has only one large bone, called the HUMERUS, or ſhoulder-bone.

It has five ſorts of motions, which are effected by five pair of muſcles; upwards, by the *deltoides*, *ſupraſpinatus*, and *coracobrachialis*; downwards, by the *teres*, *rotundus major*, and *latiſſimus dorſi*; forwards, by the *pectoralis*; backwards, by the *infraſpinatus*; and, circularly, by the *tranſverſalis*, *ſubſcapularis*, and *infraſpinatus*. See each muſcle deſcribed under its proper article.

The other part conſiſts of two bones, called FOCILS; viz. the *radius*, and *cubitus*, or *ulna*.

The muſcles whereby this part is moved, are the *biceps*, *brachiæus internus*, *gemellus*, *brachiæus externus*, *anconæus*, *pronator radii teres*, and *quadratus*; *ſupinator longus*, and *brevis*.—See each in its place.—The uſual venæſections are in the *arm*.

We have an account of a man whoſe *arm*, with the *ſcapula*, was torn off by a mill, and who was cured without any hæmorrhage. Phil. Tranſact. Nº 449. ſec. 5.

Arm, in the *Manege*, is applied to a horſe, when he endeavours to defend himſelf againſt the bit; to prevent obeying, or being checked thereby.

A horſe is ſaid to *arm* himſelf, when he preſſes down his head, and bends his neck, ſo as to reſt the branches of the bridle upon his briſket; in order to withſtand the effort of the bit, and guard his bars, and his mouth.

A horſe is ſaid to *arm himſelf with the lips*, when he covers the bars with his lips, and deadens the preſſure of the bit.—This frequently happens in thick-lipped horſes.—The remedy is by uſing a bit-mouth, forged with a canon or ſcratch-mouth, broader near the bankers than at the place of its preſſure, or reſt upon the bars.

For *arming againſt the bit*, the remedy is, to have a wooden ball covered with velvet, or other matter, put on his chaul; which will ſo preſs him between the jawbones, as to prevent his bringing his head ſo near his breaſt.

Arm, in *Geography*, is uſed for a branch of a ſea, or river. Italy and Sicily are only parted by an *arm* of the ſea.—St. George's *arm*, in the Mediterranean, is the Thracian Boſphorus.

Arm, among *Gardeners*, is ſometimes uſed in reſpect of cucumbers and melons, in the ſame ſenſe as branch, of other plants.

Arm is alſo uſed figuratively for *power*.—The ſecular *arm* is the lay or temporal authority of a ſecular judge; to which recourſe is had for the execution of the ſentences paſſed by eccleſiaſtical judges.

The church ſheds no blood: even the judges of inquiſition, after they have found the perſon guilty, ſurrender him to the ſecular *arm*.

The council of Antioch, held in 341, decrees, that recourſe be had to the ſecular *arm* to repreſs thoſe who refuſe obedience to the church: for ſecular *arm*, they here uſe exterior power.

Arm, in the *Military Art*, *Heraldry*, &c. See Arms and Armour.

Arm, in *Sea-Language*.—A ſhip is ſaid to be *armed*, when fitted out, and provided, in all reſpects, for war.

Armed ſhip more peculiarly denotes a veſſel that is occaſionally taken into the ſervice of government in time of war, and employed to guard ſome particular coaſt, or attend on a fleet. All ſhips of this ſort are commanded by an officer of the navy, and are upon the ſame eſtabliſhment with the king's ſloops.

Alſo, a croſs-bar ſhot is ſaid to be *armed*, when ſome rope-yarn, or the like, is rolled round about one end of the iron bar which runs through the ſhot, both that the ſhot may be the better rammed down into the gun, and leſt the ſharp end of the bar ſhould catch into any honeycombs within the cylinder of the piece.

Arm, *yard*. See Yard.

Arm, in reſpect of the *Magnet*.—A load-ſtone is ſaid to be *armed*, when it is capped, caſed, or ſet in iron or ſteel; in order to make it take up the greater weight; and alſo to diſtinguiſh readily its poles.

It is ſurpriſing, that a little iron faſtened to the poles of a MAGNET, ſhould ſo vaſtly improve its force, as to render it 150 times ſtronger than when naked. Mr. Butterfield told Dr. Liſter, that ſome load-ſtones would gain much more, and others vaſtly leſs, by *arming*, than one would expect; and he has obſerved, that there are ſome magnets, which ſeem to act more powerfully *unarmed*, than *armed*. Whether the magnetic force of ſome paſſes more eaſily through iron than that of others; or whether the effect depends on the different quality of iron, experiments have not yet aſcertained.—A ſtrong load-ſtone ought to have thick irons, and a weak one but thin ones: ſo that a ſtone may be eaſily overſhod.

The uſual armour of a LOAD-*ſtone*, in form of a right-angled *parallelepipedon*, conſiſts of two thin pieces of ſteel or iron, of a ſquare figure, and a thickneſs proportionable to the goodneſs of the ſtone: if a weak ſtone have a ſtrong armour, it will produce no effect; and if the armour of a ſtrong load-ſtone be too thin, its effect will not be ſo conſiderable as when thicker.—The proper thickneſs is found by filing it thinner and thinner, till its effect is found at the greateſt poſſible ſtrength.

The armour of a ſpherical LOAD-*ſtone*, conſiſts of two ſteel ſhells faſtened to one another by a joint, and covering a good part of the convexity of the ſtone. This alſo is to be filed away till the effect is found the greateſt.

Kircher, in his book *de Magnete*, tells us, that the beſt way to *arm* a load-ſtone, is, to drill a hole through the ſtone from pole to pole, and in that, to place a ſteel rod of a moderate length; which rod, adds he, will take up more weight at the end, than the ſtone itſelf *armed* the common way can do.

Gaſſendus and Cabæus preſcribe the ſame method of *arming* a load-ſtone: but Muſchenbroek has found, by repeated trials, that the uſual armour already mentioned is preferable to that obtained in this way; and he gives the following directions for preparing it. When the poles of the magnet have been diſcovered, by means of ſteel filings and a ſmall needle, he directs that thoſe parts where the poles lie ſhould be rubbed or ground into parallel planes, without ſhortening the polar axis; and the magnets may be afterwards ſhaped into the figures of cubes or parallelopipeds, or any other that may be found moſt convenient. Plates of the ſofteſt iron ſhould then be prepared, of the ſame length and breadth with the whole polar ſides of the propoſed magnet. The thickneſs of theſe plates, ſo as that they may admit and convey the greateſt quantity of the magnetic virtue, is to be previouſly determined by experiment, in a manner which he preſcribes for the purpoſe: a thicker piece of iron is to be annexed at right angles to theſe plates, which is called *pes armaturæ*, the foot or baſe of the armour: the plates, accurately ſmoothed and poliſhed, are to be applied and firmly tied to each of the polar ſides, whilſt the thicker part or baſe is made cloſely to touch the lower part of the magnet. In this way, he ſays, almoſt all the magnetic virtue iſſuing from the poles enters into the armour, is directed to the baſe, and condenſed by means of its roundneſs, ſo as to ſuſtain the greateſt weight of iron. Phyſ. Exper. and Geom. Diſſert. 1729. p. 131. See MAGNET *armed.*

ARMA *dare*, to give arms, in ſome ancient charters, ſignifies to dub, or make a knight.

ARMA *deponere*, to lay down arms, was a puniſhment anciently enjoined when a man had committed an offence. Leg. Hen. I.

ARMA *mutare*, q. d. to change arms, was a ceremony uſed to confirm a league or friendſhip.

ARMA *moluta* were ſharp weapons: Fleta calls them *arma emolita.*

ARMA *reverſata*, inverted arms, was a puniſhment when a man was convicted of treaſon or felony.

ARMADA, a Spaniſh term, ſignifying a fleet of men of war. The *armada* which attempted to invade England in the time of queen Elizabeth, is famous in hiſtory; it was partly ſcattered by the wind, and partly ſubdued by the Engliſh fleet. On which occaſion a medal was ſtruck with this motto, *Afflavit Deus, et diſſipantur.*

ARMADILLA, in the Spaniſh America, denotes a ſquadron of men of war, to the number of ſix or eight, from twenty-four to fifty pieces of cannon, which the king maintains, to prevent foreigners from trading with the Spaniards and the Indians, both in time of war, and peace.

The veſſels of this *armadilla* are thoſe that have been ſo much talked of, under the name of *guarda coſtas.*

They have even power to take all Spaniſh merchant-ſhips they meet with on the coaſts, that have not licences from the king.

The South ſea has its *armadilla*, as well as the North ſea. The ordinary abode of the former are at Calao, a port of Lima; that of the latter, at Carthagena.

ARMADILLO, in *Zoology*, the name of an animal ſomewhat approaching to the *hedge*-HOG kind, and called by the Latin authors the ECHINUS *Braſilienſis.* It is alſo called *tatou*; and by Linnæus, *dalypus cingulis novem, palmis tetradactylis, plantis pentadactylis.*

We have ſeveral ſpecies of this creature deſcribed to us; but the moſt uſual, is of the figure and ſize of a large pig, and has a bony covering, which extends over the whole body, the head and the tail. This is compoſed of a number of very elegant ſcales, which have two junctures near the hinder part of the head, by means of which the creature is able to move its neck. On the back there are ſeven diviſions, with a thick membrane between; and in all other parts of the body the ſhell is whole. The legs, ſo far as they come in ſight, are in the ſame manner defended by a bony covering. The feet are made like hands; each has five toes, and the nails are round. Its colour is a ſort of reddiſh tawny. It digs up the ground with its noſe, in the manner of a hog, but much more nimbly; the tail is thick at the inſertion, and tapers to the extremity. The creature feeds on roots and fruits, as potatoes, melons, and the like; but will eat meat alſo if it comes in its way. It is uſually found in dry places. Ray.

This creature gathers himſelf up, when he pleaſes, head, feet, and tail, within his ſhell, and becomes as round as a ball; and this he does, not only when purſued, but every time he ſleeps. He is ſo good at digging, that, unleſs tied up, he will make his way out under the walls of a houſe. He is extremely valued among the Braſilians, for the whiteneſs and delicacy of his fleſh, and furniſhes a principal diſh at their beſt feaſts. The plates of his ſhell, powdered and given in a doſe of a dram, are eſteemed a ſudorific, and a remedy for the *lues venerea.* See *Tab. of Quadrupeds*, N° 21.

See a deſcription and drawing of one of theſe animals, in Phil. Tranſ. vol. LIV. N° 97.

ARMAMAXI, in *Antiquity*, a kind of Scythian chariots, or carriages, compoſed of two wheels, variouſly adorned with crowns, ſhields, breaſt-plates, and other ſpoils, carried in proceſſion after the images of the gods and great men. The word is compoſed of the Latin *arma*, and the Greek *αμαξα, plauſtrum, carriage.*

Theſe were ſometimes called *amaxi*, or *amaxæ.* Pitiſc. Lex. Ant.

ARMAMENT, a large body of forces, raiſed and provided with the furniture of war, either for land or ſea ſervice.

ARMAN, among *Farriers*, a confection of great efficacy to prevent a total loſs of appetite in horſes.

ARMARIUM *unguentum*, among *Hermetical Philoſophers*, a SYMPATHETIC ointment, or weapon-ſalve, whereby wounds are ſaid to have been cured at a diſtance, by only dreſſing the weapon.

ARMATIUM, in *Ancient Phyſic*, a deterſive kind of *collyrium*, of great value in removing aſperities of the eye-lids. Its chief ingredients were *æs uſtum*, gum ammoniac, and the roots of the tree *thus.* The preparation is deſcribed by Galen, Aëtius, Paulus, and Scribonius.

ARMATURE, ARMATURA, in a general ſenſe, is the ſame with what we otherwiſe call armour.

ARMATURA is more particularly uſed in the *Ancient Military Art*, for a kind of exerciſe, performed with miſſive weapons, as darts, ſpears, arrows, and the like.

In this ſenſe, *armatura* ſtands contradiſtinguiſhed from *palaria*; the latter being the exerciſe of the heavy-armed, the former of the light-armed.

The *armatura* was practiſed with great diligence among the Romans: they had their *campidoctores*, on purpoſe to inſtruct the *tyrones*, or young ſoldiers, in it. Under it were included, the throwing of the ſpear or javelin, ſhooting with bows and arrows, &c.

ARMATURA is alſo an appellation given to the ſoldiers who were light-armed.

Aquinus ſeems, without reaſon, to reſtrain *armatura* to the *tyrones*, or young ſoldiers, under diſcipline or tutorage in the exerciſe above mentioned.

ARMATURA is alſo a denomination given to the ſoldiers in the emperor's retinue. Du-Cange.

Of theſe we find two ſchools, mentioned in the *notitia imperii*, called the *armaturæ ſeniores*, and *armaturæ juniores.* Their commander was entitled TRIBUNUS *armaturarum.*

ARMED, in SEA-*Language*, &c. See ARM.

ARMED, in *Heraldry*, is uſed in reſpect of beaſts and birds of prey, when their teeth, horns, feet, beak, talons, or tuſks, are of a different colour from the reſt.—He bears a cock, or a falcon, *armed*, or, &c.

ARMENA, in *Botany*, a name given by Pliny to a kind of wild aſparagus; but the ancient Greeks have uſed the ſame word to expreſs the young ſhoots of the common aſparagus, at the time when they are eaten; and not only theſe, but the young ſprouts of the cabbage, and of all other eſculent plants.

ARMENIACA, in *Botany*; ſee APRICOT.

ARMENIAN *bole*; ſee BOLE.

ARMENIAN *ſtone*, *lapis* ARMENUS, a mineral ſtone, or earth, of a blue colour, ſometimes ſpotted with green, black, and yellow. It is a very ſcarce foſſil, anciently brought only from Armenia, but is now found very pure, though in ſmall quantities, in the mines at Goſſelaer in Saxony.

The *Armenian ſtone*, in its harder ſtate, bears a near reſemblance to *lapis lazuli*, from which it ſeems only to differ in degree of maturity: they are diſtinguiſhed by this, that the *lapis armenus* is ſofter, and inſtead of ſparks of gold, is often ſpeckled with green.

Boerhaave ranks it among ſemi-metals; and ſuppoſes it compoſed of a metal and earth. Woodward ſays, it owes its colour to an admixture of copper.

Its chief uſe is in Moſaic work, though it has ſome place alſo in phyſic. It is a very valuable ſubſtance in painting, being a bright and florid blue. It was in ſo high eſteem as a paint, among the ancients, that counterfeits were continually attempted to ſerve in its place.

Both this and the *lapis lazuli* are ORES of copper.

ARMENIANS, in reſpect of religion, a diviſion among the eaſtern Chriſtians; thus called from *Armenia*, the country anciently inhabited by them.

Some have ſuppoſed, that Chriſtianity was eſtabliſhed in *Armenia* by the apoſtle St. Bartholomew; but this is certain, that in the beginning of the fourth century, the *Armenian* Chriſtians were in a very flouriſhing ſtate.

The *Armenian* church, in the ſixteenth century, was governed by three patriarchs, the chief of whom reſided in a monaſtery at Echmiazin. There were other biſhops among them, who aſſumed the title of patriarchs, without prerogatives annexed to it; though, by authority derived from the chief patriarch, they were allowed to conſecrate biſhops, and every third year to make and diſtribute the holy chriſm, or ointment, which is the privilege of the patriarchs alone.

The *Armenians*, ſince the conqueſt of their country by Scha Abbas, king of Perſia, have had no fixed place of habitation, but are diſperſed in divers parts of Perſia, Turky, and Tartary, and even ſome parts of Europe, particularly Poland.—Their chief employment is merchandize, in which they excel.—The cardinal de Richelieu, we are told, had a deſign to make an eſtabliſhment of them in France, for promoting the commerce of that country. And the chancellor Seguier granted them a printing-houſe at Marſeilles.

With regard to religion, there are two kinds of *Armenians*; the one catholics, and ſubject to the pope, having a patriarch in Perſia, and another in Poland. The other make a peculiar ſect, having two patriarchs in Natolia. The *Armenians* are generally accuſed of being Monophyſites, and only allowing of one nature in Jeſus Chriſt. As to the Euchariſt, they agree with the Greeks, except in this, that they mix no water with their wine, and uſe unleavened bread after the manner of the Latins.

They abſtain very rigorouſly from eating of blood, and meats ſtrangled, and are much addicted to faſting; inſomuch that, from their diſcourſe, one would conclude that almoſt their whole religion conſiſted in faſting.

The monaſtic order is in great repute among them, ſince one of their patriarchs introduced that of St. Baſil; but part of them, which have united with the church of Rome, have changed their ancient rule, for that of the Dominicans.

Armenian *bibles*; ſee Bibles.

ARMERIUS; ſee Dianthus.

ARMIGER, *armour-bearer*, in *Modern Writers*, denotes a title of dignity, rendered in Engliſh by *Eſquire*.

ARMILAUSA, in *Antiquity*, a ſhort military coat, reaching down only to the knee. Aquin. and Pitiſc. Lex. Ant.

It was thus called, as being divided both before and behind, and only cloſe about the ſhoulders, *in armos tantum clauſa*, quaſi *armiclauſa*. Iſid. Orig. l. xix. c. 22.

The word is ſometimes alſo written *armelauſa*, *armilauſia*, *armicaſia*, and *armilcaſia*.

Armilausa is alſo applied, in *Eccleſiaſtical Writers*, to the ſcapular of monks and canons; thus called, on account of its hanging from the arms, or ſhoulders. Schmid. Lex. Eccleſ. p. 73.

The ſame habit is vulgarly called *patience*.

ARMILLA *membranoſa* is a name given, by ſome anatomiſts, to the annular ligament.

ARMILLARY, Armillaris, in *Aſtronomy*, an epithet given to an artificial ſphere, compoſed of a number of metalline circles, repreſentative of the ſeveral circles of the mundane ſphere, put together in their natural order.

The word is formed of the Latin *armilla*, *a bracelet*.

Armillary ſpheres eaſe and aſſiſt the imagination to conceive the conſtitutions of the heavens, and the motions of the heavenly bodies.

Such is that repreſented (*Tab. Aſtron. fig.* 21.)—Where P and Q repreſent the poles of the world, AD the equator, EL the ecliptic and zodiac, PAGD the meridian, or the ſolſtitial colure, T the earth, FG the tropic of cancer, HT the tropic of capricorn, MN the arctic circle, OV the antarctic, N and O the poles of the ecliptic, and RS the horizon.

The *armillary* ſphere not long ſince conſtructed by Dr. Long, in Pembroke-hall, Cambridge, is eighteen feet in diameter; and more than thirty perſons may conveniently ſit in it. The lower part of the ſphere inviſible in England is cut off; the whole apparatus is ſo contrived, that it may be turned round with as little labour as it takes to wind up a jack.

Armillary *trigonometer*, an inſtrument firſt contrived by Mr Mungo Murray, and improved by Mr. Ferguſon, conſiſting of five ſemicircles; viz. meridian, vertical circle, horizon, hour circle, and equator; ſo adapted to each other by joints and hinges, and ſo graduated and divided, as to ſerve for expeditiouſly reſolving many problems in aſtronomy, dialling, and ſpherical trigonometry. For the drawing, deſcription, and method of uſing it, ſee Ferguſon's Tracts, p. 80, &c.

ARMILLATI *milites*, thoſe who wore bracelets on their left arms, beſtowed on them by their generals, or emperors. Though the term is more frequently applied to ſoft and effeminate ſoldiers, who wore bracelets on their arms, not as the rewards of their prowefs, but marks of their foppery. Aquin. Lex.

ARMILUSTRIUM, in *Antiquity*, a feaſt held among the Romans; wherein they ſacrificed, armed at all points, and with the ſound of trumpets.

Some define *armiluſtrium* to have been a feaſt, wherein a general review was made of all the forces in the Campus Martius.—But this does not come up to the point; for Varro does not derive the word from the Latin *arma* and *luſtrare*, *to make a review*; but from the cuſtom of holding this feaſt in the place where the reviews were uſed to be made, or rather from their going round the place armed with bucklers.

The ſacrifice was intended for the proſperity of the arms of the people of Rome; and was celebrated on the fourteenth of the calends of November.

ARMINGS, in a ſhip, are the ſame with *waſt-clothes*, being red cloths, hung about the outſides of the ſhip's upper-works, fore and aft; and before the cubbridge-heads.

There are ſome alſo hung round the tops, and called *top-armings*.

ARMINIANISM, the doctrine of Arminius and of his followers. See Arminians.

ARMINIANS, the followers of Arminius, a celebrated miniſter of Amſterdam, and afterwards profeſſor of theology in the univerſity of Leyden. Arminius, though educated at Geneva, and having imbibed the doctrines concerning predeſtination and grace maintained by Calvin, Beza, Zanchius, &c. began to expreſs his doubts concerning them in the year 1591; and upon farther inquiry adopted ſentiments more nearly reſembling thoſe of the Lutherans, than of the Calviniſts. After his appointment to the theological chair at Leyden, he thought it his duty to avow and vindicate the principles which he had embraced; and the freedom with which he publiſhed and defended them, expoſed him to the reſentment of thoſe that adhered to the theological ſyſtem of Geneva, which then prevailed in Holland; but his principal opponent was Gomar, his colleague. The controverſy which was thus begun, became more general after the death of Arminius, in the year 1609, and threatened to involve the United Provinces in civil diſcord. The *Arminian* tenets gained ground under the mild and favourable treatment of the magiſtrates of Holland, and were adopted by ſeveral perſons of merit and diſtinction. The *Calviniſts*, or *Gomariſts*, as they were now called, appealed to a national ſynod; accordingly the ſynod of Dort was convened by order of the States General, in 1618, and was compoſed of eccleſiaſtical deputies from the United Provinces, as well as from the reformed churches of England, Heſſia, Bremen, Switzerland, and the Palatinate. The principal advocate in favour of the *Arminians* was Epiſcopius, who at that time was profeſſor of divinity at Leyden. It was firſt propoſed to diſcuſs the principal ſubjects in diſpute, and that the *Arminians* ſhould be allowed to ſtate and vindicate the grounds on which their opinions were founded: but ſome difference ariſing as to the proper mode of conducting the debate, the *Arminians* were excluded from the aſſembly; their caſe was tried in their abſence; and they were pronounced guilty of peſtilential errors, and condemned as corrupters of the true religion. In conſequence of this deciſion, they were treated with great ſeverity; they were deprived of all their poſts and employments; their miniſters were ſilenced, and their congregations were ſuppreſſed. However, after the death of prince Maurice, who had been a violent partizan in favour of the *Gomariſts*, in the year 1625, the *Arminian* exiles were reſtored to their former reputation and tranquillity; and under the toleration of the ſtate, they erected churches, and founded a college at Amſterdam, appointing Epiſcopius to be the firſt theological profeſſor. The *Arminian* ſyſtem has very much prevailed in England ſince the time of archbiſhop Laud, and its votaries in other countries are very numerous.

The diſtinguiſhing tenets of the *Arminians* may be comprized in the following five articles; relating to predeſtination, univerſal redemption, the corruption of man, converſion, and perſeverance. With reſpect to the firſt, they maintained, "That God, from all eternity, determined to beſtow ſalvation on thoſe, who he foreſaw, "would perſevere unto the end in their faith in Chriſt "Jeſus; and to inflict everlaſting puniſhments on thoſe, "who ſhould continue in their unbelief, and reſiſt, "unto the end, his divine ſuccours: ſo that election "was conditional, and reprobation in like manner the "reſult of foreſeen infidelity, and perſevering wickedneſs."

On the ſecond, the *Arminians* taught, "That Jeſus "Chriſt, by his ſufferings and death, made an atonement for the ſins of all mankind in general, and of "every individual in particular; that, however, none "but thoſe who believe in him, can be partakers of "their divine benefit."

On the third article, they held, "That true faith cannot "proceed from the exerciſe of our natural faculties and "powers, nor from the force and operation of free "will; ſince man, in conſequence of his natural corruption, is incapable either of thinking or doing any "good thing; and that therefore it is neceſſary, in order to his converſion and ſalvation, that he be regenerated and renewed by the operation of the Holy "Ghoſt, which is the gift of God through Jeſus "Chriſt."

Fourthly, "That this divine grace, or energy of the "Holy Ghoſt, begins and perfects every thing that "can be called good in man, and conſequently all "good works are to be attributed to God alone; that, "nevertheleſs, this grace is offered to all, and does not "force men to act againſt their inclination, but may be "reſiſted, and rendered ineffectual, by the perverſe "will of the impenitent ſinner."—Some modern *Arminians* interpret this and the laſt article with a greater latitude.

Fifthly, "That God gives to the truly faithful, who "are regenerated by his grace, the means of preſerving themſelves in this ſtate;" and though the firſt *Arminians* made ſome doubt with reſpect to the cloſing part of this article, their followers uniformly maintain, "that the regenerate may loſe true juſtifying faith, forfeit their ſtate of grace, and die in their ſins."

The modern ſyſtem of *Arminianiſm* likewiſe, founded on a comprehenſive plan projected by Arminius himſelf, as appears from a paſſage in his laſt will, extends the limits of the Chriſtian church, and relaxes the bonds of fraternal communion in ſuch a manner, that Chriſtians of all ſects and denominations, whatever their ſentiments and opinions may be, papiſts excepted, may be formed into one religious body, and live together in brotherly love and concord. But, in order to avoid the reproach of being altogether unconnected by any common principles, Epiſcopius drew up a confeſſion of faith, expreſſed for the moſt part in words and phraſes of Holy Scripture, which the *Arminians* have generally adopted, though not enjoined upon them by any authoritative obligation.

The *Arminians* are alſo called *Remonſtrants*, from an humble petition intitled their *Remonſtrance*, which, in the year 1610, they addreſſed to the States of Holland. Their principal writers are, Arminius, Epiſcopius, Vorſtius, Grotius, Curcellæus, Limborch, Le Clerc, and Wetſtein; not to mention many others, of more modern date. Brandt's Hiſt. of the Reformation in the Netherlands; and Moſheim's Eccleſ. Hiſt. by Dr. Maclean, vol. V.

ARMISTICE, ARMISTITIUM, a ſhort truce, or a ceſſation of arms for a ſmall time.

ARMOISIN, in *Commerce*, a ſilk ſtuff, or kind of taffety, of an indifferent goodneſs; made at Lyons, and at ſeveral places in Italy. There are half *armoiſins*, made at Avignon, which are of inferior quality, and leſs price than the others. Some pretend that the word *armoiſin* comes from the Italian *armeſino*; or that thoſe ſilks were thus called, becauſe there were coats of arms delineated on the cloths in which they were wrapped.

There is alſo a taffety of this name manufactured in the Eaſt Indies; but of an inferior quality to thoſe made in Europe.

ARMONIAC; ſee *Sal* AMMONIAC.

ARMONICA is a name which Dr. Franklin has given to a muſical inſtrument conſtructed with drinking-glaſſes. It is well known, that a drinking-glaſs yields a ſweet tone, by paſſing a wet finger round its brim. Mr. Puckeridge, of Ireland, was the firſt who thought of playing tunes formed of theſe tones. He collected a number of glaſſes of different ſizes, fixed them near each other on a table, and tuned them by putting into them water, more or leſs, as each note required. Mr. Delaval, F. R. S. made an inſtrument in imitation of that which was contrived by Mr. Puckeridge; and from this inſtrument, Dr. Franklin took the hint of conſtructing his *armonica*.

The glaſſes for this muſical inſtrument, are blown as near as poſſible in the form of hemiſpheres, having each an open neck or ſocket in the middle. The thickneſs of the glaſs near the brim is about one tenth of an inch, increaſing towards the neck, which in the largeſt glaſſes is about an inch deep, and an inch and a half wide within; but theſe dimenſions leſſen, as the ſize of the glaſſes diminiſhes, only obſerving that the neck of the ſmalleſt ſhould not be ſhorter than half an inch. The diameter of the largeſt glaſs is nine inches, and that of the ſmalleſt three inches: between theſe there are twenty-three different ſizes, differing from each other a quarter of an inch in diameter. For making a ſingle inſtrument, there ſhould be at leaſt ſix glaſſes blown of each ſize, and out of theſe, thirty-ſeven glaſſes (which are ſufficient for three octaves with all the ſemitones) may be found, that will either yield the note required, or one a little ſharper, and fitting ſo well into each other, as to taper regularly from the largeſt to the ſmalleſt. The glaſſes being choſen, and the note for which each glaſs is intended being marked upon it with a diamond, they are to be tuned by diminiſhing the thickneſs of thoſe that are too ſharp, which is done by grinding them round from the neck towards the brim, comparing, by means of a well-tuned harpſichord, the tone drawn from the glaſs by your finger, with the note you want, as ſounded by the correſponding ſtring of the harpſichord. The largeſt glaſs in the inſtrument is G, a little below the reach of a common voice, and the higheſt G, including three complete octaves: and they are diſtinguiſhed by painting the apparent parts of the glaſſes within ſide, every ſemitone white, and the other notes of the octave with the ſeven priſmatic colours; ſo that glaſſes of the ſame colour (the white excepted) are always octaves to each other.

When the glaſſes are tuned, they are to be fixed on a round ſpindle of hard iron, an inch in diameter at the thickeſt end, and tapering to a quarter of an inch at the ſmalleſt. For this purpoſe, the neck of each glaſs is fitted with a cork, projecting a little without the neck; theſe corks are perforated with holes of different diameters, according to the dimenſion of the ſpindle in that part of it where they are to be fixed. The glaſſes are all placed within one another; the largeſt on the biggeſt end of the ſpindle, with the neck outwards; the next in ſize is put into the other, leaving about an inch of its brim above the brim of the firſt; and the others are put on in the ſame order. From theſe expoſed parts of each glaſs, the tone is drawn, by laying a finger upon one of them, as the ſpindle and glaſſes turn round. The ſpindle thus prepared, is fixed horizontally in the middle of a box, and made to turn on braſs gudgeons at each end. A ſquare ſhank comes from its thickeſt end through the box, on which ſhank a wheel is fixed by a ſcrew: this will ſerve, like a fly, to make the motion equable, when the ſpindle is turned by the foot like a ſpinning-wheel. The wheel is eighteen inches in diameter, and conceals near its circumference about twenty-five pounds of lead, and may be made of mahogany. An ivory pin is fixed in the face of the wheel, about four inches from the axis; over which is put the loop of the ſtring, that comes up from the moveable ſtep to give it motion. The box is about three feet long, eleven inches wide at the biggeſt end, and five inches at the ſmalleſt end: it is made with a lid, which opens at the middle of its height, and turns up by back-hinges. The inſtrument, thus completed, ſtands on a neat frame with four legs. This inſtrument is played upon by ſitting before it, as before the keys of a harpſichord, turning the ſpindle with the foot, and wetting the glaſſes now and then with a ſpunge and clean water. The fingers ſhould be firſt ſoaked in water, and rubbed occaſionally with fine chalk, to make them catch the glaſs, and bring out the tone more readily. Different parts may be played together, by uſing both hands; and the tones are beſt drawn out, when the glaſſes turn *from* the ends of the fingers, not when they turn *to* them.

The advantages of this inſtrument, ſays Dr. Franklin, are, that its tones are incomparably ſweet beyond thoſe of any other; that they may be ſwelled and ſoftened at pleaſure, by ſtronger or weaker preſſures of the finger, and continued to any length: and when it is once well tuned, it never again wants tuning. Franklin's Letters, &c. on Philoſophical Subjects, p. 428.

ARMOR, or ARMOUR, a defenſive habit, wherewith to cover and ſecure the body from the attacks of an enemy. In ancient ſtatutes this is frequently called HARNESS.

Parts of *armor* are, the buckler, cuiraſs, helmet, coat of mail, gantlet, &c.

A complete *armor* anciently conſiſted of a caſque or helm, a gorget, cuiraſs, gantlets, taſſes, braſſets, cuiſhes, and covers for the legs, to which the ſpurs were faſtened.—This they called *armor cap-a-pie*; and was the wear of the cavaliers, and men at arms.

The infantry had only part of it; viz. a pot or head-piece, a cuiraſs, and taſſes; but all light.—Laſtly, the horſes themſelves had their *armor*, wherewith to cover the head and neck.

Of all this furniture of war, ſcarce any thing is now retained, except the cuiraſs; the gorget or neck-piece, worn by officers, being at preſent only a badge of honour, and of no defence.

The gallantry of going to the battle naked, without any defenſive *armor*, prevailed ſo far, that the French, during the reign of Louis XIV. were obliged to be continually iſſuing ordonnances to reſtrain it; in conſequence of which, the general officers, and thoſe of the cavalry, were obliged to reſume the cuiraſs, which yet has been but ill obſerved.

ARMOR, *Coat*, is the eſcutcheon of any perſon, or family, with its ſeveral charges, and other furniture; as mantling, creſt, ſupporters, motto, &c.

Thus we ſay, a gentleman of *coat-armor*; meaning one who bears arms.

ARMORACIA, in *Botany*, a name given by the ancients to a kind of RADISH. Pliny mentions it, but his account is very unſatisfactory.

ARMORIAL, ſomething that relates to arms, or heraldry. In this ſenſe we ſay an *armorial* figure, *armorial* bearing, *armorial* enſign, the *armorial* lily of France, *armorial* lion or leopard of England, &c.

ARMORIAL is alſo a title given to ſeveral books, which contain the arms of a number of perſons of quality.

In this ſenſe, we meet with the French *armorial*, the Spaniſh *armorial*, &c.

ARMORIC, or AREMORIC, ſomething that belongs to the province of Bretagne, or Britany, in France.

The name *Armorica* was anciently given to all the northern and weſtern coaſt of Gaul, from the Pyreneans to the Rhine; under which name it was even known in Cæſar's time. Cæſ. de Bell. Gall. lib. vii. cap. 14.

ARMORIC, abſolutely uſed, denotes the language in uſe among the inhabitants of Britany.

The French uſually call this language *Bas-breton*; compounded, ſays M. Menage, of *ar*, *upon*, and *mor*, *ſea*.

The *Armoric* is a dialect of the Welch, and ſiſter of the Corniſh language.

The inhabitants of Britany, of Cornwall, and of Wales, formerly underſtood each other's ſpeech; though conſiderable diverſities have crept in between theſe languages, ſince their ſeparation from each other.

The inhabitants of Britany, Mr. Lluyd obſerves, by their intercourſe with the French, have much altered their ancient orthography; beſides that there are ſeveral words in the *Armoric* which have no affinity with the Welch; and that both the *Armoric* and Corniſh retain ſeveral ancient words and phraſes which are loſt in the Welch.

Julian Manoir, a Jeſuit, has publiſhed an *Armoric* grammar and vocabulary in French, which has been tranſlated into Engliſh by Mr. Williams, and publiſhed with notes by Mr. Lluyd. In Archæol. tit. 3. & 4. p. 180, &c. Before him, Yvon Quillivere had publiſhed an *Armoric* vocabulary at Paris, 1521.

Toland has given a catalogue of ſeveral *Armoric* words, which prove to be Iriſh; alſo a vocabulary *Armoric* and Iriſh.

ARMOURER, a maker of arms, or armour.

The Roman *armourers* were diſpoſed in certain places in the empire, it being forbid either to ſell, or buy, or make arms elſewhere. They were exempt from all offices, and taxes, and received a ſalary from the public.

When once they had taken the employment on themſelves, neither they, nor their children, were allowed to quit it. To prevent this, they had a kind of note, or ſtigma, impreſſed on the arm, whereby they might be known. If any of them fled, or ſecreted their ware, the reſt were obliged to anſwer for him; on account of which, the effects of ſuch as died without a legal heir went to the college.

There were fifteen *armamentaries*, or repoſitories of arms, in the Eaſtern empire, placed near the frontiers, and nineteen in the Weſtern. Pitiſc. Lex. Ant.

ARMOURER *of a ſhip*, a perſon whoſe office is to take care that the arms be in a condition fit for ſervice.

ARMORY, or **ARMOURY**, a ſtore-houſe of arms, or a place wherein military habiliments are kept, to be ready for uſe. There are *armories* in the Tower, and in all arſenals, citadels, caſtles, &c.

ARMORY is alſo uſed for a branch of HERALDRY; being the knowledge of coat-armors, as to their blazons, and various intendments.

ARM *pit*. See AXILLA.

ARMS, **ARMA**, in a general ſenſe, includes all kinds of weapons, whether for defence, or offence.

Nicod derives the word from the Latin phraſe, *quod operiant armos*, becauſe they cover the ſhoulders or ſides; but Varro derives *arma, ab arcendo, eo quod arceant hoſtes*.

It is ſuppoſed, that the firſt artificial *arms* were of wood, and were only employed againſt beaſts; and that Belus, the ſon of Nimrod, was the firſt that waged war: whence, according to ſome, came the appellation *bellum*.—Diodorus Siculus takes Belus to be the ſame with Mars, who firſt trained ſoldiers up to battle.

Arms of ſtone, and even of braſs, appear to have been uſed before they came to iron and ſteel.—Joſephus aſſures us, that the patriarch Joſeph firſt taught the uſe of iron *arms* in Egypt, arming the troops of Pharaoh with a caſque and buckler.

What contributed moſt to render the Romans maſters of the world, was, that having ſucceſſively warred againſt all nations, they conſtantly renounced their own methods, *arms*, &c. whenever they met with better.—Thus Romulus, during his war with the Sabins, a bold and warlike nation, adopted their broad buckler, in lieu of the ſmall Argian buckler, which he had uſed till that time. Monteſq. Conſid. ſur les Cauſ. de la Grand. des Rom. chap. i. p. 2. ſeq.

The principal *arms* of the ancient Britons were hatchets, ſcythes, lances, ſwords, and bucklers: the Saxons, &c. brought in the halbard, bow, arrows, arbalets, &c.

By the ancient laws of England, every man was obliged to bear *arms*, except the judges and clergy. Under Henry VIII. it was expreſly enjoined on all perſons to be regularly inſtructed, even from their tender years, in the exerciſe of the *arms* then in uſe; viz. the long bow and arrows; and to be provided with a certain number of them. 33 H. 8.

ARMS, **ARMA**, in *Law*, are extended to any thing which a man takes in his hand in his wrath, to caſt at, or ſtrike another.—So Crompton—*Armorum appellatio non ubique ſcuta, & gladios, & galeas ſignificat, ſed & fuſtes & lapides.* See VI & *Armis*.

By the common law, it is an offence for perſons to go or ride armed with dangerous weapons: but gentlemen may wear common armour, according to their quality, &c. 3d Inſt. The king may prohibit force of *arms*, and puniſh offenders according to law; and herein every ſubject is bound to be aiding. Stat. 7 Edw. 1. None ſhall come with force and *arms* before the king's juſtices, nor ride armed in affray of the peace, on pain to forfeit their armour, and to ſuffer impriſonment, &c. 2 Ed. 3. c. 3.

The importation of *arms* and ammunition are prohibited, by 1 Jac. 2. c. 8. and by 1 W. and M. ſtat. 2. c. 2. Proteſtant ſubjects may have *arms* for their defence. So likewiſe, *arms*, &c. ſhipped after prohibition, are forfeited, by 29 Geo. 1. c. 16. ſec. 2.

Arms of offence in uſe among us at preſent, are, the ſword, piſtol, muſquet, bayonet, pike, &c.

The *arms* of the Highlanders are, the broad ſword, target, poniard, and whinyar or durk, &c.

There are ſeveral acts of parliament for diſarming the Highlands; ſee 1 Geo. 1. c. 54. 11 Geo. 1. c. 26. 19 Geo. 2. c. 39. 21 Geo. 2. c. 34. 26 Geo. 2. c. 22. and 29.

ARMS *of defence*. See ARMOR.

Fire-**ARMS** are thoſe charged with powder and ball: ſuch are cannon, mortars, and other ordnance; muſquets, carabines, piſtols, and even bombs, granadoes, carcaſſes, &c.

For the rebound or reſilition of *fire-arms*, ſee REBOUND.

In the Hiſtory of the Royal Academy for the year 1707, we have an account of ſome experiments made with *fire-arms* differently loaded, by M. Caſſini. Among other things he obſerves, that by loading the piece with a ball which is ſomewhat leſs than the calibre; and only laying a little gunpowder below the ball, and a good deal above it, it will yield a vehement noiſe, but have no ſenſible effect or impulſe on the ball.

This he takes to have been all the ſecret of thoſe people who pretended to ſell the art of rendering one's ſelf invulnerable, or ſhot-proof.

ARMS, *baſs of*, was a kind of combat in uſe among the ancient cavaliers.

ARMS, *ſtand of.*—A *ſtand of arms* ſignifies a muſquet, a bayonet, a ſword, belt, and cartridge-box.

ARMS *of parade*, or *courteſy*, were thoſe uſed in the ancient juſts, and tournaments; which were commonly unſhod lances, ſwords without edge or point, wooden ſwords, and even canes.

ARMS denote the natural weapons, or parts of defence, of beaſts; as claws, teeth, tuſks of elephants, beaks of birds, &c.

ARMS are alſo uſed figuratively for the profeſſion of a ſoldier.—Thus we ſay, he was bred to *arms*.—See FRATERNITY, LAW, PLACE, SUSPENSION *of arms*.

ARMS, or **ARMORIES**, are alſo uſed, in *Heraldry*, for marks of dignity and honour, regularly compoſed of certain figures and colours, given or authorized by ſovereigns, and borne in banners, ſhields, coats, &c. for the diſtinction of perſons, families, and ſtates; and paſſing by deſcent to poſterity.

They are called *arms*, in regard they are borne principally on the buckler, cuiraſs, banners, and other apparatus of war.—They are alſo called COATS *of arms*, COAT-*armor*, &c. becauſe anciently embroidered on ſur-coats, &c.

Some will have the name to have been firſt occaſioned by the ancient knights, who in their juſts and tournaments bore certain marks (which were frequently their miſtreſs's favours) in their armour, i. e. their helms or ſhield, to diſtinguiſh them from each other.

There has been a great diſpute, among the learned, about the origin of *arms*.—Favyn will have them to have been from the beginning of the world; Segoin, from the time of Noah; others, from that of Oſiris, which is ſupported by ſome paſſages in Diodorus Siculus. Some again, from the example of the patriarch Jacob, who, when he bleſſed his ſons, gave them marks of diſtinction, which the twelve tribes bore on their enſigns; others, from the times of the Hebrews, becauſe *arms* were given to Moſes, Joſhua, the twelve tribes, David, &c.

Others will have them to have taken their riſe in the heroical age, and under the empires of the Aſſyrians, Medes, and Perſians; building upon the accounts of Philoſtratus, Xenophon, and Quintus Curtius.

Some pretend that the uſe of *arms*, and the rules of BLAZON, were regulated by Alexander.—Others will have them to have had their original under the empire of Auguſtus; others, during the inundations of the Goths; and others, under the empire of Charlemagne. Chorier obſerves, that, among the ancient Gauls, each man bore a mark on his buckler, by the ſight whereof he might be known to his fellows; and hence he refers the original of the *arms* of noble families. Camden has obſerved ſomething like this of the ancient Picts, and Britons, who, going naked to the wars, painted their bodies with BLAZONS, and figures of divers colours, which he ſuppoſes to have been different in different families, as they fought divided by kindreds. Yet Spelman ſays, that the Saxons, Danes, and Normans, firſt brought *arms* from the North into England; and thence into France.

Upon the whole, it is certain, that, from time immemorial, there have been ſymbolical marks in uſe among men, to diſtinguiſh them in armies, and to ſerve as ornaments for ſhields and enſigns; but theſe marks were uſed arbitrarily as devices, emblems, hieroglyphics, &c.

and were not regular *armories*, like ours, which are hereditary marks of the nobility of a houſe, regulated according to the rules of HERALDRY, and authorized by princes.

Before Marius, even the EAGLE was not the conſtant enſign of the Roman army; but they bore in their ſtandards a *wolf*, *leopard*, or *eagle*, indifferently, according to the fancy of the generals.

The ſame diverſity has been obſerved with regard to the French and Engliſh; on which account, authors are divided when they ſpeak of the ancient *arms* of thoſe countries.—In effect, it appears, from all the beſt authors, that the armories of houſes, as well as the double names of families, were not known before the year 1000. And ſeveral have even endeavoured to prove, that the uſe of *arms* did not begin till the time of the firſt croiſades of the Chriſtians in the Eaſt.

The truth is, it appears to have been the ancient tournaments that occaſioned the fixing of armories.

Henry the Fowler, who regulated the tournaments in Germany, was the firſt who introduced theſe marks of honour, which appear to be of an older ſtanding in Germany, than any other part of Europe.—It was then that COATS *of arms* were firſt inſtituted; which were a kind of livery compoſed of ſeveral bars, fillets, and colours; whence came the *feſs*, *bend*, *pale*, *chevron*, and *lozenge*; which were ſome of the firſt elements of ARMORIES. See BEND, CROSS, FESS, &c.—Thoſe who had never been concerned in any tournament, had no *arms*, though they were gentlemen.

Such of the nobility and gentry as croſſed the ſea, in the expeditions to the Holy Land, alſo aſſumed theſe tokens of honour to diſtinguiſh themſelves.

Before theſe times, we find nothing upon ancient tombs but croſſes, with Gothic inſcriptions, and repreſentations of the perſons deceaſed. The tomb of pope Clement IV. who died in 1268, is the firſt whereon we find any *arms*; nor do they appear on any coins ſtruck before the year 1336. We meet with figures, it is true, much more ancient, both in ſtandards, and on medals; but neither cities nor princes ever had *arms* in form: nor does any author make mention of *blazoning* before that time.

Originally, none but the nobility had a right of bearing *arms*; but king Charles V. having ennobled the Pariſians, by his charter in 1371, he permitted them to bear *arms*: from whoſe example, the more eminent citizens of other places did the like.

Camden refers the original of hereditary *arms* in England, to the time of the firſt Norman kings. He ſays, their uſe was not eſtabliſhed till the reign of king Henry III. and inſtances in ſeveral of the moſt conſiderable families in England, wherein, till that time, the ſon always bore different *arms* from the father.—About the ſame time it became the cuſtom here in England, for private gentlemen to bear *arms*; borrowing them from the lords of whom they held in fee, or to whom they were the moſt devoted. See BEARINGS.

ARMS, at preſent, follow the nature of titles, which being made hereditary, theſe are alſo become ſo, being the ſeveral marks for diſtinguiſhing of families and kindreds, as names are of perſons and individuals.

Arms make the object of the art of HERALDRY.

ARMS are variouſly diſtinguiſhed by the *Heralds*.

ARMS *of alliance*, are thoſe which families, or private perſons, join to their own, to denote the *alliances* which they have contracted by marriage.

ARMS, *aſſumptive*, are ſuch as a man has a right to aſſume of himſelf, in virtue of ſome gallant action.

As, if a man who is no gentleman of blood, nor has coat armour, takes a gentleman, lord, or prince, priſoner in any lawful war; he becomes entitled to bear the ſhield of ſuch priſoner, and enjoy it to him and his heirs.—The foundation hereof is that principle in *Military Law*, that the dominion of things taken in lawful war, paſſes to the conqueror.

ARMS, *canting*, are thoſe wherein the figures bear an alluſion to the name of the family.—Such are thoſe of the family of La Tour in Auvergne, who bear a tower; that of the family of Prado in Spain, whoſe field is a meadow.

Moſt authors hold theſe the moſt noble and regular, as is ſhewn by an infinity of inſtances produced by father Varenne and Menetrier.—They are much debaſed, when they come to partake of the REBUS.

ARMS, *charged*, are ſuch as retain their ancient integrity and value, with the addition of ſome new honourable CHARGE or BEARING, in conſideration of ſome noble action.

ARMS *of community*, are thoſe of biſhopricks, cities, univerſities, and other bodies corporate.

ARMS *of conceſſion*, or augmentation of honour, are either *entire arms*, or elſe one or more figures given by princes, as a reward for ſome extraordinary ſervice.

ARMS *of dominion*, are thoſe which emperors, kings, and ſovereign ſtates bear; being annexed to the territories which they poſſeſs. Thus the three lions are the *arms* of England; the *fleurs de lys* thoſe of France, &c.

ARMS *of family*, or *paternal arms*, are ſuch as belong to a particular family, and which no other perſon has a right to aſſume.

ARMS, *full*, or *entire*, are ſuch as retain their primitive purity, integrity, or value; without any alterations, diminutions, abatements, or the like.

It is a rule, that the ſimpler and leſs diverſified the *arms*, the more noble and ancient they are.—For this reaſon, Garcias Ximenes, firſt king of Navarre, and his ſucceſſors for ſeveral ages, bore only GULES, without any figure at all.

The *arms* of princes of the blood, of all younger ſons, and junior families, are not pure, and full; but diſtinguiſhed and diminiſhed by proper differences, &c. See DIFFERENCE, &c.

ARMS *of patronage*, are thoſe which governors of provinces, lords of manors, &c. add to their family *arms*, in token of their peculiar ſuperiority and juriſdiction. See alſo PATRONAGE.

ARMS *of pretenſion*, are thoſe of ſuch kingdoms or territories to which a prince or lord has ſome claim, and which he adds to his own, though the kingdoms or territories be poſſeſſed by a foreign prince, or other lord. Thus the kings of England have quartered the *arms* of France with their own, ever ſince the claim of Edward III. to that kingdom, in 1330.

ARMS *of ſucceſſion*, are aſſumed by thoſe who inherit eſtates, manors, &c. by will, intail, or donation, and which they either impale or quarter with their own *arms*.

ARMS are alſo ſaid to be *parted*, *couped*, *quartered*, &c. See PARTI, &c.

Arms are ſaid to be *falſe* and *irregular*, when there is ſomething in them contrary to the eſtabliſhed rules of HERALDRY.—As, when metal is put on metal, or colour on colour, &c.

The laws, and other affairs of *arms*, with the cognizance of offences committed therein, belong, among us, to the earl-marſhal, and college of *arms*. See COLLEGE *of arms*.

ARMS, in *Falconry*, denote the legs of an hawk, from the thigh to the foot. See HAWKING.

ARMS, *king at*. See KING *at arms*.

ARMS, *herald at*. See HERALD.

ARMS, *pourſuivant at*. See POURSUIVANT.

ARMY, a large body of ſoldiers, conſiſting of horſe and foot, under the command of a general, with ſeveral ranks of ſubordinate officers under him.

An *army* conſiſts of ſquadrons and battalions, and is uſually divided into three corps; which are ranged in three lines. The firſt line is called the *van-guard*; the ſecond, the *main body*; and the third, the *rear-guard*, or *body of reſerve*.—The middle of each line is poſſeſſed by foot; the cavalry forms the wings on the right and left; and ſometimes they alſo place ſquadrons of horſe in the intervals between the battalions.

When the *army* is ranged in order of battle, there are five feet diſtance between the horſes, and three between the foot. But in the ſhock the file contracts, and its front leſſens almoſt to one half.

In each line the battalions are diſtant from each other about 180 feet, a diſtance about equal to the extent of their front; and the ſame holds of the ſquadrons, which are about 300 feet diſtant, the extent of their own front. Theſe intervals are left for the ſquadrons and battalions of the ſecond line, to range themſelves againſt the intervals of the firſt line; and thoſe of the third line, againſt the intervals of the ſecond; that both the one and the other may march more readily through theſe ſpaces to the enemy.

There are uſually 300 feet left between the firſt line and the ſecond, and 600 between the ſecond line and the third; that there may be room to rally when the ſquadrons and battalions are broke. Sauv. Nouv. Ecol. Milit. p. 266.

Long experience has ſhewn, that in Europe, a prince with a million of ſubjects cannot keep an *army* of above ten thouſand men, without ruining himſelf. It was otherwiſe in the ancient republics: the proportion of ſoldiers to the reſt of the people, which is now as about one to an hundred, might then be as about one to eight. The reaſon ſeems owing to that equal partition of lands, which the ancient founders of commonwealths made among their ſubjects; ſo that every man had a conſiderable property to defend, and had means to defend it with. Whereas, among us, the lands and riches of a nation being ſhared among a few, the reſt have no way of ſubſiſting, but by trades, arts, and the like: and have neither any free property to defend, nor means to enable them to go to war in defence of it, without ſtarving their families. A large part of our people are either artiſans or ſervants, and ſo only miniſter to the luxury and effeminacy of the great. While the equality of lands ſubſiſted, Rome, though only a little ſtate, being refuſed the ſuccours which the Latins were obliged to furniſh after the taking of the city in the conſulate of Camillus, preſently raiſed ten legions within their own walls: which was more, Livy aſſures us, than they were able to do in his time, though maſters of the greateſt part of the world. A full proof, adds the hiſtorian, that we are not grown ſtronger; and that what ſwells our city is only luxury, and the means and effects of it. Vid. Liv. Dec. 1. lib. 7. and Conſid. ſur les Cauſ. de la Grand. des Rom. chap. iii. p. 24.

Our *armies* anciently were a ſort of militia, compoſed chiefly of the vaſſals and tenants of the lords.

When each company had ſerved the number of days or months enjoined by their tenure, or the cuſtoms of the fees they held, they returned home. See TENURE, FEE, &c.

The *armies* of the empire conſiſt of divers bodies of troops, furniſhed by the ſeveral circles. See EMPIRE, and CIRCLE.

The groſs of the French *armies*, under the Merovingian race, conſiſted of infantry. Under Pepin and Charlemagne, the *armies* conſiſted almoſt equally of cavalry and foot: but ſince the declenſion of the Carlovingian line, the fees being become hereditary, the national *armies*, ſays Le Gendre, are chiefly cavalry.

The *armies* of the Grand Signior conſiſt chiefly of JANISARIES, SPAHIS, and TIMARIOTS.

ARMY, *naval*, is a number of ſhips of war, equipped and manned with ſailors and marines, under the command of an admiral, with other inferior officers under him.

ARMY *of obſervation*, is employed by beſiegers, to prevent relief being brought into a place, or the ſiege being raiſed by the enemy.

ARMY, *royal*, is an *army* marching with heavy cannon; capable of beſieging a ſtrong, well-fortified city.

For the diſeaſes incident to *armies*, ſee DISEASE, CAMP, GARRISON, HOSPITAL, SOLDIER, &c.

ARNABOS, in the *Materia Medica*, a name of an aromatic drug, deſcribed by Paulus Ægineta, and other of the Greek phyſicians, and ſuppoſed to be the ſame with the *zarnab* of Aviſenna, that is, with the CARPESIA of the more ancient Greek writers.

This was a drug much uſed as an aromatic and cordial, and allowed in many caſes to be a good ſubſtitute for CINNAMON. It was the young ſhoots of the CUBEB-*tree*, or ſomething of that kind.

ARNALDIA, in *Phyſic*, a ſlow malignant kind of diſeaſe, frequent formerly in England; the moſt diſtinguiſhing ſymptom whereof was a falling of the hair.

Authors are much at a loſs for the nature and kind of this diſeaſe, which appears to have been peculiar to our country. From the deſcription given of it in an ancient chronicle, Mollerus concludes it to have been a ſpecies of the venereal diſeaſe, as that diſtemper appeared in thoſe days in this country.

ARNICA, in *Botany*, a genus of the *ſyngeneſia polygamia ſuperflua* claſs. Its characters are, that it hath a compound flower; the borders or rays being compoſed of many female florets, which ſpread open; the diſk or middle hath many hermaphrodite flowers, which are tubulous, and have each five ſhort *ſtamina*. In the hermaphrodite flowers, the *germen* is ſituated below the flower, which afterwards becomes a ſingle oblong ſeed, crowned with long ſlender down. There are two ſpecies; which grow on the Alps, and in the northern parts of Europe.

There is another *arnica*, which Neumann calls *ſchweedenſis*, that is, a ſpecies of the *aſter*. P. 361.

Dr. Bruckner recommends the decoction of *arnica vera*, or PLAVIENSIS, in feveriſh diſorders, accompanied with hæmorrhages, effloreſcentiæ, &c.

Neumann ſays, the flowers and leaves are emetic, or purgative; and it is ſaid, he adds, that an infuſion of them is remarkably ſerviceable for reſolving coagulated blood from falls, &c. and in obſtructions of different kinds. He gives alſo the chemical hiſtory of this ſpecies of DORONICUM. P. 356.

ARNODI, in *Antiquity*, the ſame with RHAPSODI.

The word is compounded of *αρνος*, *a lamb*, which was their uſual reward; and *ωδη*, *ſong*, or *ſinging*.

ARNOLDISTS, ARNALDISTS, in the twelfth century; ſo called from their chief, Arnold of Breſſe, who was a great declaimer againſt the wealth and vices of the clergy; and who is alſo charged with preaching againſt baptiſm, and the euchariſt.

After raiſing great diſturbances at Breſſe and Rome, he was burnt at this latter place in 1155, and his aſhes caſt into the Tiber.—His diſciples were alſo called *Publicans*, or *Poplicani*.

ARNOTTA, in *Botany*, a name given by the peaſants of Burgundy, and many other places, to certain roots which they frequently turn up, from five or ſix inches depth, in plowing the ground. They carefully collect theſe, and eat them, after roaſting in the aſhes, or otherwiſe; by which ſort of cooking they acquire the taſte of a cheſnut, and are found to be a very wholſome and nouriſhing food. They are blackiſh on the outſide, and white within, and are of the ſize of a ſmall walnut. They are common in the north of Scotland, and called *arnots*.

ARNULPHIN, *Arnulphinus*, a coin of the value of a ducat and an half, current in ſome parts of France in the 15th century. Du-Cange.

AROBE, by ſome ſpelt and pronounced *arrobe*; in Spaniſh, *arroba*; in the language of Peru, *arroue*: a weight uſed in Spain, Portugal, Goa, Brazil, and throughout all Spaniſh America. All theſe *arobes* are ſcarcely like each other but in name, being very different in weight, and in their proportion to the weights of other countries. The *arobe* of Madrid, and almoſt all over Spain, weighs twenty-five Spaniſh pounds.

AROLEC, the name of a weight, in uſe in ſome parts of America, and in quantity equal to twenty-five pounds of our weight.

AROMA is, by ſome authors, particularly applied to denote MYRRH.

AROMA *Germanicum*, a denomination given by Platerus to ELECAMPANE.

Some writers give the title *aroma Germanicum* to JUNIPER-*berries*, on account of the great eſteem they are in among that people, for their ſpicy, warm qualities; in which reſpect they are by many preferred to ginger itſelf.

AROMA *philoſophorum*, is uſed by ſome for SAFFRON.

Others give the appellation of *aroma philoſophorum* to Paracelſus's AROPH.

AROMATIC, AROMATICUS, is underſtood of a drug, plant, or the like, which yields a briſk fragrant ſmell, and a warm ſpicy taſte.

The word is formed of *αρωμα*, which is compounded of *αρι*, *very*, and *οδμη*, or *οσμη*, *ſmell*.

AROMATICS, or AROMATIC *medicines*, are either *ſimple* or *compound*.—To this claſs belong moſt cardiac, cephalic, and carminative remedies, with many ſtomachic ones.

Of this kind are frankincenſe, ſtorax, benjoin, cinnamon, mace, cloves, nutmeg, pepper, &c.—Such alſo are lavender, marjoram, ſage, thyme, roſemary, &c.

The peculiar qualities of *aromatics* reſide in their eſſential oils, and reſinous parts. The more eſſential oil any vegetable affords, the weaker the oil is, and *vice verſâ*. The taſte and pungency of ſome of them reſide in the oil, and of others of them in a fixt gummy reſinous matter.

Powders which have *aromatic*, or other acrid particles in them, not only abſorb liquors, but give more or leſs ſtimulus; and as the effect of all irritation is ſome degree of inflammation, which in ſores is principally removed by a ſubſequent increaſed ſuppuration, theſe powders may aſſiſt to ſeparate corrupted from ſound parts. Such of them as have balſamic particles in their compoſition, encourage the ſuppuration moſt.

Several of them reſiſt the putrefaction of animal ſubſtances, and therefore may preſerve a carious bone, or the matter coming from it, from ſuch a high degree of putrefaction as they might otherwiſe attain.

Beſide theſe effects on the ſore, regard muſt always be had to their operation, if any of their particles are abſorbed by the blood-veſſels, for ſome of them produce a fever in a greater or leſs degree, others become purgatives, &c. Med. Eſſ. Edinb. vol. V. art. 24.

Aromatics are of particular ſervice in cold cachectic habits, where the load of humours has been forced away by ſtrong detergents and cathartics; as they tend to ſtrengthen the fibres, and prevent a relapſe.—Hence alſo they become of neceſſary uſe after purging, and carrying off the waters of a dropſy, or in the intervals, to fortify the ſprings, and prevent a filling again.

AROMATICUM *roſatum*, is a compound officinal powder, made of red roſes, liquorice, aloes-wood, yellow ſanders, cinnamon, cloves, mace, gum tragacanth, nutmegs, cardamoms, galangals, ſpikenard, ambergriſe, and muſk, all mixed together. It is chiefly preſcribed in cordial and cephalic boluſes and electaries, to ſtrengthen the ſtomach and head, which all *aromatics* have a tendency to do.

AROMATICUM *vinum*. See VINUM.

AROMATICUS *calamus*. See CALAMUS.

AROMATITIS, in *Ancient Phyſiology*, a kind of bituminous ſtone, by ſome repreſented as a gem, both in ſmell and colour reſembling myrrh.

It is ſaid to have been found in Arabia and Egypt, and to have been in great uſe among ladies, as a perfume.

ARONDE, in *Fortification*. See DOVETAIL, and QUEUE *d'Aronde*.

ARO-ORCHIS, in *Botany*. See GALANGAL.

AROPH, a term uſed by Paracelſus, to denote a medicine endued with a power of breaking or diſſolving the ſtone in the human body.

In which ſenſe, *aroph* amounts to the ſame with *lithontriptic*. Van Helmont aſſures us, that he was poſſeſſed of the *aroph*; and from his account, it ſeems to have been a preparation of ſaffron and rye-bread, digeſted with ſpirit of wine, in a horſe-dung heat, and at length diſtilled. Vid. Cnoeffel. in Ephem. Acad. N. C. Dec. I. An. 4. Obſ. 109.

AROPH *Paracelſi* is alſo a name given to a kind of chemical flowers, elegantly prepared by ſublimation, from equal quantities of *lapis hæmatitis* and *ſal ammoniac*; ſaid to be of great efficacy in quartan agues, the *plica Polonica*, and hypochondriac diſeaſe.

This is alſo called *aroma philoſophorum*.

AROPH is alſo uſed to denote MANDRAGORA.

ARORNOS, in *Botany*, a name by which ſome authors have called the JUNIPER.

AROURA, a Grecian meaſure, of fifty feet.

AROURA was more frequently uſed for a ſquare meaſure, the half of the plethron.

The Egyptian *aroura* was the ſquare of a hundred cubits. Arbuth. Tab. 9.

ARPAGIUS, or rather HARPAGIUS, in ſome ancient inſcriptions, ſignifies a perſon who died in the cradle, at leaſt in early youth.

The word is formed from ἁρπαζω, *rapio, I ſnatch*.

The Romans made no funerals for their *arpagii*.—They neither burnt their bodies, nor made tombs, monuments, or epitaphs for them, which occaſioned Juvenal to ſay,

—— *Terra clauditur infans,*
Et minor igne rogi. ——

In after-times it became the cuſtom to burn ſuch as had lived to the age of forty days, and had cut any teeth; though theſe they alſo called ἁρπακτοι, or ἁρπαγμενοι, q. d. *rapti, raviſhed*. The uſage ſeems to have been borrowed from the Greeks; among whom, Euſtathius aſſures us, it was the cuſtom never to bury their children either by night or full day, but at the firſt appearance of the morning; and that they did not call their departure by the name of death, but by a ſofter appellation, ἡμερας αρπαγη; importing, that they were raviſhed by Aurora, or taken away to her embraces.

ARPENT. See ACRE.

ARQUATA, in *Zoology*, the name of a bird, called alſo by ſome NUMENIUS, and commonly known in England by the name of the CURLEW.

The male in this ſpecies is ſomewhat ſmaller than the female, and is called the *jack curlew*.

It is well known to be a very delicately taſted bird. Ray.

ARQUATA *minor*, in *Zoology*, the name uſed by authors for the bird called by our ſportſmen the WIMBREL.

ARQUEBUSADE, in *Medicine*, is a name given to a kind of water originally of French invention, recommended as uſeful in caſes of gun-ſhot wounds, from whence it derives its name. The compoſition of it is not generally known, but it is ſaid to be made from mint, ſage, mugwort, &c. and lime-water diſtilled in wine. It is alſo called *aqua vulneraria, aqua ſclopetaria*, and *aqua catapultarum*.

ARQUEBUSS, a large hand-gun, ſomething bigger than our muſquet; and called, by ſome, a caliver. See HARQUEBUSS.

ARQUEBUSS *a Croc*, is a ſort of ſmall fort-arm, which carries a ball of about three half ounces; now only uſed in Old Caſtile, and ſome garriſons of the French.

ARRACHEE, in *Heraldry*, is underſtood of repreſentations of plants forcibly torn up by the roots, with their roots hanging at them.

In this ſenſe, *arrachee* amounts to the ſame with what is otherwiſe called *eradicate*, or *eraſed*. Niſb. Her.

ARRACK; ſee ARAC.

ARRAIATIO *peditum*, the ranging or arraying of foot-ſoldiers.

ARRAIGN, or ARAIGN, in *Law*, ſignifies to ſet a thing in order, or in its place.

It is derived from the French *arraiſoner*, i. e. *ad rationem ponere, to call a man to anſwer in form of law*; which comes from the barbarous Latin *adrationare*, i. e. *placitare*.—In which ſenſe, to *arraign* a criminal, is *ponere eum ad rationem*.

Thus, he is ſaid to *arraign* a writ of *novel diſſeiſin*, who prepares and fits it for trial before the juſtices of the circuit. To *arraign* the aſſize, is to cauſe the demandant to be called to make the plaint, and to ſet the cauſe in ſuch order, as the tenant may be forced to anſwer thereto.

A priſoner is alſo ſaid to be *arraigned*, when he is indicted, and brought forth to TRIAL. But no man is properly *arraigned*, except at the ſuit of the king, upon an indictment found againſt him, or other record, wherewith he is to be charged: and this *arraignment* requires that the priſoner appears to be tried, and holds up his hand at the bar, for the certainty of the perſon, and makes a ſufficient plea to the indictment. 1 Inſt. 262. 263. The priſoner is to hold up his hand only in treaſon and felony; but this is only a ceremony: if he own that he is the perſon, it is ſufficient without it; and then upon his *arraignment* his fetters are to be taken off, and he is to be treated with all the humanity imaginable. 2 Inſt. 315. 3 Inſt. 35. The pleas upon *arraignment* are either the general iſſue, not guilty; plea in abatement, or in bar; and the priſoner may demur to the indictment; alſo he may confeſs the fact, but then the court has nothing more to do than to proceed to judgment againſt him. Till lately, if he ſtood mute, and did not put himſelf upon trial, he muſt have ſuffered the penance *pain fort & dure*, in caſes of felony, &c. 3 Inſt. 217. But now, by 12 Geo. III. c 20. ſtanding mute in felony or piracy is made a conviction. In indictments of high treaſon, or petit larceny, ſtanding mute was always equivalent to a conviction, and the criminal ſhall receive the ſame judgment and execution. For the ſolemnity of the *arraignment* and trial of a priſoner, ſee Dalt. c. 185. p. 515.

ARRANGEMENT, or RANGEMENT, the diſpoſition of the parts of a whole, in a certain order.

The modern philoſophy ſhews us, that the diverſity of the colours of bodies, depends entirely on the ſituation and *arrangement* of the parts, which reflect the light differently; the diverſity of taſtes and ſmells on the different *arrangements* of the pores, which render them differently ſenſible; and the general diverſity of bodies on the different *arrangement* of their parts.

The happy *arrangement* of words makes one of the greateſt beauties of diſcourſe.

ARRANGEMENTS, *philoſophical*. This title is given by the ingenious J. Harris, Eſq. to a moſt excellent commentary on the CATEGORIES of Ariſtotle; it is juſt as happy a ſimplification of *Logic*, as his *Hermes* is of *Grammar*. Both theſe valuable books, ſo well calculated to convey ſenſible and preciſe notions of logic and grammar, might be very uſefully and compendiouſly exhibited in the forms of a *logical* and *grammatical* tree, after the manner of genealogical tables.

ARRAS HANGINGS, a ſort of rich TAPESTRY, made at Arras, in the county of Artois, in Flanders.

ARRAY, in *Law*, the ranking or ordering a jury or inqueſt of men impanelled on any cauſe.

The word may be derived either from the obſolete French, *array, order*; or from *raye, a line, ſtroke*, &c. Hence to *array* a pannel, ann. 3 Hen. V. &c. is to ſet forth the men impanelled one by another.—By the ſtatute, every *array* in aſſize ought to be made four days before.

ARRAYERS, or ARRAJERS, ARRAITORES, is uſed, in ſome ancient ſtatutes, for ſuch officers as had care of the ſoldiers armour, and ſaw them duly accoutred in their kinds. Stat. 12 R. II. c. 6.

In ſome reigns, commiſſioners have been appointed for this purpoſe. Such were the commiſſioners of *array* appointed by king Charles I. in the year 1642.

ARREARS, ARREARAGES, ARRERAGIUM, or ARRIERAGIUM, the remains of an account; or a ſum of money remaining in the hands of an accomptant.

The word is derived from the French *arrerages*, which is formed from *arriere, behind*.

ARREARS is alſo uſed more generally for a remainder of rents or monies unpaid at the due time; whether they be rents of a manor, or any other thing reſerved: called alſo, in ſome writers, *arrieragium firmarum*.

ARRENTATION, in the *Foreſt-Law*, the licenſing an owner of lands in the foreſt, to incloſe them with a low hedge, and ſmall ditch, in conſideration of a yearly rent.

Saving the arrentations, denotes a power reſerved to give ſuch licences for yearly rent.

ARREST, in *Common Law*, the apprehending or reſtraining of one's perſon, in execution of the command of ſome court, or officer of juſtice.

The word *arreſt* is French, and is uſed in that language for a decree or determination of a cauſe debated to and fro: in which ſenſe it ſeems derived from αρεστον, *placitum, the pleaſure of the court*.

Hence, when a perſon is legally ſtopped, apprehended, and reſtrained of his liberty, for debt, &c. he is ſaid to be *arreſted*, or put under an *arreſt*; which is the beginning of impriſonment.

None ſhall be *arreſted* for debt, treſpaſs, &c. or other cauſe of action, but by virtue of a precept or commandment out of ſome court: but for treaſon, felony, or breach of the peace, a man may *arreſt* without precept or warrant. Term de Ley. 54. Perſons preſent at the committing a felony, muſt uſe their endeavours to apprehend the offender, under penalty of fine and impriſonment. 3 Inſt. 117. 4 Inſt. 177. The king cannot command any one by word of mouth to be *arreſted*; but he muſt do it by writ, or order of his courts, according to law: nor may the king *arreſt* any man for ſuſpicion of treaſon or felony, as his ſubjects may; becauſe if he doth wrong, the party cannot have action againſt him. 2 Inſt. 186. If a bailiff lays hold of one by the hand (whom he hath a warrant to *arreſt)* as he holds it out at the window, this is ſuch a taking of him, that the bailiff may juſtify the breaking open of the houſe to carry him away. 1 Vent. 306. When a perſon has committed treaſon or felony, &c. doors may be broke open to *arreſt* the offender; but not in civil caſes, except it be in purſuit of one *arreſted*, or where a houſe is recovered by real action, to deliver poſſeſſion to the perſon recovering. Plowd. 5. Rep. 91. Action of treſpaſs, &c. lies for breaking open a houſe to make *arreſt* in a civil action. Mod. Caſ. 105. But if it appear that a bailiff found an outer door, &c. open; it is ſaid he may open the inner door to make an *arreſt*. Comber. 327. An *arreſt* in the night, as well as the day, is lawful. 9 Rep. 66. By ſtat. 29 Car. II. c. 7. *arreſt* ſhall not be made on a Sunday, except in caſes of treaſon, felony, or for breach of the peace. But a perſon may be retaken on a Sunday, if *arreſted* the day before, &c. Mod. Caſ. 231.

To *move* or *plead in arreſt of judgment*, is, to ſhew cauſe why judgment ſhould be ſtayed, though there be a verdict in the cauſe.

Judgment may be *arreſted* for good cauſe in criminal caſes, as well as civil; if the indictment be inſufficient, &c. 3 Inſt. 210. Four days are allowed to move in *arreſt* of judgment.

To *plead in arreſt of taking the inqueſt*, is, to ſhew cauſe why an inqueſt ſhould not be taken.

ARRESTANDIS *bonis ne diſſipentur*, a writ which lies for him whoſe cattle or goods are taken by another, who, during the controverſy, makes, or is likely to make away with them, and will hardly be able to give ſatiſfaction for them afterwards.

ARRESTANDO *ipſum, qui pecuniam recepit ad proficiſcendum in obſequium regis*, &c. is a writ which lies for the apprehenſion of him that hath taken preſs-money to ſerve in the king's wars, and hides himſelf when he ſhould go.

ARRESTO *facto ſuper bonis mercatorum alienigenorum*, &c is a writ which lies for a denizen againſt the goods of ſtrangers, or perſons of another country, found within this kingdom, in recompence of goods taken from him in that country, after he hath been denied reſtitution there.

This anſwers to what among the ancient civilians was called *clarigatio*, now barbarouſly REPRISALIA.

ARRETED, ARRECTACUS, is ſometimes uſed in our ancient LAW-*books* for imputed, or laid to.—As, no folly may be *arreted* to one under age.

ARRETS, among *Farriers*, denote a ſort of mangy tumours on the ſinews of the hind legs of a horſe, between the ham and the paſtern; called alſo *rat-tails*.

The name is taken from the reſemblance they bear to the *arretes*, or back-bones of fiſhes.

ARRHABONARII, in *Eccleſiaſtical Hiſtory*, a ſect, in the ſixteenth century, who held that the euchariſt is neither the real fleſh and blood of Chriſt, nor yet the ſign of them, but only the pledge or earneſt thereof.

The word is derived from ἀῤῥαβων, *arrha*, *earneſt*.

ARRHÆ, or *Argentum Dei*. See EARNEST, &c.

ARRHAPHON, denotes a ſkull without ſutures, found to be the cauſe of incurable CEPHALALGIÆ.

ARRHENOGOGON, in *Botany*, a name given by ſome to the *parietaria*, or PELLITORY *of the wall*.

ARRHEPHORIA, a feaſt among the Athenians, inſtituted in honour of Minerva, and Herſe, daughter of Cecrops.

The word is compoſed of ἀῤῥητον, *myſtery*, and φερω, *I carry*; on account of certain myſterious things which were carried in proceſſion at this ſolemnity.

Boys, or, as ſome ſay, girls, between ſeven and twelve years of age, were the miniſters that aſſiſted at this feaſt, and were denominated ἀῤῥηφοροι.

This feaſt was alſo called *Herſiphoria*, from Herſe, the daughter of Cecrops, on whoſe account it is ſaid to have been firſt eſtabliſhed.

ARRIAGI, in the *Materia Medica*, a name given by ſome authors, particularly by Serapion and Aviſenna, to a fine kind of CAMPHOR.

ARRIERE-BAN, or ARIERE-*ban*, in the *French Cuſtoms*, is a general proclamation, whereby the king ſummons to the war all that hold of him; both his vaſſals, i. e. the nobleſſe, and the vaſſals of his vaſſals.

M. Caſeneuve takes the word to be compoſed of *arriere* and *ban*: the *ban*, according to him, denotes the convening of the nobleſſe or vaſſals, who hold fees immediately of the king; and *arriere*, thoſe who only hold of the king mediately.

To the provoſt of Paris belong the convoking and commanding of the *arriere-ban*.

ARRIERE-*fee*, or *fief*, is a FEE dependent on ſome other ſuperior one.

Arriere-fees commenced at the time when the counts and dukes, rendering their governments hereditary in their families, diſtributed to their officers certain parts of the royal domains which they found in their provinces; and even permitted thoſe officers to gratify the ſoldiers under them with parts thereof.

ARRIERE-*guard*. See REAR-*guard*.

ARRIERE-*vaſſal*, or *tenant*, the VASSAL or tenant of another vaſſal or tenant.

ARROBAS, or AROBAS. See AROBE.

ARROGATION; ſee ADROGATION.

ARRONDIE, in *Heraldry*. CROSS-*arrondie*, or *rounded*, is that whoſe arms are compoſed of ſections of a circle, not oppoſite to each other, ſo as to make the arm bulge out thicker in one part than another; but both the ſections of each arm lie the ſame way, ſo that the arm is every where of an equal thickneſs; and all of them terminating at the edges of the eſcutcheon, like the plain croſs.

ARROW, a miſſive weapon of offence, ſlender, pointed and barbed, made to be caſt or ſhot with a bow. See ARCHERY.

We ſay, a flight of *arrows*: *arrows* are alſo called *ſhafts*.

ARROW-*makers* are called *fletchers*, who were formerly, as well as *bowyers*, perſons of great conſequence in the commonwealth.—*Arrow*-heads and quarels were to be well boched or braſed, and hardened at the points with ſteel; the doing of which ſeems to have been the buſineſs of the *arrow*-ſmith. Vid. Stat. 7 H. IV. c. 7.

ARROW, in *Aſtronomy*, *Trigonometry*, &c. See SAGITTA.

ARROW, in *Fortification*, is a work placed at the ſaliant angles of the glacis, and conſiſts of two parapets, each forty toiſes long. This work has a communication with the covert-way, of about twenty-four or thirty feet broad, called *caponier*; and a ditch before it, of five or ſix toiſes.

ARROW, in *Surveying*, is uſed for ſmall ſtraight ſticks about two feet long, ſhod with iron ferrils. Their uſe is to ſtick into the ground, at the end of the CHAIN.

ARROW, *elf*. See ELF-*arrows*.

ARROW, *magical*, a ſort of weapon very common among the barbarous inhabitants of Lapland, and many other of the northern climates; and ſuppoſed to poſſeſs very ſtrange virtues.

ARROW, *wild-fire*. See WILD-FIRE.

ARROW-*head*, *ſagittaria*, in *Botany*, a genus of the *monoecia polyandria* claſs. Its characters are theſe: it hath male and female flowers on the ſame plant; the male flowers have a permanent empalement of three concave leaves; they have three roundiſh petals, which ſpread open, and many awl-ſhaped *ſtamina*, collected into a head terminated by erect ſummits. The female flowers are ſituated below the male; theſe have a three-leaved empalement, and three petals as the male, but no *ſtamina*; they have many compreſſed *germina* collected in a head, ſituated upon very ſhort ſtyles, and have permanent acute *ſtigmata*. The *germina* afterwards become oblong compreſſed ſeeds, having longitudinal borders, and are collected in globular heads. There are two ſpecies. See SAGITTARIUM *alexipharmacum*.

ARROW-*headed graſs*. See TRIGLOCHIN.

ARROW-*root*, *Indian*, *maranta*, in *Botany*; a genus of the *monandria monogynia* claſs. Its characters are theſe: the flower hath one petal of the grinning kind, with an oblong compreſſed tube cut into ſix ſmall ſegments, repreſenting a lip-flower. It has one membranaceous *ſtamen*, appearing like a ſegment of the petal, and a roundiſh *germen* ſituated under the flower, which turns to a roundiſh three-cornered capſule with three valves, containing one hard rough ſeed. There are two ſpecies, natives of the warm parts of America.

It is eſteemed a ſovereign remedy againſt the bite of waſps, and the poiſon of the MANCHINEEL-*tree*.

ARS *Notoria*. See NOTORIUS.

ARS *Theſſalica*, *Theſſalian art*, is uſed by *Ancient Writers*, for a ſpecies of MAGIC, whereby, it is pretended, they could draw the moon and ſtars out of heaven.

It was denominated *Theſſalian* from its ſuppoſed inventors, the people of Theſſaly.

ARSCHIN, a long meaſure uſed in China, to meaſure ſtuffs; of the ſame length with the Dutch ell, which is two feet eleven lines.

ARSE-*verſe*, in *Antiquity*, a term, or formula, inſcribed on doors, to prevent fire.

It is ſaid to be of Tuſcan origin, where the word *arſe* ſignies *avert*, and *verſe*, *fire*. Pitiſc. Lex. Ant.

ARSELLA, in *Botany*, a name given by ſome of the

Greek writers, to the *argemone*, a kind of wild poppy; and by others, to the common *agrimony*. Both one and the other of theſe plants they alſo ſometimes called SARCOCOLLA.

ARSENAL, a royal or public magazine, or place appointed for the making and keeping of arms, neceſſary either for defence or aſſault.

The *arſenal* of Venice is the place where the gallies are built and laid up.—The *arſenal* of Paris is that where the cannon or great guns are caſt. It has this inſcription over the gate:

Ætna hæc Henrico vulcania tela miniſtrat,
Tela Gigantæos debellatura furores.

There are *arſenals*, or ſtore-houſes, appropriated to naval furniture and equipments.—At Marſeilles is the *arſenal* for the gallies; and at Toulon, Rochefort, and Breſt, are thoſe for the men of war.

ARSENIC, ARSENICUM, in *Natural Hiſtory*, a ponderous mineral ſubſtance, volatile and uninflammable, which gives a whiteneſs to ſeveral metals in fuſion, and proves extremely cauſtic, or corroſive, to animals, ſo as to become a violent poiſon.

The word is compounded of *ανηρ*, *man*, or *αρσην*, *male*, and *νικαω*, *I kill*; alluding to its poiſonous quality.

Arſenic is dug out of mines in Saxony, near Goſlar; in Bohemia, in the valley of Joachim; and in England, in the Mendip hills, in great quantities. It has ſo ſtrong a corroſive quality, as ſometimes to burn and ulcerate the hands and feet of the miners; and is a deadly poiſon for all known animals. All the three kinds of *arſenic* are extracted from it; and it likewiſe ſerves to make *zaffera*, uſed by potters in giving a blue colour to their veſſels; and the *encauſtum cœruleum*, or that kind of blue ſometimes uſed by painters; and often by women, to mix with their ſtarch for whitening and ſtiffening linen. The way to make all theſe is taught by Kunkel, in his Art of making Glaſs.

Arſenic is made by ſublimation from COBALT: the method of which, as practiſed in Hungary, is given us by Dr. Krieg, in the Philoſophical Tranſactions, Nº 293.—The COBALT being beat to powder, and the light ſandy part waſhed off, by a current of water, they put what remains into the furnace; the flame of which paſſing over the powder, takes along with it the *arſenical* part, in form of a ſmoke; which being received by a chimney, and carried thence into a cloſe wooden channel, ſticks by the way to the ſides; and is ſcraped off, in form of a whitiſh or yellowiſh powder.—From what remains of the *cobalt*, they proceed to make SMALT.

Arſenic conſiſts of an acid ſalt, and a kind of mercurial metallic ſubſtance, which diſcovers itſelf when it is diſtilled in a retort, mixed with ſoap, ſuet, oil, or any fat or oily ſubſtance: for with a ſtrong degree of fire, the *arſenic* will be raiſed into the neck of the retort in a metallic form, like *antimony*. The ſulphur contained in *arſenic* is in ſo ſmall a proportion, that it does not flame when caſt on burning coals; though *cobalt* contains a great quantity of ſulphur, which conſequently has been ſeparated from the *arſenical* parts in the calcination and deflagration, and ſo evaporated: but the ſmell of *arſenic* proves, that ſome ſulphur ſtill remains in it.

Arſenic is very volatile; for if any quantity of it is put into a crucible, and ſet over a fire, it neither burns, nor perfectly melts, but it will preſently evaporate in white fumes, without leaving any remainder. Geoffroy. This poiſonous mineral, though not found native in its perfect form, but buried in ores of various kinds, yet is capable of being ſeparated, and raiſed out of that ore, by the vapours continually paſſing through the earth; and, in this caſe, is carried up into the air, and occaſions many of the epidemical and fatal diſeaſes, to which the countries, where minerals are found in the earth, are ſubject. Delafont does not ſcruple to attribute the plague itſelf to the air's being infected with theſe *arſenical* exhalations, entering the human body, either by the pores, or by reſpiration, or both.

Arſenic is attracted with a different force by different metals, and attracts them reciprocally: of all metals, it abſorbs iron moſt greedily; after this, copper, tin, lead, ſilver, and gold, in this order of ſucceſſion; therefore, all metals may be freed from the foulneſs of *arſenic* by iron. The *ſcoriæ* may be uſed for this purpoſe in fuſion, in an open fire; for though they do not produce this effect as *ſcoriæ*, yet here being reduced to iron again, they act in the ſame manner as if pure iron had been put in.

Lead mixed with *arſenic*, and expoſed to the fire, is, in great part, immediately carried away in form of a thick ſmoke; the remainder is a glaſs of a fine ſaffron colour. Silver is alſo penetrated by *arſenic* in the ſame manner, and loſes its malleability; but the *arſenic* vaniſhes from it in a ſtrong fire, in the form of a ſmoke. Gold, penetrated by *arſenic*, becomes very brittle, and loſes its colour; and, being ſuddenly thrown into a violent fire part of it is ſublimed.

The ſmalleſt quantity of *cryſtalline arſenic*, being mixed with any metal, renders it friable, and abſolutely deſtroys its malleability.

Hence, the refiners dread nothing ſo much as *arſenic* in their metals; nor could any thing be ſo advantageous to them, were ſuch a thing to be had, as a *menſtruum* that would abſorb, or act on *arſenic* alone; for then their metals would be readily purified, without flying off, or evaporating.

A ſingle grain of *arſenic* will turn a pound of copper into a beautiful white metal, called *alchemy*, looking like ſilver. This hint many perſons have endeavoured to improve on, for making ſilver, but in vain, as the mixture could never be brought to ſuſtain the hammer: ſome have been hanged for coining ſpecies of this ſpurious ſilver.

The chemiſts furniſh ſeveral preparations of *arſenic*, which all turn on repeated ablutions and ſublimations, to blunt its corroſive ſalts, and change it into a ſafe medicine, after the manner of ſublimate.—Such are *ruby of arſenic*, &c. But it ſcarce appears worth the pains.

Arſenic, though a virulent poiſon, has been introduced into medicine. Mr. Boyle mentions a balſam made of it, with nitre and ſpirit of wine, or vinegar, as efficacious in the cure of venereal ulcers.

Dr. Cheyne mentions pills made of *arſenic*, as uſed for the cure of obſtinate quartans.

Arſenic is applied to many mechanical purpoſes. It is uſed by dyers, as an ingredient in their compoſitions for ſcarlets, and other fine red colours; by goldſmiths, for enamelling; by makers of glaſs, for promoting the fuſion of fritt, and the tranſparency of glaſs; by potters, for a white glazing; by aſſayers, in form of glaſs, for promoting the ſcorification of ores which contain tin and antimony, for the preparation of compound metals, and for whitening copper and braſs. Neumann obſerves, that a beautiful metal, like the fineſt ſteel, may be made by melting caſt iron with *arſenic*, glaſs, and a little tin; and that a metal reſembling ſilver may be made from iron, tin, *arſenic*, and perhaps a little copper. Mr. Brandt (Act. Upſal. 1733.) propoſes to make a varniſh for ſhips, of *arſenic*, with pitch, ſulphur, or roſin, to preſerve the timber from rotting, and from worms. See Neumann's Natural Hiſtory of this ſubſtance, and his account of its various kinds, effects, uſes, &c. in Dr. Lewis's edition of his Works, p. 140, & ſeq.

Arſenic is by ſome ranked in the claſs of *ſulphurs*.

There are divers kinds of *arſenics*; viz. yellow, red, and cryſtalline or white.

ARSENIC, *native*, is called ORPIMENT. It is of a yellow or orange colour; whence it is alſo denominated *auripigmentum*. It is chiefly found in copper-mines, in a ſort of glebes or ſtones, of different figures and ſizes. Its colour, though always yellow, yet admits of different ſhades and mixtures, as a golden yellow, reddiſh yellow, greeniſh yellow, &c. It is found to contain a portion of gold, but ſo little, as not to quit the coſt of ſeparating it; but there is beſides this a yellow factitious *arſenic*, made of the white *arſenic* and ſulphur.

Our yellow and red *arſenics* are artificial, being only white *arſenic* mixed with different proportions of ſulphur. The white is the ſtrongeſt, the yellow is weaker, and the red weakeſt. White *arſenic*, ſublimed with one tenth of its weight of ſulphur, is yellow; and with one fifth it is red. Both the yellow and the red foſſil *arſenics*, when of a ſmooth texture, are called *zarnichs*; but when compoſed of ſmall ſcales or leaves, they are called *auripigmenta*.

ARSENIC, *regulus of*, is the moſt fixed and compact part thereof, prepared by mixing it with pot-aſhes and ſoap, then fuſing the whole, and caſting it into a mortar; upon which the heavieſt part falls to the bottom.

ARSENIC, *cauſtic oil of*, is a butyrous liquor, like butter of antimony, prepared of *arſenic*, and corroſive ſublimate, being a combination of marine acid with the *arſenic*.—It ſerves to eat off fungous fleſh, and to cleanſe carious bones, &c.

Some recommend rock cryſtal reduced to an impalpable powder, as an antidote againſt *arſenic*; but large quantities of milk, oils, or fat broths, are more to be depended on, while the poiſon remains in the *primæ viæ*: but after it has got into the blood, alexiterial medicines are to be uſed, ſuch as Venice treacle, mithridate, bezoar, powder of vipers, contrayerva root, and ſuch like, and afterwards a milk diet. Geoffroy.

ARSENICAL *magnet*, *magnes arſenicalis*, is a preparation of antimony, with ſulphur and white *arſenic*.

ARSENOTHELYS, among *Ancient Naturaliſts*, the ſame with hermaphrodite.

The Greeks uſe the word both in ſpeaking of men and beaſts.—It is formed from αρσην and θηλυς, *male* and *female*.

ARSMART, *perſicaria*, in *Botany*. Its characters are theſe: the flower hath no empalement; it hath one petal, which is permanent, and cut into five ſegments, which ſpread open; it has in ſome ſpecies five, and in others ſix ſhort ſtamina, terminated by roundiſh ſummits, and a three-cornered germen, ſupporting two or three ſhort ſlender ſtyles, crowned by ſingle ſtigmas. The germen afterwards becomes a roundiſh, acute-pointed ſeed, wrapped up in the petal of the flower.

This, in the Linnæan ſyſtem, belongs to the genus POLYGONUM.—There are ſeveral ſpecies.

The common *arſmart* without ſpots, is by ſome eſteemed a good diuretic, but it ſeems too acrid to be given internally without great caution. Externally it is uſed by many in cataplaſms againſt indurated tumours, and in inveterate ulcers: that with ſpotted leaves has no virtues.

Arſmart, by its heat and pungency, becomes almoſt intolerable to the tongue; and hence it obtains in ſcorbutic, hypochondriac, and other diſorders, ariſing from a ſluggiſh circulation of the fluids.

Several value its diſtilled water for its efficacy in the ſtone in the kidneys or bladder. Some alſo uſe the plant in external applications, particularly to diſſipate bruiſed blood; others for the tooth-ach, &c.

ARSIS *and theſis*, in *Proſody*, are names given to the two proportional parts into which every FOOT or RHYTHM is divided.

By *arſis* and *theſis* are uſually meant no more than a proportional diviſion of the metrical feet, made by the hand or foot of him that beats the time.

As in meaſuring the quantities of words the hand is elevated, as well as let fall; that part of the time which is taken up in meaſuring the foot, by lifting the hand up, is termed *arſis*, or *elevatio*; and the part where the hand is let fall, *theſis*, or *poſitio*. Vid. Auguſtin. de Muſica, lib. ii. cap. 10. *In plaudendo enim quia elevatur & ponitur manus, partem pedis ſibi elevatio vendicat, partem poſitio.*

Fugha per ARSIN *& theſin*. See FUGUE.

ARSON, *ab ardendo*, in the law of England, a felony at common law, in maliciouſly and voluntarily burning the houſe, or out-houſes, of another by night or by day. See Hawkins's Pleas of the Crown, book i. chap. 39.

As to the puniſhment of *arſon*, it ſeems now clearly ſettled, that the principal, not being in holy orders, is excluded from the benefit of clergy. See Hawk. lib. cit. book ii. chap. 33. ſect. 107.

In ſome places this crime is puniſhed by burning the offender. And this was the old Roman law. See INCENDIARY.

ARSURA, in *Ancient Cuſtoms*, a term uſed for the melting of gold or ſilver, either to refine them, or to examine their value. Spelman.

The method of doing this is explained at large in the Black Book of the Exchequer, aſcribed to Gervaiſe, in the chapter De Officio Militis Argentarii, being in thoſe days of great uſe, on account of the various places, and different manners in which the king's money was paid.

ARSURA is alſo uſed for the loſs or diminution of the metal in the trial. In this ſenſe, a pound was ſaid *tot ardere denarios*, to loſe ſo many penny-weights.

ARSURA is alſo uſed for the duſt and ſweepings of ſilverſmiths, and others, who work in ſilver melted down. Du-Cange.

ARSURA is alſo uſed, in ſome writers, for the diſeaſe called ERYSIPELAS, or IGNIS *ſacer*.

ART, is defined to be a habit of the mind preſcribing rules for the due production of certain effects; or the introducing of changes in bodies from ſome foreknowledge and deſign in a perſon endued with a principle or faculty of acting.

The word *art* is derived from αρος, *utility*, *profit*; and is found in that ſenſe in Æſchylus.

According to Lord Bacon, it is a proper diſpoſition of the things of nature by human thought and experience, ſo as to make them anſwer the deſigns and uſes of mankind. Nature, according to that philoſopher, is ſometimes free, and at her own diſpoſal; and then ſhe manifeſts herſelf in a regular order: as we ſee in the heavens, plants, animals, &c.—Sometimes ſhe is irregular and diſorderly, either through ſome uncommon accident, or depravation in matter, when the reſiſtance of ſome impediment perverts her from her courſe; as in the production of monſters.—At other times ſhe is ſubdued and faſhioned by human induſtry, and made to ſerve the ſeveral purpoſes of mankind.—This laſt is what we call *art*.—In which ſenſe, *art* ſtands oppoſed to *nature*.

Hence, the knowledge of nature may be divided into the hiſtory of *generation*, of *pretergeneration*, and of *arts*.—The firſt conſiders NATURE at *liberty*; the ſecond, her *errors*; and the third, her *reſtraints*.

ART is alſo uſed for ſcience or knowledge reduced into *practice*.

Several of the ſchoolmen hold logic and ethics to be *arts*; inaſmuch as they do not terminate in mere *theory*, but tend to *practice*.

In this ſenſe ſome branches of the mathematics alſo are *arts*; others, matters of *doctrine*, or *ſcience*.—*Statics* is wholly ſcientifical, as it comprehends the mere contemplation of motion: *mechanics*, on the contrary, is an *art*, as it reduces the doctrine of *ſtatics* into practice.

ART is more commonly uſed to denote a certain ſyſtem or collection of rules, precepts, and inventions or experiments, which being duly obſerved, make the things a man undertakes ſucceed, and render them advantageous and agreeable.

In this ſenſe, *art* is oppoſed to *ſcience*, which is a collection of ſpeculative principles, and concluſions.

The nature and origin of *art*, and its diſtinction from ſcience, are conſidered more at large in the preface to this work.

Arts, according to the foregoing definition, may be divided into *active* and *effective*.—Such as leave no external effect after their operation, as dancing, fiddling, &c. are called *active* or *practical arts*: thoſe which do leave an effect behind them, as painting, &c. are called *effective arts*.

Farther, with reſpect to their ſcope and object, they may be divided into *human*, as *medicine*; and *divine*, as *theology*.

ARTS, *human*, again, may be ſubdivided into *civil*, as *law*, *politics*, &c. *military*, as *fortification*, &c. *phyſical*, as *agriculture*, *chemiſtry*, *anatomy*, &c. *metaphyſical*, as *logic*, pure *mathematics*, &c. *philological*, as *grammar*, *criticiſm*, &c. *mercantile*, to which belong the *mechanical arts* and *manufactures*. See each in its place.

Arts are more properly divided into *liberal* and *mechanical*.

ARTS, *liberal*, are thoſe that are noble, and *ingenious*; or which are worthy of being cultivated without any immediate regard to the lucre ariſing from them.—Such are *poetry*, *muſic*, *painting*, *grammar*, *rhetoric*, the *military art*, *architecture*, and *navigation*.

ARTS, *mechanical*, are thoſe, wherein the hand and body are more concerned than the mind; and which are chiefly cultivated for the ſake of the profit attending them.—Of which kind are moſt of thoſe which furniſh us with the neceſſaries of life, and are popularly known by the name of trades.—Such are *weaving*, *turnery*, *brewing*, *maſonry*, *clock-making*, *carpentry*, *joinery*, *foundery*, *printing*, &c.

The *mechanical arts* take their denomination from μηχανη, *machine*; as being all practiſed by means of ſome machine or inſtrument.

With the *liberal arts* it is otherwiſe; there being ſeveral of them which may be learnt and practiſed without any inſtrument at all: as *logic*, *eloquence*, *medicine* properly ſo called, &c.

The *arts* which relate to the ſight and hearing, Lord Bacon obſerves, are reputed *liberal*, beyond thoſe which regard the other ſenſes, and are chiefly employed in matters of luxury: theſe are uſually called the *fine arts*; ſuch are *poetry*, *painting*, *ſculpture*, *muſic*, *gardening*, and *architecture*.

It has been well noted by philoſophers, that, during the riſe and growth of ſtates, the *military arts* chiefly flouriſh; when arrived at their height, the *liberal arts*; and when in a declining ſtate, the *voluptuary arts*.

There are alſo divers particular *arts*; as the *art* of *memory*, the *art* of *deciphering*, the *art* of *ſwimming*, *art* of *diving*, &c.

Democritus maintained, that men learnt all their *arts* from brutes; that the *ſpider* taught them *weaving*; the *ſwallow*, *building*; the *nightingale*, *muſic*; and ſeveral kinds of *medicine*.

ART, *term of*. See TERM.

ARTS, *bachelor of*. See BACHELOR.

ARTS, *maſter of*. See MASTER, DEGREE, FACULTY.

ART is alſo applied to divers imaginary, and even ſuperſtitious doctrines and inventions.—Such are, Lully's ART, or the *tranſcendental* ART. This is an art by means of which a man may diſpute whole days on any topic in nature without underſtanding the leaſt tittle of the thing in diſpute; thus called from its inventor Raymond Lully. It conſiſts chiefly in diſpoſing the ſeveral ſorts of beings into divers ſcales or climaxes, to be run down in a deſcending progreſſion.—Thus, whatever was propoſed as the ſubject of diſcourſe, they would ſay, firſt, it is a being, and conſequently, one true, good, perfect: then, it is either created, or uncreated. Again, every created being is either body or ſpirit, &c.

ARS *notoria* is a pretended manner of acquiring ſciences by infuſion, without any other application than a little faſting, and performing a few ceremonies. It was ſolemnly condemned by the Sorbonne in 1320.

ART, *St. Anſelm's*, is a ſuperſtitious manner of curing wounds, by barely touching the linen wherewith thoſe wounds had been covered.

Delrio, in his Diſquiſitiones Magicæ, obſerves, that ſome Italian ſoldiers, who practiſed this *art*, attributed the invention thereof to St. Anſelm; but he aſſures us withal, that it was really invented by Anſelm of Parma, a celebrated magician.

ART, *St. Paul's*, is a branch of the *ars notoria*, ſo called as being ſuppoſed to have been taught by St. Paul, after his being taken up into the third heaven.

ART *and Part*, is a phraſe uſed in the north of England, and in Scotland.—When any one is charged with a crime, they ſay he is *art and part* in committing the ſame; that is, he was concerned both in the contrivance and in the execution of it.

The facts inferring *art and part* need not to be particularly laid in the libel or indictment, for theſe general words, as terms of ſtated ſignification, are ſufficient. Yet theſe facts may be ſet forth, and it is proper ſo to do, if the proſecutor chooſes to confide in the court rather than in the jury. Vid. Mackenz. Crim. Law.

One may be *art and part*, 1. By giving counſel to perpetrate, without diſtinction, whether the crime would have been committed without ſuch counſel or not: this being what can never be perfectly known. But it is to be obſerved, that in the more atrocious crimes, he that gives counſel is equally puniſhed as he that commits them; but in the leſs atrocious, leſs ſeverely. And ſometimes reaſons of mitigation are taken from the age, the manner of adviſing, &c.

2. By aid and aſſiſtance, and that either previous, or concomitant, or ſubſequent, to the commiſſion of the crime.

3. By a clear and explicit mandate to commit the crime, or to do ſomewhat unlawful in itſelf, which with great probability might produce it, if executed by the hand of the mandatory, and not that of another.

ART, *hermetical*. See HERMETICAL.

ART, *hyſſopic*. See HYSSOPIC.

ARTABA, an ancient meaſure of capacity uſed by the Perſians, Medes, and Egyptians.

The Perſian *artaba* is repreſented by Herodotus as bigger than the Attic *medimnus* by three Attic *chœnixes*; from which it appears, that it was equal to $6\frac{3}{4}$ Roman *modii*; conſequently that it contained $166\frac{2}{3}$ pounds of wine or water; or $126\frac{2}{3}$ pounds of wheat.

The Egyptian *artaba* contained five Roman *modii*, and fell ſhort of the Attic *medimnus* by one *modius*; conſequently held $133\frac{1}{3}$ pounds of water or wine, 100 pounds of wheat, or 60 of flour.

The Babylonians allowed their god Belus twelve *artabas* of fine flour for his daily ſuſtenance; which will amount to 60 Roman *modii*, and conſequently 720 pounds of flour.

The Median *artaba* was of the ſame content with the Attic *medimnus*, and conſequently equal to ſix Roman *modii*, held 160 pounds of water, or wine, and 120 of wheat. Beverin. de Pond. & Menſ. part 2. p. 125.

ARTADA, or ARTADAR, is uſed by ſome writers for REALGAR burnt, or calcined; commended by Paracelſus in malignant ulcers, and by Foreſtus for the cure of the POLYPUS.

ARTANITA *of the ancients*. See LEONTOPETALON.

ARTEDIA, in *Botany*, a genus of the *pentandria digynia* claſs. We have no Engliſh name for this genus. The characters are, that it is an umbelliferous plant; the rays of the large umbel are difform, the flowers of the ſmall ones in the diſk are male, and the rays are hermaphrodite. Theſe have each five ſlender ſtamina; thoſe flowers that compoſe the rays have a ſmall germen at bottom, which afterward becomes a roundiſh compreſſed fruit, with a leafy border; this ſplits into two, and contains two oblong ſeeds with ſcaly borders. There are two ſpecies, natives of the Eaſt.

ARTEMISIA, in *Antiquity*, yearly feſtivals obſerved in divers cities of Greece, particularly Delphi, in honour of Diana, ſurnamed Artemis.

In the *Artemiſia*, a mullet was ſacrificed to this goddeſs, as being thought to bear ſome reſemblance to her, becauſe it is ſaid to hunt and kill the SEA-*hare*. Athen. lib. vii.

ARTEMISIA, in *Botany*. See MUGWORT.

ARTEMONITES, in *Church Hiſtory*, Chriſtians in the third century who denied the divinity of Chriſt, aſſerting him to have only had a human nature, though divinely ſent, and more excellent than the prophets. Prateol. Elench. Hær. l. i. n. 70.

ARTENNA, in *Zoology*, the name of a water-bird, of the ſize of a hen, of a browniſh colour on the back, and white on the belly; having a hooked bill, and its three fore-toes connected by a membrane, but the hinder one looſe. It is found on the iſland Tremiti in the Adriatic ſea, and is ſuppoſed to be the *avis* DIOMEDIS of the ancients. Ray.

ARTERIA *aſpera*. See ASPERA.

ARTERIA *ſacra*. See SACRA.

ARTERIA *venoſa*, a name given by the ancients to what we call the pulmonary vein, or that veſſel whereby the blood is conveyed from the lungs to the left ventricle of the heart. Gorr. Def. Med. p. 54.

The denomination was anciently given it, on a ſuppoſition of its being an air veſſel, and that it ſerved for the conveyance of the vital aura from the lungs to the heart.

ARTERIACS, ARTERIACA, medicines proper for diſorders of the *trachea*, and the voice.

Arteriacs are reduced by Galen into three kinds: 1. Such as are void of all acrimony, ſerving to mollify the aſperities of the part; to which kind belong, gum tragacanth, *aſter ſamius*, *amylum*, or ſtarch, milk, &c. 2. Thoſe of an acrimonious quality, whereby they ſtimulate even the ſound parts; ſuch are honey, turpentines, bitter almonds, iris root, &c. 3. Thoſe of an intermediate kind, ſoft and mild, yet detergent; ſuch are butter, and divers preparations made of almonds, milk, honey, &c.

ARTERIAL, or ARTERIOUS, in *Anatomy*, ſomething that relates to the arteries. See ARTERY.

The *arterial* blood is ſuppoſed more warm, florid, and ſpirituous, than the venal.

ARTERIOSA *vena*, or *arterial vein*, a denomination given to the pulmonary artery, or that veſſel whereby the blood is conveyed from the right ventricle of the heart to the lungs.

ARTERIOSUS *canalis*, is a tube in the heart of a *fœtus*; which, with the *foramen ovale*, ſerves to maintain the circulation of the blood, and to divert it from the lungs.

ARTERIOTOMY, in *Chirurgery*, &c. the operation of opening an artery; or of letting blood with a lancet by the arteries, practiſed in ſome extraordinary caſes.

The word is formed of αρτηρια, and τεμνω, *ſeco*, *I cut*.

The word *arteriotomy*, according to its etymology, ſignifies that chirurgical operation, by which, for the ſafety of the patient, the arteries are opened almoſt in the ſame manner with the veins, in order to procure a diſcharge of blood. But though in our own days this operation is not ſo frequently attempted as in former ages, for fear not only of too great an effuſion of blood, but alſo of an ANEURISM; yet if it is cautiouſly performed, it has the ſuffrage of the greateſt phyſicians in its favour; as being a practice of ſingular uſe, and unattended with any bad conſequences. Accordingly we read that the more ancient phyſicians opened arteries in various parts of the body.

Arteriotomy, however, being a hazardous operation, is ſeldom uſed with deſign, except in the forehead, the temples, and behind the ears, where the arteries are eaſily cloſed again by means of the *cranium* underneath, which would be very difficult to effect in any other part.—In the other parts it uſually proves fatal; and we have numerous inſtances of perſons killed in bleeding, by the opening an artery inſtead of a vein.

Opening an artery is much more difficult than the opening a vein, as the veſſel ſeldom appears plainly through the ſkin, and there is no guide but its vibration under the finger.

In the operation of *arteriotomy*, the patient muſt be placed in a good light, and the ſurgeon muſt place two fingers of his left-hand, at a ſmall diſtance from each other, both on the artery. He muſt then obſerve the courſe of the veſſel, and cut down into it deeper than in *phlebotomy*, and raiſe the point of the lancet, ſo as to make a ſufficient orifice: in this he need not fear the cutting of the veſſel quite through, for even that is attended with no ill conſequences after deligation. If now the blood follows the lancet in a very florid and ſalient ſtream, you may be ſatisfied the artery is well opened: if this is not the caſe it muſt be cut again; but as in this operation, the fine point of a lancet is apt to be broke againſt the bone, the uſe of a ſmall ſcalpel is preferable. A pound or a pound and half of blood ſhould be taken by this operation: when the ſufficient quantity of blood is taken, the deligation muſt be made with three compreſſes, each larger than the other, laying on the ſmalleſt firſt, in which muſt be included a farthing, a bit of lead, or of chewed paper, to compreſs the artery againſt the bone, and the head muſt continue tied up with a proper bandage eight days. Heiſter.

Fernelius, Severinus, Tulpius, and Catherwood, have endeavoured to introduce *arteriotomy* in apoplectic caſes, as much preferable to veneſection.

ARTERY, in *Anatomy*, a hollow fiſtulous canal, appointed to receive the blood from the ventricles of the heart, and diſtribute it to all parts of the body, for the maintenance of heat and life, and the conveyance of the neceſſary nutriment.—See *Tab. Anat.* (*Angeiol.*) *fig.* 1.

The word is, ſome imagine, derived from αηρ, *aer*, the *air*, and τηρεω, *ſervo*, *to keep*; but others, who underſtand

ſtand the uſe of the part better, derive it from *αιρω, I lift*, becauſe of its continual throbbing or beating.

The *arteries* are ordinarily compoſed of three coats or membranes. The firſt or outermoſt, nervous or tendinous; being a thread of fine blood-veſſels with nerves, for nouriſhing the other coats. The ſecond muſcular, and made up of circular, or rather ſpiral fibres; of which there are more or fewer ſtrata according to the bigneſs of the *artery:* theſe fibres have a ſtrong elaſticity, by which they contract themſelves with force, when the power by which they have been ſtretched out ceaſes. The third and inmoſt coat is a fine, denſe, tranſparent membrane, keeping the blood within its channels, which otherwiſe, upon the dilatation of an *artery*, would eaſily ſeparate the ſpiral fibres from one another. As the *arteries* grow ſmaller, theſe coats grow thinner.

All the *arteries* are conical, i. e. they begin with the trunk, and, growing leſs and narrower, end in branches ſo minute, that they eſcape the ſight, unleſs aſſiſted with microſcopes; by which, in the tails of tadpoles, and very ſmall eels, the extremities of the *arteries* ſeem, by the ſwift uninterrupted courſe of the blood, to be inoſculated, or continued to the originations of the veins: though by the tranſparency of thoſe veſſels, the actual continuation be not viſible.

The coats of the *arteries* are of a very denſe, cloſe contexture; by which means the blood not being viſible through them, they generally appear white. Add, that the blood, proceeding from a greater capacity to a leſs, is thereby ſomewhat obſtructed in its paſſage; but being forced on by the motion of the heart, it diſtends the coats, and thereby occaſions a ſalient motion, called the PULSE. —By this thickneſs and whiteneſs of the *arteries*, with the pulſation obſerved therein, *arteries* are diſtinguiſhed from veins.

The pulſe of the *arteries*, like that of the heart, conſiſts of two reciprocal motions, a *ſyſtole* or contraction, and a *diaſtole* or dilatation: but they keep oppoſite times; the *ſyſtole* of the one anſwering to the *diaſtole* of the other.

All the *arteries* of the body, we have obſerved, ariſe in two large trunks, from the two ventricles of the heart. That from the right ventricle is called the *pulmonary artery*, ſerving to carry the blood into the lungs: that from the left, the *aorta*, or *great artery*; which, by its numerous ramifications, furniſhes all the reſt of the body, as far as the remoteſt ſtages of CIRCULATION.

The great *artery*, after it leaves the heart, divides into two large trunks, called the *aſcending*, or upper, and *deſcending*, or lower *trunks*.

The *aſcending trunk*, or *aorta aſcendens*, conveys the blood to the head, and other upper parts of the body, and is ſubdivided into three branches.—The firſt, the right *ſubclavian*, whence ariſe the *carotid*, *vertebral*, *cervical*, right *axillary*, &c.—The ſecond, is the left *carotid*.—The third, the left *ſubclavian*; whence ariſe the left *cervical*, *vertebral*, and *axillary*.—See each deſcribed in its proper article, AXILLARY, CAROTID, CERVICAL, SUBCLAVIAN, VERTEBRAL, &c.

The deſcending trunk, or *aorta deſcendens*, carries the blood to the trunk, and the lower parts of the body.

Out of this ariſe the *bronchial*, *intercoſtals*, *cœliac*, *phrenic*, *meſenteric*, *emulgent*, *ſpermatic*, *iliac*, *umbilical*, *epigaſtric*, *hypogaſtric*, *crural*, &c. with their ſeveral ramifications.—See each in its place.

Mr. Weitbrecht concludes, from the ſmall quantity of blood thrown out of the heart into the *arteries*, and the great reſiſtance in the capillary *arteries*, that all or much the larger ſhare of what is ſent out of the heart, is retained in the *arteries* during the *ſyſtole* of the heart, and is ſent forward into the veins, by the contraction of the *arteries*, but ſo, that the veins can have no pulſation, becauſe ſo much as is received from the veins is thrown into the heart at the ſame time. The ſmallneſs of the quantity of blood thrown out of the heart makes him think, that the pulſation of the *arteries* cannot be ſo much owing to their diſtention, as to their change of place; and he ſays he perceived, upon trial, that all the *arteries* of the body are not dilated or contracted at the ſame time.

The *auricles* alſo, according to him, ſerve to give an *impetus* to the blood in the ventricles of the heart; for the blood moves ſo ſlow in the veins, that its *momentum* would not be ſufficient to diſtend, and to give a ſpring great enough to the ventricles. The pulmonary blood acquiring conſiderable velocity by the motion of the lungs, requires a much leſs *auricle* from the blood of the *vena cava*. Comment. Acad. Petrop. tom. vi. & vii.

A draught of the ſeveral *arteries*, with their diviſions and ſubdiviſions, in their natural order and poſition, as taken from the life, ſee in plate *Anatomy* (*Angeiol. fig.* 6.)

ARTERY is alſo applied to that fiſtulous tube, compoſed of cartilages and membranes, which deſcends from the mouth to the lungs, for the conveyance and reconveyance of the air, in reſpiration.

This is particularly called the *aſpera arteria*, or *trachæa*, and popularly the WIND-*pipe*.

ARTERY, *wounded*. See ANEURISM.

ARTHANITA, in *Botany*. See CYCLAMEN, and SOW-BREAD.

ARTHEL, ſomething caſt into a court, in Wales, or its marches; whereby the court is letted or diſcontinued for the time.—The caſting of *arthel* is prohibited, 26 Hen. VIII. cap. 6.

ARTHRITIC *Waters*. See WATER.

ARTHRITICA, in *Botany*, a name given by ſome to the PRIMROSE, and by others to the *ground*-PINE.

ARTHRITIS, in *Medicine*, a diſeaſe better known under the name of the GOUT.

The word is formed from *αρθρον, articulus, joint*; in regard the chief ſeat of that diſtemper is in the joints.

ARTHRODIA, in *Anatomy*, a ſpecies of ARTICULATION, wherein a flat head of one bone is received into a ſhallow ſocket of another.

The word is formed from *αρθρον, articulus*, and *δεχομαι, recipio, I receive*.

Such is the articulation of the *humerus* with the *ſcapula*.

ARTHRODIA, or ARTHRODIUM, in *Natural Hiſtory*, the name of a genus of CRYSTAL, of which there are five ſpecies. See *Tab. Foſſils, Claſs* 3.

ARTHRODIA, in *Zoology*, a lately eſtabliſhed claſs of *animalcula*, containing thoſe with viſible limbs.

ARTHROSIS, in *Anatomy*, a juncture of two bones, deſigned for motion; called alſo *articulation*.

The word is formed from *αρθρον, articulus*.

ARTICHOKE, in *Botany*, called by the Latins CYNARA, of the *ſyngeneſia polygamia æqualis* claſs. Its characters are theſe: It hath a compound flower made up of many hermaphrodite florets, included in one common ſcaly empalement. The florets are tubulous, equal, and uniform, divided at the top into five narrow ſegments; and they have five ſhort, hairy ſtamina. At the bottom of each is ſituated an oval germen, which afterward becomes a ſingle, oblong, compreſſed, four-cornered ſeed, crowned with long hairy down.

We have two ſorts of *artichokes* that are cultivated in the Engliſh gardens, which we ſhall diſtinguiſh here, only by the names whereby they are generally known among gardeners.

The beſt ſort is what the gardeners call the globe *artichoke*. This hath large heads, with broad brown ſcales, which turn inward; the fleſhy part at the bottom of the ſcales is very thick, and is therefore much preferred to the other, called the French *artichoke*; the ſtalks of which do generally grow taller, with ſmaller heads, formed more conical than thoſe of the globe; the ſcales are narrower, of a greener colour, and frequently turned outward. The fleſhy part, or bottom, is not near ſo thick, and hath a diſagreeable perfumed taſte. This was almoſt totally rooted out of the Engliſh gardens before the hard froſt in 1739-40, when the greateſt part of the roots of the other ſort were deſtroyed; many perſons were ſupplied the following ſpring with plants from Guernſey, where they cultivate only the latter ſort; but ſince the other has been increaſed again, this green ſort has been rooted out of moſt gardens, to make way for the globe *artichoke*.

The manner of propagating this uſeful plant, is from ſlips or ſuckers taken from the old plant in February and March; theſe, if planted in a good ſoil, will produce a good fruit the autumn following. The old *artichoke* ſtocks are to be dreſſed in the latter end of February, or beginning of March; this muſt be thus performed; with a ſpade remove all the earth from about the ſtock, down below the part from which the young ſhoots are produced. Then make choice of two of the cleareſt and ſtraighteſt, and moſt promiſing plants which are produced from the under-part of the ſtock; let theſe be left for a crop; then with a thumb force off all the other buds and young ſhoots cloſe to the head of the ſtock from whence they are produced, and with the ſpade draw the earth about the two plants which are left, cloſing it faſt with the hands to each of them, and ſeparating them aſunder as far as can be without breaking them, then crop off the tops of the leaves which hang down.

When this is done, a crop of ſpinach may be ſowed between the ſtocks, which will be gathered off before they come to ripen; in the beginning of May, when the *artichokes* begin to fruit, all the young plants produced ſince the dreſſing muſt be removed, and all the ſuckers taken off, leaving only the one principal fruit; and when the *artichoke* is fit to gather, the ſtock muſt be cut down cloſe to the ground, that it may ſhoot out new ſprouts before

October, which is the ſeaſon for earthing them, or, as the gardeners call it, landing the *artichoke* ſtocks. Miller.

The earthing them is thus done; cut off all the ſprouts cloſe to the ground, then dig trenches between the rows, covering up the ſtocks with the earth in ridges; thoſe *artichokes* which are planted in a moiſt rich ſoil will always produce the largeſt fruit, but the roots will not live through the winter in a very moiſt one.

The *artichoke* is a pleaſant, wholeſome, and very nouriſhing food; the roots are reckoned to be aperitive, cleanſing, and diuretic; good for the jaundice, and to provoke urine.

The French and Germans eat not only the heads, but alſo the young ſtalks boiled, and ſeaſoned with butter and vinegar. The Italians ſeldom boil the heads, but eat them raw, when young, with ſalt, oil, and pepper.

Artichokes have the reputation of promoting venereal inclinations to a very great degree; the ſtalks, preſerved in honey, are ſaid to be an excellent pectoral; but they ſhould firſt be blanched, like celery.

The common leaves, boiled in white wine whey, are much commended in the jaundice, as is alſo the juice of theſe leaves. James.

ARTICHOKE, *Jeruſalem*, is the root of a ſpecies of the *helianthus*, or SUN-*flower* of the perennial kind, which is propagated in many gardens for the uſe of the kitchen; it is a very agreeably taſted root, but watery and windy, and therefore at preſent generally diſregarded.

It is propagated by planting out the ſmaller roots, or even pieces of the larger, which have buds to them, in the ſpring or autumn; they muſt be allowed a very conſiderable diſtance, for they ſpread immoderately, and multiply very quick. The autumn following, when their ſtems decay, the roots may be taken up for uſe. They are but an unſightly plant, though very tall, and are commonly placed in obſcure corners of a garden. Miller.

ARTICLE, ARTICULUS, a little part or diviſion of a book, writing, or the like.—Aquinas divides his ſum of theology into ſeveral queſtions; and each queſtion into divers *articles*.—Such an account conſiſts of ſo many *articles*.

ARTICLE is alſo applied to the ſeveral clauſes or conditions of a contract, treaty of peace, or the like.

In this ſenſe we ſay, *articles* of marriage, *articles* of capitulation, preliminary *articles*, &c.

ARTICLES *of the clergy*, ARTICULI *cleri*, are certain ſtatutes touching perſons and cauſes eccleſiaſtical, made under Edward II. and III.

ARTICLE *of faith* is by ſome defined a point of Chriſtian doctrine, which we are obliged to believe, as having been revealed by God himſelf, and allowed and eſtabliſhed as ſuch by the church.

The thirty-nine *articles* were founded, for the moſt part, upon a body of *articles* compiled and publiſhed in the reign of Edward VI. They were firſt paſſed in the convocation, and confirmed by royal authority in the year 1562. They were afterwards ratified anew in the year 1571, and again by Charles I. The law requires a ſubſcription to theſe *articles* of all perſons ordained to be deacons or prieſts, 13 El. cap. 12. of all clergymen inducted to any eccleſiaſtical living, by the ſame ſtatute, and of licenſed lecturers and curates, 13 El. cap. 12. and 13 and 14 Ch. II. cap. 4. of the heads of colleges, of chancellors, officials and commiſſaries, and of ſchoolmaſters. By 1 Wil. 3. cap. 18. diſſenting teachers are to ſubſcribe all, except the 34th, 35th, and 36th, and part of the 20th (and in the caſe of Anabaptiſts, except alſo part of the 27th); otherwiſe they are exempted from the benefits of the act of toleration.

ARTICLE, *articulus*, in *Anatomy*, denotes a joint, or juncture, of two or more bones of the body.

ARTICLE *of death*, *articulus mortis*, the laſt pangs, or agony of a dying perſon.

The pope uſually ſends his benediction to the cardinals, &c. *in articulo mortis*.

ARTICLE, in *Arithmetic*, ſignifies the number 10, or any number juſtly diviſible into ten parts; as 20, 30, 40, &c. —Theſe are ſometimes called *decads*, and ſometimes *round numbers*.

ARTICLE, in *Grammar*, denotes a particle uſed in moſt languages for the declining of nouns, and denoting the ſeveral caſes and genders thereof.

The uſe of *articles* ariſes chiefly hence, that in languages which have not different terminations, to expreſs the different ſtates and circumſtances of nouns, there is ſomething required to ſupply that office.

The Latins have no *articles*; but the Greeks, and moſt of the modern languages, have had recourſe to them, for fixing and aſcertaining the vague ſignification of common and appellative names.

The Greeks have their ὁ, the eaſtern tongues their *he emphaticum*; the Italians their *il*, *lo*, and *la*.—The French their *le*, *la*, and *les*.—The Germans their *der*, *das*, *dat*.

The Engliſh alſo have two *articles*, *a* and *the*; which, being prefixed to ſubſtantives, apply their general ſignification to ſome particular things. See letter A.

Some grammarians make the *article* a diſtinct part of ſpeech; others will have it a pronoun; and others a noun adjective. See SPEECH and PRONOUN.

Articles are of great ſervice in a language, as they contribute to the more neat and preciſe expreſſing of ſeveral properties and relations, which muſt otherwiſe be loſt. And hence one great diſadvantage of the Latin, above other languages which have *articles*; in that the *article* being either expreſſed, or left out, makes an alteration in the ſenſe, which the Latins cannot diſtinguiſh. —Thus when the devil ſaid to our Saviour, *Si tu es Filius Dei*, it may either be underſtood, *if thou art a Son of God*, or, *if thou art the Son of God*.—Scaliger, from the want of *articles* in the Latin, has concluded them uſeleſs. The Italians even prefix *articles* to proper names, which do not naturally need any, becauſe they of themſelves ſignify things individually.—Thus they ſay, *il Arioſto*, *il Taſſo*, *il Petrarcha*.—Even the French join the *article* to the proper names of kingdoms, provinces, &c. as *la Suede*, *la Normandie*.—And we likewiſe annex it to the names of certain mountains and rivers; as the *Rhine*, the *Danube*, the *Alps*, &c.

ARTICLE, *indefinite*. The article *a* is ſaid to be *indefinite*, becauſe applied to names taken in their more general and confuſed ſignification; as, he travelled with the port and equipage of *a* prince; where the words, *a prince*, may be underſtood of any prince in the general. Or, *a* reſpects our primary perception, and denotes individuals, as unknown.

ARTICLE, *definite*. The *article the* is ſaid to be *definite*, or *demonſtrative*, as fixing the ſenſe of the word it is put before, to one individual thing. Or *the* reſpects our ſecondary perception, and denotes individuals as known. See DEFINITIVE.

Fa. Buffier diſtinguiſhes a third kind of *articles* in French, which he calls *intermediate*, or *partitive*; ſerving to denote part of the thing expreſſed by the ſubſtantives they are added to: as, *des ſcavants ont cru*, *ſome learned men have ſuppoſed*. &c. I want *de la lumiere*, *ſome light*, &c.

The uſe and diſtinction of the *definite* and *indefinite articles le* or *la*, and *de* or *du*, make one of the greateſt difficulties in the French tongue, as being utterly arbitrary, and only to be acquired by practice.—We may add, that in the Engliſh, though the *articles* be ſo few, yet they are of ſuch frequent uſe, that they eaſily diſcover any ſtranger, from a natural Engliſhman.

ARTICULARIS, ARTICULAR, in *Medicine*, an epithet applied to a diſeaſe, which more immediately infeſts the *articuli*, or joints.

The *morbus articularis* is the ſame with the Greek ἀρθριτις, and our GOUT.

ARTICULATE *ſounds* are thoſe which expreſs the letters, ſyllables, &c. of any alphabet, or language. See INARTICULATE.

Brutes cannot form *articulate* ſounds, or they cannot *articulate* the ſounds of their voice; excepting ſome few birds, as the *parrot*, *pye*, *raven*, *ſtarling*, &c.

ARTICULATED *libel*, *libellus articulatus*, that wherein the parts of a fact are ſet forth to the judge in ſhort, diſtinct *articles*.

This amounts to much the ſame with what is otherwiſe called *libellus poſitionalis*.

ARTICULATED *leaf*. See LEAF.

ARTICULATED *radius*, in *Natural Hiſtory*. See RADIUS *articulatus*.

ARTICULATION, in *Grammar*, a diſtinct pronunciation of words and ſyllables.

Articulation is that part of grammar, which treats firſt of ſounds and letters; then of their combinations, for the compoſing of ſyllables and words. Hence he who pronounces his words clearly and diſtinctly, is ſaid to pronounce them *articulately*.

ARTICULATION, ἀρθρωσις, in *Anatomy*, the juncture or connexion of two bones. The bones cannot ſerve the intended purpoſes, except the ſeveral pieces are fitly adjuſted, and then kept together in different ways. The moſt ancient oſteologiſts (ſpeaking only of the perfect bones of an adult) called the firſt of theſe *articulation*, and the other SYMPHYSIS.

Articulation thus underſtood is of two kinds, one moveable, by which the bones are allowed a certain degree of motion; the other immoveable, by which they are fixed together without motion. The firſt is commonly called DIARTHROSIS; that is (according to the expreſſion of Carolus Stephanus, an ancient phyſician of the faculty at Paris) an *articulation* ſeparated; the other *ſynarthroſis*, or an *articulation* conjoined. There is ſtill another ſpecies of *articulation*, which cannot well be reduced to either of the two former, as partaking of both: this, therefore, may be eſtabliſhed as a third kind, by the name of AMPHIAR-

PHIARTHROSIS, which agrees better to this ſort, than to the other *articulations*, to which it has ſometimes been applied.

ARTIFICERS, thoſe who work with the hands, and ſell things faſhioned by them into other forms.

Artificers amount to the ſame with what we otherwiſe call *handicrafts* and *mechanics:* ſuch are ſmiths, carpenters, taylors, ſhoemakers, weavers, and the like.

The Roman *artificers* had their peculiar temples, where they aſſembled and choſe their own patron, to defend their cauſes: they were exempted from all perſonal ſervices. Taruntenus Paternus reckons thirty-two ſpecies of *artificers*, and Conſtantine thirty-five, who enjoyed this privilege. The *artificers* were incorporated into divers colleges or companies, each of which had their tutelar gods, to whom they offered their worſhip. Several of theſe, when they quitted their profeſſion, hung up their tools, a votive offering to their gods. Pitiſc. Lex. Ant.

Artificers were held a degree below merchants, and *argentarii*, or money-changers, and their employment more ſordid. Some deny, that in the earlieſt ages of the Roman ſtate, *artificers* were ranked in the number of citizens; others, who aſſert their citizenſhip, allow that they were held in contempt, as being unfit for war, and ſo poor that they could ſcarce pay any taxes. For which reaſon they were not entered among the citizens, in the cenſor's books; the deſign of the *cenſus* being only to ſee what number of perſons were yearly fit to bear arms, and to pay taxes towards the ſupport of the ſtate. It may be added, that much of the *artificers* buſineſs was done by ſlaves, and foreigners, who left little for the Romans to mind but their huſbandry and war. Dion. Hal. l. ii. p. 98.

By means of the *arts*, the minds of men are engaged in inventions beneficial to the whole community; and thus prove the grand preſervative againſt that barbariſm and brutality, which ever attend on an indolent and inactive ſtupidity.

By the Engliſh laws, *artificers* in wool, iron, ſteel, braſs, or other metal, going out of the kingdom into any foreign country without licence, are to be impriſoned three months, and fined in a ſum not exceeding one hundred pounds. And ſuch as going abroad, and not returning on warning given by our embaſſadors, &c. ſhall be diſabled from holding lands by deſcent or deviſe, from receiving any legacy, &c. and be deemed aliens. Stat. 5. Geo. I. cap. 27. By 23 Geo. II. cap. 13. § 1. penalty is alſo inflicted on ſeducing *artificers* to go abroad.

Ramazini has a treatiſe on the diſeaſes of *artificers*.

Artificer *by fire*, a denomination ſometimes given to chemiſts, and workers in metals.

ARTIFICIAL, ſomething made by art; not produced naturally, or in the common courſe of things.

Artificial is alſo frequently uſed for *factitious*.

Thus we have *artificial* ſal ammoniac, *artificial* borax, &c.

Artificial *fire-works* are compoſitions of inflammable materials; chiefly uſed on ſolemn occaſions, by way of rejoicing. See Sav. Etr. tom. iv. p. 66.

Artificial *lightning*. See ELECTRICITY and LIGHTNING.

Artificial *lines*, on a ſector or ſcale, are certain lines ſo contrived, as to repreſent the logarithmic ſines and tangents; which, by the help of the line of numbers, will ſolve all queſtions in *trigonometry*, *navigation*, &c. pretty exactly.

Artificial *magnets*. See MAGNETS.

Artificial *muſic*, that which is according to the rules of art; or executed by inſtruments invented by art. It is alſo uſed, in another ſenſe, for ſome artful contrivance in muſic; as when a piece is ſung in two parts; one whereof is by B molle, or flat, and the other by B ſharp. See Artificii Muſicali del Signor Vitali.

ARTILLERY, the heavy equipage of war; comprehending all ſorts of great fire-arms, with their appurtenances; as cannons, mortars, bombs, petards, muſquets, carbines, &c.

In this ſenſe, the word *artillery* coincides with what we otherwiſe call *ordnance*.

The Perſians, we are told in the embaſſy of Figueroa, would never, in 1518, have either *artillery* or *infantry* in their armies, becauſe they hindered their charging and retiring with that nimbleneſs wherein their chief military addreſs and glory lay.

The term *artillery* is ſometimes alſo applied to the ancient inſtruments of war, as the *catapultæ*, battering rams, &c.

Artillery, *park of*, is that place in a camp ſet apart for the *artillery*, or large fire-arms.

Artillery, *traile*, or *train of*, is a ſet or certain number of pieces of ordnance, mounted on carriages, with all their furniture fit for marching. To this frequently belong mortar-pieces, with bombs, carcaſes, &c. It is under the direction of the maſter of the *artillery*.

There are trains of *artillery* in moſt of the king's magazines; as in the Tower, at Portſmouth, Plymouth, Windſor, &c.

Artillery *guard* is a detachment from the army to ſecure the artillery. This corps is in the front, and their centries are round the park. Upon a march they go in the front and rear of the *artillery*, and muſt be ſure to leave nothing behind. If a gun or waggon break down, the captain is to leave a part of his guard to aſſiſt the gunners and matroſſes in getting it up again.

The writers upon *artillery* are, Caſimir Semionowitz, a Pole, Buchnerus, Braunius, Mieth, S. Remy in his Memoires d'Artillerie, M. Belidor, M. le Blond, and Muller on Artillery, which contain an accurate deſcription of all the machines and inſtruments of war now in uſe, with every thing that relates to them.

Artillery *company of London*, is a band of infantry, conſiſting of about four hundred men.

Their officers are a leader, two lieutenants, two enſigns, three gentlemen of arms, two ſerjeants, and a provoſt-marſhal.

Artillery is alſo uſed for what we otherwiſe call *pyrotechnia*, or the art of fire-works, with the inſtruments and apparatus belonging thereto.

ARTIPHYES, in the *Ancient Phyſic*, denotes an even, entire, and perfect critical day; ſuch, according to Hippocrates, are the fourteenth and forty-ſecond days.

ARTISAN. See ARTIST.

ARTISCUS, in *Medicine*, denotes a *troche*, but more particularly that prepared of viper's fleſh, mixed up with bread, to be uſed in the compoſition of venice treacle.

Theſe are more particularly called *artiſci theriaci*, or *theriacal troches*.

They were formerly in great vogue, and brought with much parade from Venice; but Zwelfer diſcovered their vanity; ſince which time, vipers powder has been generally ſubſtituted for them, in the preparation of the treacle.

ARTIST, in a general ſenſe, a perſon ſkilled in ſome art; or, according to Mr. Harris's definition, a perſon poſſeſſing an habitual power of becoming the cauſe of ſome effect, according to a ſyſtem of various and well-approved precepts.

In this ſenſe, we ſay, an excellent, a curious *artiſt*. The pre-eminence is diſputed between ancient and modern *artiſts*, eſpecially as to what relates to ſculpture, painting, and the like. At Vicenza, we are told of a privilege granted to *artiſts*, like that of clergy in England; in virtue of this, criminals adjudged to death ſave their lives, if they can prove themſelves the moſt excellent and conſummate workmen in any uſeful art. This benefit is allowed them *in favorem artis*, for the firſt offence, except in ſome particular crimes, of which coining is one. The exception is juſt, ſince here the greater the *artiſt*, the more dangerous the perſon. Evelyn's Diſc. of Medals, ch. vii. p. 237, &c.

Artist, *artiſta*, in an academical ſenſe, denotes a philoſopher or proficient in the faculty of arts.

Artist is more peculiarly underſtood of a *chemiſt* or *alchemiſt*.

In which ſenſe it is, that Paracelſus and other ADEPTS uſe the word.

ARTIZOOS, is uſed by ſome ancient phyſicians for an infant ſhort-lived, by reaſon of a difficult birth, whereby he was long detained in the paſſage from the womb.

ARTOMELI, in *Ancient Pharmacy*, a kind of cataplaſm, prepared of bread and honey, applied chiefly to the *præcordia*.

ARTOTYRITES, or ARTOTYRITÆ, a branch of the ancient *Montaniſts*, who firſt appeared in the ſecond century; chiefly in Galatia.

They uſed bread and cheeſe in the Euchariſt, or perhaps bread baked with cheeſe.—Their reaſon was, that the firſt men offered to God not only the fruits of the earth, but of their flocks too.

Hence, according to St. Auguſtine, came their name, which is compoſed of αρτος, *bread*, and τυρος, *cheeſe*.

ARVALES *fratres* were prieſts in ancient Rome, who aſſiſted in the ſacrifices of the *Ambarvalia* offered every year to Ceres and Bacchus for the proſperity of the principal fruits of the earth, viz. the corn and wine.

They were inſtituted by Romulus, and were twelve in number; all of them perſons of the firſt diſtinction; the founder himſelf having been of the body.—They made a college, called *collegium fratrum arvalium*.

The mark of their dignity was a garland, compoſed of ears of corn tied with a white ribband: this, Pliny ſays, was the firſt crown in uſe at Rome.

According to Fulgentius, Acca Laurentia, Romulus's nurſe, was the firſt founder of this order of prieſts: ſhe, it ſeems, had twelve ſons, who uſed to walk before her in proceſſion to the ſacrifice; one of whom dying, Romulus, in favour of his nurſe, promiſed to take his place; and hence, ſays he, came this ſacrifice, the number twelve, and the name of brother.—Pliny (lib. xvii. cap. 2.)

2.) ſeems to indicate the ſame thing, when he mentions, that Romulus inſtituted prieſts of the fields, after the example of Acca Laurentia his nurſe.

ARVIL-*ſupper*; an entertainment made at funerals in the northern part of England; and *arvil*-bread is the bread delivered to the poor on ſuch occaſions.

ARUM, *African*. See CALLA.

ARUM, *floating*. See ORONTIUM.

ARUM, in *Botany*. See WAKE-*Robin*.

ARUNCUS, *greater meadow ſweet*, in *Botany*, the name of a genus of plants, called by Tourneſort, and others, BARBA *capræ*; and by Linnæus SPIRÆA.

This plant has been ſuppoſed to be of the ſame genus with the *filipendula*; but, by the cloſe examination of the flowers, they appear to be extremely different.

ARUNDELIAN *Marbles*, MARMORA *Arundeliana*, or Oxford MARBLES, are ancient ſtones, whereon is inſcribed a chronicle of the city of Athens, engraven in capital letters in the iſland of Paros, one of the Cyclades, 263 years before Jeſus Chriſt.

They take their name from Thomas earl of Arundel, who procured them out of the Eaſt, or from Henry his grandſon, who preſented them to the univerſity of Oxford.—An account of all their inſcriptions was publiſhed in 1676, by Dr. Prideaux.

ARUNDO, in *Botany*. See REED.

ARUNDO *Indica*, in the *Materia Medica*, the name of the ARUNDO *ſanguinem draconis manans* of Moriſon. This is the plant from the fruit of which, by maceration in warm water, they get a kind of dragon's blood, which makes the fine red of the Indian varniſhes. Dale.

ARURA, in *Antiquity*. See AROURA.

ARURA, in *Middle Age Writers*, denotes a field ploughed and ſowed.

ARUSPICES, an order of prieſts among the ancient Romans, who foretold things to come, chiefly by inſpecting the entrails of beaſts which were killed in ſacrifice.

The word ſeems more properly written *haruſpices*; as being derived from *haruga*, which ſignifies the entrails of victims; and *aſpicere*, *to view* or *conſider*.

The doctrine or diſcipline of the *aruſpices* was formed into a preciſe art, called *aruſpicina*.

Cato, who was an *augur*, uſed to ſay, he wondered how one *aruſpex* could look at another without laughing in his face. By which we learn what opinion he had of the ſolidity of the *aruſpicina*.

ARUSPICI *libri*, a kind of ſacred writings among the ancient Hetrurians, wherein the laws and diſcipline of the *aruſpices* were deſcribed.

Theſe were alſo called *rituales*, ſometimes *fulgurales libri*, as directing how to take indications from thunder, lightning, &c.

ARVUM, in *Ancient Agriculture*, properly denoted ground ploughed, but not ſowed.

Though the word is alſo ſometimes extended to all arable, or corn land, in contradiſtinction from paſture.

ARX, in the *Ancient Military Art*, a town, fort, or caſtle, for defence of a place.

The *arx*, in ancient Rome, was a diſtinct edifice from the capitol, though ſome have confounded the two. According to Ryckius, the *arx*, properly ſpeaking, was a place on the higheſt part of the Capitoline Mount, ſtronger and better fortified than the reſt, with towers and pinnated walls; in which was alſo the temple of Jupiter Capitolinus. Struv. Synt. Ant. Rom. c. 11. p. 522.

ARX alſo denoted a conſecrated place on the Palatine Mount, where the augurs publicly performed their office.

Some will have the *arx* to have been the augural temple; but Varro expreſly diſtinguiſhes between the two.

ARX was particularly uſed for a public place in Rome, ſet apart for the operations of the AUGURS.

In which ſenſe, *arx* amounts to the ſame with what is otherwiſe called *auguraculum*, and *auguratorium*, and in the camp *augurale*.

Out of this *arx* it was that the *feciales*, or heralds, gathered the graſs uſed in the ceremony of making leagues and treaties. Liv. i. c. 24.

ARYTÆNOIDES, in *Anatomy*, the third and fourth cartilages of the LARYNX, ſituate under the *thyroides*; called alſo *guttales*: thus called on account of the figure of an αρυταινα, *ewer*; which, together, they ſomewhat reſemble: and the name is compounded of that word, and ειδος, *ſhape*, or *figure*.

ARYTÆNOIDEUS, in *Anatomy*, one of the muſcles ſerving to cloſe the LARYNX; otherwiſe called little *arytænoideus*, and *aryartænoideus*, as deriving its origin from the poſterior and inferior part of the *arytænoides*.

The *arytænoideus* has its head in one *arytænoid* cartilage, and its tail in the other; and ſerves to bring them together, and ſhut the *rima* or *glottis*.

ARYTHMUS, or ARHYTHMUS, in *Medicine*, is uſed by ſome for a ſinking, or failure of the pulſe, ſo that it can no longer be felt; but it more properly denotes an irregularity, or want of due order and proportion of the PULSE.

The word is formed from the privative α, and ρυθμος, *modulus*, or *meaſure*.

AS, among *Antiquaries*, ſometimes ſignifies a particular weight; in which ſenſe the Roman *as* is the ſame with the Roman *libra*, or *pound*.

The word is by ſome derived from ἀις, which, in the Doric dialect, is uſed for εις, *one*, q. d. an entire thing; though others will have this money named *as*, quaſi *æs*; becauſe made of braſs.—Budæus has written nine books *de aſſe, & ejus partibus*, of the *as*, and its parts.

The *as* had ſeveral diviſions. See the table under AS, an integer.

AS was alſo the name of a Roman coin, which was made of different matters, and different weights, in different ages of the commonwealth.

Under Numa Pompilius, according to Euſebius, the Roman money was either of wood, leather, or ſhells.—In the time of Tullus Hoſtilius, it was braſs, and was called *as*, *libra*, *libella*, or *pondo*, becauſe actually weighing a pound, or twelve ounces. The Romans reckoned by *aſſes* before they coined ſilver, in the 485th year of the city, and afterwards they kept their accounts in SESTERCES.

When the firſt Punic war had exhauſted the treaſury, they reduced the *as* to two ounces. In the ſecond Punic war, Hannibal preſſing hard on them, the *aſſes* were farther reduced to an ounce a-piece.—Laſtly, by the Papirian law, they took away half an ounce more, and reduced the *as* to a bare half-ounce: and it is generally thought, that it reſted here all the time of the commonwealth, and even till Veſpaſian's reign.

This laſt was called the Papirian *as*, becauſe the law juſt mentioned was paſſed in the year of Rome 563, by C. Papirius Carbo, then tribune of the people. Thus, there were four different *aſſes* in the time of the commonwealth.

The figure ſtamped on the *as* was at firſt a ſheep, ox, or ſow; and from the time of the kings, a Janus with two faces on the one ſide, and the *roſtrum* or prow of a ſhip on the reverſe.

The triens and quadrans of copper had the figure of a ſmall veſſel called *ratis*, on the reverſe. Thus Pliny: *Nota æris*, (i. e. *aſſis*) *fuit ex altera parte Janus geminus, ex altera roſtrum navis: in triente vero & quadrante rates.* Hiſt. Nat. lib. xxxiii. cap. 3.—Hence theſe pieces were ſometimes called *ratiti*.

AS was alſo uſed to denote any *integer*, or whole.—Whence the Engliſh word *ace*.

Thus, *as* ſignified the whole inheritance; whence *hæres ex aſſi*, the heir to the whole eſtate.

So the *jugerum*, or Roman acre of land, being reckoned the *integer*, was called *as*, and divided, like it, into twelve *unciæ*.

The *as*, and its parts or diviſions, ſtand thus:

1	As	12 *Unciæ*	$\frac{1}{2}$	*Semis*	6 *Unciæ*
$\frac{11}{12}$	*Deunx*	11	$\frac{5}{12}$	*Quincunx*	5
$\frac{5}{6}$	*Dextans*	10	$\frac{1}{3}$	*Triens*	4
$\frac{3}{4}$	*Dodrans*	9	$\frac{1}{4}$	*Quadrans*	3
$\frac{2}{3}$	*Bes*	8	$\frac{1}{6}$	*Sextans*	2
$\frac{7}{12}$	*Septunx*	7	$\frac{1}{12}$	*Uncia*	1

ASA, among *Naturaliſts*. The writers of the later ages have formed this word *aſa* from the *laſar* of the ancients, and attributed it to a gum very different from that anciently known by the name they have thus corrupted.

The *aſa* of the ancients was an odoriferous and fragrant gum; and the *aſa* of the after-ages had ſo little title to this epithet, that they diſtinguiſhed it by one, expreſſing its being of an offenſive or ſtinking ſmell.

The Arabian writers, according to this diſtinction, deſcribe two kinds of *aſa*, the one *ſtinking*, the other *aromatic*; and the modern Greeks preſerved the name *aſa*, or *laſar*, to the ſtinking gum the Latins called by that name, but added a diſtinctive epithet to expreſs its ſmell, and called it *ſcardolaſarum*.

ASA *dulcis*, in the *Materia Medica*, a name by which ſome authors have called the *benjamin*, or BENZOIN of the ſhops. Dale.

ASA *fœtida*, ſee ASSA *fœtida*.

ASAPHEIS, ασαφεις, from α negative, and σαφης, *clear*, *open*; in Hippocrates, in Prorrh. & Coac. are ſuch patients as do not utter their words in a clear manner. The defect is occaſioned, as Galen ſays, Comm. 2. in Prorrh. "either by ſome hurt which the organs of ſpeech have "contracted from a diſorder of the nerves, or elſe by a "*delirium*."

ASAPPES, or AZAPES, an order of ſoldiers in the Turkiſh army, whom they always expoſe to the firſt ſhock of the enemy; to the end that the enemy being thus fatigued, and their ſwords blunted, the ſpahis and janizaries may fall on, and find an eaſy conqueſt.

The word is derived from the Turkiſh *ſaph*, which ſignifies *rank*, from whence they have formed *aſphaph, to range in battle*.

The *aſappes* are ſaid to be held of ſo little value, that they frequently ſerve as bridges for the cavalry to paſs over, in bad roads, and as faſcines to fill up the ditches of places beſieged.—The greateſt part of them are natural Turks; they travel on foot, and have no pay, but the plunder they can get from the enemy.

ASARABACCA, or ASSARA-BACARA, in *Botany*, a plant ſuppoſed to be mentioned by Pliny and Dioſcorides, under the name of *baccharis*, or *nardus ruſtica*; by us called ASARUM; of the *dodecandria monogynia* claſs.

Its characters are, that the flower hath no petals, but a thick coloured empalement, and twelve ſhort ſtamina. At the bottom of the empalement is incloſed a thick germen, which afterward turns to a thick capſula, having ſix cells containing ſeveral oval ſeeds. There are three ſpecies.

Among the ancients it was much in uſe as an emetic and cathartic. It is chiefly uſed among us as a ſternutatory, in order to which, it is dried and reduced to a powder, to be taken as a ſnuff; in which quality it drains the head of mucous humours. It is alſo a powerful emmenagogue, and has been recommended by authors in the gout, dropſy, and many other chronic diſorders.

ASARINA, in *Botany*, baſtard ASARUM, a ſpecies of the ANTIRRHINUM, in the Linnæan ſyſtem. Its characters are, that the flower is of one leaf, of the grinning kind, divided at the top into two lips, the upper one divided in two parts, the lower one ſlightly divided into three obtuſe parts. The two lips join cloſe together, ſo as to form a kind of ſnout. It hath four ſtamina; in the centre is placed a round germen, which afterward turns to a round huſk, divided into two cells, full of roundiſh ſeeds. There are two ſpecies.

ASAROTA, *ασαρωτα*, from *α* and *σαιρω*, *I ſweep*, a kind of painted pavements in uſe before the invention of moſaic work. The moſt celebrated was that at Pergamus, painted by Seſus, and exhibiting the appearance of crumbs, as if the floor had not been ſwept after dinner, whence, according to Pliny, the denomination. Perrault ſuppoſes them to have been a black kind of pavements of a ſpongy matter. Plin. Nat. Hiſt. lib. xxxvi. cap. 25. Perrault ad Vitruv. lib. vi. cap. 5.

ASARUM, in *Botany*. See ASARABACCA, and ASARINA.

ASASI, in *Botany*, a name given, by the people of Guinea, to a tree, the leaves of which being boiled in water, and held in the mouth, cure the tooth-ach. This tree, in its form and manner of growing, reſembles the laurel; the leaves are very hard and ſtiff, and grow alternately on the ſtalks; they have ſhort pedicles, and the branches are blackiſh and rugged, but they are variegated with ſmall reddiſh ſpangles, or ſcaly protuberances. Phil. Tranſ. N° 232.

ASBESTINE, ſomething incombuſtible, or that partakes of the nature and qualities of the *lapis aſbeſtos*. Such as *aſbeſtine* paper and cloth. See ASBESTOS.

ASBESTOS, a mineral ſubſtance, of a whitiſh, or ſilver colour, and a woolly texture; conſiſting of ſmall threads, or delicate fibres, endued with the wonderful property of reſiſting fire, and remaining unconſumed in the intenſeſt heat.

The word properly ſignifies an incombuſtible body; it is formed of the privative *α*, and *σϐεννυμι*, *extinguo*.

This lanuginous mineral is ſometimes alſo called *amianthus*, and ſometimes *ſalamandra*, or *ſalamander's wool*, from the candle-wicks ſaid to be made anciently of it. From a pungent quality, which Agricola ſays it has on the tongue, though without aſtringency, it has been by ſome called *alumen*, having the epithet of *plumeum* added to it, taken from its downy filaments, to diſtinguiſh it from the other alums; though it is to be obſerved, the true plume-alum is another ſort of body, being a real efflореſcence of alum.

From its light grey colour, it is called *polia* and *corſoides*; and from its likeneſs to the hoary fibres of ſome ſorts of mat-weed, *ſpartapolia*. From the capacity it has of being ſpun into thread, it is called *linum*, with ſome diſtinguiſhing epithet, taken either from its quality, as *linum aſbeſtinum vivum*, or *incombuſtibile*; or from the place where it is found, as *linum foſſile*, *linum Indicum*, *Creticum*, *Cypricum*, and *Carpaſium*, or *Caryſtium*. Beſides the places whence it borrows its names, it is alſo found in Tartary, at Namur, in the Low Countries, in Thuringia among the mines, in the Old Noricum, in Egypt, in the mountains of Arcadia, at Puteoli, in the iſland of Corſica, in the iſland of Angleſey in Wales, and in Aberdeenſhire in Scotland, at Montauban in France, and in the kingdom of Siberia.

Naturaliſts generally reckon it among the ſtones, whence its appellation of *lapis aſbeſtos*, &c. But Dr. Plot rather judges it a *terra lapidoſa*, or middle ſubſtance, between ſtone and earth. As to its generation, the ſame author takes it to be a mixture of ſome ſalt, and a pure earth without ſulphur, coagulated in the winter, and hardened by the heats in ſummer. The ſalt, Ja. Heſſus pretends, is a liquid alum of a milky ſubſtance, inclining to yellow, that ſweats out of the earth, and ſmells like rotten cheeſe.

The *aſbeſtos*, or *lapis aſbeſtos*, is really a ſort of native, fiſſile ſtone, which one may ſplit into threads or filaments, very fine and brittle, yet ſomewhat tractable, ſilky, and of a greyiſh ſilvery colour, not unlike talc of Venice. Acids have no effect upon it.

It is almoſt inſipid to the taſte, indiſſoluble in water; and, expoſed to the fire, it neither conſumes nor calcines.—A large burning-glaſs, indeed, reduces it into little glaſs globules, in proportion as the filaments ſeparate; but common fire only whitens it.

Theſe filaments are of different lengths, from one inch to ten.—The ſtone is uſually found incloſed within other very hard ſtones; though ſometimes growing to the ſurfaces of them, and ſometimes detached or ſeparate from any.

The proprietor of a forge in France found great quantities of a ſubſtance, which anſwered all the common uſes of native *aſbeſtos*. Upon a farther inquiry into the nature of it, he concludes, that both the one and the other are calcined iron deprived of its phlogiſton; and by reuniting the phlogiſton with them, he can reſtore both to their primitive ſtate of iron. Phil. Tranſ. vol. li. part 2. N° 72.

The *aſbeſtos*, applied to any part of the body, excites an itching; and yet we read of it as anciently preſcribed for diſeaſes of the ſkin; and particularly for the itch: unleſs it were rather the *alumen plumoſum* that was meant hereby; for even at this day, they are frequently confounded. The induſtry of mankind has found a method of working this untoward mineral, and employing it in divers manufactures, chiefly cloth and paper.

The manufacture is, undoubtedly, difficult enough. Pliny calls the *aſbeſtos*, *inventu rarum, textu difficilimum*: Wormius aſſures us, that the method of making cloth of *aſbeſtos* is now entirely unknown: in reality, one would ſcarce imagine the thing practicable, without the mixture of ſome other pliant matter, as wool, hemp, or flax, along with the *aſbeſtos*, the filaments of this latter appearing too coarſe and brittle, to make any tolerable fine work. However this be, Bapt. Porta aſſures us, that, in his time, the ſpinning of *aſbeſtos* was a thing known to every body at Venice.

Sig. Caſtagnatta, ſuperintendant of ſome mines in Italy, is ſaid to have carried the manufacture to ſuch perfection, that his *aſbeſtos* was ſoft and tractable, much reſembling lamb-ſkin dreſſed white: he could thicken and thin it at pleaſure, and thus either make it into a very white ſkin, or a very white paper.

This kind of linen cloth was chiefly eſteemed by the ancients; though then better known, and more common, than among us, being held equally precious with the richeſt pearls: nor is it now of mean value, even in the country where it is moſt generally made, a China cover (i. e. a piece of twenty-three inches and three quarters long) being worth eighty tale, i. e. 36*l.* 13*s.* 4*d.* Pliny ſays, he himſelf had ſeen napkins thereof, which, being taken foul from the table, after a feaſt, were thrown into the fire, and by that means were better ſcoured than if they had been waſhed in water, &c. But its principal uſe, according to Pliny, was for the making of ſhrouds for royal funerals, to wrap up the corpſe, ſo that the aſhes might be preſerved diſtinct from thoſe of the wood, &c. whereof the funeral pile was compoſed: and the princes of Tartary, according to the accounts in the Philoſophical Tranſactions, ſtill uſe it at this day in burning their dead. Some of the ancients are ſaid to have made themſelves cloaths of it, particularly the Brachmans, among the Indians. The wicks for their perpetual lamps, according to Dr. Liſter, were alſo made of it; and ſome to this day uſe it for the wicks of ſuch lamps as they would not have any trouble with; becauſe the *aſbeſtos* never waſting, there is no occaſion for ſhifting the wick: Septalla, canon of Milan, had thread, ropes, nets, and paper, made of the *aſbeſtos*. A handkerchief or pattern of this linen was long ſince preſented to the Royal Society, a foot long, and half a foot broad. This gave two proofs of its reſiſting fire; though, in both experiments, it loſt above three drachms in its weight. When taken out red-hot, it did not burn a piece of white paper, on which it was laid. Mr. Villette pretends, that his large burning concave uſually vitrifies the *aſbeſtos*.

The method of preparing the incombuſtible paper and cloth is thus deſcribed by Ciampini. The ſtone is laid to ſoak in warm water, then opened and divided by the hands, that the earthy matter may be waſhed out. The ablution being ſeveral times repeated, the flax-like filaments are collected and dried; and they are moſt conveniently ſpun with an addition of flax. Two or three filaments of the *aſbeſtos* are eaſily twiſted along with the flaxen thread, if the operator's fingers are kept oiled. The cloth alſo, when woven, is beſt preſerved by oil from breaking or waſting. On expoſure to the fire, the flax and the oil burn out, and the cloth remains pure and white. Probably from the diſſipation of ſome extraneous matter of this kind proceeded the diminution of weight in the handkerchief juſt recited; for pure *aſbeſtos* leaves nothing. The ſhorter filaments which ſeparate in waſhing the ſtone, may be made into paper in the common manner. Phil. Tranſ. N° 273.

It is firſt neceſſary to obſerve, that in the ſearching after this ſubſtance, the diſtinction between the *aſbeſtoſes* and amianthi is carefully to be obſerved, the one of theſe being compoſed of the long threads, and the other of very ſhort and abrupt ones; this is their great diſtinction, and all the *aſbeſtoſes*, or long-threaded ones, are more or leſs fitted for this work, and none of the *amianthi*, or ſhort-threaded ones, are at all ſo. Beſides, the *aſbeſtos* is ſomewhat heavier than the amianthus.

Asbestos, *falſe*, is a name given to plume-alum. See *Plume* Allum.

ASCARIDES, in *Medicine*, a ſlender ſort of worms, found in the *inteſtinum rectum*, chiefly of children, and frequently voided with their *fæces*; ſometimes alſo adhering to the fundament, or even pendent from it.

They are thus called from ασκαριζω, *I leap*, on account of their continual troubleſome motion, cauſing a moſt intolerable itching. They are ranged by Linnæus among the *vermes inteſtinæ*.

The *aſcarides* are worms not ſo dangerous as ſome others, but more difficult to be expelled, and that for ſeveral reaſons. The firſt is, becauſe thoſe creatures are remote from the ſtomach; ſo that remedies loſe their virtue before they can come where the worms are. The ſecond is, becauſe the *aſcarides* are wrapt up in viſcous humours, which hinder the operation of medicines. The third is, becauſe theſe worms aſcend ſometimes into the *cœcum*. Now that gut being like the bottom of a ſack, the *aſcarides* keep themſelves as it were intrenched in that place. However it be, it is better to attack them below.

The beſt known remedy for them is Harrowgate water, at the ſpring; the flower of brimſtone taken with treacle, in ſuch a quantity as to purge the patient gently every day, is perhaps the next moſt efficacious remedy. The fumes of tobacco, injected in form of a clyſter, have been ſucceſsfully uſed for expelling *aſcarides*. Med. Obſ. and Inq. vol. ii. p. 307.

Aſcarides are ſaid to be often the occaſion of a *prolapſus ani*. See Procedentia.

The name *aſcarides* is alſo given by M. Reaumur to a ſort of ſmall *worms* or maggots, bred from the eggs of winged animals; which bury themſelves between the membranes of the leaves of plants, and there eat away the parenchymatous ſubſtance.

As ſmall as theſe *aſcarides* in general are, they do not fail to ſhew the proper characters, by which they may be reduced to regular claſſes: thoſe which have had their origin from the eggs of butterflies, are truly and properly caterpillars in miniature; the others are maggots from flies; and if from beetles, they are hexapode *worms*.

Of the little caterpillars, ſome have ſixteen feet, ſome only fourteen; and ſome of them are perfectly ſmooth and equal all over the body; others have a number of rings or annular diviſions, like the larger caterpillars; their ſeveral changes in arriving at the fly-ſtate are the ſame with thoſe of the common ſilk-worm, and other ſpecies of large caterpillars.

The *ovula* of the parent butterfly are depoſited ſingly, only one being placed on a leaf; for the little caterpillar is of the nature of the ſolitary, not the gregarious animals. Theſe eggs are ſo ſmall, as to be ſcarce viſible, except to an obſerver ſo accurate as M. Reaumur; but he not only diſcovered them lying upon the leaves of plants, but traced them to the time of their hatching; and obſerved this curious particular, that the caterpillar never enjoys the light or free air, but as ſoon as ever it is hatched eats its way through the integument of the leaf; and, under the cover of its ſhell, buries itſelf among the parenchymatous matter, whence it never comes out again till it arrives at the fly ſtate.

The worms which are hatched of the eggs of flies, make their way as ſpeedily into the ſubſtance of the leaf; but with this difference in the manner of doing it, that as the caterpillar eats its way through with its teeth, the *worm* ſtrikes its head forcibly againſt it ſeveral times, and by repeated blows at length breaks a hole in it, large enough to admit its little body; and then feeds on the parenchyma of the leaf, in the ſame manner with the caterpillar. Theſe finally change into their chryſalis ſtate, within the covert of the membrane of the leaf.

The laſt kind of *aſcarides* which are to become beetles, make their way into the ſubſtance of the leaf in the ſame manner; and when they have fed their deſtined time upon its parenchyma and juices, they ſometimes change in the covering of the membrane, and ſometimes come out of their holes, and chooſe the ſurface of the leaf for the ſcene of this great cataſtrophe.

ASCENDANT, in *Genealogy*, is underſtood of anceſtors, or ſuch relations as have gone before us: ſuch are father, grandfather, &c.—They are thus called in contradiſtinction to deſcendants, or the deſcending line. It is a canon in law, that inheritances never lineally *aſcend*. Marriage is always forbid between the *aſcendants* and *deſcendants*, in a direct line.

Ascendant, in *Aſtrology*, denotes the *horoſcope*; or the degree of the ecliptic which riſes upon the horizon, at the time of the birth of any one.

This is ſuppoſed to have an influence on the perſon's life and fortune, by giving him a bent and propenſity to one thing more than another.

In the celeſtial theme, this is alſo called the *firſt houſe*, the *angle of the Eaſt*, or *Oriental Angle*, and the *ſignificator of life*.—Such a planet ruled in his *aſcendant*.—Jupiter was in his *aſcendant*, &c.

Hence the word is alſo uſed in a moral ſenſe, for a certain ſuperiority which one man has over another, from ſome unknown cauſe.

ASCENDENS *obliquus*. See Obliquus.

ASCENDING, in *Aſtronomy*, is underſtood of thoſe ſtars, or degrees of the heavens, &c. which are riſing above the horizon, in any parallel of the equator.

Ascending *latitude* is the latitude of a planet when going towards the north pole.

Ascending *node* is that point of a planet's orbit, wherein it paſſes the ecliptic, to proceed northward.

This is otherwiſe called the *northern node*, and is repreſented by this character ☊. See Node, &c.

Ascending *ſigns*, among *Aſtrologers*, are thoſe which are upon their aſcent, or riſe, from the *nadir*, or loweſt part of the heavens, to the *zenith*, or higheſt.

Ascending, in *Anatomy*, is applied to ſuch veſſels as carry the blood upwards, or from lower to higher parts of the body. The *aſcending aorta*, *aorta aſcendens*, is the ſuperior trunk of the artery, which furniſhes the head.

The *aſcending cava*, *vena cava aſcendens*, is a large vein, formed by a meeting or union of the iliacs of one ſide, with thoſe of the other. See *Tab. Anat.* (*Splanch.*) *fig.* 1. *lit.* o. (*Angeiol. fig.* 6. *lit.* cc.)

Many of the ancient anatomiſts called this the *deſcending cave*; as imagining that the blood deſcended from the liver by this vein, to ſupply the parts below the diaphragm. But the moderns have ſhewn, that it has a quite contrary uſe, and ſerves for the conveyance of the blood from the lower parts to the heart; whence its appellation *aſcendant*.

ASCENSION, Ascensio, a riſing or moving upward.

Ascension, in *Theology*, is particularly uſed for that miraculous elevation of our Saviour, when he mounted to heaven, in the ſight of his apoſtles.

Ascension-*day*, popularly called *Holy Thurſday*, a feſtival of the church, held ten days before Whitſuntide, in memory of our Saviour's *aſcenſion*.

Ascension, in *Aſtronomy*, is either *right* or *oblique*.

Ascension, *right*, of the ſun, or of a ſtar, is that degree of the equinoctial, accounted from the beginning of Aries, which riſes with the ſun, or ſtar, in a right ſphere.

Or, right *aſcenſion*, is that degree and minute of the equinoctial, counted as before, which comes to the meridian with the ſun, or ſtar, or other point of the heavens.

The reaſon of thus referring it to the meridian, is, becauſe that it is always at right angles to the equinoctial, whereas the horizon is only ſo in a right, or direct ſphere.

The right *aſcenſion* ſtands oppoſed to the right *deſcenſion*.

Two fixed ſtars, which have the ſame right *aſcenſion*, i. e. are at the ſame diſtance from the firſt point of Aries in a right ſphere; or, which amounts to the ſame, are in the ſame meridian, riſe at the ſame time.—If they be not in the ſame meridian, the difference between the time when they riſe is the preciſe difference of their right *aſcenſion*.—In an oblique ſphere, where the horizon cuts all the meridians obliquely, different points of the meridian never riſe or ſet together; ſo that two ſtars, on the ſame meridian, never riſe or ſet at the ſame time; and the more oblique this ſphere, the greater is the interval of time between them.

To find the right *aſcenſions* of the ſun, ſtars, &c. trigonometrically, ſay, As radius is to the coſine of the ſun's greateſt declination, ſo is the tangent of the diſtance from Aries to Libra, to the tangent of right *aſcenſion*.—To find the right *aſcenſions* mechanically by the globe, ſee Globe.

The *arch of right aſcenſion* is that portion of the equator intercepted between the beginning of Aries, and the point of the equator which is in the meridian: or, it is the number of degrees contained therein.—This coincides with the right *aſcenſion* itſelf.—The right *aſcenſion* is the ſame in all parts of the globe.

We ſometimes alſo ſay, the *right aſcenſion* of a point of the ecliptic, or any other point of the heavens.

The difference between the *right* and *oblique aſcenſions* is called the ASCENSIONAL *difference*.

Ascension, *angle of right*. See Angle.

Ascension, *oblique*, is an arch of the equator intercepted between the firſt point of Aries, and that point of the equator, which riſes together with a ſtar, &c. in an oblique ſphere.

The oblique *aſcenſion* is numbered from weſt to eaſt; and is more or leſs, according to the different obliquity of the ſphere.

To find the oblique *aſcenſions* of the ſun, either trigonometrically, or by the globe, ſee Globe.

The *arch of oblique aſcenſion*, is an arch of the horizon intercepted between the beginning of Aries, and the point of the equator, which riſes with a ſtar, or planet, in an oblique ſphere.—This coincides with the *oblique aſcenſion* itſelf.—The *oblique aſcenſions* change according to the latitude of the places.

Ascension *and deſcenſion*, *refraction of*. See Refraction.

ASCENSIONAL *difference* is the difference between the right and oblique *aſcenſion* of the ſame point on the ſurface of the ſphere.

To find the *aſcenſional* difference trigonometrically; having the latitude of the place, and the ſun's declination given, ſay, As radius is to the tangent of the latitude, ſo is the tangent of the ſun's declination to the ſine of the *aſcenſional* difference.

If the ſun be in any of the northern ſigns, and the *aſcenſional* difference, as DO, be ſubtracted from the right *aſcenſion* reckoned at D (*Tab. Aſtronomy*, *fig.* 63.) the remainder will be the oblique *aſcenſion* at O.—If he be in a ſouthern ſign, the *aſcenſional* difference being added to the right *aſcenſion*, the ſum is the oblique *aſcenſion*; and thus may tables of oblique *aſcenſions* be conſtructed for the ſeveral degrees of the ecliptic, under the ſeveral elevations of the pole. The ſun's *aſcenſional* difference converted into time, is juſt ſo much as he riſes before or after ſix o'clock.

ASCENSORIUM ſometimes occurs in our ancient writers for a ſtair, or ſtep.

ASCENT, Ascensus, the motion of a body tending from below upwards; or the continual receſs of a body from the earth.

In this ſenſe the word ſtands oppoſed to *deſcent*.

The Peripatetics attribute the ſpontaneous *aſcent* of bodies to a principle of levity, inherent in them.

The moderns deny any ſuch thing as ſpontaneous levity, and ſhew, that whatever *aſcends*, does it in virtue of ſome external impulſe, or extruſion. Thus it is that ſmoke, and other rare bodies, *aſcend* in the atmoſphere; and oil, light woods, &c. in water: not by any external principle of levity, but by the ſuperior gravity, or tendency downwards of the parts of the medium wherein they are.

The *aſcent* of light bodies in heavy mediums is produced after the ſame manner as the *aſcent* of the lighter ſcale of a balance.—It is not that ſuch ſcale has an internal principle, whereby it immediately tends upwards; but it is impelled upwards by the preponderancy of the other ſcale; the exceſs of the weight of the one having the ſame effect by augmenting its impetus downwards, as ſo much real levity in the other: becauſe the tendencies mutually oppoſe each other, and that action and reaction are always equal. See this farther illuſtrated under the articles Specific *Gravity*, and Fluid.

Ascent *of Bodies on inclined Planes*. See the doctrine and laws of them under *Inclined* Plane.

Ascent *of fluids* is particularly underſtood of their riſing above their own level, between the ſurfaces of nearly contiguous bodies, or in ſlender capillary glaſs tubes, or in veſſels filled with ſand, aſhes, or the like porous ſubſtances.

This effect happens as well *in vacuo*, as in the open air, and in crooked, as well as ſtrait tubes. Some liquors, as ſpirit of wine, and oil of turpentine, *aſcend* ſwifter than others; and ſome riſe after a different manner from others. Mercury does not aſcend at all, but rather ſubſides.

The *phænomenon*, with its cauſes, &c. in the inſtance of capillary tubes, will be ſpoken of more at large under Capillary *tube*.

As to planes. Two ſmooth poliſhed plates of glaſs, metal, ſtone, or other matter, being ſo diſpoſed as to be almoſt contiguous, have the effect of ſeveral parallel capillary tubes; and the fluid riſes in them accordingly: the like may be ſaid of a veſſel filled with ſand, &c. the divers little interſtices whereof form, as it were, a kind of capillary tubes. So that the ſame principle accounts for the appearance in them all. And to the ſame may probably be aſcribed the *aſcent* of the ſap in vegetables. Thus Sir I. Newton. "If a large pipe of glaſs be filled "with ſifted aſhes, well preſſed together, and one end "dipped into ſtagnant water, the fluid will *aſcend* ſlowly "in the aſhes, ſo as in the ſpace of a week or fortnight "to reach the height of thirty or forty inches above the "ſtagnant water. This *aſcent* is wholly owing to the "action of thoſe particles of the aſhes which are upon "the ſurface of the elevated water; thoſe within the "water attracting as much downwards as upwards: it "follows, that the action of ſuch particles is very ſtrong; "though being leſs denſe and cloſe than thoſe of glaſs, "their action is not equal to that of glaſs, which keeps "quick-ſilver ſuſpended to the height of ſixty or ſeventy "inches, and therefore acts with a force which would "keep water ſuſpended to the height of about ſixty feet. "By the ſame principle, a ſponge ſucks in water, and "the glands in the bodies of animals, according to their "ſeveral natures and diſpoſitions, imbibe various juices "from the blood." Optics, p. 367.

If a drop of oil, water, or other fluid, be laid on a glaſs plane, perpendicular to the horizon, ſo as to ſtand without breaking, or running off; and another plane, inclined to the former ſo as to meet a-top, be brought to touch the drop, then will the drop break, and *aſcend* towards the touching end of the planes; and it will *aſcend* the faſter in proportion as it is higher, becauſe the diſtance between the planes is conſtantly diminiſhing.—After the ſame manner, the drop may be brought to any part of the planes, either upward or downward, or ſideways, by altering the angle of inclination.

Laſtly, if the ſame perpendicular planes be ſo placed, as that two of their ſides meet, and form a ſmall angle, the other two being only kept apart by the interpoſition of ſome thin body; and thus immerged in a fluid tinged with ſome colour; the fluid will aſcend between the planes, and this the higheſt where the planes are neareſt; ſo as to form a curve line, which is found to be a juſt *hyperbola*, one of the *aſymptotes* whereof is the line of the fluid, the other being a line drawn along the touching ſides.—The phyſical cauſe, in all theſe *phænomena*, is the ſame power of Attraction.

Ascent *of vapour*. See Cloud and Vapour.

Ascent, in *Aſtronomy*, &c. See Ascension.

Ascent, in *Logic*, denotes a kind of argumentation, wherein we riſe from particulars to univerſals.

As, when we ſay, this man is an animal, and that man is an animal, and the other man, &c. therefore, every man is an animal.

ASCESIS, properly denotes exerciſe of the body. It is formed from the verb ασκειν, uſed by the ancients in ſpeaking of the ſports and combats of the *athletæ*.

Ascesis is alſo uſed by philoſophers, to denote an exerciſe conducive to virtue, or to the acquiring a greater degree of virtue. Buddæus has a diſſertation on this philoſophical *aſceſis*.

ASCETERIUM, in *Eccleſiaſtical Writers*, is frequently uſed for a monaſtery, or place ſet apart for the exerciſes of virtue and religion.

The word is formed from *aſceſis*, *exerciſe*, or *aſcetra*, one who performs exerciſe. Originally it ſignified a place where the *athletæ*, or gladiators, performed their exerciſes.

ASCETIC, an ancient appellation given to ſuch perſons as, in the primitive times, devoted themſelves more immediately to the exerciſes of piety and virtue, in a retired life; and, particularly, to prayer, abſtinence, and mortification.

The word is derived from ασκεω, *exerceo*, *I exerciſe*.

Afterwards, when the monks came in faſhion, this title was beſtowed upon them; eſpecially upon ſuch of them as lived in ſolitude.

Ascetic is alſo a title of ſeveral books of ſpiritual exerciſes.—As, the *Aſcetics*, or devout treatiſes of St. Baſil, archbiſhop of Cæſarea in Cappadocia.

We alſo ſay the *aſcetic* life, meaning the exerciſe of prayer, meditation, and mortification.

A SECRETIS. See Secretary.

ASCHARIOUNS, or Ascharians, followers of Aſcharius, one of the moſt celebrated doctors among the Mahometans.

ASCHIA, in *Ichthyology*. See Grayling.

ASCIA, in *Antiquity*, an inſtrument ſuppoſed of the ax-kind, uſed in the fabric of the Roman tombs, and frequently repreſented on them.

The *formula ſub aſcia dedicare*, is frequently found inſcribed on ancient tomb-ſtones. We alſo meet with *regum aſcia ne poleito*, among the antique laws of the Twelve

Tables. Theſe expreſſions, and the figure of the *aſcia*, as ſeen on the tombs, have puzzled ſeveral antiquaries, who have formed very curious conjectures concerning it. F. Martin rejects all their opinions; and with conſiderable probability affirms, that the *aſcia* was a hoe, or ſort of pick-ax for digging up the ground, which is to this day called *aſſados*, or *aſſaidos*, in Languedoc. This *aſcia* he pretends was not an inſtrument of common uſe, but conſecrated and employed only for digging of graves; and that it is the ſame with what Sidonius Apollinarius calls *raſtrum funebre*, wherewith the Gauls digged their graves. Lib. iii. ep. 12.

This, he thinks, appears plainly to be the ſignification of the word, from the Latin proverb, *ipſe mihi aſciam in crus impegi*; which often happens to thoſe who work with this inſtrument.

On this footing the famous law of the Twelve Tables, wherein the *aſcia* is mentioned, and the explication of which has puzzled all our antiquaries, contained only a prohibition to dig graves with an inſtrument of iron or copper, ſuch as the *aſcia*. In reality it was a tradition obſerved by the remoteſt antiquity, that no inſtrument made of thoſe metals ſhould be uſed in ſepulchres.

Dom. Martin has given a diſſertation concerning the funeral monuments of the Romans, conſecrated *ſub aſcia*. La Relig des Gaul. tom. ii. liv. 5.

ASCIA is alſo uſed, in *Surgery*, for a kind of bandage, ſomewhat oblique, or crooked; whoſe form and uſe are well deſcribed by Scultetus, in his Armam. Chirurg. p. 1. tab. 54. fig. 3.

ASCII, in *Geography*, are thoſe inhabitants of the globe, who, at certain times of the year, have no ſhadow.

The word is formed of the privative *α*, and *σκια*, *umbra*, *ſhadow*.

Such are the inhabitants of the torrid zone; becauſe the ſun is ſometimes vertical to them.—To find on what days the people of any parallel are *aſcii*, ſee GLOBE.

ASCIDIA, a genus of the order of *molluſca* worms, in the Linnæan ſyſtem.

ASCINDOE, in *Botany*, a name given by the people of Guinea to a ſhrub, which they uſe in medicine, boiling it in water, and giving the decoction in gonorrhœas, and the like complaints. Petiver has named it the prickly Guinea ſhrub, with roundiſh crenated leaves, and filamentous flowers. The leaves are about an inch wide, and about an inch and a half long; they ſtand on ſhort foot-ſtalks; and at the ends of the branches, there ſtand cluſters of ſtamineous flowers. The thorns on the large branches are very ſtrong. Phil. Tranſ. N° 232.

ASCITÆ, in *Antiquity*, a ſect, or branch, of Montaniſts, who appeared in the ſecond century.

The word is derived from *ασκος*, a *bag*, or *bottle*.

The *Aſcitæ* were ſo called, becauſe they introduced a kind of Bacchanals into their aſſemblies, who danced round a bag or ſkin blowed up; ſaying, they were thoſe new bottles filled with new wine, whereof Jeſus Chriſt makes mention, Matth. ix. 17.—They are ſometimes alſo called *Aſcodrogitæ*.

ASCITES, in *Medicine*, a ſpecies of DROPSY, affecting chiefly the *abdomen*, or lower belly.

The word is borrowed from *ασκος*, *uter*, *bag*, or *bladder*.

The *aſcites* is the ordinary WATER-DROPSY.

ASCLEPIA, in *Antiquity*, feaſts celebrated through Greece in honour of Bacchus.

ASCLEPIAD, ASCLEPIADEUS, a Greek or Latin verſe of four feet, containing a ſpondee, a choriambus, and two dactyls; or, which amounts to the ſame, a ſpondee, two choriambuſes, and a pyrrhichius.

Such is the verſe,

Mæcenas atavis edite regibus.
And, *Sublimi feriam ſidera vertice.*

ASCLEPIAS, in *Botany*, *Vincetoxicum*, *Hirundinarea*. See SWALLOW-*Wort*.

ASCODRUTÆ, in *Antiquity*, a ſect in the ſecond century, who rejected all uſe of ſymbols and ſacraments, on this principle, that incorporeal things cannot be communicated by things corporeal, nor divine myſteries by any thing viſible.

ASCOGEPHYRUS, in *Middle Age Writers*, denotes a bridge ſupported on bags made of leather, or bullocks hides. Such bridges appear to have been in uſe among the ancients, and to have given the denomination to a tribe of Arabs, hence called *Aſcitæ*.

Hence alſo the appellation *aſcomanni*, given to pirates, by reaſon of their uſing bridges, or rather boats made of leather. Plin. Hiſt. Nat. lib. vi. c. 9. Du-Cange.

ASCOLIA, in *Antiquity*, a feaſt, which the peaſants of Attica celebrated in honour of Bacchus.

They ſacrificed a he-goat to him (as being the deſtroyer of vines); and of the victim's ſkin made a foot-ball, which they blew up, and anointed with ſome unctuous matter; or, as Potter thinks, they made a bottle of it, which they filled with oil and wine. The young people playing at this, and keeping themſelves always on one foot, whilſt the other was ſuſpended in air, by their frequent falls, gave occaſion of diverſion to the ſpectators. He that held the ſport longeſt, and made the largeſt hops, was the conqueror. Hence the game called *aſcoliaſm*. Pitiſcus.

ASCRIPTI, or ADSCRIPTI, in *Antiquity*, thoſe who entered their names in the colonies, and became *coloni*.

ASCRIPTITII, or ADSCRIPTITII, a kind of villains who coming from abroad, ſettle in the lands of ſome new lord, whoſe ſubjects or ſervants they commence; being ſo annexed to the lands, that they may be transferred and ſold with the ſame.

The *aſcriptitii* are annexed to the land they hold, ſo that they cannot ſtir from it; beſides, that whatever they acquire accedes to the benefit of the lord of the land. Du-Cange, and Calv. Lex. Jur.

ASCRIPTITII is ſometimes alſo uſed in ſpeaking of aliens or foreigners, newly admitted to the freedom of a city or country.

ASCRIPTITII was alſo uſed in the *Military Laws*, for the recruits appointed to ſupply the loſſes of the legions, called alſo ACCENSI.

ASCRIPTIVI, in *Antiquity*. See ASCRIPTITII.

ASCUS, in *Natural Hiſtory*, a word uſed by De Laet, as the name of that pouch or bag which nature has given to the OPOSSUM, or POSSUM, as our common people in America call it, for the receiving the young ones into it in time of danger.

This *aſcus* is a ſkinny bag, ſeparate from the reſt of the body, and only adhering by a membrane to the bottom of the belly. It is a vulgar error to ſuppoſe, that the young of this animal are taken back again into the womb, in time of danger, they being only at liberty to creep into and out of this bag, prepared on purpoſe for them.

ASCYRUM, in *Botany*. See *St.* PETER'S-WORT.

ASEKI, or ASEKAI, the name which the Turks give to the favourite ſultaneſſes, who have brought forth ſons. Theſe are greatly diſtinguiſhed above others in their apartments, attendants, penſions, and honours. They have ſometimes ſhared the government. The ſultana who firſt preſents the emperor with a male child, is reckoned the chief favourite, is called *buyuk aſeki*, and ranks as a legitimate wife: though, from the time of Bajazet I. the ſultans are forbid to marry by a public law, which Solyman II. violated in favour of Roxalana.

ASELLI, two fixed ſtars of the fourth magnitude, in the conſtellation CANCER.

ASELLI is ſometimes uſed for MILLEPEDES.

ASELLII *Pancreas*. See PANCREAS.

ASELLUS, in *Ichthyology*, the name of a genus of fiſh, including the *cod* and *whiting*; of which writers enumerate ſeveral ſpecies. See Willughby's Hiſt. Piſc. p. 160. See COD and FISHERY.

ASEMOS, *ασημος*, from *α* negative, and *σημα*, a *ſign*, is an epithet applied to events that fall out contrary to all appearance, and without any manifeſt cauſe.

ASEPTA, in *Medicine*, *ασηπτα*, from *α* negative, and *σηπω*, *to putrefy*; ſignifies any thing unputrefied, or unconcocted.

ASH-*tree*, *fraxinus*, in *Botany*, a genus of the *polygamia dioecia* claſs. Its characters are, that it hath hermaphrodite and female flowers on the ſame tree, and ſometimes on different trees. The hermaphrodite flowers have no petals, but a ſmall empalement including two erect ſtamina. In the centre is ſituated an oval compreſſed germen, which afterward becomes a compreſſed bordered fruit, ſhaped like a bird's tongue, having one cell, incloſing a ſeed of the ſame form. The female flowers are the ſame, but have no ſtamina. There are ſix ſpecies.

Theſe trees are now propagated in plenty in the nurſeries for ſeed, as there have been of late years a great demand for all the hardy plants of trees and ſhrubs which will live in the open air; but all thoſe trees which are grafted upon the common *aſh*, are not ſo valuable as thoſe which are raiſed from ſeeds, becauſe the ſtock generally grows much faſter than the grafts; whereby the lower part of the trunk, ſo far as the ſtock riſes, will often be twice the ſize of the upper; and if the trees ſtand much expoſed to the wind, the grafts are frequently broken off to the ſtock, after they are grown to a large ſize, which is a great diſappointment to a perſon, after having waited ſeveral years, to ſee their trees ſuddenly deſtroyed. Beſide, if the wood of either of the ſorts is valuable, it can be of little uſe when the trees are ſo raiſed.

The common *aſh* propagates itſelf in plenty by the ſeeds which ſcatter in the autumn; ſo that where the ſeeds happen to fall in places where the cattle do not come, there will be plenty of plants come up in the ſpring. But where any perſon is deſirous to raiſe a quantity of the trees, the ſeeds ſhould be ſown as ſoon as they are ripe, and then the plants will come up the following ſpring; but if the ſeeds are kept out of the ground till ſpring, the plants will not come up until the year after, which is the ſame with all the ſorts of *aſh*.

When the plants are come up, they muſt be kept clean from weeds during the ſummer; and if they make any good progreſs in the ſeed-bed, they will be fit to tranſplant by the following autumn; therefore there ſhould be ſome ground prepared to receive them, and as ſoon as their leaves begin to fall, they may be tranſplanted. In taking them up, care ſhould be taken not to tear off any of their roots; to prevent which, they ſhould be taken up with a ſpade, and not drawn up, as is frequently practiſed. For, as many of the plants which riſe firſt from ſeeds, will outſtrip the others in their growth, ſo it is frequently practiſed to draw up the largeſt plants, and leave the ſmaller to grow a year longer before they are tranſplanted: and to avoid hurting thoſe which are left, the others are drawn out by hand, and thereby many of their roots torn off or broken. The better way therefore is to take up all, tranſplanting the larger ones together in rows, and the ſmaller by themſelves. The rows ſhould be three feet aſunder, and the plants a foot and a half diſtant in the rows. In this nurſery they may remain two years, by which time they will be ſtrong enough to plant where they are to remain; for the younger they are planted out, the larger they grow: ſo that where they are deſigned for uſe, they ſhould be planted very young; and the ground where the plants are raiſed ſhould not be better than that where they are deſigned to grow.

If a wood of theſe trees is rightly managed, it will turn greatly to the advantage of its owner; for by the underwood which will be ready for cutting every eight or ten years, there will be a continual income, more than ſufficient to pay the rent of the ground, and all other charges: and ſtill there will be a ſtock preſerved for timber, which in a few years will be worth forty or fifty ſhillings a tree.

The beſt ſeaſon for felling theſe trees, is from November to February; for if it be done too early in autumn, or too late in the ſpring, the timber will be ſubject to be infeſted with worms, and other inſects: but for lopping of pollards, the ſpring is preferable for all ſoft woods.

This timber is of excellent uſe to the wheelwright and cartwright, for ploughs, axle-trees, wheel-rings, harrows, bulls, oars, blocks for pullies, and many other purpoſes. Miller's Gardener's Dict.

ASH, *mountain*; ſee SERVICE-*tree*.

ASH, *poiſon*; ſee POISON-*wood*.

ASHES, *cineres*, the terrene or earthy part of wood, and other combuſtible bodies, remaining after they are burnt or conſumed with fire.

This name is generally applied to the ſubſtance remaining of bodies containing an inflammable matter, after they have been deprived of it, by burning, or calcination in open air. Pewterers, for example, give the name of *tin-aſhes* to the earth of this metal, which in fuſion has been deprived of its phlogiſton and metallic properties.

Aſhes are properly the earth and fixed ſalts of the fuel, which the fire cannot raiſe; all the other principles being gone off in the ſmoke.

The chemiſts frequently call the *aſhes* of a body its *calx*. —*Aſhes*, if well burnt, are uſually pure white, becauſe the oil to which they owe their blackneſs when in a coal, is ſuppoſed quite evaporated. The *aſhes* of kali, fern, or the like, are a principal matter in the compoſition of glaſs.

The *aſhes* of all vegetables are found to contain iron, inſomuch that M. Geoffroy makes it a chemical problem, which he propoſes to the public, *to find aſhes without any particles of iron therein.*—Whether the metal exiſted in the plants themſelves, or is produced in them by the operation of calcination, is a point very ingeniouſly controverted between Meſſ. Geoffroy and Lemery the younger, in the Memoirs of the Royal Academy. See the ſubſtance of the diſpute under METAL.

Aſhes are of conſiderable uſe in making lixiviums, or lyes, for the purpoſes of medicine, for bleaching, and for ſugar-works, &c.

White *aſhes* were forbid to be exported, 2 and 3 Ed. VI. c. 26. on account of their neceſſary uſe in the making of ſoap, and ſaltpetre; as well as for the whitening of linen, and the dying and ſcouring of woollen cloth.

In the bills of entry, we find divers ſorts of *aſhes* imported from abroad: as POT-*aſhes*, PEARL-*aſhes*, from Germany; wood or SOAP-*aſhes*, and WEED-*aſhes*. See POT-*aſhes*, &c.

The ancients preſerved the *aſhes* of their dead anceſtors with great care and piety, in urns made for the purpoſe. See URN, &c.

The *aſhes* of all kinds of fuel make a fine manure for lands. They are the moſt proper for cold and wet lands, and ſhould be kept dry till the time of uſing them, that the rain may not waſh out their ſalts. One load of dry *aſhes* are found by the farmers to go as far as two loads that have been more careleſly kept. The wetting them moderately ſometimes with urine, or ſoap-ſuds, adds to their virtue. Six loads of common *aſhes* are generally allowed to an acre; but two loads of thoſe preſerved in this manner, will be ſufficient for the ſame quantity of ground.

The advantage that vegetable *aſhes* are of to land, is abundantly ſeen in the profit of the farmer, by burning his ſtubble, &c. But ſea-coal *aſhes* are the beſt for cold lands, and their virtue is found to be the moſt laſting of that of any kind.

Aſhes are a great improvement for graſs ground, as well as ploughed lands. On the former they are to be ſtrewed in April, and on the latter, as ſoon as the corn is ſown. Soap-*aſhes*, after the ſoap-boilers have done with them, are found alſo to be of very great advantage to cold and ſour lands. The worſt ſort of land we have, which is naturally over-run with furze and heath, has been tried with this manure, in large quantities, and vaſt crops of wheat have been obtained from it for ſix years together. Kiln-*aſhes*, ſuch as are made of ſtraw, furze, &c. are as good as any, but they are very light. The maltſters in the Weſt of England ſift theſe over their corn and graſs, but being very light, this muſt by no means be done in windy weather, and ſucceeds beſt of all when done juſt before rain or ſnow.

Pot-*aſhes*, after the pot-aſh-men have done with them, are alſo of great ſervice; but as they have been, in a great meaſure, deprived of their ſalt, they are to be laid on in conſiderable quantity.

Turf-*aſhes* are very good for all ſorts of land, but eſpecially for clay-land; but theſe are much the better, when mixed firſt with lime.

ASHES, *pot*; ſee POT-*aſhes*.

ASHLAR, a term uſed among *Builders*; by which they mean common or free ſtones, as they come out of the quarry, of different lengths and thickneſſes.

ASHLERING, among *Builders*, ſignifies quartering, to lath to, in garrets, about 2½, or 3 feet high, perpendicular to the floor, up to the underſide of the rafters.

ASH-WEDNESDAY, the firſt day of Lent, ſuppoſed to have been ſo called from a cuſtom in the church, of ſprinkling aſhes that day on the heads of penitents then admitted to penance.

ASIARCHA, in *Antiquity*, the ſuperintendant of the ſacred games in Aſia. Montfaucon. Pal. Græc. lib. ii. c. 6. p. 161.

The *Aſiarcha* differed from the *Galatarcha*, *Syriarcha*, &c. Some will have the *Aſiarchs* to have been perſons of rank, choſen in the way of honour, to procure the celebration of the ſolemn games, at their own expences.

ASIATIC *ſtyle*; ſee STYLE.

ASIICTOS, in *Natural Hiſtory*, a name given by the ancients to a ſtone, deſcribed to have been of a black colour, variegated with ſpots and veins of red.

ASILUS, in *Zoology*, the name uſed by many for the LUTEOLA, or *regulus non criſtatus*, an extremely ſmall bird, common among willows.

ASILUS, in *Zoology*, the name of a genus of inſects, belonging to the *diptera* of Linnæus, called in Engliſh the HORNET-*fly*, or WASP-*fly*.

The diſtinguiſhing characters of this genus are theſe: they are of the two-winged kind, with a ſtyle or oblong body, terminated by a protuberance or head, and called a ballancer, under each wing: to this add, that the head is furniſhed, by way of mouth, with a ſnout of a ſubulated figure, which is ſimple and very ſharp at the extremity. They are among the largeſt of the FLY-kind.

Authors have called theſe inſects by the names of MUSCÆ *crabroniformes*, MUSCÆ *rapaces*, and MUSCÆ *veſpiformes*.

ASINARII, an appellation given, by way of reproach, to the ancient Chriſtians, as well as Jews, from a miſtaken opinion, among heathens, that they worſhipped an aſs.

The appellation was originally given to the Jews, and only became applied to the Chriſtians: the Jews were charged with keeping a golden aſs's head in the ſanctuary of the temple, to which, on certain occaſions, they paid adoration; in memory of a herd of aſſes, which in their paſſing through the wilderneſs, ſhewed Moſes the way, under a diſtreſſing want of water, to a ſpring. Tacit. Hiſt. lib. v.

Some had even the impiety to repreſent Chriſt with an aſs's ears, and one foot hoofed, holding a book, with the inſcription *Deus Chriſtianorum* ονοχηλος. Crinit. de Honeſt. Diſcipl. lib. i. c. 9.

ASINIUS *lapis*, a name given by ſome writers of the middle ages, to a ſtone, ſaid to be found in thoſe places frequented by the wild aſs. See BEZOAR.

ASINUS *piſcis*, in *Zoology*, a name given by ſome authors to the ÆGLEFINUS, or common haddock, called alſo ONOS. Willughby.

ASIO, in *Zoology*, a name given by Aldrovandus, and others, to the OTUS, or leſſer horn-owl.

ASKER, a name uſed in ſome parts of England for the water-newt, or EFT.

ASLANI, in *Commerce*, a name given to the Dutch dollar, current in moſt parts of the Levant.

The word is alſo written corruptly, *aſſelani*. It is originally Turkiſh, and ſignifies a lion, which is the figure ſtamped on it. The Arabs taking the figure of the lion for a dog, call it *abuſketh*.

The *aſlani* is ſilver, but of a baſe alloy, and oftentimes counterfeit. It is current for 115 or 120 aſpers. See ASPER.

ASMODAI, the name given by the Jews to the prince of demons; and, according to R. Elias, the ſame with *Sammael*.

ASOTUS, in *Ichthyology*, a ſpecies of the SILURUS.

ASP, in *Natural Hiſtory*, a ſmall poiſonous kind of ſerpent, whoſe bite gives a ſpeedy, but eaſy death.

It is ſaid to be thus denominated from ασπις, *ſhield*, in regard to its manner of lying convolved in a circle, in the center of which is the head, which it exerts, or raiſes, like the *umbo* or *umbilicus* of a buckler.

This ſpecies of ſerpent is very frequently mentioned by authors, but ſo careleſly deſcribed, that it is not eaſy to determine which, if any of the ſpecies known at preſent, may properly be called by this name.

Naturaliſts mention three ſpecies of *aſps*; the firſt called *cherſæa*, the ſecond *chelidonia*, and the third *ptyas*, the moſt fatal of all.

It is with the *aſp* that Cleopatra is ſaid to have diſpatched herſelf, and prevented the deſigns of Auguſtus, who intended to have carried her captive to adorn his triumphal entry into Rome. But the fact is conteſted: Brown places it among his vulgar errors. The indications of that queen's having uſed the miniſtry of the *aſp*, were only two almoſt inſenſible pricks found in her arm. In reality, Plutarch ſays, it is unknown of what death ſhe died.

Lord Bacon makes the *aſp* the leaſt painful of all the inſtruments of death: he ſuppoſes its poiſon to have an affinity to opium; but to be leſs diſagreeable in its operation; which does not ſo well quadrate with the deſcription of the ſymptoms given by Dioſcorides and others. Immediately after the bite, the ſight becomes dim, a ſenſible tumour ariſes, and a moderate pain is felt in the ſtomach.

Matthiolus adds, that the bite is followed by a ſtupor of the whole body, paleneſs, coldneſs of the forehead, continual yawning, nictitation of the eye-lids, inclination of the neck, heavineſs of the head, ſinking into a profound ſleep, and laſtly convulſions.

The bite of the *aſp* is ſaid by Ariſtotle to admit of no remedy. Pliny and Ægineta allow of no other cure, but to cut off the wounded part. Others recommend burning the part, with the internal uſe of hot alexipharmic medicines.

The ancients had a plaſter called δι' ασπιδων, made of this terrible animal, of great efficacy as a diſcutient of *ſtrumæ*, and other indurations, and uſed likewiſe againſt pains of the gout. The fleſh and ſkin, or *exuvia* of the creature, had alſo their ſhare in the ancient *Materia Medica*.

ASPALATH, ASPALATHUM, in *Pharmacy*, the wood of a foreign tree, heavy, oleaginous, ſomewhat ſharp and bitter to the taſte, and of a ſtrong ſmell, and purple colour.

The *aſpalath* is otherwiſe called *lignum Rhodium*, or ROSE-*wood*; and by ſome, *Cypreſs-wood:* the former on account of its ſweet ſmell, or growth in the iſland of Rhodes; the latter from its being alſo found in the iſland of Cyprus. Though ſome will have *aſpalathum* a different wood from the *lignum Rhodium*.

Aſpalath was anciently in much repute, as an aſtringent, ſtrengthener, and drier; but it is now much diſuſed in internal practice.

In virtue, taſte, ſmell, and weight, it reſembles the *lignum aloes*; and in phyſic they are frequently ſubſtituted the one for the other.

Aſpalathum affords an oil of an admirable ſcent; reputed one of the beſt of perfumes; it is chiefly uſed in ſcenting pomatums, and liniments.

ASPALATHUS, in *Botany*, a genus of the *diadelphia decandria* claſs; the calyx of which conſiſts of a ſingle-leafed perianthium, divided into five ſegments; the corolla is papilionaceous; the fruit is a roundiſh, turgid, unilocular, bivalve pod; the ſeed is ſingle, and frequently kidney-ſhaped.

ASPARAGUS, in *Botany*, vulgarly called SPARROW-*graſs*; a genus of the *hexandria monogynia* claſs. Its characters are, that the flower is naked, having no empalement, and is of the bell-ſhaped kind, ſpread open, and reflexed on the top. Theſe are male and hermaphrodite, ſometimes on different plants, and at other times on the ſame ſtalks. The hermaphrodite flowers have a *germen*, which afterwards becomes a round berry, having three cells; in each of which is lodged one or two ſeeds. The male flowers have ſix *ſtamina*, but no *germen* or ſtyle; nor are ſucceeded by any berries. There are ten ſpecies, according to Mr. Miller; the firſt of which is the common *aſparagus*, which is cultivated for the uſe of the table, and may probably have been brought by culture to the perfection it now is, from the wild ſort which grows naturally in the fens of Lincolnſhire, where the ſhoots are no larger than ſtraws.

This *aſparagus* is propagated by ſeeds, in the procuring which, particular care ſhould be taken to get it from a perſon of ſkill and integrity. But where a perſon is in poſſeſſion of ſome good beds of *aſparagus*, it is much the beſt way to ſave it himſelf; in order to which, a ſufficient number of the faireſt buds ſhould be marked early in the ſpring, and be permitted to run up to ſeed; becauſe thoſe which run up after the ſeaſon for cutting the *aſparagus*, are generally ſo backward, as not to ripen the ſeeds, unleſs the ſummer is warm, and the autumn favourable.

There are ſome perſons who plant the ſeeds of *aſparagus* in the place where the roots are to remain, which is a very good method, if it is performed with care. The way is this; after the ground has been well trenched and dunged, they lay it level, and draw a line acroſs the ground, in the ſame manner as is practiſed in planting the young plants. With a dibble make holes at a foot diſtance, into each of which are to be dropped two ſeeds, for fear one ſhould miſcarry; which holes ſhould not be more than half an inch deep. Then cover the ſeeds, and remove the line a foot back for another row; and after four rows are finiſhed, leave ſpace for an alley between the beds. If it is to be taken up for hot beds, there may be ſix rows planted in each bed, nine inches diſtance between the rows. This ſhould be performed by the middle of February, becauſe the ſeeds lie long in the ground: but if onions are intended to be ſown upon the ground, that may be performed a fortnight or three weeks after, provided the ground be not ſtirred ſo deep as to diſturb the *aſparagus* ſeeds, in raking the onion ſeed into the ground.

A month after this, the *aſparagus* will come up; the crop of onions muſt then be thinned, and the weeds carefully cleared away. About Auguſt, the onions will be fit to pull up. In October following, cut off the ſhoots of the *aſparagus* within two inches of the ground, clear well all weeds away, and throw up the earth upon the beds, ſo as to leave them five inches above the level of the alleys. A row of coleworts may be planted in the middle of the alleys, but nothing muſt be now ſown on the beds. In the ſpring, the weeds muſt be hoed up; and all the ſummer, the beds kept clear of weeds. In October, they muſt be turned up, and earthed again, as in the preceding ſeaſon.

The ſecond ſpring after planting, ſome of the young *aſparagus* may be cut for the table. The larger ſhoots ſhould only be taken, and theſe ſhould be cut at two inches under ground, and the beds every year managed as in the ſecond year.

It is proper to take notice of a common error that has long prevailed with moſt people, which is, that of not dunging the ground for *aſparagus*, believing that the dung communicates a ſtrong rank taſte to it; which is a great miſtake, for the ſweeteſt *aſparagus* is that which grows on the richeſt ground, the poor ground occaſioning that rank taſte ſo often complained of.

The quantity of ground neceſſary to be planted with *aſparagus*, to ſupply a ſmall family, ſhould be at leaſt five or ſix rods; leſs than which will not do, for if there cannot be a hundred cut at a time, it will be ſcarcely worth while to plant it. Miller.

ASPARAGUS is a medicinal plant, which furniſhes one of thoſe called the five opening roots. It is a known diuretic; its top, or head, taken in the way of food, readily diſcovers itſelf in the ſmell of the urine: but its root is ſtill more ſtrongly endued with that quality, as containing more of the ſalt from which it is derived. Hence it becomes, among us, an ingredient in all compoſitions, intended to cleanſe the *viſcera*, and guard againſt jaundices, dropſies, &c. It is alſo of ſome uſe as a pectoral; and makes a chief ingredient in the ſyrup of marſhmallows, againſt the ſtone. Though foreign phyſicians ſpeak more ſparingly of the uſe and virtues of this medicine.

ASPARAGUS was alſo uſed by the ancient Greeks, to expreſs not only the young ſhoots of the plant of that name, but any other young ſprouts of an eatable plant. The ſprouts of the ſeveral kinds of cabbage were particularly expreſſed by this word, or ſometimes by the compound term *crambaſparagus*.

ASPASIA, among *Ancient Phyſicians*, a conſtrictive medicine for the *pudenda muliebria*. It conſiſted only of wool, moiſtened with an infuſion of unripe galls. Caſtell. Lex. Med.

ASPASTICUM, in *Eccleſiaſtical Writers*, a place, or apartment, adjoining to the ancient churches, wherein the biſhop and preſbyters ſat, to receive the ſalutations of the perſons who came to viſit them, deſire their bleſſing, or conſult them on buſineſs.

This is alſo called *aſpaticum*, *diaconicum*, *receptorium*, *metatorium* or *meſatorium*, and *ſalutatorium*; in Engliſh, *greeting-houſe*.

ASPECT, Aspectus, in *Gardening*, is uſed for what we otherwiſe call *expoſure*.

Aspect, in *Aſtronomy*, is uſed for the ſituation of the ſtars, or planets, in reſpect of each other; or, in *Aſtrology*, it denotes a certain configuration, and mutual relation between the planets, ariſing from their ſituations in the zodiac, whereby their powers are ſuppoſed to be mutually either increaſed or diminiſhed, as they happen to agree or diſagree in their active or paſſive qualities. Though ſuch configurations may be varied, and combined a thouſand ways, yet only a few of them are conſidered.—Hence, Wolfius more accurately defines *aſpect* the meeting of luminous rays emitted from two planets to the earth, either ſituate in the ſame right line, or including an angle which is one or more quota parts of four right angles.

The doctrine of *aſpects* was introduced by the aſtrologers, as the foundation of their predictions.—Hence, Kepler defines *aſpect* an angle formed by the rays of two planets meeting on the earth, able to excite ſome natural power or influence.

The ancients reckoned five *aſpects*, viz. *conjunction*, denoted by the character ☌; *oppoſition*, by ☍; *trine*, by △; *quadrate*, by □; and *ſextile*, by ✱.

Conjunction, and *oppoſition*, are the two extremes of the *aſpects*; the firſt being the beginning, and the ſecond the higheſt or ultimate term. See CONJUNCTION, and OPPOSITION.

Trigon, or *trine*, is the third part of a circle, or the angle meaſured by AB (*Tab. Aſtron. fig.* 3.).

Tetragon, or *quadrate*, is the fourth part of a circle, or the angle meaſured by the quadrant AD. *Sextile*, which is the ſixth part of a circle, or angle, is meaſured by the ſextant AG. See TRIGON, &c.

The *aſpects* are divided, with regard to their ſuppoſed influences, into *benign*, *malign*, and *indifferent*.

The quadrate *aſpect* and oppoſition are reputed *malign*, or *malific*; trine and ſextile, *benign*, or *friendly*; and conjunction, an *indifferent aſpect*.

To the five ancient *aſpects*, the modern writers have added ſeveral more: as *decile*, containing the tenth part of a circle; *tridecile*, three tenths; and *biquintile*, four tenths, or two fifths.—Kepler adds others, as he tells us, from meteorological obſervations: as the *ſemi-ſextile*, containing the twelfth part of a circle; and *quincunx*, containing five twelfths.—Laſtly, to the aſtrological phyſicians we owe, *octile*, containing one eighth; and *trioctile*, containing three eighths. Some have alſo added *quintile*, containing a fifth part of the circle; and *biquintile*, or two fifths.

The angle intercepted between two planets in the *aſpect* of conjunction is 0; in the ſemi-ſextile *aſpect*, 30°; in decile, 36°; in octile, 45°; in ſextile, 60°; in quintile, 72°; in quartile, 90°; in tridecile, 108°; in trine, 120°; in trioctile, 135°; in biquintile, 144°; in quincunx, 150°; in oppoſition, 180°.

Theſe angles, or intervals, are reckoned on the ſecondary circles; or according to the longitudes of the planets; ſo that the *aſpects* are the ſame, whether a planet be in the ecliptic, or out of it.

The *aſpects* are uſually divided into *partile* and *platic*.

Aspects, *partile*, are when the planets are juſt ſo many degrees diſtant, as is above expreſſed.—Theſe alone are the *proper aſpects*.

Aspects, *platic*, are when the planets do not regard each other from theſe very degrees; but the one exceeds as much as the other comes ſhort.—So that the one does not caſt its rays immediately on the body of the other, but only on its orb or ſphere of light.

Aspect, *double*, is uſed in painting, where a ſingle figure is ſo contrived, as to repreſent two or more different objects, either by changing the poſition of the eye, or by means of angular glaſſes.—Inſtances hereof, ſee under the articles ANAMORPHOSIS, CATOPTRIC, CISTULA, and MIRROUR.

ASPEN-*tree*; ſee POPLAR.

ASPER, in *Grammar*.—*Spiritus* ASPER, a character, or accent, in form of a *c*; placed over certain letters, in the Greek tongue, to ſhew they are to be ſtrongly aſpirated, and that the breath is here to ſupply the place of an *h*.

Asper, or **Aspre**, alſo ſignifies a little Turkiſh ſilver coin, wherein moſt of the grand ſignior's revenues are paid. The *aſper* is worth ſomething more than an Engliſh halfpenny.—The only impreſſion it bears, is that of the prince's name under whom it was ſtruck.—The pay of the janizaries is from two to twelve *aſpers per diem*.

Asper, in *Ichthyology*, a ſmall fiſh caught in the Rhone, ſo called from the roughneſs of its ſcales. Its head is large, in proportion to its body, and of a pointed ſhape. It has no teeth, but its jaws are ſharp to the touch. It is of a dark red colour, with large black ſpots. It is good to eat, being eſteemed aperitive. Lemery.

ASPERA *Arteria*, in *Anatomy*, the WIND-*pipe*; otherwiſe called the TRACHEA.

The *aſpera arteria* is a canal ſituate in the middle and fore-part of the neck, before the *œſophagus*: its upper end is called the LARYNX; from whence it deſcends to the fourth *vertebra* of the back, where it divides, and enters the lungs.—See *Tab. Anat. Angeiol. fig.* 2. & *lit.* c. *Splanch. fig.* 12. *litt.* tt. & ſ.

It is formed of annular cartilages, ranged at ſmall and equal diſtances from one another, and growing ſmaller and ſmaller, as they approach the lungs; thoſe of the *bronchia* being ſo cloſe to one another, that, in expiration, the ſecond enters within the firſt, and the third within the ſecond, and the following always enters the preceding.

Betwixt the *larynx* and the lungs, theſe cartilages make not complete rings; being flat on one ſide, and not finiſhing the whole circle, but repreſenting the figure of the ancient Greek *ſigma*: whence they are alſo denominated *ſigmoides*.—Their hind part, which is contiguous to the *œſophagus*, is membranous, that they may better contract and dilate, and give way to the food as it paſſes down the gullet.

The cartilages of the *bronchia* are completely annular: yet their capillary branches have no cartilages, but inſtead of them, ſmall circular ligaments, which are at pretty large diſtances from one another.—The uſe of the cartilages is to keep the paſſage for the air open; but in the capillary *bronchia*, they would hinder the ſubſiding of the veſſels.

Theſe cartilages are tied together by two membranes, external and internal: the external is compoſed of circular fibres, and covers the whole *trachea* externally; the internal is of an exquiſite ſenſe, and covers the cartilages internally: it is compoſed of three diſtinct membranes; the firſt woven of two orders of fibres; thoſe of the firſt order being longitudinal, for the ſhortening the *trachea*; theſe make the cartilages approach, and enter one another: the other order is of circular fibres, for contracting the cartilages.

When theſe two orders of fibres act, they aſſiſt, together with the external membrane, in expiration, in coughing, and in altering the tone of the voice.

The ſecond membrane is altogether glandulous; and the excretory veſſels of its glands, opening into the cavity of the *trachea*, ſeparate a liquor for moiſtening the ſame, and defending it from the acrimony of the air.—The laſt is a net of veins, nerves, and arteries; the veins are branches of the *vena cava*, the nerves of the recurrent; and the arteries are ſprigs of the *carotides*.

Tranſverſe ſections of the *aſpera arteria* have been commonly reputed mortal. Yet in the modern practice we find many inſtances to the contrary. In ſome dangerous caſes of quinſies, &c. they are even obliged to cut open this part. This operation is called BRONCHOTOMY, or LARYNGOTOMY.

In the Philoſoph. Tranſact. is a letter by Mr. John Keen, recommending the more frequent uſe of bronchotomy, or opening the wind-pipe, upon preſſing occaſions; which he urges from a remarkable caſe of a perſon who had the *trachea*, or wind-pipe, cut quite through beneath the *pomum Adami*, cured by ſtitching the wound, and uſing proper medicines.

There are curious obſervations on ſome peculiar advantages in the ſtructure of the *aſperæ arteriæ*, or WIND-*pipes* of ſeveral birds, and of the land-tortoiſe, in the Phil. Tranſ. vol. LVI. N° 24. an. 1766. The birds referred to are the wild *ſwan*, *colum*, *ſeras*, *crane*, Indian *cock*, and *demoiſelle*. See each, and TORTOISE.

ASPERGELLOUS, in *Botany*, the name given by Micheli to that genus of moſſes called, by Dillenius and others, *byſſus*. Linnæus preſerves the name of *byſſus* to theſe plants, but he removes them out of the claſs of moſſes, and places them under the general ſeries of funguſes, defining them to be funguſes compoſed of diſtinct capillary fibres, without knots.

ASPERGILLUM, in *Antiquity*, a long bruſh made of horſe-hair, fixed to a handle, wherewith the luſtral water was ſprinkled on the people in luſtrations and purifications. Horſley Brit. Rom. l. ii. c. 1.

This is alſo denominated *aſpergile*, and *aſperſorium*.

The ancients, inſtead of a bruſh, made uſe of branches of laurel and olive.

It is alſo uſed, in *Eccleſiaſtical Writers*, to denote the inſtrument in Romiſh churches, wherewith holy water is ſprinkled.

ASPERIFOLIOUS, in *Botany*, one of the diviſions or claſſes of plants in the *Fragmenta Methodi Naturalis* of Linnæus; ſo denominated, becauſe uſually rough-leaved. According to Mr. Ray, theſe plants make a diſtinct genus, the characters of which are, that the leaves ſtand alternately, or without any certain order, on the ſtalks: the flowers are monopetalous, but they have the margin cut into five diviſions, ſometimes deep, ſometimes ſhallow; and the upper ſpike or top of the plant is often curved back, ſomething like a ſcorpion's tail.

In the place of each flower, there uſually ſucceed four ſeeds; Mr. Ray ſuppoſes the *cerinthe* the only plant of this genus that hath leſs than four ſeeds at the baſe of each flower: this indeed hath but two.

To the claſs of *herbæ aſperifoliæ* belong the *pulmonaria maculoſa*, *cynogloſſa*, *borago*, *bugloſſa*, *anchuſa*, *echium*, *linum umbilicatum*, *heliotropium majus*, *aparine major*, *conſolida major*, *lithoſpermum*, *echium ſcorpioides*, and *cerinthe*.

They all poſſeſs the ſame general virtues, and are ſubaſtringent, and uſeful both internally and externally, as agglutinants.

ASPERITY, implies the inequality or roughneſs of the ſurface of any body; whereby ſome parts of it do ſo ſtick out beyond the reſt, as to hinder the hand, &c. from paſſing over it eaſily and freely.

Aſperity, or roughneſs, ſtands oppoſed to ſmoothneſs, evenneſs, politure, &c.—From the *aſperity* of the ſurfaces of contiguous bodies, ariſes friction.

According to the relations of Vermauſen, the blind man ſo famous for diſtinguiſhing colours by the touch, it ſhould appear, that every colour has its particular degree and kind of *aſperity*. He makes black the rougheſt, as it is the darkeſt of colours; but the others are not ſmoother in proportion as they are lighter; i. e. the rougheſt do not always reflect the leaſt light: for, according to him, yellow is two degrees rougher than blue, and as much ſmoother than green. See COLOURS.

ASPERJULA, a medicinal plant, reputed warm, and drying, recommended as an hepatic, and detergent.

This is alſo called ASPERGULA *odorata*, and *rubeola montana odorata*; in Engliſh, WOODRUFFE.

The ancients directed it externally in cataplaſms, to aſſuage and diſcuſs tumours, and applied it to the feet to promote delivery. But the moderns own no ſuch qualities in it; nor do they much uſe it internally.

ASPERSION, the act of ſprinkling with water, or ſome other fluid.

The word is formed of the Latin *aſpergere*, *to ſprinkle*; of *ad*, *to*, and *ſpargo*, *I ſcatter*.

Some contend for baptiſm by *aſperſion*, others by *immerſion*.

ASPERUGO, in *Botany*; ſmall wild BUGLOSS, or gooſe-*graſs*; a genus of the *pentandria monogynia* claſs; the characters of which are, that the flower is of one leaf, with a ſhort cylindrical tube, and hath five ſhort *ſtamina* in the centre, with four compreſſed *germina*, which afterwards become four oblong ſeeds, encloſed in the empalement. We have but one ſpecies, which alſo goes by the name of *great gooſe-graſs*, or *German madwort*.

This is an annual plant, which is found wild in ſome parts of England, as, near Newmarket, at Boxley in Suſſex, and in Holy Iſland. It is preſerved in the botanic gardens for variety, and may be eaſily propagated by ſeeds, which ſhould be ſown in autumn; and when the plants come up, they require no other culture than to keep them clear from weeds. They flower in May, and their ſeeds ripen in June.

ASPERULA, in *Botany*. See WOODRUFFE.

ASPHALATUS, in *Botany*. See ROBINIA.

ASPHALITES, in *Anatomy*, the fifth VERTEBRA of the loins.

It is thus called, becauſe conceived as the ſupport of the whole ſpine of the loins; from the privative *α*, and *σφαλλω*, *I ſupplant*.

ASPHALTOS, or ASPHALTUM, a ſolid, brittle, black, inflammable, bituminous ſubſtance, reſembling pitch, brought from the Eaſt, and particularly from Judea; whence it is alſo called *Jews-pitch*.

The *aſphaltos* of the Greeks is the *bitumen* of the Latins. Modern naturaliſts, who make a claſs of *bitumens*, generally place *aſphaltos* at the head of it, as being the moſt maturated and concocted of the whole tribe; but conſiſting of the ſame ſimple principles as the reſt.

It is chiefly found ſwimming on the ſurface of the *Lacus Aſphaltites*, or Dead Sea, where anciently ſtood the cities of Sodom and Gomorrah.—It is caſt up from time to time, in the nature of a liquid pitch, from the earth which lies under this ſea; and being thrown upon the water, it there ſwims like other fat bodies, and condenſes by little and little, through the heat of the ſun, and the ſalt that is in it: it burns with great vehemence; in which it reſembles *naphtha*; but is firmer as to conſiſtence. The genuine *aſphaltum* has no ſmell, and is not acted upon by water, nor highly rectified ſpirit of nitre, nor olive oil, nor the eſſential oils of aniſeed or turpentine.

The Arabs uſe it for pitching their ſhips, as we do common pitch.—Beſides this uſe, it was frequently employed in the embalming of the ancients. In a fluid ſtate, it is uſed for burning in lamps, and for varniſhes.

It is ſuppoſed to fortify the conſtitution, and reſiſt putrefaction; and to reſolve, attenuate, cleanſe, and cicatrize wounds: but is little uſed among us, either externally or internally.

It is uſual to ſophiſticate the *aſphaltos*, by mixing common pitch with it; the reſult whereof makes the factitious *piſſaſphaltum*, which the coarſeneſs of the black colour, and the fetid ſmell, eaſily diſcover. Moſt of that which is ſold in the ſhops under the name of *Jews-pitch*, is of the ſophiſticated kind. There is, however, beſide this, a native *piſſaſphaltum*.

ASPHALTUM alſo denotes a kind of bituminous ſtone, found near the ancient Babylon, and lately in the province of Neufchâtel; which, mixed with other matters, makes an excellent cement, incorruptible by air, and impenetrable by water; this was ſuppoſed to be the mortar ſo much celebrated among the ancients, wherewith the walls of Babylon, and the temple of Jeruſalem, were cemented.

It yields an oil which defends ſhips from water, worms, &c. much better than the ordinary compoſition; and which is alſo of good ſervice for the cleanſing and healing of ulcers, &c.

ASPHODELUS, in *Botany*. See KING'*s-ſpear*.

ASPHYXIA, is uſed by *Ancient Phyſicians*, to denote a privation, or ceſſation of the pulſe, through the whole body, and all its arteries.

The word is derived from *α*, and *σφυξις*, *a pulſe*.

In ſtrictneſs, no ſuch ceſſation can ever happen, except in caſe of death; but in ſome other caſes, the pulſe is found ſo remiſs and languid, as not to be perceivable by the touch.

Hence the *aſphyxia* is conſidered as an attendant of deep faintings, or deliquiums; and amounts to much the ſame with what is otherwiſe called *lipopſychia* or *ſyncope*.

Mr. Sage has lately publiſhed a treatiſe, recommending the volatile alkali fluor as the moſt effectual remedy in *aſphyxies*. See SUFFOCATION.

ASPHYXIA is alſo uſed by ſome for a privation of pulſe in ſome one part of the body, e. gr. in the arm, &c.

ASPIC, in *Botany*, a plant which grows in plenty in Languedoc, in Provence, and eſpecially on the mountain of St. Baume, in France. It is a kind of lavender, nearly like what grows in our gardens; both with regard to the figure and colour of its leaves and flowers. The botaniſts call it *male lavender*, *lavendula mas*, or *ſpica nardi*, *pſeudo nardus*, &c.

ASPILATES, or ASPLENITES, in the writings of the ancients, the name of a ſtone, famous for its virtues againſt the ſpleen, and many other diſorders; it was to be applied externally, and faſtened on to the part with camel's hair.

ASPINY, or ANGLIARY-*thorn*, a drug uſed in medicine; on which particular duties are impoſed, by the tariff of the cuſtom-houſe at Lyons.

ASPIRATE, ASPIRATIO, in *Grammar*, a character uſed to denote an aſpiration.

The *aſpirate*, by the Greeks called *ſpiritus aſper*, and marked over their vowels, ſeems to be of a very different nature from the letters; but is nevertheleſs a true letter, as well as the reſt, and a real conſonant.—By letters we do not mean the characters of the alphabet, which are changeable according to the languages and the people, and among the ſame people, according to time and cuſtom; and even according to the fancy of particular perſons.—Thus, ſome, for inſtance, write the *aſpirates*, or letters *aſpirated*; which, by others, are omitted; though both the one and the other pronounce alike; as in *huomo*, *huomini*, an Italian word frequently written *uomo*, *uomini*. But, by letters, we mean articulate ſounds, marked by them, and formed by the organs of ſpeech; viz. the throat, mouth, tongue, palate, teeth, &c.

Theſe ſounds are of two kinds, the one *ſimple*, and the other *compound*, or modified.—*Simple* are thoſe pronounced by a ſingle motion of the organ; ſuch are the vowels.

Compound ſounds are thoſe ſame ſimple ſounds modified by a motion of the organ, ſuperadded to the motion neceſſary to pronounce the ſimple ſound; of which kind are the conſonants.

Now an *aſpirate* is an effect or conſequence of a motion made by ſome of the organs of ſpeech; and therefore it muſt either be a vowel, or a conſonant.—The former it cannot be, as not being a ſimple ſound, or a ſound that may be pronounced by itſelf. It muſt therefore be a modificative, or conſonant; and in effect it has all the properties of one.

For, 1ſt, It reſults from a motion of the organ, which, of itſelf, produces no ſound. Thus the *ſpiritus* of the Greeks, our *h aſpirate*, as well as that of the French, and other people, has no more ſound of itſelf, than *b*, *c*, *d*, &c. and the ſame thing may be obſerved of the *aleph*, *heth*, and *caph*, of the Eaſtern languages.

2dly, On the contrary, our *h*, the *ſpiritus* of the Greeks, and the other *aſpirates* juſt mentioned, are pronounced with all the vowels, in the ſame manner as conſonants are.—They modify thoſe vowels, and are effects of a motion of the organ ſuperadded to the motion neceſſary to form the vowel. Thus, to pronounce *ha*, two motions of the organ are required as well as for *ba*, or *ca*, &c. one for *a*, which itſelf is a ſound; the other for *h*, which yields no ſound, no more than *b*; but adds ſomething to *a* which modifies it, and makes that *ha* is not mere *a*, nor *ba*, nor *ca*, &c. And this muſt hold ſtill more ſenſibly in the ſtronger *aſpirates*, as thoſe of the oriental tongues חָ, חֵ, חי, חו, חו, כּ, כֵ, &c. in all which, there are evidently two motions, the one to expreſs the vowel, and the other to modify it: now this being the nature and eſſence of a conſonant, it follows, that let them be denoted in what manner they will, whether as our *h*, as the orientals do, i. e. by proper characters in the courſe of the words themſelves; or, as the Greeks do ſome of theirs, by a ſign of aſpiration placed over the vowel; it matters not. The *aſpirate* is no leſs a conſonant in ἁιρω, than in χαιρω; in ἑω, than in χεω; in ὁλη, than in χολη; and ſo of others.

The third and laſt reaſon urged by ſome, is, that the Eaſtern languages, which, according to them, do not expreſs the vowels, do yet expreſs the *aſpirates*. This kind of argument ſeems, however, to be grounded on a miſtake; ſince it is more than probable, that the א, ה, ו, ע of thoſe languages, ſhould be ranked among the vowels, and were ſo uſed.

Add, that the *aſpirate* is frequently changed into a conſonant, and expreſſed by a conſonant. Thus, of ἑξ is made *ſex*; of ἑπτα, *ſeptem*; of ἑσπερος, *veſperus*, &c. of the Hebrew יין, ὁινος, and thence *vinum*, &c. Nay, even in the ſame language, Heſiod, ſpeaking of Hercules's buckler, uſes ʽΗρσυν for Θηρσυν; making no difference between a Θ and an *aſpirate*.

Hence it follows, that *aſpirates* are real conſonants; and that we ought not to exclude the *h* in our language, out of the number of letters.

Other grammarians contend, that the *h* is founded only by a ſtrong emiſſion of the breath, without any conformation of the organs of ſpeech, and conſequently is no letter. See H.

ASPIRATION, the act of aſpirating, i. e. of pronouncing any ſyllable, or word, ſtrongly; with a good deal of breath, and vehemence.

This we do, for inſtance, in thoſe words which have the letter *h* before them; as *harangue*, *hook*, *Holland*, *hero*, &c. whereas the like ſyllables are ſounded much ſofter and eaſier without the *h*; as in the *ear*, *eat*, &c. See H.

ASPIUS, in *Ichthyology*, a ſpecies of the *cyprinus*, belonging to the *abdominal* order. It is met with in the lakes of Sweden.

ASPLENIUM, in *Botany*; ſee Milt-*waſte*.

ASS, *aſinus*, in *Zoology*, a quadruped of the horſe kind, with a long head, long ears, a round body covered with a ſhort and coarſe fur, of a pale dun colour, with a ſtreak of black running down its back, and acroſs its ſhoulders, and a tail not hairy all the way, as in a horſe, but only at the end. As to his qualities, he is ſlow, lazy, and dull; but patient, proper to work hard, and to carry or drag heavy weights. The largeſt and ſtrongeſt of theſe animals are choſen for ſtallions to leap mares, which are deſigned in ſtuds for the breeding mules; and ſome of thoſe mules are ſo highly valued, as to be ſold even dearer than the fineſt horſes.

Though the *aſs* agrees with the horſe in many reſpects, it nevertheleſs has but a mean reſemblance to that noble animal; being not only ſmaller, but wanting the ſymmetry and beauty, ſo conſpicuous in the horſe.

The *aſs*'s ears ſeem much over-proportioned in length to the head. Its eyes are large, but have nothing bright or ſtriking in them; and the neck is long, but lank; and the tail is very long.

So nearly allied are the horſe and *aſs* kind, that they will copulate together, the produce of which commixture is a MULE.

This animal is originally a native of Arabia, and other parts of the Eaſt; its ſize and ſpirit decline as it advances into the colder regions. It was loſt in England during the reign of queen Elizabeth; and probably introduced again in the ſucceeding reign. We find mention of it in the hiſtory of this country, as early as the time of king Ethelred, and afterwards in the reign of Henry III. Pennant's Zoology, vol. i. p. 14.

The fleſh of animals which have ſolid hoofs is very bad food; but of theſe, the beſt and lighteſt (as they ſay who have travelled over Aſia) is the fleſh of wild *aſſes*.

The blood of the *aſs* is ſaid to be ſudorific, and that of a young *aſs* to cure the jaundice.

Aſs's milk is very nouriſhing and abſtergent, and is therefore eſteemed good in a conſumption, in diſorders of the ſtomach, abſceſſes of the kidneys, the ſtone in the bladder, and arthritic pains. It is eſteemed gently cathartic, and was frequently directed by Hippocrates as a purge in large quantities. As a topic, it makes the gums firm, eaſes arthritic pains, and gives the face an agreeable whiteneſs, if waſhed with it. See Milk.

The urine of an *aſs* is a powerful remedy, as is ſaid, in diſorders of the kidneys, cures the itch, takes away warts and callous excreſcencies, relieves in atrophies, palſies of the limbs, and pains of the gout.

The dung of this animal alſo is of uſe in medicine.

We have known, ſays Aetius, the juice of *aſs*'s dung highly beneficial in a dyſentery, eſpecially if the beaſt has been fed upon the mountains, or has had an aſtringent paſture. If the juice be inſufficient, let the dung be moiſtened with the juice of plantain, which muſt afterwards be expreſſed and infuſed.

The hoofs of *aſſes*, calcined and drank every day, are ſaid to cure the epilepſy; and mixed and worked with oil, to diſcuſs ſtrumous ſwellings: alſo the aſhes of the ſame, well beaten in woman's milk, and reduced to a collyrium, are ſuppoſed to deterge cicatrices in the eyes, if rubbed thereon together with milk.

Wild *aſſes* are plentiful in many warm countries, particularly in Africa. See Zebra.

Ass, *cucumber*; ſee Momordica.

Asses, *order of*, *aſinorum ordo*, a denomination given to the Mathurins, or Trinitarians, becauſe they were anciently obliged, in travelling, to ride on *aſſes*, not horſes. This obligation was ſet aſide, by a new rule given the order by pope Clement, in 1267. Du-Cange.

ASSA-Dulcis; ſee Asa-*dulcis*.

Assa-*fœtida*, or Asa-*fœtida*, a gum, or reſin, brought from the Eaſt Indies, of a browniſh colour, a ſharp taſte, and a very ſtrong offenſive ſmell; whence it is alſo called *ſtercus diaboli*, or devil's dung.

The goodneſs of *aſſa-fœtida* is known by its colour and ſmell: a tolerable ſcent, and a clear colour, are the ſigns of its good quality; as a black colour, and a great ſtench, are proofs of the contrary. The ſtrong ſcent of this gum is much like that of garlic. The Engliſh and Dutch import it from Surat.

Geoffroy gives the following account of *aſſa-fœtida*. Many authors, ſays he, have doubted whether our *aſſa-fœtida* be that of the ancients, which was by them called the food of the gods. But when we conſider the deſcription of Dioſcorides, and the relations of travellers, who ſay that the Perſians, Indians, aud other Eaſtern nations uſe it in ſauces, and call it alſo the food of the gods; there can be no reaſon to queſtion, but that ours is the ſame with the ancients.

Aſſa-fœtida, ſays he, is a gum reſin, brought to us in lumps of different colours; white, yellowiſh, blue, or brown; which laſt is the worſt colour of all. It has a very ſtrong fœtid ſmell; and we are obliged to Kœmpfer for an exact hiſtory of the tree which produces it, and of the manner of gathering it, &c. In general, this tree, or large plant, is of the umbelliferous kind, growing plentifully in the province of Lahir, in the dominions of the Great Mogul; and in that of Chorazen, in Perſia. In the months of July and Auguſt, the country people make inciſions in the roots of theſe trees, through which the juice drains. It is whitiſh and thin at firſt, but by drying ſoon becomes thicker, and of a brown colour; in which form it is gathered, and preſerved for uſe. The root of the plant reſembles a large parſnep, and is externally black.

Aſſa-fœtida is an excellent remedy in all hyſteric diſorders, whether only ſmelled to, or mixt in what is taken internally. It is alſo eſteemed a good ſudorific, and ſtrengthens the ſtomach. The doſe is from twelve grains to half a dram: but with a view to the ſtomach only, it muſt be given in ſmaller doſes. Externally, it is a good diſſolvent, and in that intention is an ingredient in the *ceratum de galbano*, and is ſometimes tied to the bits of horſe's bridles.

The *aſſa-fœtida* plant is recommended by Mr. Lawrence to be cultivated in our fields, for the food of cattle, inſtead of clover, ſaintfoin, or other ſuch herbs as we ſow among corn, and make into hay in the ſucceeding ſummers, and uſed as food for cattle at other ſeaſons. This gentleman is of opinion, that the ſheep, fed on this plant, would afford mutton of a much finer flavour than any that we are at preſent acquainted with. But it ſeems ſtrange, that this ſhould be the effect of theſe creatures feeding on a plant of ſo ſtrong a ſcent, that, as the ſame author obſerves, one dram of the freſh root ſmells more than a hundred weight of the drug, as kept by the druggiſts, and that the whole air is ſtrongly and very diſagreeably ſcented with it, wherever it grows. Upon the whole, it ſeems probable, that though this plant, or the *cytiſus*, or ſeveral others, might be cultivated in England for the food of cattle, yet not any one would be ſo eaſily raiſed, or make ſo great an advantage to the farmer, as the SAINTFOIN.

ASSABA, the name given by the people of Guinea to a ſhrub which they are very fond of, for its medicinal virtue; they boil it in water, and rub it on a *bubo*, and it proves a cure. Phil. Tranſ. Nº 232.

ASSAC, or ASSAX, in the *Materia Medica* of the *Ancients*, the name given by the Arabians to the *gum ammoniac* of the Greeks; but by many of the qualities attributed to this drug, it does not appear to be the ſame that is now called ſo.

ASSACH, or ASSATH, a kind of purgation, anciently uſed in Wales, by the oaths of 300 men.

ASSAILANT, one that aſſaults, or ſets upon another. See ASSAULT.

ASSAPOORY, in *Natural Hiſtory*, a name given by the people of the Eaſt Indies to a peculiar ſpecies of ſlate, which they uſe in medicine, reducing it to powder, and ſtrewing this on burning coals, that the ſick perſon may receive the fumes of it. It is principally uſed for children, when they are diſordered by taking cold. The ſmell of it, while burning, is very offenſive.

ASSARABACCA; ſee ASARABACCA.

ASSARIUM, denotes a ſmall copper coin, being a part or diminutive of the *as*.

The word is uſed by Suidas indifferently with οϐολος, and νομισμα, to denote a ſmall piece of money; in which he is followed by Cujacius, who defines ασσαριον by *minimus æris nummus*.

We find mention of the *aſſarion* in the goſpel of St. Matthew, chap. x. ver. 29.

ASSARON, an ancient Jewiſh meaſure of capacity, equal to the tenth part of the EPHAH.

The *aſſaron* is the ſame with what is more frequently called *omer*, or *gomer*.

Joſephus calls it εσσαρον; in the Hebrew it is alſo written *aſſarith*. Calmet and Arbuthnot.

ASSART, ASSARTUM, in *Law*, an offence committed in the foreſt, by pulling up, by the roots, woods which ſerve as thickets and covert for the deer, and making them plain as arable land.

This is the greateſt treſpaſs that can be committed in the foreſt, being more than a waſte. For whereas waſte of the foreſt is but the felling and cutting the coverts, which may grow again; *aſſart* is a total extirpation. What we call *aſſartum*, is elſewhere termed DISBOSCATIO.

ASSART was alſo uſed for a parcel of land *aſſarted*. See ESSART.

ASSART-*rents* were thoſe formerly paid to the crown for the foreſt-lands *aſſarted*. See RENT.

ASSASIN, or ASSASSIN, a perſon who kills another with the advantage either of an inequality in the weapons, or by means of the ſituation of the place, or by attacking him at unawares.

The word *aſſaſſin* is ſaid, by ſome, to have been brought from the Levant, where it took its riſe from a certain prince of the family of the *Arſacidæ*, popularly called *Aſſaſins*, living in a caſtle between Antioch and Damaſco, and bringing up a number of young men, ready to pay a blind obedience to his commands; whom he employed in murdering the princes with whom he was at enmity. The *Aſſaſins*, or *Aſſaſinians*, *Aſſaſinii*, above mentioned, poſſeſſed eight or twelve cities about Tyre; they choſe themſelves a king, whom they called the *old man of the mountain*. In 1213, they aſſaſſinated Louis of Bavaria. They were Mahometans, but paid ſome tribute to the knights templars.—The favourers of the *Aſſaſins* were condemned by the council of Lyons, and under Innocent IV. in 1231.—The Tartars overcame them, and killed their ſenior of the mountain in 1257, upon which the faction became extinct.

There was a certain law of nations, an opinion received in all the republics of Greece and Italy, whereby he that *aſſaſſinated* an uſurper of the ſupreme power, was declared a virtuous man. At Rome, eſpecially, after the expulſion of the kings, the law was formal and ſolemn, and inſtances of it admitted. The commonwealth armed the hand of any citizen, and created him magiſtrate for that moment. Conſid. ſur les Cauſ. de la Grand. des Rom. chap. xi. p. 121.

ASSATION, the preparing or dreſſing foods, or medicaments, in their own juices, by an external heat, without addition of any foreign moiſture.

Aſſation, in reſpect of culinary matters, is more frequently called *roaſting*; and, in pharmacy, *uſtion*, or *torrefaction*.

The word is formed of the Latin *aſſare*, *to roaſt*.

ASSAULT, in the *Art of War*, an attack made upon a camp, fortreſs, or poſt, in order to carry or become maſter thereof.

An *aſſault* is properly a general furious attack, wherein the aſſailants do not ſcreen themſelves by any works.—We ſay, to give an *aſſault*, to be commanded to the *aſſault*, to ſtand an *aſſault*, to repulſe an *aſſault*, to carry by *aſſault*, &c.

While an *aſſault* laſts, and both parties are mixed, the fire of the batteries ceaſes; and there is no uſe of cannon on either ſide; for they are afraid of deſtroying their own men thereby.

A governor was formerly obliged to ſuſtain three *aſſaults* before he gave up the place.—It is very difficult ſaving a town from pillage that is carried by *aſſault*.

Few places, of late years, ſtand *aſſaults*: M. de Feuquiere finds but three in his time. The firſt was Neuhaſel in 1683, commanded by the Turkiſh baſhaw: it was taken, as moſt others muſt be, becauſe the column of infantry that marched to the breach, conſiſted of more ranks than that of the infantry which defended it.—The ſecond was Buda, the baſhaw of which was killed in the attack. He had ſome flanking works remaining, whoſe fires had not been entirely ruined by the artillery of the beſiegers.—The third was the caſtle of Namur, defended by M. de Boufflers; which was not carried, becauſe the column of infantry which attacked the breach, marched too far off unſheltered.—We may add Bergen-op-zoom, taken by the French in 1747.—Add, that it is almoſt impoſſible to carry a place by *aſſault* or ſtorm, when the breach may be defended by the fires of works not yet deſtroyed. In reality, it ſhould be defended by no other fires, but thoſe which are oppoſed to it in front, or from the breach itſelf. Feuq. Mem. chap. xcix. Such obſtinacy in defending places to the laſt extremity is no longer found, except among the Turks; with whom it is a point of religion not to ſurrender to the Chriſtians, by capitulation, any place where they have once had a moſque.—Though of late they have ſometimes departed from this maxim.

ASSAULT, ASSULTUS, or *Inſultus*, in *Law*, an offer, or attempt, to hurt the perſon of another.

Or, it is a violent injury offered to a man's perſon, of a larger extent than battery, becauſe it may be committed by only offering to give a blow; or even, according to ſome, by a threatening ſpeech, by preſenting a piſtol, or the like.—Though ſome, it is to be obſerved, deny that words can amount to an *aſſault*.

To rebuke a collector with foul words, ſo that he depart for fear, without doing his office, has been adjudged an *aſſault*; and to ſtrike a man, though he be not hurt, or ſometimes not even hit, with the blow, is reputed the ſame. For, in treſpaſs for *aſſault* and battery, a man may be found guilty of the *aſſault*, and excuſed of the battery. 25 Ed. III. c. 4. But every battery includes an *aſſault*.

The *aſſaulting* a perſon with offenſive weapons, with a deſign to rob (though no robbery enſues), is puniſhed with tranſportation for ſeven years. 7 Geo. II. c. 21. *Aſſaulting* in the ſtreet or highway, with intent to ſpoil people's cloaths, and ſo ſpoiling them, is felony and tranſportation, by 6 Geo. I. c. 23. ſec. 11. And *aſſaulting* a privy counſellor in the execution of his office, is felony without benefit of clergy, by 9 Ann, c. 16.

ASSAY, ESSAY, or SAY, in *Metallurgy*, the proof or trial of the goodneſs, purity, value, &c. of metals, and metalline ſubſtances.

In ancient ſtatutes, this is called *touch*; and thoſe who had the care of it, *keepers of the touch*.—Under Henry VI. divers cities were appointed to have *touch* for wrought ſilver-plate. 2 Hen. VI. c. 14.—By this, one might imagine they had no better method of *aſſaying* than the ſimple one, by the touch-ſtone; but the caſe is far otherwiſe. In the time of king Henry II. the biſhop of Saliſbury, then treaſurer, conſidering that though the money paid into the king's exchequer for his crownrents, did anſwer *numero & pondere*; it might nevertheleſs be mixed with copper or braſs: wherefore a conſtitution was made, called the *trial by combuſtion*; which differs little or nothing from the preſent method of *aſſaying* ſilver. See a deſcription of it in the Black Book in the Exchequer, written by Gervaſe of Tilbury, c. xxi.—This trial is alſo there called *eſſaium*, and the officer who made it is named *fuſor*. Vid. Lownd. Eſſ. Amend. Silv. Coin. p. 5, & 155.

The method ſtill in uſe of *aſſaying* gold and ſilver, was firſt eſtabliſhed by an act of the Engliſh parliament, in 1354. Anderſon's Com. vol. i. p. 187.

Assaying, *ars docimaſtica*, in its extent, comprehends particular manners of examining every ore, or mixed metal, according to its nature, with the beſt-adapted fluxes; ſo as to diſcover, not only what metals, and what proportions of metal, are contained in ores; but likewiſe how much ſulphur, vitriol, alum, arſenic, ſmalt, &c. may be obtained from every one reſpectively.

Aſſaying is more particularly uſed by moneyers and goldſmiths, for the making a proof or trial by the cuppel, or teſt, of the fineneſs or purity of the gold and ſilver to be uſed in the coining of money, and manufacture of plate, &c. or that have been already uſed therein.

There are two kinds of *aſſaying*; the one before metals are melted, in order to bring them to their proper fineneſs; the other after they are ſtruck, to ſee that the ſpecies be ſtandard.

For the firſt *aſſay*, the *aſſayers* uſe to take fourteen or fifteen grains of gold, and half a dram of ſilver, if it be for money; and eighteen grains of the one, and a dram of the other, if for other occaſions.

As to the ſecond *aſſay*, it is made of one of the pieces of money already coined, which they cut in four parts. The quantity of gold for an *aſſay* among us, is ſix grains; in France, nearly the ſame; and in Germany, about three times as much.

In order to the due ſeparation of metals from metals, or of a confuſed mixture of metals, ſuch as thoſe commonly called *electrums*, or ſuch as the Corinthian braſs was ſuppoſed to be, we muſt obſerve, that experience has taught us a certain effect of lead, which could not be well conceived *à priori*.

Assaying *gold*.—In order to the *aſſaying* of gold ores, it muſt be obſerved, that the method varies, according to the nature and diſpoſition of the mineral matters along with which the metals happen to be mixed; whether it be ſtoney, earthy, ſulphureous, arſenical, &c. The art of making *aſſays* with diſpatch upon gold and ſilver ores, depends upon the ſcorification or vitrification of thoſe heterogeneous foſſile ſubſtances which may be incorporated therewith: lead and the glaſs of lead, and antimony and its glaſs, being great ſcorificators or vitrifiers, they become the natural agents on ſuch occaſions.

Silver is ſeparated from gold by means of *aqua fortis*, which diſſolves the ſilver, and leaves the gold entire behind; but in order to the ſucceſs of the operation, the mixt maſs ſhould contain conſiderably more ſilver than gold, otherwiſe the particles of ſilver will be defended by thoſe of the gold from the action of the acid. The writers on *aſſaying* generally direct three parts of ſilver to one of gold; but Dr. Lewis obſerves, that leſs is ſufficient, and ſhould therefore be made uſe of.—The ſeparation of baſer metals is effected by keeping the maſs in fuſion for ſome time upon a cuppel, with the addition of lead. The lead with all the metals, ſilver and platina excepted, turns into a *ſcoria* or droſs, which riſes to the ſurface, and is no longer miſcible with any metallic body in its perfect metallic ſtate.

For various other proceſſes of *aſſaying*, the curious are referred to Dr. Lewis's Phil. Techn. who has treated this ſubject very copiouſly and very accurately.

The method of *aſſaying* gold by coppelling, is thus performed. The *aſſayer*, having weighed the gold he intends to make the trial in, very exactly, with ſcales that will turn with the hundredth part of a grain, and noted down the weight, he adds twice as much fine ſilver thereto; though this ſhould be in proportion to the fineneſs the gold ſeems to be of, the baſeſt gold requiring the leaſt ſilver. The gold and ſilver, thus weighed and mixed, are wrapped up in a piece of paper, to prevent their loſing any thing of their weight, which would diſturb the accuracy of the *aſſay*.

While the *aſſayer* is weighing his materials, a reverbatory fire is lighted in a furnace, furniſhed with a muffler, and a cuppel, or teſt, ſet therein to heat: this done, a little bullet of lead is put in the cuppel, of a weight proportionable to the quantity and quality of the gold to be *aſſayed*. The quantity of lead ſhould be at leaſt three or four times that of the gold; if the gold is very impure, ten or twelve times its quantity will be neceſſary. When copper and gold lie mixed in equal quantities, the copper will not be ſeparated from the gold with leſs than twenty times its quantity of lead; and if the copper be in very ſmall proportion, as a twentieth or thirtieth part of the gold and ſilver, upwards of ſixty parts of lead are neceſſary for one of the copper. When the lead is well melted, and appears very clean and bright, they put in the mixture of gold and ſilver, and let it fuſe till it appear of an opal colour, and have fixed itſelf, in a little lump, to the bottom of the cuppel.

This done, the cuppel is left to cool in the furnace itſelf; after which, the lump is ſeparated very exactly from the place where it ſtuck to the veſſel, and beaten or hammered on the anvil; heating it, again and again, on the coals, to promote the ſtretching. It is likewiſe made to paſs ſeveral times between poliſhed ſteel rollers, ſcrewed gradually cloſer and cloſer, till it is extended into a very thin plate.

When ſufficiently hammered, &c. they roll it up in form of a cornet, or coffin; and thus put it in a glaſs matraſs, capable of containing four ſpoonfuls of water; and, having added to it a quantity of *aqua fortis*, well corrected, that is, mixed with near one third of the quantity of river-water, they boil it over a wood-fire, till ſuch time as the *aqua fortis* yields no more red fumes.

This firſt water being poured off, and the cornet left alone at the bottom of the matraſs, they fill the matraſs again, but with pure *aqua fortis*; which, after boiling, is poured off in its turn, at ſuch time as the fumes are become white.—This done, they fill up the matraſs with river-water, to waſh the cornet.

When waſhed, they put it dry in a crucible, with a cover over it, and heat it till it become of a cherry-colour. But the uſe of a crucible is attended with this inconvenience, that ſmall particles of the earth are apt to adhere imperceptibly to the gold, and thus render the *aſſay* leſs certain.

This done, the *aſſay* is finiſhed; and there remains nothing but to weigh it againſt the ſame weight of fine gold, as was uſed at firſt, before the *aſſay*: for by comparing the firſt weight of the gold, before it was put in the fire, and the *aqua fortis*, with what it retained after it had thus undergone the teſt, they judge, from the greater or leſs loſs it has ſuſtained, of the quantity of alloy mixed with it.

By the above deſcribed proceſſes, gold may be ſeparated from all the known metallic bodies, platina excepted. See Platina.

The ultimate refinement of gold, is thought to be that procured by fuſing it thin along with antimony; wherein the antimony tears away and imbibes the ſubſtance of all the other metals, but leaves the gold untouched; which therefore, as the heavier body, falls like a regulus to the bottom of the melting cone. See an account of the proceſs, in Dr. Lewis's Phil. Techn. p. 156; upon which he obſerves, that platina cannot thus be ſeparated from the gold; that ſome of the ſilver will remain; and, in general, that gold cannot be ſo effectually purified by ſubſtances which operate upon the alloy, and not upon the gold, as by thoſe which act on the gold itſelf, and not on the alloy.

The *alloy* of gold is eſtimated by carats, that of ſilver by penny-weights. The carat with us is divided into four grains; among the Germans, into twelve parts; and by the French, into thirty-two. The Chineſe reckon by touches, of which the higheſt number denoting pure gold, and correſponding to our twenty-four carats, is one hundred.

Gold without an alloy, is ſaid to be twenty-four carats fine. According to the proportion of pure gold, to that of the alloy in an ounce, the mixture is ſaid to be ſo many carats fine. If there be two carats of alloy, to twenty-two of pure gold, it is ſaid to be twenty-two carats fine: if four of alloy, to twenty of gold, twenty carats fine, &c.

Assaying *ſilver*.—The proceſs is much the ſame as in gold; only leſs difficult, and ſhorter. The ſilver is weighed, as before; and the ſame furnace, and muffler, the ſame fire, the ſame cuppel, uſed. Add, that lead is likewiſe put in the cuppel, proportioned to the quantity and quality of the ſilver to be *aſſayed*.

The lead being well melted, and clear, the ſilver is put in; and after it is brought to an opal colour, and fixed in a lump at the bottom of the cuppel, which happens in about half an hour; they let it cool, and cleanſe it: and, laſtly, weigh it again, as in gold. And, from its diminution, they eſtimate the quantity of alloy.

The alloy of ſilver with copper, may be examined by the cuppel in the following manner: Firſt, have ready a touch-ſtone, and a ſet of touch-needles; wipe carefully both the touch-ſtone, and the metal to be examined, and rub the metal on the ſtone; compare its mark with the needles, and by that means make a gueſs at the quantity of copper contained, and of courſe know how much lead will be neceſſary for conſuming that quantity. But as the lead neceſſary for conſuming the copper is not in a quantity proportionable to that of the copper, when this is mixed with ſilver, we ſhall here give, from

Lazarus Erker, the quantity to be added in every caſe. We ſhall take for our examples, a ſeries of touch-needles, made according to the mark, divided into half-ounces and grains. See Touch-needles.

½ ounce ſilver,	½ ounce copper,	Marks of lead to be added.
15½	½	4.
15	1	6.
14	2	8.
12 and 13	4 and 3	10.
9 — 12	7 — 4	14.
4 — 8	12 — 8	15.
1 — 4	15 — 12	16.

Every body may reduce this table to the needles, made according to the mark of the avoirdupoiſe, or that of carats: nor is it neceſſary to proportion the quantities of lead to be added, ſo far as one half centner. Cramer.

In the mean time, let the metal to be tried with the needles undergo the operation of cuppelling, together with the quantity of lead indicated by the touching; and the fire muſt be made the gentler, as the ſilver is alloyed with a greater quantity of copper; and on the contrary, the ſmaller the quantity of the alloy of copper is, the ſtronger muſt be the fire to be uſed in the operation. When the lead, which muſt be firſt put into the cuppel, begins to ſmoke and boil, then the metal to be examined is to be added, and the fire continued till the copper is all conſumed, and reduced to yellow ſcoriæ; and the bead of ſilver left in the center of the cuppel muſt be weighed, which, ſubtracting the known quantity of ſilver in the lead uſed in the operation, will ſhew the quantity of ſilver, and conſequently that of the copper in the alloy.

Assaying *of lead*.—The *aſſay* of gold and ſilver being performed by means of lead; it is of the utmoſt importance the lead be free from any mixture of either of the two metals; otherwiſe the *aſſay* will be falſe, becauſe the gold and ſilver mixed with the lead will not evaporate like other kinds of alloy, but unite with the metal under *aſſay*.

To prevent this diſorder, and aſſure the operation, there is no way but firſt to *aſſay* the lead itſelf.

This *aſſay* is performed in the ſame furnace, and with the ſame cuppels, as thoſe of gold and ſilver; but the proceſs is incomparably more ſimple: all here required, when the cuppel is heated, being to put in the piece of lead to be *aſſayed*. If this lead evaporate entirely, it is fit for the purpoſe: on the contrary, if there remain any little grain of ſilver, &c. at the bottom, it muſt be ſet aſide.

Assaying *of tin*. See Tin.

Assay-Master, an officer, under certain corporations, entruſted with the care of making true *touch*, or *aſſay*, of the gold and ſilver brought to him; and giving a juſt report of the goodneſs or badneſs thereof.

Such is the *aſſay-maſter* of the mint in the Tower, called alſo *aſſayer of the king*.

The *aſſay-maſter* of the goldſmiths company is a ſort of aſſiſtant-warden, called alſo a *touch-warden*, appointed to ſurvey, *aſſay*, and mark all the ſilver work, &c. committed to him.—There are alſo *aſſay-maſters* appointed by ſtatute, at York, Exeter, Briſtol, Cheſter, Norwich, Newcaſtle, and Birmingham, for *aſſaying* wrought plate.

The *aſſay-maſter* is to retain eight grains of every pound Troy of ſilver brought to him; four whereof are to be put in the Pix, or box of deal, to be re-*aſſayed* the next year; and the other four to be allowed him for his waſte and ſpillings. 12 and 13 W. III. c. 4. 1 An. c. 9.

Note, The number of penny-weights ſet down in the *aſſay-maſter*'s report, is to be accounted as *per pound*, or ſo much in every pound of twelve ounces Troy.—For every twenty penny-weight, or ounce Troy, the ſilver is found by the *aſſay* to be *worſe* than ſtandard, or ſterling, ſix pence is to be deducted; becauſe every ounce will coſt ſo much to reduce it to ſtandard goodneſs, or to change it for ſterling.

In gold, for every carat it is ſet down to be *worſe* than ſtandard, you muſt account that in the ounce Troy it is worſe by ſo many times 3*s.* 8*d.* And for every grain it is ſet down worſe, you muſt account it worſe by ſo many times 11*d.* in the ounce Troy. And for every half grain 5*d.* ½; for ſo much it will coſt to make it of ſtandard goodneſs, &c. Touchſtone of Gold and Silver Ware, &c. p. 41, &c.

Assay-*balance*. The flat pieces of glaſs often placed under the ſcales of an *aſſay-balance*, ſeem, by their power of electricity, capable of attracting, and thereby making the lighter ſcale preponderate, where the whole matter weighed is ſo very ſmall. See Phil. Tranſ. N° 480, p. 245. The electricity of a flat ſurface of about three inches ſquare, has been known to hold down one ſcale, when there were about two hundred grains weight in the other. See Balance and Electricity.

Assay *of weights and meaſures*, ſignifies the trial or examination of common weights and meaſures, by the Clerk *of the market*.

ASSEMBLAGE, the joining, or uniting, of ſeveral things together; or, the things themſelves ſo joined, or united.

The *aſſemblage* of two bones for motion, is called Articulation.

Carpenters and joiners have various kinds and forms of *aſſemblage*; as, with mortiſes and tenons, with dovetails, &c. See Dove-tail, Mortise, &c.

The Europeans admire the Carpentry of ſome Indians, where the *aſſemblage* is made without either nails or pins. Herrera.

Assemblage is alſo uſed, in a more general ſenſe, for a collection of ſeveral things, ſo diſpoſed together, as that the whole has an agreeable effect.—It is with diſcourſe as with bodies, which owe their chief excellency to the juſt *aſſemblage* and proportion of their members.

ASSEMBLY, a meeting of ſeveral perſons in the ſame place, and with the ſame common deſign.

The word is formed of *adſimulare*; compounded of *ad*, *to*, and *ſimul*, *together*.

Aſſemblies of the clergy are called convocations, ſynods, councils; though that annual one of the kirk of Scotland retains the name *General Aſſembly*, &c.—The *aſſemblies* of judges, &c. are called *courts*, &c.—The *aſſemblies* of the Roman people were called *comitia*.—The *aſſembly* of a preacher, &c. is his audience.—The academies have their *aſſemblies*, or days of *aſſembly*.

Under the Gothic governments, the ſupreme legiſlative power was lodged in an *aſſembly* of the ſtates of the kingdom, held annually for the like purpoſes as our parliament.

Some feeble remains of this uſage ſtill ſubſiſt in the annual *aſſemblies* of the ſtates of Languedoc, Bretagne, and a few other provinces of France; but theſe are no more than ſhadows of the ancient *aſſemblies*. It is only in Great Britain, Sweden, and Poland, that ſuch *aſſemblies* retain their ancient powers and privileges.

Assemblies of the *campus Martii*, or *Maii*, of the field of *Mars*, or *May*; ſee Field *of Mars*, &c.—Rebellious *aſſembly*; ſee Rebellious.—Unlawful *aſſembly*; ſee Unlawful.

Assembly is particularly uſed in the *Beau-monde*, for a ſtated and general meeting of the polite perſons of both ſexes; for the ſake of converſation, gallantry, dancing, and play.

Assembly is alſo uſed in the *Military Art*, for the ſecond beat of the drum, being that before the march.

On hearing this, the ſoldiers ſtrike their tents, roll them up, and then ſtand to their arms.—The third beating is called the *march*, as the firſt is called the *general*.

ASSENSU *Regio*; ſee Regio.

Dower ex **Assensu** *Patris*; ſee Dower.

ASSENT, Assensus, an agreement or acquieſcence of the mind to ſomething propoſed, or affirmed.—Thus, to *aſſent* to any propoſition, is to allow it to be true, or to perceive its truth.

Aſſent is diſtinguiſhed, like faith, into *implicit*, or *blind*; and *explicit*, or *ſeeing*, &c.—Others diſtinguiſh it into *actual* and *habitual*.

Assent, *actual*, is a determination of the mind, ariſing from the perception of the truth of any propoſition.

Assent, *habitual*, conſiſts in certain habits of believing or acquieſcing, induced in the mind by repeated acts.

To this belongs faith, which is an *aſſent* ariſing from the authority of the perſon who ſpeaks.—Such alſo is opinion, which is defined an *aſſent* of the mind *cum formidine oppoſiti*, &c.

Assent, for the meaſures and degrees of, ſee Demonstration, Evidence, Probability, &c.

Father Malebranche lays it down as an axiom, or principle of method, never to allow any thing for truth, from which we can forbear our *aſſent* without ſome ſecret reproach of our own reaſon.

Assent, *royal*; ſee Royal.

ASSERAC, among the Turks; ſee Assis.

ASSERIDA, in *Botany*, a name given by the people of Guinea to a kind of ſhrub, the leaves of which being chewed, are a cure for the colic, to which that people are very ſubject. Phil. Tranſ. N° 232.

ASSERTION, Assertio, in the language of the ſchools, a propoſition which a perſon advances; and which he avows to be true, and is ready to maintain in public.

ASSESSOR, Assessour, an inferior or ſubordinate officer the Exchequer, written by Gervaſe of Tilbury, c. xxi.—This trial is alſo there called *eſſaium*, and the officer who made it is named *fuſor*. Vid. Lownd. Eſſ. Amend. Silv. Coin. p. 5, & 155.

The method ſtill in uſe of *aſſaying* gold and ſilver, was firſt eſtabliſhed by an act of the Engliſh parliament, in 1354. Anderſon's Com. vol. i. p. 187.

Assaying, *ars docimaſtica*, in its extent, comprehends particular manners of examining every ore, or mixed metal, according to its nature, with the beſt-adapted fluxes; ſo as to diſcover, not only what metals, and what proportions of metal, are contained in ores; but likewiſe how much ſulphur, vitriol, alum, arſenic, ſmalt, &c. may be obtained from every one reſpectively.

Aſſaying is more particularly uſed by moneyers and goldſmiths, for the making a proof or trial by the cuppel, or teſt, of the fineneſs or purity of the gold and ſilver to be uſed in the coining of money, and manufacture of plate, &c. or that have been already uſed therein.

There are two kinds of *aſſaying*; the one before metals are melted, in order to bring them to their proper fineneſs; the other after they are ſtruck, to ſee that the ſpecies be ſtandard.

For the firſt *aſſay*, the *aſſayers* uſe to take fourteen or fifteen grains of gold, and half a dram of ſilver, if it be for money; and eighteen grains of the one, and a dram of the other, if for other occaſions.

As to the ſecond *aſſay*, it is made of one of the pieces of money already coined, which they cut in four parts. The quantity of gold for an *aſſay* among us, is ſix grains; in France, nearly the ſame; and in Germany, about three times as much.

In order to the due ſeparation of metals from metals, or of a confuſed mixture of metals, ſuch as thoſe commonly called *electrums*, or ſuch as the Corinthian braſs was ſuppoſed to be, we muſt obſerve, that experience has taught us a certain effect of lead, which could not be well conceived *à priori*.

Assaying *gold*.—In order to the *aſſaying* of gold ores, it muſt be obſerved, that the method varies, according to the nature and diſpoſition of the mineral matters along with which the metals happen to be mixed; whether it be ſtoney, earthy, ſulphureous, arſenical, &c. The art of making *aſſays* with diſpatch upon gold and ſilver ores, depends upon the ſcorification or vitrification of thoſe heterogeneous foſſile ſubſtances which may be incorporated therewith: lead and the glaſs of lead, and antimony and its glaſs, being great ſcorificators or vitrifiers, they become the natural agents on ſuch occaſions.

Silver is ſeparated from gold by means of *aqua fortis*, which diſſolves the ſilver, and leaves the gold entire behind; but in order to the ſucceſs of the operation, the mixt maſs ſhould contain conſiderably more ſilver than gold, otherwiſe the particles of ſilver will be defended by thoſe of the gold from the action of the acid. The writers on *aſſaying* generally direct three parts of ſilver to one of gold; but Dr. Lewis obſerves, that leſs is ſufficient, and ſhould therefore be made uſe of.—The ſeparation of baſer metals is effected by keeping the maſs in fuſion for ſome time upon a cuppel, with the addition of lead. The lead with all the metals, ſilver and platina excepted, turns into a *ſcoria* or droſs, which riſes to the ſurface, and is no longer miſcible with any metallic body in its perfect metallic ſtate.

For various other proceſſes of *aſſaying*, the curious are referred to Dr. Lewis's Phil. Techn. who has treated this ſubject very copiouſly and very accurately.

The method of *aſſaying* gold by coppelling, is thus performed. The *aſſayer*, having weighed the gold he intends to make the trial in, very exactly, with ſcales that will turn with the hundredth part of a grain, and noted down the weight, he adds twice as much fine ſilver thereto; though this ſhould be in proportion to the fineneſs the gold ſeems to be of, the baſeſt gold requiring the leaſt ſilver. The gold and ſilver, thus weighed and mixed, are wrapped up in a piece of paper, to prevent their loſing any thing of their weight, which would diſturb the accuracy of the *aſſay*.

While the *aſſayer* is weighing his materials, a reverbatory fire is lighted in a furnace, furniſhed with a muffler, and a cuppel, or teſt, ſet therein to heat: this done, a little bullet of lead is put in the cuppel, of a weight proportionable to the quantity and quality of the gold to be *aſſayed*. The quantity of lead ſhould be at leaſt three or four times that of the gold; if the gold is very impure, ten or twelve times its quantity will be neceſſary. When copper and gold lie mixed in equal quantities, the copper will not be ſeparated from the gold with leſs than twenty times its quantity of lead; and if the copper be in very ſmall proportion, as a twentieth or thirtieth part of the gold and ſilver, upwards of ſixty parts of lead are neceſſary for one of the copper. When the lead is well melted, and appears very clean and bright, they put in the mixture of gold and ſilver, and let it fuſe till it appear of an opal colour, and have fixed itſelf, in a little lump, to the bottom of the cuppel.

This done, the cuppel is left to cool in the furnace itſelf; after which, the lump is ſeparated very exactly from the place where it ſtuck to the veſſel, and beaten or hammered on the anvil; heating it, again and again, on the coals, to promote the ſtretching. It is likewiſe made to paſs ſeveral times between poliſhed ſteel rollers, ſcrewed gradually cloſer and cloſer, till it is extended into a very thin plate.

When ſufficiently hammered, &c. they roll it up in form of a cornet, or coffin; and thus put it in a glaſs matraſs, capable of containing four ſpoonfuls of water; and, having added to it a quantity of *aqua fortis*, well corrected, that is, mixed with near one third of the quantity of river-water, they boil it over a wood-fire, till ſuch time as the *aqua fortis* yields no more red fumes.

This firſt water being poured off, and the cornet left alone at the bottom of the matraſs, they fill the matraſs again, but with pure *aqua fortis*; which, after boiling, is poured off in its turn, at ſuch time as the fumes are become white.—This done, they fill up the matraſs with river-water, to waſh the cornet.

When waſhed, they put it dry in a crucible, with a cover over it, and heat it till it become of a cherry-colour. But the uſe of a crucible is attended with this inconvenience, that ſmall particles of the earth are apt to adhere imperceptibly to the gold, and thus render the *aſſay* leſs certain.

This done, the *aſſay* is finiſhed; and there remains nothing but to weigh it againſt the ſame weight of fine gold, as was uſed at firſt, before the *aſſay*: for by comparing the firſt weight of the gold, before it was put in the fire, and the *aqua fortis*, with what it retained after it had thus undergone the teſt, they judge, from the greater or leſs loſs it has ſuſtained, of the quantity of alloy mixed with it.

By the above deſcribed proceſſes, gold may be ſeparated from all the known metallic bodies, platina excepted. See Platina.

The ultimate refinement of gold, is thought to be that procured by fuſing it thin along with antimony; wherein the antimony tears away and imbibes the ſubſtance of all the other metals, but leaves the gold untouched; which therefore, as the heavier body, falls like a regulus to the bottom of the melting cone. See an account of the proceſs, in Dr. Lewis's Phil. Techn. p. 156; upon which he obſerves, that platina cannot thus be ſeparated from the gold; that ſome of the ſilver will remain; and, in general, that gold cannot be ſo effectually purified by ſubſtances which operate upon the alloy, and not upon the gold, as by thoſe which act on the gold itſelf, and not on the alloy.

The *alloy* of gold is eſtimated by carats, that of ſilver by penny-weights. The carat with us is divided into four grains; among the Germans, into twelve parts; and by the French, into thirty-two. The Chineſe reckon by touches, of which the higheſt number denoting pure gold, and correſponding to our twenty-four carats, is one hundred.

Gold without an alloy, is ſaid to be twenty-four carats fine. According to the proportion of pure gold, to that of the alloy in an ounce, the mixture is ſaid to be ſo many carats fine. If there be two carats of alloy, to twenty-two of pure gold, it is ſaid to be twenty-two carats fine: if four of alloy, to twenty of gold, twenty carats fine, &c.

Assaying *ſilver*.—The proceſs is much the ſame as in gold; only leſs difficult, and ſhorter. The ſilver is weighed, as before; and the ſame furnace, and muffler, the ſame fire, the ſame cuppel, uſed. Add, that lead is likewiſe put in the cuppel, proportioned to the quantity and quality of the ſilver to be *aſſayed*.

The lead being well melted, and clear, the ſilver is put in; and after it is brought to an opal colour, and fixed in a lump at the bottom of the cuppel, which happens in about half an hour; they let it cool, and cleanſe it: and, laſtly, weigh it again, as in gold. And, from its diminution, they eſtimate the quantity of alloy.

The alloy of ſilver with copper, may be examined by the cuppel in the following manner: Firſt, have ready a touch-ſtone, and a ſet of touch-needles; wipe carefully both the touch-ſtone, and the metal to be examined, and rub the metal on the ſtone; compare its mark with the needles, and by that means make a gueſs at the quantity of copper contained, and of courſe know how much lead will be neceſſary for conſuming that quantity. But as the lead neceſſary for conſuming the copper is not in a quantity proportionable to that of the copper, when this is mixed with ſilver, we ſhall here give, from

Lazarus Erker, the quantity to be added in every caſe. We ſhall take for our examples, a ſeries of touch-needles, made according to the mark, divided into half-ounces and grains. See TOUCH-NEEDLES.

½ ounce ſilver,	½ ounce copper,	Marks of lead to be added.
15½	½	4.
15	1	6.
14	2	8.
12 and 13	4 and 3	10.
9 — 12	7 — 4	14.
4 — 8	12 — 8	15.
1 — 4	15 — 12	16.

Every body may reduce this table to the needles, made according to the mark of the avoirdupoiſe, or that of carats: nor is it neceſſary to proportion the quantities of lead to be added, ſo far as one half centner. Cramer.

In the mean time, let the metal to be tried with the needles undergo the operation of cuppelling, together with the quantity of lead indicated by the touching; and the fire muſt be made the gentler, as the ſilver is alloyed with a greater quantity of copper; and on the contrary, the ſmaller the quantity of the alloy of copper is, the ſtronger muſt be the fire to be uſed in the operation. When the lead, which muſt be firſt put into the cuppel, begins to ſmoke and boil, then the metal to be examined is to be added, and the fire continued till the copper is all conſumed, and reduced to yellow ſcoriæ; and the bead of ſilver left in the center of the cuppel muſt be weighed, which, ſubtracting the known quantity of ſilver in the lead uſed in the operation, will ſhew the quantity of ſilver, and conſequently that of the copper in the alloy.

Assaying *of lead.*—The *aſſay* of gold and ſilver being performed by means of lead; it is of the utmoſt importance the lead be free from any mixture of either of the two metals; otherwiſe the *aſſay* will be falſe, becauſe the gold and ſilver mixed with the lead will not evaporate like other kinds of alloy, but unite with the metal under *aſſay*.

To prevent this diſorder, and aſſure the operation, there is no way but firſt to *aſſay* the lead itſelf.

This *aſſay* is performed in the ſame furnace, and with the ſame cuppels, as thoſe of gold and ſilver; but the proceſs is incomparably more ſimple: all here required, when the cuppel is heated, being to put in the piece of lead to be *aſſayed*. If this lead evaporate entirely, it is fit for the purpoſe: on the contrary, if there remain any little grain of ſilver, &c. at the bottom, it muſt be ſet aſide.

Assaying *of tin.* See TIN.

Assay-Master, an officer, under certain corporations, entruſted with the care of making true *touch*, or *aſſay*, of the gold and ſilver brought to him; and giving a juſt report of the goodneſs or badneſs thereof.

Such is the *aſſay-maſter* of the mint in the Tower, called alſo *aſſayer of the king*.

The *aſſay-maſter* of the goldſmiths company is a ſort of aſſiſtant-warden, called alſo a *touch-warden*, appointed to ſurvey, *aſſay*, and mark all the ſilver work, &c. committed to him.—There are alſo *aſſay-maſters* appointed by ſtatute, at York, Exeter, Briſtol, Cheſter, Norwich, Newcaſtle, and Birmingham, for *aſſaying* wrought plate.

The *aſſay-maſter* is to retain eight grains of every pound Troy of ſilver brought to him; four whereof are to be put in the PIX, or box of deal, to be re-*aſſayed* the next year; and the other four to be allowed him for his waſte and ſpillings. 12 and 13 W. III. c. 4. 1 An. c. 9.

Note, The number of penny-weights ſet down in the *aſſay-maſter*'s report, is to be accounted as *per pound*, or ſo much in every pound of twelve ounces Troy.—For every twenty penny-weight, or ounce Troy, the ſilver is found by the *aſſay* to be *worſe* than ſtandard, or ſterling, ſix pence is to be deducted; becauſe every ounce will coſt ſo much to reduce it to ſtandard goodneſs, or to change it for ſterling.

In gold, for every carat it is ſet down to be *worſe* than ſtandard, you muſt account that in the ounce Troy it is worſe by ſo many times 3*s*. 8*d*. And for every grain it is ſet down worſe, you muſt account it worſe by ſo many times 11*d*. in the ounce Troy. And for every half grain 5*d*. ½; for ſo much it will coſt to make it of ſtandard goodneſs, &c. Touchſtone of Gold and Silver Ware, &c. p. 41, &c.

Assay-*balance.* The flat pieces of glaſs often placed under the ſcales of an *aſſay-balance*, ſeem, by their power of electricity, capable of attracting, and thereby making the lighter ſcale preponderate, where the whole matter weighed is ſo very ſmall. See Phil. Tranſ. N° 480, p. 245. The electricity of a flat ſurface of about three inches ſquare, has been known to hold down one ſcale, when there were about two hundred grains weight in the other. See BALANCE and ELECTRICITY.

Assay *of weights and meaſures*, ſignifies the trial or examination of common weights and meaſures, by the CLERK *of the market.*

ASSEMBLAGE, the joining, or uniting, of ſeveral things together; or, the things themſelves ſo joined, or united.

The *aſſemblage* of two bones for motion, is called ARTICULATION.

Carpenters and joiners have various kinds and forms of *aſſemblage*; as, with mortiſes and tenons, with dovetails, &c. See DOVE-TAIL, MORTISE, &c.

The Europeans admire the CARPENTRY of ſome Indians, where the *aſſemblage* is made without either nails or pins. Herrera.

Assemblage is alſo uſed, in a more general ſenſe, for a collection of ſeveral things, ſo diſpoſed together, as that the whole has an agreeable effect.—It is with diſcourſe as with bodies, which owe their chief excellency to the juſt *aſſemblage* and proportion of their members.

ASSEMBLY, a meeting of ſeveral perſons in the ſame place, and with the ſame common deſign.

The word is formed of *adſimulare*; compounded of *ad*, *to*, and *ſimul*, *together*.

Aſſemblies of the clergy are called convocations, ſynods, councils; though that annual one of the kirk of Scotland retains the name *General Aſſembly*, &c.—The *aſſemblies* of judges, &c. are called *courts*, &c.—The *aſſemblies* of the Roman people were called *comitia*.—The *aſſembly* of a preacher, &c. is his audience.—The academies have their *aſſemblies*, or days of *aſſembly*.

Under the Gothic governments, the ſupreme legiſlative power was lodged in an *aſſembly* of the ſtates of the kingdom, held annually for the like purpoſes as our parliament.

Some feeble remains of this uſage ſtill ſubſiſt in the annual *aſſemblies* of the ſtates of Languedoc, Bretagne, and a few other provinces of France; but theſe are no more than ſhadows of the ancient *aſſemblies*. It is only in Great Britain, Sweden, and Poland, that ſuch *aſſemblies* retain their ancient powers and privileges.

Assemblies of the *campus Martii*, or *Maii*, of the field of *Mars*, or *May*; ſee FIELD *of Mars*, &c.—Rebellious *aſſembly*; ſee REBELLIOUS.—Unlawful *aſſembly*; ſee UNLAWFUL.

Assembly is particularly uſed in the *Beau-monde*, for a ſtated and general meeting of the polite perſons of both ſexes; for the ſake of converſation, gallantry, dancing, and play.

Assembly is alſo uſed in the *Military Art*, for the ſecond beat of the drum, being that before the march.

On hearing this, the ſoldiers ſtrike their tents, roll them up, and then ſtand to their arms.—The third beating is called the *march*, as the firſt is called the *general*.

ASSENSU *Regio*; ſee REGIO.

Dower ex **Assensu** *Patris*; ſee DOWER.

ASSENT, **Assensus**, an agreement or acquieſcence of the mind to ſomething propoſed, or affirmed.—Thus, to *aſſent* to any propoſition, is to allow it to be true, or to perceive its truth.

Aſſent is diſtinguiſhed, like faith, into *implicit*, or *blind*; and *explicit*, or *ſeeing*, &c.—Others diſtinguiſh it into *actual* and *habitual*.

Assent, *actual*, is a determination of the mind, ariſing from the perception of the truth of any propoſition.

Assent, *habitual*, conſiſts in certain habits of believing or acquieſcing, induced in the mind by repeated acts.

To this belongs faith, which is an *aſſent* ariſing from the authority of the perſon who ſpeaks.—Such alſo is opinion, which is defined an *aſſent* of the mind *cum formidine oppoſiti*, &c.

Assent, for the meaſures and degrees of, ſee DEMONSTRATION, EVIDENCE, PROBABILITY, &c.

Father Malebranche lays it down as an axiom, or principle of method, never to allow any thing for truth, from which we can forbear our *aſſent* without ſome ſecret reproach of our own reaſon.

Assent, *royal*; ſee ROYAL.

ASSERAC, among the Turks; ſee ASSIS.

ASSERIDA, in *Botany*, a name given by the people of Guinea to a kind of ſhrub, the leaves of which being chewed, are a cure for the colic, to which that people are very ſubject. Phil. Tranſ. N° 232.

ASSERTION, **Assertio**, in the language of the ſchools, a propoſition which a perſon advances; and which he avows to be true, and is ready to maintain in public.

ASSESSOR, **Assessour**, an inferior or ſubordinate officer of juſtice, chiefly appointed to aſſiſt the ordinary judge with his opinion and advice.

The word is formed of *ad*, *to*, and *ſedeo*, *I ſit*.

In this ſenſe, the maſters in chancery are *aſſeſſors* of the lord chancellor.

There are two kinds of *aſſeſſors* in the imperial chamber, *ordinary* and *extraordinary*.—The ordinary are now in number forty-one, whereof five are elected by the emperor, viz. three counts or barons, and two *juriſconſulti*, or civil lawyers. The electors appoint ten, the ſix circles eighteen, &c. They act in quality of counſellors of the chamber, and have ſalaries accordingly.

Assessor is alſo uſed for a perſon who *aſſeſſes*, or lays *aſſeſſments* of taxes, and other public duties.

In this ſenſe, *aſſeſſors*, among us, are inhabitants of a town, or village, elected by the community, to *aſſeſs*, or ſettle the taxes, and other impoſitions of the year, to fix the proportion which each perſon is to bear, according to his eſtate, and to ſee the collection made.—Theſe are alſo called in our law *aſſiſors*.—By the ſtat. 16 and 17 Car. II. two inhabitants in every pariſh were made *aſſeſſors* for the royal aid.

ASSETS, (Fr. *aſſez*, i. e. *ſatis*, *enough*) in *Law*, ſignifies goods enough to diſcharge that burden which is caſt upon the executor or heir, in ſatisfying the debts and legacies of the teſtator or anceſtor. Bro. tit. *Aſſets*. *Aſſets* are real or perſonal; where a man hath lands in fee-ſimple, and dies ſeiſed thereof, the lands which come to his heir, are *aſſets* real; and where he dies poſſeſſed of any perſonal eſtate, the goods which come to to the executor, are *aſſets* perſonal. *Aſſets* are alſo divided into *aſſets per deſcent*, and *aſſets inter maines*; *aſſets* by deſcent, is where a perſon is bound in an obligation, and dies ſeiſed of lands which deſcend to the heir, the land ſhall be *aſſets*, and the heir ſhall be charged as far as the land to him deſcended will extend: *aſſets inter maines*, is when a man indebted makes executors, and leaves them ſufficient to pay his debts and legacies; or where ſome commodity or profit ariſeth to them in right of the teſtator, which are called *aſſets* in their hands. Terms de Ley. 56. 77.

Leaſes are *aſſets* to pay debts, notwithſtanding the aſſent of the executor to the deviſe of them. 1 Lill. abr. 99. *Aſſets* in the hands of one executor, are *aſſets* in the hands of others; and if an executor hath goods of the teſtator in any part of the world, he ſhall be charged in reſpect of them. 6 Rep. 47. In actions againſt executors, the jury muſt find the value of the *aſſets*; for the plaintiff ſhall recover only according to the value of the *aſſets* found. 1 Rol. Rep. 58. A ſpecial judgment againſt *aſſets* only, ſhall have relation to, and bind the lands from the time of the filing the original writ or bill. Carth. Rep. 245.

ASSEVERATION, an earneſt affirmation, or avouching.

ASSIDEANS, or rather Hasideans, in *Antiquity*, a ſect among the Jews; thus called from the Hebrew הסידים, *hhaſidim*, *merciful*, *righteous*.

The *Aſſideans* are recorded as holding works of ſupererogation neceſſary. They were the fathers and predeceſſors of the PHARISEES; and from them likewiſe aroſe the ESSENI.

ASSIDENT *ſign*, *ſignum aſſidens*, in *Medicine*, a ſymptom which uſually attends a diſeaſe, but not always.

Thus a dry rough tongue, thirſt, and watching, are *aſſident ſigns* in an ardent fever.

In this ſenſe, *aſſidents* differ from *pathognomonics*, which are inſeparable from the diſeaſe.

ASSIDUUS, or Adsiduus, among the Romans, denoted a rich or wealthy perſon.

The word in this ſenſe is derived from *as aſſis*, q. d. a monied man.

Hence we meet with *aſſiduous* ſureties, *aſſidui fidejuſſores*, anſwering to what the French now call city ſureties or ſecurities, *cautions bourgeoiſe*.

When Servius Tullius divided the Roman people into five claſſes, according as they were aſſeſſed, or taxed to the public; the richer ſort who contributed ASSES, were denominated *aſſidui*; and as theſe were the chief people of buſineſs, who attended all the public concerns; thoſe who are diligent in attendances came to be denominated *aſſidui*.

Assidui was alſo uſed for volunteers, or thoſe who ſerved in the army at their own expence.

ASSIENTO, or Assienta, in matters of *Commerce*, a contract or convention between the king of Spain, and other powers, for furniſhing the Spaniſh dominions in America with negro ſlaves.

The term is originally Spaniſh, and ſignifies *a bargain*: accordingly the firſt *aſſiento* was a treaty or contract made with the French Guinea company, whereby they were put in poſſeſſion of this privilege, in conſideration of a certain duty which they were to pay to the king of Spain's farms, for every negro thus furniſhed.

The Spaniards, having almoſt deſtroyed the natural inhabitants of Spaniſh America, have been many years, and ſtill are, obliged to perform the work of their mines, and other laborious buſineſs, by negroes, of whom they could ſcarce ever obtain the number they have wanted: and it is certain, if they were fully ſupplied, they would get yearly above twice the ſilver perhaps they now do, or have done for many years paſt. It muſt be confeſſed, they have uſed variety of meaſures to obtain them. The Genoeſe undertook to ſupply them at a concerted price between them; for which end they formed a company called the *aſſiento*, who had their factors at Jamaica, Curaſoa, and Brazil: but by their ill management made nothing of this contract; nor did their ſucceſſors the Portugueſe. After them it fell into the hands of the French, who made ſo much of it, that they were enabled, by a computation made from the regiſters of Spain, to import into the French dominions, no leſs than 204,000,000 of pieces of eight. Yet they at length overglutted the market, and became ſufferers towards the concluſion.

By the treaty of Utrecht, Philip V. being declared king of Spain by the allies; it was one of the articles of the peace between England and France, that the *aſſiento* contract ſhould be transferred to the Engliſh. Accordingly a new inſtrument was ſigned in May 1713, to laſt thirty years; and the furniſhing of negroes to the Spaniſh America was committed to the *South-ſea* COMPANY, juſt then erected: though the firſt convention for this purpoſe was made in or about the year 1689.

In virtue hereof, they were yearly to furniſh 4800 negroes; for which they were to pay at the ſame rate as the French, with this condition, that during the firſt twenty-five years, only half the duty ſhall be paid for ſuch as they ſhall import beyond the ſtated number.

The laſt article gives them a farther privilege not enjoyed by the French; which is, that the Engliſh *aſſientiſts* ſhall be allowed, every year, to ſend to the Spaniſh America a ſhip of five hundred tons, loaden with the ſame commodities as the Spaniards uſually carry thither; with a licence to ſell the ſame, concurrently with them, at the fairs of Porto Bello, Carthagena, and Vera Cruz. This additional article was ſuppoſed as advantageous to the company, as the whole contract beſides; being granted contrary to the uſual Spaniſh policy, which has ever ſolicitouſly preſerved the commerce of their America to themſelves.

Some new articles have been ſince added to the ancient *aſſiento*; as, that the Engliſh ſhall ſend their regiſter-ſhip yearly, even though the Spaniſh flota and galleons do not go; and that, for the firſt ten years, the ſaid ſhip may be of 650 tons.

Finally, as the South-ſea company had on the whole been loſers by their trade, and as at the time of the treaty of Aix-la-Chapelle, in 1748, they had only four years more of their *aſſiento* term remaining (the war between Spain and England having commenced in 1739, and interrupted the continuance of it), which Spain was determined not to renew, at leaſt not on any promiſing terms; for theſe and other reaſons, it was concluded by the Britiſh court, to inſtruct her miniſter at Madrid, to obtain the beſt equivalent that could be procured for the remaining ſhort time of the company's *aſſiento* contract.

The manner of valuing the negroes, in order to ſettle the king of Spain's duty, is the ſame as delivered under Negro.

ASSIGN, in *Common Law*, a perſon to whom a thing is *aſſigned*, or made over.

The word *aſſign* is ſaid to have been introduced in favour of baſtards; who, becauſe they cannot paſs by the name of *heirs*, are compriſed under that of *aſſigns*.

ASSIGNABLE *Magnitude*, in *Geometry*, is uſed for any finite *magnitude*. And,

Assignable *Ratio*, for the *ratio* of any finite quantities.

ASSIGNEE, in *Law*, a perſon to whom a thing is appointed, or *aſſigned*, to be occupied, paid, or done.

An *aſſignee* differs from a *deputy* in this, that the *aſſignee* poſſeſſes or enjoys the things in his own right; and a *deputy* in the right of another.

Aſſignee may be ſo either by *deed*, or by *law*.

Assignee *by deed* is, when a leſſee of a term ſells and aſſigns the ſame to another: that other is his *aſſignee by deed*

Assignee *by law*, is he whom the law ſo makes, without any appointment of the perſon.

Thus, an executor is *aſſignee by law* to the teſtator, who dies poſſeſſed of a leaſe made to him and his *aſſigns*.

Assignees under a commiſſion of bankruptcy, are perſons to whom the bankrupt's eſtate is *aſſigned*, for the benefit of the creditors: they are choſen at one of the three meetings appointed by the commiſſioners, and publiſhed in the Gazette, by the major part, in value, of the creditors, who ſhall then have proved their debts; but they may be originally appointed by the commiſſioners, and afterwards approved or rejected by the creditors; and no creditor ſhall be admitted to vote in the choice of *aſſignees*, whoſe debt does not amount to ten pounds. The *aſſignees* may purſue any legal method of recovering the property veſted in them, by their own authority; but cannot commence a ſuit in equity, nor compound any debts owing to the bankrupt, nor refer any matters to arbitration, without the conſent of the creditors, or a major part of them in value, obtained at a Gazette meeting.

The *aſſignees* muſt, within twelve months after the commiſſion iſſued, give one and twenty days notice to the creditors of a meeting for a dividend; and within eighteen months, a ſecond and final dividend ſhall be made, unleſs all the effects were exhauſted by the firſt.

ASSIGNING is uſed for the act of appointing a deputy; or the making over a right to another.

In this ſenſe we ſay, ſuch lands or eſtates were *aſſigned* or made over to ſuch perſons for ſuch uſes, &c.—In the ſtat. 20 Edw. I. we read of juſtices *aſſigned* to take aſſizes, &c.

Assigning alſo ſignifies pointing out, or ſetting forth.—Thus we ſay, to *aſſign* the real cauſe of ſuch an event, &c.

To aſſign error, is to ſhew in what part of a proceſs at law an error is committed.

To aſſign falſe judgment, *verdict*, &c. is to declare how and where judgment, verdict, or the like, is unjuſt.

To aſſign waſte, is to ſhew eſpecially wherein the waſte is committed.

ASSIGNMENT, the act of *aſſigning*, or transferring the intereſt or property a man has in any thing; or of appointing and ſetting over a right to another.

No eſtate of freehold or term for years ſhall be *aſſigned*, but by deed in writing ſigned by the parties, except by operation of law. Stat. 29 Car. II. c. 3. If leſſee for years *aſſigns* all his term in his leaſe to another, he cannot reſerve a rent in the *aſſignment*; for he hath no intereſt in the thing by reaſon of which the rent reſerved ſhould be paid; and where there is no reverſion, there can be no diſtreſs: but debt may lie on it as on a contract. 1 Lill. abr. 99. If an *aſſignment* is made by an aſſignee, the firſt aſſignee is not ſuable for the rent; for if he be accepted by the leſſor, the admiſſion of one aſſignee is the admiſſion of twenty. Comp. Attorn. 491. Bonds, &c. are aſſigned by power of attorney, to receive and ſue in the aſſigner's name: but bills of exchange are aſſignable by indorſement; and the aſſignees may recover in their own names, by ſtat. 3 and 4 Ann, c. 9.

The *aſſignment of a dower*, is the ſetting out of a woman's marriage-portion by the heir.

Assignment, *novel*; ſee Novel.

ASSIMILATION, the act of *aſſimilating*; an act whereby a thing is rendered ſimilar, and like to another.

The word is compounded of *ad*, *to*, and *ſimilis*, *like*.

Assimilation, Assimilatio, in *Phyſics*, is properly a motion whereby bodies convert other duly diſpoſed bodies into a nature like, or homogeneous to their own.

Inſtances of this *aſſimilation* we ſee in flame, which converts the oily or other particles of fuel into its own fiery and luminous nature. The like alſo appears in air, ſmoke, and ſpirits of all kinds.

The like we ſee in vegetables, where the watery juices imbibed from the earth, being further prepared and digeſted in the veſſels of the plant, become of a vegetable nature, and augment the wood, leaves, fruit, &c.

So alſo, in animal bodies, we ſee the food *aſſimilated*, or changed into an animal ſubſtance, by digeſtion, chylification, and the other operations neceſſary to nutrition.

Assimilation, in *Rhetoric*; ſee Simile.

ASSIRATUM, in *Antiquity*, a bloody draught, wherewith treaties were ratified.

It was made of wine, and blood, called by the ancient Romans *aſſir*.

ASSIS, in *Phyſiology*, either denotes opium, or a powder made of hemp-ſeed, which being formed into boles about the bigneſs of cheſnuts, is ſwallowed by the Egyptians, who are hereby intoxicated, and become ecſtatic, and full of the moſt agreeable viſions.

This is alſo called by the Turks *aſſerac*.

ASSISA, or Assisia; ſee the articles Assise, and Tallage.

Assisa *cadere*, *to fall from the aſſiſe*, in *Law*, is to be nonſuited.

Assisa *cadit in juratum*, is where the thing in controverſy is ſo doubtful, that it muſt neceſſarily be tried by a jury,

Assisa *capi in modum aſſiſe*, is when the defendant pleads directly to the aſſiſe, without taking any exception to the count, declaration, or writ.

Assisa *continuanda*, is a writ directed to the juſtices, to take an aſſiſe for the continuance of a cauſe, where certain records alleged cannot in time be procured by the party.

Assisa *nocumenti*, is an aſſiſe of nuiſance.

Assisa *panis & cereviſiæ*, denotes the power or privilege of aſſigning, or adjuſting the weight and meaſure of bread and beer.

Assisæ *judicium*, in *Law*, ſignifies a judgment of the court, given either againſt the plaintiff or defendant, for default.

Assisa *proroganda*, is a writ directed to the juſtices of aſſiſe, for the ſtay of proceedings, on account of the king's buſineſs, wherein the party is employed.

ASSISE, or Assize, *aſſiſa*, in *Law*, a ſitting of judges, or juſtices, for the hearing or determining of cauſes.

The word is French, *aſſiſe*, of *aſſis*, *ſeated*; formed of the Latin *aſſideo*, *I ſit by*; which is compounded of *ad*, *to*, and *ſedeo*, *I ſit*.

Assise, *clerk of*; ſee Clerk.

Assise, or Assises, was anciently uſed for certain extraordinary ſittings of ſuperior judges, in the inferior courts depending on their juriſdiction; to inquire whether the ſubaltern judges and officers did their duty; to receive the complaints preferred againſt them; and take cognizance of appeals from them. Theſe are alſo called *mercurial aſſiſes*.

Assise was alſo a court or aſſembly, compoſed of ſeveral great perſons of the realm; held occaſionally in the king's palace, for the final deciſion of all affairs of importance.

This is more uſually called, among our writers, *placita*, *malla publica*, or *curiæ generales*. Yet there is ſome difference between *aſſiſes*, and *placita*.—The viſcounts, or ſheriffs, who originally were only lieutenants of the *comites*, or counts, and rendered juſtice in their place, held two kinds of courts, the one ordinary, held every day, and called *placitum*; the other extraordinary, called *aſſiſe*, or *placitum generale*; at which the count himſelf aſſiſted, for the diſpatch of the more weighty affairs.

Hence the term *aſſiſe* came to be extended to all grand days of judgment, at which the trials and pleadings were to be ſolemn and extraordinary.

The modern conſtitution of *aſſiſes* is pretty different from that hitherto ſpoken of.—Our *aſſiſe* may be defined a court, place, or time, where and when writs and proceſſes, either civil or criminal, or both, are conſidered, diſpatched, decided, &c. by judges and jury.

In this ſenſe we have two kinds of *aſſiſes*; *general* and *ſpecial*.

Assises, or Assizes, *general*, are thoſe held by the judges twice a year, in their ſeveral circuits.

The nature of theſe *aſſiſes* is explained by lord Bacon, who obſerves, that all the counties of the kingdom are divided into ſix circuits; through each of which two learned men, aſſigned by the king's commiſſion, ride twice a year, called *juſtices* or *judges of aſſiſe*, who have ſeveral commiſſions, by which they ſit; viz.

1. *A commiſſion of oyer and terminer*, directed to them, and many others of the beſt account in their reſpective circuits. In this commiſſion, the judges of *aſſiſe* are of the *quorum*; ſo that without them there can be no proceeding. This commiſſion gives them power to tranſact matters relating to treaſons, murders, felonies, and other miſdemeanours.

The ſecond is of *gaol-delivery*, which is only to the judges themſelves, and the clerk of the *aſſiſe* aſſociate.—By this commiſſion, they have concern with every priſoner in gaol, for what offence ſoever.

The third is directed to themſelves, and the clerk of the *aſſiſe*, to take writs of poſſeſſion, called alſo *aſſiſes*; and to do right and juſtice thereupon.

The fourth is to take the nisi prius, directed to the *juſtices*, and the clerks of *aſſiſes*; whence they are alſo called *juſtices of niſi prius*.

The fifth is a *commiſſion of peace*, in every county of their circuit; and all the juſtices of the peace, having no lawful impediment, are bound to be preſent at the *aſſiſes*, to attend the judges.

The ſheriff of every ſhire is alſo to attend in perſon, or by a ſufficient deputy allowed by the judges, who may fine him if he fail.

This excellent conſtitution of judges, circuits, and *aſſiſes*, was begun in the time of Henry II. though ſomewhat different from what it is now.

The *grand aſſiſe*, or trial by jury, inſtituted by Henry II. as an alternative inſtead of judicial combats, is particularly deſcribed by Glanvil, who was probably the adviſer of the meaſure.

For this purpoſe, a writ *De magna aſſiſa eligenda* was directed to the ſheriff, to return four knights, who were to elect twelve others to be joined with them; all theſe together formed the *grand aſſiſe*, ordained to try the matter of right.

The judges of *aſſiſe* came into uſe in the room of the ancient juſtices in eyre, *juſtitiarii in itinere*; who were appointed by the great council of the realm, A. D. 1176, 22 Hen. II. with a delegated power from the king's great court; and they made their circuit round the kingdom once in ſeven years, for the purpoſe of trying cauſes. They were afterwards directed by Magna Charta, c. 12. to be ſent into every county once a year. Blackſtone's Com. vol. iii.

Assise, *ſpecial*, is a particular commiſſion granted to certain perſons, to take cognizance of ſome one or two cauſes, as a diſſeiſin, or the like.—This was very frequently practiſed among our anceſtors. Bracton, lib. iii. c. 12.

Assise is alſo uſed for a writ directed to the ſheriff, for the recovery of poſſeſſion of things immoveable, whereof a man's ſelf, or anceſtors, have been diſſeiſed.

Lyttelton, and others, ſuppoſe theſe writs of *aſſiſe* to have given the denomination to the *aſſiſes*, or courts ſo called; and they aſſign ſeveral reaſons of the name of the writ: as,

1. Becauſe ſuch writs ſettle the poſſeſſion, and right, in him that obtains by them. 2. Becauſe originally they were executed at a certain time and place appointed; for, by the Norman law, the time and place muſt be known forty days before the judges ſit; and by our law there muſt be fifteen days preparation, except they be tried in the ſtanding courts at Weſtminſter.—But it is more natural to ſuppoſe the writs denominated from the courts; and that they were called *aſſiſes*, becauſe anciently tried at ſpecial courts of *aſſiſes*, ſet and appointed for that purpoſe.—Though of latter days, theſe are diſpatched at the general *aſſiſes*, along with the commiſſion of oyer and terminer, &c.

This writ is as well of things corporeal, as incorporeal rights, being of four ſorts, viz.

Assise *of novel diſſeiſin*, *aſſiſa novæ diſſeiſinæ*, which lies where a tenant in fee-ſimple, fee-tail, or for life, is lately diſſeiſed of his lands and tenements, rent-ſervice, rent-ſec, or rent-charge, common of paſture, common way, &c.

To this may be added, the bill of freſh force, directed to the officers or magiſtrates of cities or towns corporate: being a kind of *aſſiſe* for recovery of poſſeſſion in ſuch places, within forty days after the force, as the ordinary *aſſiſe* is in the county.

Assise *of mort d' aunceſtor*, *aſſiſa mortis anteceſſoris*, lies where a father, mother, brother, uncle, &c. dies ſeiſed of lands, tenements, rents, &c. held in fee-ſimple; and, after their death, a ſtranger abates. It is good as well againſt the abator, as any other in poſſeſſion.

Assise *of darrein preſentment*, *aſſiſa ultimæ preſentationis*, lies where a perſon, or his anceſtor, have preſented a clerk to a church; and after the church becomes vacant by death, or otherwiſe, a ſtranger preſents his clerk to the ſame church, in diſturbance of them.

Theſe three *aſſiſes* were inſtituted by Henry II. in the place of duels; which, till then, had obtained on theſe occaſions. See Duel.

Assise *of utrum* lies for a parſon againſt a layman, or for a layman againſt a parſon, for a land or tenement, doubtful whether it be in lay-fee, or free-alms. See Tithe.

Assise is alſo uſed, according to Lyttelton, for a jury.—This, that author ſuppoſes to be by a *metonymia effecti*, the jury being ſo called, becauſe ſummoned by virtue of the writ of *aſſiſe*.

Yet it muſt be obſerved, that the jury, ſummoned upon a writ of right, is likewiſe called the *aſſiſe*; but this may be ſaid to be καταχρηϛικως, or abuſively ſo termed.—*Aſſiſe*, in this ſignification, is divided into *magna & parva*.

Assise is farther uſed, according to Lyttelton, for an ordinance, or ſtatute, regulating the weight, ſize, or dimenſions of certain commodities.—Thus the ancient ſtatute of bread and ale, *anno* 51 Hen. III. is termed the *aſſiſe of bread and ale*, *aſſiſa panis & cereviſæ*.

Assise is further uſed for the ſcantling or quantity itſelf, preſcribed by the ſtatute.—When wheat is of ſuch or ſuch price, bread ſhall be of ſuch *aſſiſe*.

We have divers ſtatutes for fixing the *aſſiſe* of fiſh, cloths, wood, billets, faggots, and the like. Vide 34 & 35 Hen. VIII. c. 3. 9 Ann, c. 15. 10 Ann, c. 6. 19 Car. II. c. 3. 4 Jac. I. c. 2. 1 Geo. I. ſtat. 2. c. 18.

Fixing any *aſſiſe* of cloth, or preſcribing what length, breadth, weight, &c. it ſhall have, Sir Joſiah Child thinks, does more hurt than good. As the faſhions and humours of mankind are variable, to ſupply all markets at all times, we muſt have of all ſorts, cheap and light, as well as heavier and better.—Stretching with tenters is eſſential to our drapery, and the preciſe degree or quantity of it cannot without injury be preſcribed by any law; but muſt be left to the vender's or exporter's diſcretion.

Assise *of the foreſt*, is a ſtatute or condition containing orders to be obſerved in the king's foreſt.—It is called an *aſſiſe*, becauſe it ſets down and appoints a certain meaſure, rate, or order in the things it concerns.

Assise, again, is uſed for the whole proceſs in court, founded on a writ of *aſſiſe*; and ſometimes for a part of it, viz. the iſſue, or verdict of the jury.

Thus we read, that "*aſſiſes* of novel diſſeſin ſhall not "be taken but in their ſhires; and after this manner, "&c." Mag. Chart. cap. 12.—So in Merton, cap. 4. Hen. III. we meet with, "certified by *aſſiſe*, quitted by "*aſſiſe*, &c."

Assise, *continuance of*; ſee Continuance.—Juſtices of *aſsiſe*; ſee Justice.—Limitation of *aſsiſe*; ſee Limitation.—Rents of *aſsiſe*; ſee Rent.

ASSISER, or Assizer *of weights and meaſures*, is an officer who has the care and overſight of thoſe matters.

ASSISII, in *Eccleſiaſtical Writers*, denote perſons beneficed in a cathedral church, not in a rank below that of canons. The *aſsiſii* perhaps anſwered to our minor canons. They were thus called, either becauſe they were allowed an *aſſiſia* or penſion, or from *aſſiduus*, *diligent*.

ASSISOR, the ſame with Assessor.

In Scotland, *aſsiſors* are the ſame with our jurors.

ASSISTANCE; ſee Aid.

ASSISTANT is uſed for a perſon or officer appointed to attend another principal officer, for the more eaſy and regular diſcharge of his function.—Such a biſhop or prieſt had ſeven or eight *aſsiſtants*.

Assistant, in Roman Catholic countries, is particularly applied to a kind of counſellors, or controllers, added to the generals or ſuperiors of monaſteries, &c. to take care of the affairs of the community.

The general of the Jeſuits has five *aſsiſtants*, of conſummate experience, choſen by him out of all the provinces of the order, and denominated from the kingdoms or countries to which they belong, i. e. Italy, Spain, Germany, France, and Portugal.

In a like ſenſe, moſt of our trading companies have their courts of *aſsiſtants*.

Assistants are alſo thoſe condemned to *aſsiſt* in the execution of a criminal.

ASSISUS, in *Ancient Law-Writers*, denotes a thing demiſed, or farmed out for ſuch an aſſiſe, or certain rent, in money, or proviſions. Hence *terra aſsiſa* was commonly oppoſed to *terra dominica*; this laſt being held in demesne, or occupied by the lord, whereas the former was let out to tenants. Hence alſo *redditus aſsiſus* denotes the ſet or ſtanding rent.

ASSITHMENT, or Assythment, in the *Law of Scotland*, is a compenſation given for a man ſlain.

Aſsithment is the ſame with what, in the *Engliſh Law*, is called *man*-bote. See Bote.

ASSIUS *Lapis*, in *Phyſiology*; ſee Lapis *Aſſius*.

ASSOCIATE, an adjunct, partner, or member.

The word is compounded of *ad*, and *ſocius*, *companion*.

ASSOCIATION, Associatio, the act of aſſociating, or forming a ſociety or company.

Aſsociation is properly a contract or treaty of partnerſhip, whereby two or more perſons unite together, either for their mutual aſſiſtance, or for the joint carrying on of an affair; or even for a more commodious manner of life.—The cloſeſt of all *aſsociations* is that made by the band of matrimony.

Association *of ideas*, is where two or more ideas conſtantly and immediately follow or ſucceed one another in the mind, ſo that one ſhall almoſt infallibly produce the other; whether there be any natural relation between them, or not.

Where there is a real affinity or connexion in ideas, it is the excellency of the mind, to be able to collect, compare, and range them in order, in its inquiries: but where there is none, nor any cauſe to be aſſigned for their accompanying each other, but what is owing to mere accident or habit; this unnatural *aſsociation* becomes a great imperfection, and is, generally ſpeaking, a main cauſe of error, or wrong deductions in reaſoning. Thus, the idea of goblins and ſprights has really no more affinity with darkneſs than with light; and yet let a fooliſh maid inculcate theſe ideas often on the mind of a child, and raiſe them there together, it is poſſible he ſhall never be able to ſeparate them again ſo long as he lives, but darkneſs ſhall ever bring with it thoſe frightful ideas.—Let cuſtom, from the very childhood, have joined the idea of figure and ſhape to the idea of God, and what abſurdities will that mind be liable to, about the Deity?

Such wrong combinations of ideas, Mr. Locke ſhews, are a great cauſe of the irreconcileable oppoſition between the different ſects of philoſophy and religion: for we cannot imagine, that all who hold tenets different from, and ſometimes even contradictory to one another, ſhould wilfully and knowingly impoſe upon themſelves, and refuſe truth offered by plain reaſon: but ſome looſe and independent ideas are by education, cuſtom, and the conſtant din of their party, ſo coupled in their minds, that they always appear there together: theſe they can no more ſeparate in their thoughts, than if they were but one idea, and they operate as if they were ſo. This gives ſenſe to jargon, demonſtration to abſurdities, conſiſtency to nonſenſe, and is the foundation of the greateſt, and almoſt of all, the errors in the world. See Idea and Abstraction.

Aſsociation forms a principal part of Dr. Hartley's mechanical theory of the mind. He diſtinguiſhes it into ſynchronous and ſucceſſive; and aſcribes our ſimple and complex ideas to the influence of this principle or habit. Particular ſenſations reſult from previous vibrations conveyed through the nerves to the medullary ſubſtance of the brain; and theſe are ſo intimately *aſsociated* together, that any one of them, when impreſſed alone, ſhall be able to excite in the mind the ideas of all the reſt. Thus we derive the ideas of natural bodies from the *aſsociation* of the ſeveral ſenſible qualities with the names that expreſs them, and with each other. The ſight of part of a large building ſuggeſts the idea of the reſt inſtantaneouſly, by a ſynchronous *aſsociation* of the parts; and the ſound of the words, which begin a familiar ſentence, brings to remembrance the remaining parts, in order, by ſucceſſive *aſsociation*. Dr. Hartley maintains, that ſimple ideas run into complex ones by *aſsociation*; and apprehends, that by purſuing and perfecting this doctrine, we may ſome time or other be enabled to analyſe thoſe complex ideas, that are commonly called the ideas of reflection, or intellectual ideas, into their ſeveral component parts, i. e. into the ſimple ideas of ſenſation of which they conſiſt; and that this doctrine may be of conſiderable uſe in the art of logic, and in explaining the various *phænomena* of the human mind. Obſervations on Man. vol. i. paſſim. See Vibrations and Vibratiuncles.

Association, in *Law*, is a patent by the king, either of his own motion, or at the ſuit of a party plaintiff, to the juſtices of aſſiſe; to have other perſons *aſsociated* to them, in order to take the aſſiſe.

Upon this patent of *aſsociation*, the king ſends his writ to the juſtice of the aſſiſe, thereby commanding them to admit ſuch as are ſo ſent.

The *clerk of the* assise is uſually aſſociate of courſe; in other caſes ſome learned ſerjeants at law are appointed.

Association *of parliament*. In the reign of king William III. the parliament entered into a ſolemn *aſsociation* to defend his majeſty's perſon and government againſt all plots and conſpiracies: and all perſons bearing offices civil or military, were enjoined to ſubſcribe the *aſsociation* to ſtand by king William, on pain of forfeitures and penalties, &c. by ſtat. 7 and 8 W. III. c. 27.

ASSOILE, in our *Ancient Law-Books*, ſignifies to abſolve, deliver, or ſet free from an excommunication. See Absolution.

ASSONANCE, in *Rhetoric* and *Poetry*, a term uſed where the words of a phraſe, or a verſe, have the ſame ſound or termination, and yet make no proper rhyme.

Theſe are uſually vicious in Engliſh; the Romans ſometimes uſed them with elegancy: as *Militem comparavit, exercitum ordinavit, aciem luſtravit.*

The Latins call it *ſimiliter deſinens*; and the Greeks ὁμοιοτελευτον.

ASSONANT *rhymes* is a term particularly applied to a kind of verſes common among the Spaniards, where a reſemblance of ſound ſerves inſtead of a natural rhyme.

Thus, *ligera*, *cubierta*, *tierra*, *meſa*, may anſwer each other in a kind of *aſsonant* rhyme, becauſe they have each an *e* in the penultimate ſyllable, and an *a* in the laſt.

ASSRUMINA, in *Botany*, the name given by the people of Guinea to the ſhrub whoſe leaves they uſe as a cure for the long worms, which are found in their fleſh in thoſe parts of the world; they only bruiſe the leaves, and apply a large lump of the maſs to the part where the worm is, and they are eaſed at once, without the pain and hazard of drawing it out. Phil. Tranſ. N° 232.

ASSUMPSIT, in *Law*, a naked contract; or a voluntary promiſe by word of mouth, by which a man *aſsumes* and takes upon him to perform, and pay any thing to another.

This term comprehends any verbal promiſe; and is variouſly expreſſed by the civilians, according to the nature of the promiſe: ſometimes by *pactum*; ſometimes by *promiſſio*, *pollicitatio*, or *conſtitutum*.

Where a man ſells goods to another the law makes the *aſſumpſit*; and promiſes that he ſhall pay for them.

ASSUMPTION, a feaſt celebrated in the Romiſh church, in honour of the miraculous aſcent of the Holy Virgin, as they deſcribe it, body and ſoul, into heaven.

Assumption was alſo, among our *Anceſtors*, uſed for the day of the death of any ſaint: *Quia ejus anima in cœlum* aſſumitur. See Anniversary.

Assumption, in *Logic*, is the minor, or ſecond propoſition, in a categorical ſyllogiſm.

Assumption is ſometimes alſo uſed for a consequence drawn from the propoſitions whereof an argument is compoſed.

Thus we ſay, the premises are true, but the *aſsumption* is captious.

Assumptive *arms*, in *Heraldry*. See Arms.

ASSURANCE, *policy of*. See Policy.

Assurance, in *Commerce*. See Insurance.

We have ſeveral offices of *aſſurance* from fire.—As the Royal-Exchange *aſſurance*; the Sun-fire-office; the Hand-in-hand fire-office; the London *aſſurance*, &c. ſome for houſes, others for goods, and ſome for both.

We have alſo *aſſurances for life*, in virtue whereof, when the perſon aſſured dies, a ſum of money becomes payable to the perſon in whoſe behalf the policy of *aſſurance* was granted.

Assurances *on lives*.—By assuring a life is meant obtaining ſecurity for a ſum of money to be received ſhould the life drop, in conſideration of ſuch a payment made to the *aſſurer*, as is a ſufficient compenſation for the loſs and hazard to which he expoſes himſelf.—The ſum at which this compenſation ſhould be valued, depends

1. On the rate of intereſt at which money is improved: And 2. On the probability of the duration of the life to be aſſured.—If intereſt is *high*, and alſo the probability *high* of the duration of the life, the value of the *aſſurance* will be proportionably *low*. On the contrary, if the rate of intereſt is *low*, and the probability of living alſo *low*, the value of the *aſſurance* will be proportionably *high*.—In order to explain this: let 100*l*. be ſuppoſed to be aſſured on a life for a year to come; that is, let 100*l*. be ſuppoſed payable a year hence, provided a life of a given age fails in that time. Were the intereſt of money at 5 *per cent.* and the life *ſure* of failing, the value of the *aſſurance* would be the ſame with the preſent value of 100*l*. payable at the end of the year, reckoning intereſt at 5 *per cent.* that is, it would be that ſum, which being now put out to intereſt at 5 *per cent.* would produce 100*l*. at the end of the year, or 95*l*. 4*s*. 8*d*. See Annuities.

On the contrary, if it be an even chance, or the odds are equal, whether the life does or does not fail in the year, the value of the *aſſurance* will be half the former value, or 47*l*. 12*s*. 4*d*.—If the odds *againſt* its failing are *two* to *one*, that is, if it is to be expected, that ſome *one* of *three* lives, at the age of the given life, will fail in the year, the value of the *aſſurance* will be a *third* of the firſt value, reckoning the ſame intereſt; or 31*l*. 15*s*.—If the odds are 19 to 1, or if it may be expected, that ſome one out of twenty lives, at the age of the given life, will fail in a year; the value of the *aſſurance* will be a twentieth part of the firſt value, or 4*l*. 16*s*.—If the odds are 49 to 1, or only one out of fifty ſuch lives as the given life can be expected to fail in the year, the value of the *aſſurance* will be a fiftieth part of the firſt value; that is, it will be 1*l*. 18*s*.—Now the odds of 3 to 1 are, according to Dr. Halley's Table of Obſervations (ſee Mortality), the odds that a life aged 87, will not drop in a year. The odds of 19 to 1 are the odds, according to the ſame table, that a life aged 64, will not drop in a year. And the odds of 49 to 1 are the odds that a life aged 39 will not drop in a year. It follows, therefore, that the value of the *aſſurance* of 100*l*. for a year, on a life aged 87, is 31*l*. 15*s*. on a life aged 64, 4*l*. 16*s*. on a life aged 39, 1*l*. 18*s*. reckoning intereſt at 5 *per cent.* If intereſt is reckoned at 3 *per cent.* theſe values will be 32*l*. 7*s*.—4*l*. 17*s*.—1*l*. 18*s*. 10*d*.

The *aſſurances* moſt commonly practiſed are ſuch *aſſurances* as theſe on ſingle lives for ſingle years; but *private* aſſurers, and alſo ſome aſſuring *offices*, being ignorant of the principles of calculation in this caſe, it has been the cuſtom among them to pay no regard to any difference of ages, but to demand 5*l*. from all ages indiſcriminately, for the *aſſurance* of 100*l*. for one year.—Nothing can be more abſurd or inequitable; for it appears that this is *more* than the value of the *aſſurance* of a life at the age of 64; and that it is *more* than *double* the value of the *aſſurance* of a life aged 39, allowing the *aſſured* to make 5 *per cent.* of the money he advances.

When a life is aſſured for any number of years, the value may be paid either in *one ſingle preſent* payment; in conſequence of which the ſum aſſured will become payable without any farther compenſation, whenever, within the given term, the life ſhall happen to drop. Or the value may be paid in *annual payments*, to be continued till the failure of the life, ſhould that happen within the term; or, if not, till the determination of the term.

The method of finding theſe values cannot be eaſily underſtood by thoſe who are not acquainted with the doctrine of life-annuities, as it has been taught by mathematicians; but the following obſervations may be of uſe to give ſome general idea of the ſubject.

Let us ſuppoſe, that a perſon at 39 years of age wants to aſſure 100*l.* on his life for 26 years, or till he is 65 years of age; and that he chuſes to advance the proper compenſation for it in a *fixed annual* payment; the firſt is to be made immediately, and to be continued till either the term ends, or his life drops.—The value of the *aſſurance* for the *firſt* year is by what has been already ſhewn, 1*l.* 18*s.* reckoning intereſt at 5 *per cent.* The value of the *aſſurance* for the laſt year of the term, ſuppoſing him to have lived to the beginning of it, or to have completed 64, is likewiſe, by what has been already ſhewn, 4*l.* 16*s.* reckoning all along the ſame intereſt.—If, therefore, the value of the *aſſurance* for the whole 26 years is to be one conſtant ſum payable at the beginning of every year, that ſum ought, it is obvious, to be *greater* than the *firſt*, and *leſs* than the *laſt*; or a ſum, which is ſome *mean* between 1*l.* 18*s.* and 4*l.* 16*s.*—The rule for finding this mean, in all caſes, is the following.

"From the value of an annuity *certain* for the given "term, found by Table III. under the article of ANNUITIES, ſubtract the value of the life for the given "term, found in the method explained under the article "LIFE-*Annuities*, and reſerve the remainder.—Multiply the value of 1*l.* due at the end of the given "term (found by Table I. under the article *Annuities*) "by the *perpetuity* (ſee PERPETUITY); and alſo by the "*probability* (ſee MORTALITY) that the given life ſhall "fail in the given term. The *product* added to the *reſerved remainder*, and the *total* multiplied by the annual "intereſt of the ſum to be aſſured, and afterwards divided by 1*l.* increaſed by its intereſt for a year, and "alſo by the value already mentioned, with unity added, "of the life for the given term, will be the required "value of the *aſſurance* in a *fixed annual* payment, till "either the life fails, or the term ends."

EXAMPLE.

Let the term be 26 years, the life aged 39, the ſum 100*l.* and the intereſt 5 *per cent.*

SOLUTION.

The value of the life of a perſon whoſe age is 39, for 26 years, is (reckoning intereſt at 5 *per cent.* and taking Mr. De Moivre's valuation of lives 11.113. See LIFE-*Annuities*. This value ſubtracted from 14.375 (the value of an annuity certain for 26 years) (ſee Table III. under Annuities) leaves 3.262, the remainder to be *reſerved*.

The value of 1*l.* to be received at the end of 26 years, is .2812 by Table II. under the article ANNUITIES.—The probability that the life of a perſon aged 39 ſhall fail in 26 years, is, by Dr. Halley's Table of Obſervations, (ſee MORTALITY) $\frac{262}{454}$. And the *perpetuity* is 20. Theſe numbers multiplied by one another, and 3.262 added to the product, make 6.508, which multiplied by 5*l.* the annual intereſt of 100*l.* gives £32.54. This laſt ſum divided by 1.05, or 1*l.* increaſed by its intereſt for a year, gives 31*l.* And 31*l.* divided by 12.113, the value of the life for 26 years, with unity added, gives £2.56, or 2*l.* 11*s.* 2*d.* ½; which is the required value, *in fixed annual payments*, of the *aſſurance* of 100*l.* on the given life for 26 years, reckoning intereſt at 5 *per cent.*

The value of the ſame *aſſurance*, *in one preſent payment*, is, evidently, that ſum which is the value of an annuity (equal to the annual payment juſt determined) on the life for the given term. That is, it is the ſum which is the value of an annuity of 2*l.* 11*s.* 2*d.* ½ for 26 years on a life aged 39, the firſt payment of which is to be made immediately. The product, therefore, of the value of the life for 26 years, with unity added, into £2.56, is the value of the *aſſurance* in a ſingle preſent payment. It is, therefore, 31*l.* or the ſum ariſing in the foregoing operation, before the diviſion by the value of the life for the given term.

If the *aſſurance* is to be made for the whole poſſible duration of the life, the method of finding the value will be more ſimple, and the rule for this purpoſe is as follows. "From the perpetuity ſubtract the value of the given "life, and multiply the remainder by the product of the "given ſum into the intereſt of 100*l.* for a year: and "this laſt product, divided by 100*l.* increaſed by its intereſt for a year, will give the value in a *ſingle preſent payment*. And this payment divided by the value "of the life, will give the value of the *aſſurance* in *annual payments* during the continuance of the life."

EXAMPLE.

Let the age of the life be, as in the laſt example, 39; the ſum to be aſſured for its whole duration, 100*l.* and the rate of intereſt 5 *per cent.*

The intereſt of 100*l.* for a year is 5*l.*—100*l.* increaſed by this intereſt is 105*l.* and the value of the life is, according to Mr. De Moivre's (ſee LIFE-*Annuities*) valuation of lives, 11.966.—The value of the life ſubtracted from the PERPETUITY (that is, from 20) gives £8.034, which multiplied by the product of 100*l.* into 5, or by 500, gives 4017; and this, divided by 105 (or by 100*l.* increaſed by its intereſt for a year) gives £38.25, which is the value in a *ſingle payment* of the *aſſurance* of 100*l.* for the whole duration of a life aged 39, reckoning intereſt at 5 *per cent.* And this payment divided by £11.966 is £3.196, the value of the ſame *aſsurance* in *annual payments* during the continuance of the life.

REMARKS.

If the value of the *aſſurance* is deſired in annual payments, this rule ſuppoſes the *firſt* not to be made till the end of a year. If the firſt payment is to be made immediately, as was ſuppoſed in the former queſtion, the value in a ſingle payment (found as directed by the rule) muſt be divided by the value of the life *increaſed by unity*; that is, in the preſent inſtance, by £12.966, which will make the required value of the *aſſurance* £2.95, inſtead of 3.197, or 2*l.* 19*s.* inſtead of 3*l.* 3*s.* 11*d.*

The reaſon of directing that unity ſhould be added to the values of lives taken from the tables, in order to find the values of *aſſurances* in *annual payments*, beginning immediately, is that, in all the tables, the values of annuities on lives are given on the ſuppoſition that the firſt payment is not to be made till the end of a year. If, therefore, the firſt yearly payment is to be made immediately, the value muſt exceed that in the tables one year's purchaſe.

REMARK II.

The PERPETUITY means the value of the fee-ſimple of an eſtate found by dividing 100*l.* by the rate of intereſt. For example: if the rate of intereſt is 5 *per cent.* the perpetuity is 20; for 100*l.* divided by 5 gives 20.—In like manner, 25, 28.57, 33.333, may be found to be the *perpetuity*, when the rates of intereſt are 4, 3½, and 3 *per cent.*

REMARK III.

If inſtead of a *groſs ſum*, an *eſtate*, or a perpetual *annuity* is to be aſſured for the whole duration of a life, the value in a *ſingle payment*, will be "the value of the life "ſubtracted from the perpetuity, and the remainder "multiplied by the annuity, or by the rent of the eſtate." —And the value, in *annual payments beginning immediately*, will be "the ſingle payment divided by the value of the life increaſed by unity."—Univerſally. It ought to be remembered, that the *aſſurance* of an *eſtate* or *annuity* after any given life or lives, is worth as much more than the *aſſurance* of a correſponding ſum, as 100*l.* increaſed by its intereſt for a year, is greater than 100*l.*—Thus, the preſent values, *in ſingle and annual payments*, of the *aſſurance* of an eſtate of 5*l.* *per ann.* for ever, and of a 100*l.* in money, on the whole duration, or on any part of an aſſigned life, are to one another (intereſt being at 5 *per cent.*) as 105*l.* to 100*l.*—The reaſon of the difference is, that the algebraical calculations, by which theſe values are determined, ſuppoſe that the *groſs ſum*, and the firſt yearly payment of the *annuity* are to be received at the ſame time, after the extinction of the lives. It is eaſy to ſee, that this is a circumſtance which muſt make the latter of moſt value.

This ſpecimen is ſufficient to explain the general nature and principles of *aſſurances* on ſingle lives; and to teach the method of finding, in all caſes, the values of ſuch *aſſurances*. Thoſe who may wiſh to know more on this ſubject, and to ſee the mathematical demonſtrations of the rules we have here given, may conſult Dr. Price's treatiſe, entitled, Obſervations on reverſionary Payments; on the Method of calculating the Values of Aſſurances on Lives, &c. chap. 1.

Aſſurances may be made on any number of *joint* lives, or on the *longeſt* of any lives: that is, an aſſurer may bind himſelf to pay any ſums at the extinction of any *joint* lives, or the *longeſt* of any lives, or at the extinction of any one or two of any number of lives. Rules for finding the values in all ſuch caſes, as far as two lives are concerned, may be found in the treatiſe juſt referred to. There are farther *aſſurances* on ſurvivorſhips; by which is meant an obligation for the value received, to pay a given ſum or annuity, *provided* a given life ſhall ſurvive any other given life or lives. The method of finding theſe values will be given under the article SURVIVORSHIP.

All theſe different kinds of *aſſurances* are of the greateſt uſe; and the offices for making them are a particular advantage to the public. The principal of theſe offices in England are the London and the Royal Exchange *aſſurance* offices; the Amicable Society, incorporated for a perpetual *aſſurance* office; and the Society for equitable *Aſſurances* on Lives and Survivorſhips, near Black-Fryars bridge.

The two firſt of theſe offices, having chiefly in view *aſſurances* on ſhips and houſes, they do little in the way of *aſſurances* on lives; and all the buſineſs they tranſact in this way is at 5*l.* for every 100*l.* aſſured on a ſingle life for a ſingle year, without paying any regard to the ages of the lives aſſured.

The Amicable Society at Serjeant's Inn requires an annual payment of 5*l.* from every member during life, payable quarterly. The whole annual income hence ariſing is equally divided among the *nominees*, or *heirs*, of ſuch members as die every year; and this renders the dividends among the *nominees*, in different years, more or leſs, according to the number of members who have happened to die in thoſe years. But this ſociety engages that the dividends ſhall not be leſs than 150*l.* to each claimant, though they may be *more*.—None are admitted whoſe ages are *greater* than 45, or leſs than 12; nor is there any difference of contribution allowed on account of difference of age.—This ſociety has ſubſiſted ever ſince 1706, and its credit and uſefulneſs are well eſtabliſhed. Its plan, however, is liable to ſeveral objections.—Firſt, it is evident, that regulating the dividends among the *nominees*, by the number of members who die every year, is not equitable; becauſe it makes the benefit which a member is to receive to depend, not on the value of his contribution, but on a *contingency*; that is, the number of members that ſhall happen to die the ſame year with him.—Secondly, its requiring the ſame payments from all perſons under 45, is alſo not equitable; for the payment of a perſon admitted at 12, ought not to be more than *half* the payment of a perſon admitted at 45.—Thirdly, its plan is ſo narrow, as to confine its uſefulneſs too much. It can be of no ſervice to any perſon whoſe age exceeds 45. It is, likewiſe, by no means properly adapted to the circumſtances of perſons who want to make *aſſurances* on their lives for only one year, or a ſhort *term* of years. For example: the true value of the *aſſurance* of 150*l.* for five years, on the life of a perſon whoſe age is 39, may be found, by the firſt rule, to be nearly three guineas *per ann.* ſuppoſing intereſt at 3 *per cent.* and the probability of the duration of human life, as they are given in Dr. Halley's Table of Obſervations. But ſuch an *aſſurance* could not be made in this ſociety without an annual payment of 5*l.*

Neither is the plan of this ſociety at all adapted to the circumſtances of perſons who want to make *aſſurances* on particular ſurvivorſhips. For example: a perſon poſſeſſed of an eſtate or ſalary, which muſt be loſt with his life, has a perſon dependent upon him, for whom he deſires to ſecure a ſum of money payable at his death. But he deſires this only as a ſecurity againſt the danger of his dying *firſt*, and leaving a wife, or a parent, without ſupport. In theſe circumſtances he enters himſelf into this ſociety; and, by an annual payment of 5*l.* entitles his *nominee* at his death to 150*l.* In a few years, perhaps, his *nominee* happens to die; and having then loſt the advantages he had in view, he determines to forfeit his former payments, and to withdraw from the ſociety.—The right method, in this caſe, would have been to have taken from ſuch a perſon the true value of the ſum aſſured, "on the ſuppoſition of non-payment, provided "he ſhould ſurvive."—In this way, he would have choſen to contract with the ſociety; and had he done this, he would have paid for the *aſſurance* (ſuppoſing intereſt at 3 *per cent.* his age 30, the age of his *nominee* 30, and the values of lives as given by Mr. De Moivre) 3*l.* 8*s.* in annual payments, to begin immediately, and to be continued during the joint duration of his own life, and the life of his *nominee*.

None of theſe objections are applicable to the plan of the ſociety which meets at Black-Fryars Bridge, and which has juſtly ſtyled itſelf the *Equitable Society for Aſſurances on Lives and Survivorſhips*. The buſineſs tranſacted by this ſociety is ſo extenſive, and it is governed ſo entirely by calculations, founded on the beſt rules and obſervations, that it cannot but prove one of the greateſt public benefits.

It was eſtabliſhed in the year 1762, in conſequence of propoſals which had been made, and lectures recommending ſuch a deſign, which had been read by Mr. Dodſon, the author of the Mathematical Repoſitory.—It aſſures any ſums or reverſionary annuities, on any life or lives for *any number* of years, as well as for the *whole continuance* of the lives; and in any manner that may be beſt adapted to the views of the perſons aſſured: that is, either by making the aſſured ſums payable *certainly* at the failure of any given lives; or on *condition* of ſurvivorſhip; and alſo, either by taking the price of the *aſſurance* in *one preſent payment*, or in *annual payments*, during any ſingle or joint lives, or any terms, leſs than the whole poſſible duration of the lives.—Any perſons, for inſtance, who depend on incomes which muſt be loſt when they die, or who are only tenants for life in eſtates, may, if they want to borrow money, be enabled to give ſufficient ſecurity, by aſſuring ſuch ſums as they want to borrow in this ſociety, and aſſigning the policy; in conſequence of which, the lender will, during the term of the *aſſurance*, be guarded againſt all danger of loſing his principal by the death of the borrower.—In the ſame way, clergymen, counſellors, perſons holding any places of profit, traders, and others, who have families, whoſe ſubſiſtence depends on the continuance of their lives, may here be enabled to make ſome proviſion for their families after their deceaſe.—All perſons who enjoy annuities for the lives of others, may here ſecure themſelves againſt the loſs they would ſuſtain, ſhould they ſurvive the perſons on whoſe lives the annuities depend, by making *aſſurances* which ſhould entitle them to any ſums, payable on condition their ſurvivorſhip ſhould take place. Any perſon entitled to an eſtate, annuity, legacy, or office, after another perſon, provided he ſurvives, may here ſecure ſome equivalent for his family at his deceaſe, provided he does *not* ſurvive.—Huſbands may, in this ſociety, ſecure annuities for their wives, provided they ſhould leave them widows.—Parents, by aſſuring the lives of their children when infants, till they attain a given age, may ſecure for them, ſhould they live to that age, ſuch ſums as may be neceſſary to put them out to apprenticeſhips, or to make capitals or fortunes for them, with which to ſet out in buſineſs, or to marry.—Any perſons, apprehenſive of being left without ſupport in old age, when incapable of labour, may, in this ſociety, purchaſe an annuity, to commence at any future year of his life, and to continue during the remainder of his life; and he may do this at a very ſmall expence, if he is young, and willing to wait for the commencement of his annuity, till he is 55 or 60 years of age.

In ſhort, there are no kinds of *aſſurances* on lives and ſurvivorſhips, which this ſociety does not make. In doing this, it follows the rules which have been given by the beſt mathematical writers on the doctrine of *Life-Annuities* and *Reverſions*, particularly Mr. Simpſon; and, in order to gain ſuch a profit as may render it a *permanent* benefit to the public, and enable it to bear the expences of management, it takes the advantage of making its calculations at ſo low an intereſt as 3 *per cent.* and, from tables of the probabilities and values of lives in London, where (as in all great towns) the rate of human mortality is much greater than it is in common among mankind. This ſociety has lately made a particular enquiry into its own ſtate, as to *profit* and *loſs*, by all the buſineſs it has tranſacted from its firſt inſtitution. This enquiry was made in three different methods, propoſed to the directors by Dr. Price, the author of the Treatiſe on Reverſionary Payments; and the reſult has been, that it appears, that a much ſmaller proportion of the perſons aſſured have died, than *ſhould* have died, according to the tables for London, from which the calculations have been made, or even according to Dr. Halley's table for Breſlaw; that, for this reaſon, the claims have been much leſs than they *ſhould* have been; and that the ſociety has for many years been enjoying an income, ſome thouſands *per ann.* greater than it wants, and a *ſurplus ſtock* of near 40,000*l.* over and above what is neceſſary to enable it to make good all its engagements.

In theſe circumſtances, the ſociety finding itſelf well ſecured againſt future hazards, and being unwilling to take from the public an extravagant profit, have determined to reduce all the *future* payments for *aſſurances one tenth*; and alſo to return to the perſons now aſſured *one tenth* of all the payments which they have made. And there is, it ſeems, reaſon to expect that this will be only a preparation for farther reductions. Nor need the public, we are informed, be apprehenſive of their going too far in making reductions; for in conſequence of the enquiry they have lately made, and of the order into which this enquiry has thrown their accounts, they will have it in their power to determine exactly from year to year what they are able to do, and always to keep under their view a clear ſtate of their own circumſtances.

From the preceding account of this Society it is manifeſt, that its buſineſs is ſuch, that none but ſkilful mathematicians are qualified to conduct it. The intereſt of the ſociety, therefore, abſolutely requires, that it ſhould make the places of thoſe who manage its buſineſs ſo advantageous, as to induce the ableſt mathematicians to accept them; and this will render it the more neceſſary for the ſociety to take care, on any future vacancies, to pay no regard, in filling them up, to any other conſiderations than the ability and integrity of the candidates. The conſequence of granting good pay will be a multitude of ſollicitations on every vacancy, from perſons who, however unqualified, will hope for ſucceſs from their connexions, and the intereſt they are able to make; and ſhould the ſociety, in any future time, be led by ſuch cauſes to truſt its buſineſs in the hands of perſons not poſſeſſed of ſufficient ability, as *calculators* and *mathematicians*, ſuch miſtakes may be committed as may prove, in the higheſt degree, detrimental.—We have reaſon to know, that at preſent the ſociety is in no danger of this kind; and one of the great public advantages attending it, is, that it has eſtabliſhed an *office*, where not only the buſineſs we have deſcribed is tranſacted with faithfulneſs and ſkill; but where alſo all who want ſolutions of any queſtions relating to life-annuities and reverſions may apply, and be ſure of receiving juſt anſwers.

TABLE of the rates of *aſſurance* on ſingle lives in the Society for equitable Aſſurances near Black-Fryars Bridge.

SUM aſſured 100*l.*

Age	One year			Seven years at an annual payment of			For the whole life, at an annual payment of		
	£.	*s.*	*d.*	£.	*s.*	*d.*	£.	*s.*	*d.*
10	1	9	6	1	10	7	2	2	10
15	1	11	0	1	12	7	2	6	6
20	1	13	11	1	16	0	2	12	10
25	1	17	7	2	0	2	3	0	6
30	2	2	6	2	6	0	3	8	11
35	2	8	7	2	14	2	3	17	9
40	2	19	2	3	5	1	4	7	11
45	3	11	0	3	18	6	5	0	0
50	4	4	8	4	11	2	5	12	11
55	5	0	9	5	11	7	6	9	3
60	5	19	1	6	16	10	7	17	7
65	7	0	11	8	13	0	10	3	9

Theſe rates are 10 *per cent.* lower than the true values, according to the decrements of life in London, reckoning intereſt at 3 *per cent.*; but at the ſame time, for all ages under fifty, they are near a *third* higher than all the true values, according to Dr. Halley's Table of the decrements of life at Breſlaw, and Dr. Price's Tables of the decrements of life at Northampton and Norwich.—As, therefore, this ſociety has lately found that the decrements of life among its members have hitherto been lower than even thoſe given in theſe laſt Tables, it may be reaſonably expected, that they will in time reduce their rates of *aſſurance* to the true values, by theſe Tables.

ASSURANCE, *collateral.* See COLLATERAL.

ASSURGENT *leaves*, in *Botany*, denotes ſuch as are firſt bent down, and then riſe erect towards the apex.

ASSUROR, a merchant, or other perſon, who aſſures, or makes out a policy of inſurance for a ſhip, houſe, life, or the like.

Aſſurors are not anſwerable for what damages ariſe through the negligence, or other fault of the maſter or ſeamen; or even thoſe which ariſe from any vice or defect in the thing aſſured.

ASSURRITANI, or ASSURRANI, a branch of *Donatiſts*, in the middle of the fourth century. The *Aſſurritani* maintained, the Son inferior to the Father; they rebaptized their converts from the catholics, and aſſerted that the church is not compoſed of good and bad, but of the good alone.

ASSYRIAN *letters*, *litteræ Aſſyriæ*, a denomination given by ſeveral Rabbins, and Talmudiſts, to the characters of the preſent Hebrew alphabet, as ſuppoſing them to have been borrowed from the Aſſyrians during the Jewiſh captivity in Babylon. Montfaucon.

ASTAEUS, a ſpecies of the *crab* inſect.

ASTAKILLOS, a denomination given by Paracelſus to a malignant gangrenous ulcer in the legs, occaſioned by a mercurial ſalt in the blood. This is alſo called by him *araneus*, and *ulcus araneum*, the *ſpider's ulcer*.

ASTALIN, in *Ancient Writers*, the ſame with *aſtanda*.

ASTANDA, in *Antiquity*, a royal courier or meſſenger, the ſame with ANGARUS.

King Darius of Perſia is ſaid by Plutarch, in his book on the fortune of Alexander, to have formerly been an *aſtanda*.

ASTARILÆ, ASTHARITÆ, or ASTHAROTHITÆ, a name given by ſome to the Jews, who fell into the worſhip of Aſtaroth, or Aſtharoth, the goddeſs of the Sidonians, ſuppoſed the ſame with Aſtarte, or the moon.

ASTAROTH, in *Mythology*, an idol of the Philiſtines, which the Jews deſtroyed at the command of Samuel. It was alſo the name of a deity of the Sidonians, which was worſhipped by Solomon in his idolatrous days.

ASTATI, in the ninth century, the followers of one Sergius, who renewed the errors of the MANICHEES.

The word is derived from the privative *α*, and *ιςημι*, *ſto*, *to ſtand*, and ſignifies any thing unſtable and inconſtant. They prevailed much under the emperor Nicephorus; but his ſucceſſor, Michael Curopalates, curbed them with very ſevere laws.

ASTEISM, in *Rhetoric*, a genteel way of irony, or handſome way of deriding another. Such is that of Virgil:

> *Qui Bavium non odit, amet tua carmina Mævi*, &c.

ASTER, in *Botany*. See STAR-WORT.

ASTER, in *Mineralogy*, a denomination given to a ſpecies of Samian earth.

ASTER *thalaſſius*, the *ſtella marina*, or STAR-*fiſh*.

ASTER is alſo a denomination, in the *Ancient Pharmacy*, given to a kind of medicine, invented by Andromachus, againſt defluxions, and divers other pains.

ASTENA, a genus of worms of the *molluſca* order, in the Linnæan ſyſtem.

ASTERIA, in *Zoology*, a name by which ſome authors have called the *accipiter palumbarius*, or GOSHAWK.

ASTERIA is alſo the name of a gem, uſually called the cat's eye, or *oculus cati*. It has only two colours, a pale brown and a white, the brown ſeeming the ground, and the white playing about in it, as the fire colour in the opal. It is conſiderably hard, and will take a fine poliſh, but is uſually worn with its native ſhape and ſmoothneſs

It is found in the Eaſt and Weſt Indies, and in Europe. The iſland of Borneo affords ſome very fine ones, but they are uſually ſmall; they are very common in the ſands of rivers in New Spain; and in Bohemia they are not unfrequently found immerſed in the ſame maſſes of jaſper with the OPAL.

ASTERIA is alſo the name of a figured ſtone. See STAR-*ſtone*.

ASTERIA. See STAR-*fiſh*.

ASTERION, in *Aſtronomy*, one of the CANES VENATICI.

ASTERISCUS, *aſteroides buphthalmum*, in *Botany*. See Ox-*eye*.

ASTERISK, a character in form of a ſmall ſtar, ſet over any word, or ſentence, to make it the more conſpicuous, or to refer to the margin, or elſewhere, for a quotation, explanation, or the like.

The word is a diminutive of *αςηρ*, a *ſtar*.

ASTERISM, ASTERISMUS, in *Aſtronomy*, the ſame with CONSTELLATION.

The word comes from *αςηρ*, *ſtella*, *ſtar*.

ASTERN, denotes any diſtance behind a ſhip.

ASTEROPHYTON, in *Natural Hiſtory*, a name given to a kind of STAR-fiſh, which is compoſed of a great number of cylindric rays, each branching out into ſeveral others, ſo as to repreſent the branched ſtalks of a very intricate ſhrub.

ASTEROPODIUM, in *Natural Hiſtory*, the name given by authors to a kind of extraneous foſſil, of an imbricated texture, compoſed of a number of ſmall convex or concave plates, and ſerving, when entire, as a baſe, or root, to the *aſteria*, or STAR-*ſtone*.

It is very plain, that this is the remains of ſome animal body, probably of the ſtar-fiſh kind, to which the *aſteria* have alſo once belonged; but our imperfect knowledge in the animal hiſtory, has not yet aſcertained us of the particular creature; the moſt probable conjecture is, that it is the Magellanic STAR-*fiſh*, the rays of which nicely and exactly repreſent ſome of the moſt perfect *aſteropodia*.

ASTHMA, in *Medicine*, a diſeaſe of the lungs, accompanied with a ſhortneſs and difficulty of reſpiration.

An *aſthma* is a difficulty of breathing, ariſing from a diſorder of the lungs; and uſually attended with violent motions of the diaphragm, abdominal and intercoſtal muſcles, to the very *ſcapula*, and the *pinnæ* of the noſtrils; as alſo with a rattling in the throat.

If reſpiration be only thick and quick, without the other ſymptoms, it is called a *dyſpnœa*.—And if it be ſo intenſe as to occaſion a violent motion of the muſcles of the thorax, ſo that the patient cannot be tolerably eaſy, except in an erect poſture, it is called an *orthopnœa*.

The *aſthma* is uſually divided into *moiſt* and *dry*, or *manifeſt* and *occult*, or *pneumonic* and *convulſive*: the firſt is attended with an expectoration of purulent matter; the latter is without.

The true or *pneumonic aſthma* is occaſioned by an abundance of ſeroſities, or of groſs, viſcous, or purulent humours,

mours, collected in the cavities of the lungs, which ſtop up or ſtraiten the paſſages of the air, and compreſs the *bronchia.*

Aſthmas may alſo be owing to empyemas, phthiſes, polypuſes, crudities in the ſtomach, cachexies, &c.

Dr. Mead obſerves, that whatever occaſions the ambient air to enter the lungs with leſs freedom than uſual, brings on this diſeaſe. Hence it may ariſe, 1ſt. From an impediment to the action of the diaphragm, or of the intercoſtal and abdominal muſcles. 2dly, From an obſtruction to the free paſſage of the air into the *aſpera arteria*, or its ramifications, whether it ariſes from a tumour, or from viſcid humours. 3dly, The air itſelf may be a cauſe, if it be much heavier, or lighter than uſual. 4thly, The tenderneſs of the lungs may ſometimes occaſion this diſtemper, as appears from thoſe who are ſubject to a difficulty of breathing upon removing from the thick air of the town into the clear air of the country. 5thly, The difficult paſſage of the air through the lungs may be reckoned among the cauſes of difficult reſpiration. And this may happen either from the weakneſs of the heart, or the too great thickneſs of the blood.

That kind called the convulſive *aſthma* is ſuppoſed to be occaſioned by an irregular motion of the animal ſpirits; and happens when the ſpirits do not flow faſt enough, or in ſufficient quantity, into the muſcles of the breaſt, either by reaſon of an obſtruction, or of ſome other obſtacle: the neceſſary conſequence whereof is a violent and painful reſpiration, in which nature's effort ſeems to be the relieving herſelf from the load of a *plethora*, by a ſpitting of blood, though ſhe fails in the attempt. The *convulſive aſthma* reſembles the *incubus*, or night-mare, in many particulars; but it never ſeizes any body, unleſs they are awake, whereas the other uſually attacks them when between ſleep and waking; and this is a much more laſting complaint, and more frequent, in the returns of its fits than the other. The *incubus* alſo prevents reſpiration in ſo violent a degree, that the perſon can form no articulate ſound. But the *convulſive aſthma* ſuffers a ſomewhat more free reſpiration, and the uſe of the voice. The *incubus* is a diſeaſe of very little danger; the *convulſive aſthma*, on the contrary, is a very dangerous, and often fatal, diſorder. Juncker, Conſp. Med. p. 364.

Asthma *convulſive, ſigns of it.* Theſe are a terrible ſhortneſs of breath, which differs from that of the ſuffocative catarrh only in this, that it is ſomewhat leſs violent, and is not attended with the ſame ſenſation of a ſtuffing up of the breaſt: this is attended with a numbneſs of the limbs, and a general laſſitude of the whole body; there is a violent compreſſion felt in the breaſt, and about the ſhoulders, with a great palpitation of the heart. The face is red in ſome parts, and ſeems tumid, and the temporal arteries are diſtended. The bowels are uſually coſtive, and there is a dimneſs often in the eyes, and ſometimes an alienation of the mind. Theſe ſymptoms uſually come on in an evening, and laſt an hour or two. Often, however, the fits are of much longer duration, and ſometimes they obſerve regular periods, at different diſtances of time.

Asthma *convulſive, perſons ſubject to it.* Thoſe of plethoric habits are much more ſubject, than any other people, to this diſeaſe. It does not often ſeize young perſons, except in conſequence of other diſeaſes, and in that caſe it uſually is a very bad omen. It is moſt common to people of a middle age, and, with them, ſometimes returns with frequent, but leſs violent fits, for many years together; ſometimes it is more violent, and takes them off in a very little time. People often fall into this diſeaſe, from having been uſed to periodic bleedings, or cuppings, and having afterwards neglected them; thoſe who change a buſy or laborious life, for an idle or ſedentary one, alſo often fall into it; as do thoſe who have had the gout, thrown back by improper medicines. Women alſo ſometimes fall into it from ſuppreſſions or imminutions of the *menſes*; and men of hypochondriac habits, from ſuppreſſions of habitual evacuations of blood from the hæmorrhoidal veins. The cauſes of this diſeaſe are very various, and it is ſometimes an idiopathic, ſometimes a ſymptomatic, complaint; it very often attends malignant fevers, and arthritic complaints, and joins itſelf with other diſtemperatures of the breaſt.

Asthma, *convulſive, prognoſtics in it.* This, though not immediately deſtructive, is often a very dangerous complaint, and in a ſhorter or longer time, proves fatal to the patient. In middle-aged people it uſually brings on either acute fevers, or ſpitting of blood; and in old people, palſies, apoplexies, or ſuffocative catarrhs. Juncker.

The *aſthma*, again, is either *continual*, or *periodical*, and *intermitting*; which laſt returns chiefly when a ſober *regimen* is not obſerved.

The *aſthma* is found to be the moſt violent when the patient is in bed, and in a prone poſture; the contents of the lower belly, in that caſe, bearing againſt the diaphragm, ſo as to leſſen the capacity of the breaſt, and to leave the lungs leſs room to move.

Asthma, *method of treatment.* The cure of the true or pneumonic *aſthma* is by bleeding; after which emetics may be uſed; and, if the paroxyſm returns, epiſpaſtics, with glyſters inſtead of purges.—Linctuſes alſo give ſome relief, millepedes, ſpirit of gum ammoniac, with ſal ammoniac, coffee, tincture of ſulphur, &c. are alſo greatly commended in *aſthmatic* caſes.

Sir John Pringle obſerves, that coffee made freſh and ſtrong, allowing about an ounce for one diſh, and repeated every quarter or half an hour, is the beſt abater of the paroxyſms of the periodic *aſthma*, which he has ever known.

For the convulſive kind, the cure is attempted by antiepileptics, antihyſterics, antiſpaſmodics, opiates, &c.—Externally, ſpirit of wine and camphire may be rubbed on the breaſt and ſhoulders, eſpecially where the patient has been uſed to cupping, and has neglected it; rubbing the ſhoulders with a flannel, often has a good effect alſo; and fumigations may be uſed of amber, ſtorax, and maſtich, with flowers of citrine ſtœchas. When the fit is off, the patient ſhould uſe frequent waſhing the feet in warm water, and ſhould be always blooded in the foot in ſpring and fall; he ſhould alſo take gentle purges at times, and if the neglect of habitual cuppings, or ſuppreſſions of the hæmorrhoids, or, in women, of the *menſes*, have concurred, great care is to be taken to bring all back to their old ſtate again, otherwiſe no radical cure can be expected. Beſides, a mixture of ſpirit of hartſhorn, and tincture of ſalt of tartar, ſhould be given to promote an equal diſtribution of the blood to all parts of the body.

Bleedings in the time of the fit, though they always give relief, yet are as much to be avoided as poſſible, ſince they ſubject the patient to frequent returns, and make it always neceſſary to repeat them at the time; for as nature intends, by this *aſthma*, the relieving herſelf from a *plethora*, by a diſcharge of blood, where ſhe finds this intent anſwered by the opening a vein, ſhe will always afterwards bring on this diſeaſe, when at all moleſted by a *plethora*, and will never ſuffer it to go off but by the ſame means. In a firſt attack of this diſeaſe, bleeding is not abſolutely neceſſary, and is therefore always to be carefully avoided; but in caſes where cuſtom has made it neceſſary, it muſt be done, and a large quantity always taken away. Bleeding in the arm is found moſt ſerviceable in the time of the fit, and in the foot, by way of prevention. Vomits, in theſe caſes, are often very hurtful, and the more violent ones always dangerous, in conſideration of the ſpitting of blood, which there is always a greater or leſſer tendency to; yet, in caſes where a full meal has juſt preceded it, and where there is no immediate reaſon againſt it, a ſmall doſe of ſome gentle vomit may be properly given, after bleeding, and a glyſter. Dr. Akenſide recommends an emetic of ipecacuanha, to be uſed as ſpeedily in the fit, as attending circumſtances will admit. A ſweat very often ſucceeds the more violent fits of this diſorder, and is always obſerved to do the patient good; this is promoted by the nitrous and cinnabarine medicines. When this diſeaſe is attended with hypochondriac complaints, the *mixtura ſimplex*, well camphorated, is found of great uſe, as it diſpels the flatulencies, which, in this caſe, are joined with, and always greatly exaſperate, the diſeaſe. The volatile ſalts are to be avoided in the time of the fit, and all anodynes, if given while the bowels are in a coſtive ſtate, bring on miſchief. The giving, in this caſe, the expectorating medicines, which are ſerviceable in other *aſthmas*, is not only uſeleſs, as there is, in this caſe, nothing to be expectorated, but it is alſo dangerous. Finally, in caſes where there are hypochondriac complaints joined with this diſeaſe, the application of leeches to the hæmorrhoidal veins is attended uſually with great ſucceſs. Juncker, & Med. Tranſ. Lond. vol. i.

The method of cure in this diſtemper, ſays Dr. Mead, muſt vary with its cauſes. Blood-letting is, generally ſpeaking, uſeful in every ſpecies of it. Vomits are uſeful, if the ſtomach or lungs be loaded with tough phlegm. The body muſt be kept open with gentle cathartics. Flatulent food and drink ſhould be avoided; exerciſe uſed till wearineſs; and friction, till a ſweat is ready to break out.

Oxymel of ſquills, and ſimple cinnamon water, or garlic, are good in caſe of viſcid and tough humours. But if the fault lie in the nervous juice, the ſtrong ſmelling gums are proper, eſpecially the milk of gum ammoniac. Anodynes are very hurtful in the firſt caſe, but ſerviceable in this, if joined with volatile ſalts or ſpirits. The paregoric elixir is one of the beſt of this tribe.

As every ſpecies of this diſeaſe is attended with more or leſs efferveſcence in the blood, the bark will be found uſeful; and there have been inſtances where it has done vaſt ſervice, mixed with the cinnabar of antimony. Mead. Mon. & Pract. Med. cap. 8.

Bliſters on the back give relief during the fit; and by keeping them open as long as poſſible may prevent returns.

In general, all ales, and eſpecially that prepared of wheat, are in this diſorder to be avoided. In *aſthmatic* caſes, the moſt proper liquor is old Rheniſh wine, mixed with three or four parts of pure ſpring water, or the Seltern waters. Beſide, infuſions by way of tea, prepared of hyſſop, Paul's betony, garden-crowfoot, ground-ivy, liquorice-root, the *tragus* (ſea-grape), and the flowers of the daiſy, are highly beneficial in all *aſthmas*, from whatever cauſe they may ariſe. Such ſubſtances as are too ſweet, or prepared with ſugar or honey, are in every ſpecies of the *aſthma*, but more eſpecially thoſe of the ſerous, or hypochondriacal kind, to be carefully abſtained from. Hoffman.

ASTIPULATOR, in the Roman order, he by whoſe conſent and leave a nun takes the religious habit. Du-Cange.

ASTORCHA, in *Botany*, a name by which ſome authors call the yellow *ſtœchas*, and others the purple, commonly called the Arabian.

ASTRÆA, in *Aſtronomy*, a name which ſome give to the ſign Virgo, by others called Erigone, and ſometimes Iſis. The poets feign that Juſtice quitted heaven to reſide on earth, in the golden age; but, growing weary of the iniquities of mankind, ſhe left the earth, and returned to heaven, where ſhe commenced a conſtellation of ſtars, and from her orb ſtill looks down on the ways of men. Ovid. Met. lib. i. ver. 149.

ASTRAGAL, in *Anatomy*, a bone of the heel, having a convex head, articulated with the *tibia*, by *ginglymus*. See *Tab. Anat.* (*Oſteol.*) *fig.* 7. *a. a. fig.* 3. *n.* 25. 25.

The *aſtragalus*, called alſo *talus*, and popularly *os baliſtæ*, is the firſt bone of the *tarſus*, and the higheſt of all thoſe that belong to the foot.

This bone may be divided into two portions, one large and *poſterior*, the other ſmall and *anterior*; the firſt is, as it were, the body of the bone, the latter an *apophyſis*, though commonly called, the *anterior* portion. The body, or *poſterior* portion, has four ſides, one *ſuperior*, two lateral, and one *inferior*. The upper ſide is the largeſt; it is covered all over with a cartilage, and is cylindrically convex from before backward, with a depreſſion running through the middle of its breadth, which repreſents half a pulley, and is continuous with the two lateral cartilaginous ſides, of which the external is broader than the other. The upper ſide is articulated with the lower ſide of the *baſis* of the *tibia*, the internal lateral ſide with the inner ankle, and the external lateral ſide with the outer ankle; below the internal lateral ſide there is a great depreſſion without a cartilage, and ſeveral other inequalities. The lower ſide is likewiſe cartilaginous, and obliquely concave, for its articulation with the *os calcis*. At the very loweſt and *poſterior* part of the body of the *aſtragalus*, on the edge of the lower ſide, is a ſmall oblique ſmooth notch, or channel, for the paſſage of the tendons. The *apophyſis*, or *anterior* part of the *aſtragalus*, is diſtinguiſhed from the body, by a ſmall depreſſion on the upper part; and on the lower part by a long oblique unequal notch, very broad toward the outſide. The *anterior* ſide of this *apophyſis* is all cartilaginous, and obliquely convex, for its articulation with the *os ſcaphoides*. The lower ſide, which is likewiſe cartilaginous, is parted in two, and articulated with the *os calcis*, being diſtinguiſhed from the lower ſide of the body of the bone, by the long oblique notch already mentioned. Beſide theſe two cartilaginous ſides, there is a third below the *anterior*, towards the inner part, which, in the dried ſkeleton, touches nothing. Winſlow.

Some alſo apply the name *aſtragalus* to the *vertebræ* of the neck.—Homer, in his Odyſſey, uſes the term in this ſenſe.

ASTRAGAL, in *Architecture*, from the Greek αςραγαλος, *the bone of the heel*, is a little round member, in form of a ring, or bracelet; ſerving as an ornament at the tops and bottoms of columns.—See *Tab. Architect. fig.* 40. *lit.* E. & *fig.* 2. 24. 25. 27.

It is alſo uſed both above and below the liſtel, adjoining immediately to the ſquare or dye of the pedeſtal. It is frequently carved with hearts and olives, which the French call *pater-noſters*.

ASTRAGAL, in *Gunnery*, is a kind of ring or moulding on a piece of ordnance, at about half a foot diſtance from the mouth; ſerving as an ornament to the piece, as the former does to a column.

ASTRAGAL *tyles*. See TYLE.

ASTRAGALOIDES, in *Botany*, the *phaca* of Linnæus. See *Baſtard Milk* VETCH.

ASTRAGALOMANCY, a ſpecies of divination performed by throwing ſmall pieces, with marks correſponding to the letters of the alphabet; the accidental diſpoſition of which formed the anſwer required. This kind of divination was practiſed in a temple of Hercules, in Achaia. Hiſt. de l'Acad. Inſcrip. tom. i. p. 122.

The word is derived from αςραγαλος, and μαντεια, *divination*.

ASTRAGALOTE, in *Natural Hiſtory*, a ſpecies of foſſile *alum*, thus called, from its reſembling a *talus*, or ankle-bone; whence it is alſo denominated *talare*.

ASTRAGALUS, in *Botany*, a genus of the *diadelphia decandria* claſs, *wild liquorice*, *liquorice vetch*, or *milk vetch*. Its characters are, that it hath a butterfly-flower. The ſtandard, or *vexillum*, is upright, blunt, and reflexed on the ſides. The wings, which are oblong, are ſhorter than the ſtandard; and the heel, which is bordered, is of the ſame length with the wings. At the bottom of the flower is ſituated a taper germen, which afterward becomes a pod having two cells, with a row of kidney-ſhaped ſeeds in each. Miller enumerates twenty ſpecies. The root of this plant, drank in wine, ſtops a looſeneſs, and provokes urine. Dried to a powder, it is, with good effect, ſprinkled on old ulcers, and ſtops bleeding. Lemery.

According to ſome, it is good to increaſe the milk in wet-nurſes.

ASTRAL, ſomething belonging to the ſtars, or depending on the ſtars.

The word comes from *aſtrum*, of the Greek αςηρ, *ſtar*.

ASTRAL, or ſiderial year. See YEAR.

ASTRANTIA, in *Botany*. See MASTER-*Wort*.

ASTRAPÆA, in *Natural Hiſtory*, a name given by the ancients to a ſtone, ſince called, improperly, *aſtrapia*, and by ſome *aſtrapea*. The deſcription we have of it, is, that it was a blue, or blackiſh one, with white variegations, running in the form of waves and clouds in it. Some ſpecimens of the Perſian *lapis lazuli* are of this kind, but they are rare. It is probable that the ancients meant theſe, by the name, but as they were not a diſtinct ſpecies, they ought not to have confounded the ſame ſtone under two names.

ASTRARII, in *Middle Age Writers*, the ſame with *manſionarii*, thoſe who live in the houſe, or family, at the time, for inſtance, when a perſon dies. Du-Cange.

Theſe are alſo denominated *aſtro-addicti*, q. d. *tied to the hearth*.

ASTRARIUS *hæres* is uſed in our *Old Writers*, where the anceſtor, by conveyance, hath ſet his heir apparent, and his family, in a houſe, in his life-time.

Spelman carries the import of the word further, as if it denoted an heir to whom the inheritance was given by his predeceſſor in his own life, by a writing in form.

The word is formed from *aſtre*, an ancient French term for the hearth of a chimney.

ASTRICTION, *adſtrictio*, in *Medicine*, an operation intended partly to conſtringe the parts and pores of the body, when too looſe, and partly to reſtrain the courſe of the humours, when too fluid.

Aſtriction, with regard to the object, is of two ſorts; the firſt employed on the too much relaxed *ſolids*; the ſecond on the *fluids*, chiefly in hæmorrhages; intended to moderate or reſtrain the flux of the blood through the cuſtomary paſſages, as the noſe, *menſes*, *lochia*, and the like; and ſometimes alſo to ſtop extraordinary and unuſual hæmorrhages, ariſing from violent cauſes.

ASTRICTIOR *toga*. See TOGA.

ASTRICUS *lapis*, in *Natural Hiſtory*, a kind of figured ſtone, broken or cut from the *enaſtros*, after the ſame manner as the *trochitæ* from the *entrochi*.

ASTRILD, in *Ornithology*, a ſpecies of the LOXIA.

ASTRINGENS *crocus martis*. See CROCUS.

ASTRINGENTS, in *Medicine*, binding remedies; or ſuch as have the power of contracting the parts, and diminiſhing the pores thereof.

Aſtringents chiefly act either by the aſperity of their particles, whereby they corrugate the membranes, and make them draw up cloſer; or by thickening the fluids, whereby they cannot run off ſo faſt as before.

Hence, *aſtringents* are of the claſs of ſtrengtheners, or corroborants; the nature and operation whereof, ſee under the article STRENGTHENER.

Aſtringents naturally ſtand oppoſed to *laxatives*. They only differ from what are called *ſtyptics*, in degree of efficacy.

Among ſimples, mint, red roſes, nettles, ſanicle, barberries, quinces, pomgranates, ſloes, cinnamon, blood-ſtone, alum, chalk, boles, coral, &c. are the principal *aſtringents*.

Aſtringent medicines are to be avoided in all inflammatory caſes, for they diſturb nature in the effort ſhe is making to relieve herſelf from a congeſtion of blood in the part; and prevent that free paſſage which the blood ought to have, and which alone can make a cure, or break through the obſtruction that is the real diſeaſe.

Mr. Petit concludes, from a great many experiments he made in covering pieces of fleſh with the different ſorts of *aſtringents* employed in hæmorrhages, that ſome act only as abſorbents; ſuch are earthy ſubſtances, moſt of the *aſtringent* plants, ſome gums, reſins, and animal ſubſtances. Other *aſtringents* abſorb, and, at the ſame time, their ſaline and ſulphureous particles, inſinuating themſelves into the fleſh, preſerve it from corruption. Vitriol and alum, which are acknowledged to be among the ſtrongeſt *aſtringents*, appeared, by his experiments, to abſorb moſt humidity. Mem. Acad. Scienc. an. 1732. *Aſtringents* are beſt adminiſtered in ſmall doſes, with a large quantity of ſome proper liquid. Extracts made from *aſtringent* vegetables do not keep long. Dr. Percival, in his Medical Eſſays and Experiments, obſerves, that *aſtringents*, acid and vegetables, neutralize each other; that vegetable acids leſſen their aſtriction externally; but that mineral acids increaſe it both internally and externally. Vegetable *aſtringents* are the moſt powerful, as medicines; and of theſe one of the ſtrongeſt is galls.

From the infuſions of certain *aſtringent* vegetables, mixed with green vitriol, commonly called copperas, is produced a deep black liquor, of moſt extenſive uſe for dying and ſtaining black; to woollen and ſilk it gives a permanent colour, although from linen, and other vegetable bodies, this blackneſs is diſcharged by waſhing. Of ſuch *aſtringent* vegetables, the principal are, the excreſcences from the OAK, called GALLS, proceeding from the juices of the tree, iſſuing through ſmall wounds made by certain inſects, not found in this climate. Other kinds of excreſcences are found upon our oaks, occaſioned, perhaps, by inſects of another kind. There are many other vegetable ſubſtances that have a like effect in different degrees; all, in general, that are auſtere, *aſtringent*, or corrugating to the taſte, inſomuch, that turning a ſolution of vitriol black, is looked upon as a ſure teſt of *aſtringency* in vegetables. This power, by which they produce this BLACKNESS, and their *aſtringency*, or that quality by which they contract animal fibres, and by which they contribute to the TANNING of leather, ſeem to depend upon one and the ſame principle, and to be proportional to one another. This *aſtringent* and colouring matter is diſſolved and extracted from galls, acorns, the leaves, the bark, and wood of the oak; from the leaves, ſmall branches, and flowery cluſters of the ſumach-tree, balauſtine-flowers, pomegranate-peel, alder-bark, biſtort-root, &c. both by water and ſpirit of wine, and it does not exhale in the evaporation of liquors by heat. There are differences in the *phænomena* produced by different *aſtringents*. Commercium Phil. Techn. p. 344, p. 382, and p. 418.

See Neumann's chemical hiſtory of *aſtringent* vegetables, his account of their antiſeptic nature, of the methods of extracting their *aſtringency*, of their ſtriking colours with chalybeate vitriol, of their uſe in tanning, of their giving ſome durable dyes, and of their fixing others, in Dr. Lewis's edition of Neumann's Works, with his own additional obſervations. 4to. an. 1759. p. 362, *&* *ſeq.*

ASTROBOLISM, the ſame with *ſphacelus*; though properly applied to plants which are deſtroyed in the dog-days, as if blaſted by that ſtar.

The word is derived from αϛηρ, *ſtar*, and βαλλω, *I ſtrike.*

ASTRODICTICUM, an aſtronomical inſtrument invented by M. Weighelius, by means of which many perſons ſhall be able at the ſame time to behold the ſame ſtar.

ASTROGNOSIA, from αϛηρ, *ſtar*, and γινωσκω, *I know*; the art of knowing the fixed ſtars, their names, ranks, ſituations in the conſtellations, and the like.

ASTROITES, *lapis* ASTROITES, ASTROCHITES, or ASTERIA. See STAR-*ſtone.*

ASTROLABE, ASTROLABIUM, was originally uſed for a ſyſtem or aſſemblage of the ſeveral circles of the ſphere, in their proper order and ſituation with reſpect to each other.

The ancient *aſtrolabes* appear to have been much the ſame with our armillary ſpheres.

The firſt and moſt celebrated of this kind was that of Hipparchus, which he made at Alexandria, the capital of Egypt, and lodged in a ſecure place, where it ſerved for divers aſtronomical operations.—Ptolemy made the ſame uſe of it; but as the inſtrument had ſeveral inconvenieneies, he contrived to change its figure, though perfectly natural, and agreeable to the doctrine of the ſphere; and to reduce the whole *aſtrolabe* upon a plane ſurface, to which he gave the denomination of the PLANISPHERE.—Hence

ASTROLABE is uſed among the moderns for a PLANISPHERE; or a ſtereographic projection of the circles of the ſphere upon the plane of ſome great circle thereof.

The uſual planes of projection are that of the equinoctial, the eye being ſuppoſed in the pole of the world; that of the meridian, the eye being ſuppoſed in the point of interſection of the equinoctial and horizon; and that of the horizon.

Stoffler, Gemma Friſius, and Clavius, have treated at large of the *aſtrolabe.*—For a farther account of the nature and kinds hereof, ſee PLANISPHERE.

ASTROLABE, or *Sea* ASTROLABE, more particularly denotes an inſtrument chiefly uſed for taking the altitude of the pole, the ſun, or ſtars, at ſea.

The word is formed from αϛηρ, *ſtar*, and λαμϐανω, *capio, I take.*—The Arabs call it in their tongue, *aſtharlab*; a word formed by corruption from the common Greek name.

The common *aſtrolabe*, repreſented *Tab. Navigation, fig.* 22. conſiſts of a large braſs ring, about fifteen inches in diameter, whoſe limb, or a convenient part thereof, is divided into degrees and minutes; fitted with a moveable index, or label, which turns upon the centre, and carries two ſights.—At the zenith is a ring A, to hang it by in time of obſervation.

To uſe the *aſtrolabe*, turn it ſo to the ſun, as that the rays may paſs freely through both the ſights F and G; in which caſe the edge of the label cuts the altitude in the divided limb.

The *aſtrolabe*, though now grown into diſuſe, is at leaſt equal to any of the other inſtruments uſed for taking the altitude at ſea; eſpecially between the tropics, when the ſun comes near the zenith.—There are a great many other uſes of the *aſtrolabe*; whereof Clavius, Henrion, &c. have written entire volumes.

ASTROLOGICAL *fate.* See FATE.

ASTROLOGY, the art of foretelling future events, from the aſpects, poſitions, and influences of the heavenly bodies.

The word is compounded of αϛηρ, *ſtar*, and λογος, *diſcourſe*; whence, in the literal ſenſe of the term, *aſtrology* ſhould ſignify no more than the *doctrine* or *ſcience of the ſtars*; which we read was its original acceptation, and made the ancient *aſtrology*; though, in courſe of time, an alteration has ariſen; that which the ancients called *aſtrology*, being afterwards termed ASTRONOMY.

Aſtrology may be divided into two branches, *natural* and *judiciary.*

To the former belongs the predicting of natural effects; as, the changes of weather, winds, ſtorms, hurricanes, thunder, floods, earthquakes, &c.

This art properly belongs to PHYSIOLOGY, or *natural philoſophy*; and is only to be deduced, *à poſteriori*, from *phænomena* and obſervations.

Its foundation and merits the reader may gather from what we have ſaid under AIR, ATMOSPHERE, and WEATHER.

For this *aſtrology*, Mr. Boyle makes an apology in his Hiſtory of the Air.

ASTROLOGY, *judiciary*, or *judicial*, which is what we commonly call ſimple *aſtrology*, is that which pretends to foretel moral events; i. e. ſuch as have a dependence on the free will and agency of man; as if they were directed by the ſtars. This art, which owed its origin to the practices of knavery on credulity, is now univerſally exploded by the intelligent part of mankind.

The profeſſors of this kind of *aſtrology* maintain, "That the
" heavens are one great volume or book, wherein God has
" written the hiſtory of the world; and in which every
" man may read his own fortune, and the tranſactions of
" his time.—The art, ſay they, had its riſe from the ſame
" hands as *aſtronomy* itſelf: while the ancient Aſſyrians,
" whoſe ſerene unclouded ſky favoured their celeſtial
" obſervations, were intent on tracing the paths and pe-
" riods of the heavenly bodies, they diſcovered a con-
" ſtant, ſettled relation of analogy, between them and
" things below; and hence were led to conclude theſe
" to be the *Parcæ*, the Deſtinies, ſo much talked of,
" which preſide at our births, and diſpoſe of our future
" fate.

" The laws therefore of this relation being aſcertained,
" by a ſeries of obſervations, and the ſhare each planet
" has therein; by knowing the preciſe time of any per-
" ſon's nativity, they were enabled, from their know-
" ledge in aſtronomy, to erect a ſcheme or horoſcope of
" the ſituation of the planets, at that point of time; and
" hence, by conſidering their degrees of power and in-
" fluence, and how each was either ſtrengthened or tem-
" pered by ſome other, to compute what muſt be the re-
" ſult thereof."

Thus the *aſtrologers.*—But the chief province now remaining to the modern profeſſors, is the making of calendars or almanacks.

Judicial *aſtrology* is commonly ſaid to have been invented in Chaldæa, and thence tranſmitted to the Egyptians, Greeks, and Romans; though ſome will have it of Egyptian origin, and aſcribe the invention to Cham. But it is to the Arabs that we owe it. At Rome the people were ſo infatuated with it, that the *aſtrologers*, or, as they were then called, the *mathematicians*, maintained their ground in ſpite of all the edicts of the emperors to expel them out of the city. See GENETHLIACI.

Add, that the Bramins, who introduced and practiſed this art among the Indians, have hereby made themſelves the arbiters of good and evil hours, which gives them great authority: they are conſulted as oracles; and they have taken care never to ſell their anſwers but at good rates.

The ſame ſuperſtition has prevailed in more modern ages and nations. The French hiſtorians remark, that, in the time of queen Catharine de Medicis, *aſtrology* was in ſo much vogue, that the moſt inconſiderable thing was not to be done without conſulting the ſtars. And in the reigns of king Henry III. and IV. of France, the predictions of *aſtrologers* were the common theme of the court converſation.

This predominant humour in that court was well rallied by Barclay, in his Argenis, lib. ii. on occaſion of an *aſtrologer*, who had undertaken to inſtruct king Henry in the event of a war then threatened by the faction of the Guiſes.

ASTROLUS, in *Natural Hiſtory*, a name given by authors to a white and ſplendid ſtone, ſmall in ſize, and of a roundiſh figure, reſembling the eyes of fiſhes.

ASTROMETEOROLOGIA, the art of foretelling the weather, and its changes, from the aſpects and configurations of the moon and planets.

This makes a ſpecies of *aſtrology*, diſtinguiſhed by ſome under the denomination of *meteorological aſtrology*.

ASTRONIUM, in *Botany*, a genus of the *dioecia pentandria* claſs; the calyx of which has five leaves, and the corolla five petals.

ASTRONOMICAL, ſomething that relates to *aſtronomy*.

ASTRONOMICAL *Calendar*, *Characters*, *Column*, *Horizon*, *Hours*, *Month*, *Quadrant*, *Ring-Dial*, *Sector*, *Tables*, *Teleſcope*, *Time*, *Year*. See the ſeveral ſubſtantives.

ASTRONOMICAL *Obſervations*. See COELESTIAL *Obſervations*.

The *aſtronomical* obſervations of the ancients, among which thoſe of Hipparchus make a principal figure, are carefully preſerved by Ptolemy in his Almageſt.

In the year 880, Albategni, a Saracen, applied himſelf to the making of obſervations: in 1457, Regiomontanus undertook the province at Norimberg; and his diſciples, J. Wernerus, and Ber. Waltherus, continued the ſame from 1475 to 1504. Their obſervations were publiſhed together in 1544.—In 1509, Copernicus, and after him the landgrave of Heſſe, with his aſſiſtants Rothmannus and Byrgius, obſerved; and after them Tycho, at Uraniburgh, from 1582 to 1601.—All the obſervations hitherto rehearſed, together with Tycho's *apparatus* of inſtruments, are contained in the Hiſtoria Cœleſtis, publiſhed in 1672, by order of the emperor Ferdinand.—Soon after, Hevelius, with a ſtill more magnificent and better contrived apparatus of inſtruments, deſcribed in his Machina Cœleſtis, began a courſe of obſervations. It is objected to him, that he only uſed plain ſights, and could never be brought to take the advantage of teleſcopic ones; which occaſioned Dr. Hook to write animadverſions on Hevelius's inſtruments, printed in 1674, wherein he too raſhly deſpiſes them, on account of their inaccuracy: but Dr. Halley, who at the inſtance of the Royal Society went over to Dantzick in the year 1679, to inſpect his inſtruments, approved of their juſtneſs, as well as of the obſervations made with them. See SIGHTS.

Jer. Horrox, and Will. Crabtree, two of our own countrymen, are famous for their obſervations from the years 1635 to 1645.—They were followed by Flamſteed, Caſſini the father and ſon, Halley, de la Hire, Roemer, and Kirchius.—See farther under OBSERVATORY, CATALOGUE, &c.

ASTRONOMICAL *place* of a ſtar or planet, is its longitude, or place in the ecliptic, reckoned from the beginning of Aries, *in conſequentia*, or according to the natural order of the ſigns.

ASTRONOMICALS, a name uſed by ſome writers for ſexageſimal fractions; on account of their uſe in *aſtronomical* calculations.

ASTRONOMICUS *Radius*. See RADIUS.

ASTRONOMY, ASTRONOMIA, the doctrine of the heavens, and their *phænomena*.

The word is compounded of αςηρ, *ſtar*; and νομος, *law*, *rule*. *Aſtronomy* is properly a mixed mathematical ſcience, whereby we become acquainted with the celeſtial bodies, their magnitudes, motions, diſtances, periods, eclipſes, &c. Some underſtand the word *aſtronomy* in a more extenſive ſenſe, including under it the theory of the univerſe, and the primary laws of nature: in which ſenſe it rather ſeems a branch of phyſics than of mathematics.

The heavens may be conſidered two ways; either as they appear to the naked ſenſe, or as they are diſcovered by the underſtanding; and hence *aſtronomy* is divided into two branches, SPHERICAL and THEORICAL.

The invention of *aſtronomy* has been variouſly aſſigned; and ſeveral perſons, ſeveral nations, and ſeveral ages, have laid claim to it.—From the accounts given us by the ancient hiſtorians, it appears that kings were the firſt inventors and cultivators of it: thus, Belus, king of Aſſyria; Atlas, king of Mauritania; and Uranus, king of the country ſituate on the ſhore of the Atlantic ocean, are ſeverally recorded, as the perſons to whom the world owes this noble ſcience; to whom we may add, Fohi, Taut, and Zoroaſter, as ſome of the moſt ancient of all the *aſtronomers*, whoſe names are recorded.

This, at leaſt, is pretty evident, that it was known to thoſe nations long before it came into Greece: agreeably to which Plato tells us, it was a Barbarian who firſt obſerved the heavenly motions; to which he was led by the clearneſs of the weather in the ſummer ſeaſon; as in Egypt and Syria, where the ſtars are conſtantly ſeen, there being no rain or clouds to interrupt the proſpect. And the want of this clearneſs of atmoſphere the ſame author lays down as the reaſon why the Greeks came ſo late to the knowledge of *aſtronomy*.

The generality of writers fix the origin of *aſtronomy* and aſtrology in Chaldæa; and accordingly among the ancients we find the word *Chaldæan* frequently uſed for *aſtronomer*.—Some chooſe, however, to attribute the invention to the ancient Hebrews; and ſome, even to the firſt men; building on the authority of Joſephus, and what he mentions about Seth's pillars.

It may be worth noting, though there are no hiſtorical facts to ſupport it, that Rudbeck, in his *Atlantica*, maintains *aſtronomy* to have been invented by the Swedes: his reaſons are, the great diverſity in the length of the days in that country, which muſt naturally lead the people to conclude the earth round, and that they lived near one of its extremes.

By Porphyry's account, *aſtronomy* muſt have been of a very ancient ſtanding in the Eaſt; for he tells us, that when Babylon was taken by Alexander, there were brought thence celeſtial obſervations for the ſpace of 1903 years, which therefore muſt have commenced within 115 years after the flood, or within fifteen years after the building of Babel.—Epigenes, according to Pliny, affirmed that the Babylonians had obſervations of 720 years, engraven on bricks.—Achilles Tatius aſcribes the invention of *aſtronomy* to the Egyptians; and adds, that their knowledge therein was engraven on columns, and by that means tranſmitted to poſterity.

M. Bailly, in his elaborate Hiſtoire de l' Aſtronomie Ancienne, &c. endeavours to trace the origin of *aſtronomy* among the Chaldæans, Egyptians, Perſians, Indians, and Chineſe, to a very early period. He maintains, that it was cultivated in Egypt and Chaldæa 2800 years before the Chriſtian æra; in Perſia, 3209; in India, 3101; and in China, 2952 years before this æra: he alſo apprehends, that *aſtronomy* had been ſtudied long before this diſtant period, and that we are only to date its revival from thence.

From the Egyptians, *aſtronomy* is commonly ſuppoſed to have paſſed to the Greeks: Laertius tells us, that Thales, firſt, about the ninetieth Olympiad, and after him Eudoxus and Pythagoras, travelled into Egypt, to be inſtructed in this ſcience; and that this laſt, in particular, living in a cloſe community with the Egyptian prieſts for ſeven years, and being initiated into their religion, was inſtructed in the true ſyſtem of the univerſe; which he afterwards taught in Greece and Italy.—He was the firſt, among the Europeans, who taught that the earth and planets turn round the ſun, which ſtands immoveable in the centre: that the diurnal motion of the ſun and fixed ſtars is not real, but apparent, ariſing from the earth's motion round its own axis, &c.—Diogenes Laertius ſays, that Pythagoras taught that the world was round, containing the earth in the middle of it; and that Philolaus firſt maintained, that the earth moved in a circle.

Yet Vitruvius repreſents the introduction of *aſtronomy* into Greece, ſomewhat differently: maintaining, that Beroſus, a Babylonian, brought it thither immediately from Babylon itſelf; and opened an *aſtronomical* ſchool in the iſland of Cos. Pliny, lib. vii. cap. 37. adds, that, in conſideration of his wonderful predictions, the Athenians erected him a ſtatue in the *gymnaſium*, with a gilded tongue.—If this Beroſus be the ſame with the author of the Chaldee hiſtories, he muſt have been before Alexander.

After Pythagoras, *aſtronomy* ſunk into neglect; moſt of the celeſtial obſervations brought from Babylon were loſt; and it was but a very ſmall number that Ptolemy, in his time, was able to retrieve. However, ſome few of his followers continued to cultivate *aſtronomy*; among whom were Philolaus and Ariſtarchus Samius; the latter of whom expreſly affirms, that the fixed ſtars and the ſun remain immoveable, and that the earth is carried in a circle round the ſun, placed in the middle of its courſe. Nor is there any ſatisfactory evidence, though many claims have been ſet up, that the true ſyſtem was underſtood or propoſed before his time. Archimed. Aren. ed. Oxon. 1676.

At length, thoſe patrons of learning, the Ptolemies, kings of Egypt, founding an academy of *aſtronomy* at Alexandria, there aroſe ſeveral eminent *aſtronomers* from it; particularly Hipparchus, who, according to Pliny, undertook what would have been a great work even for a god to atchieve, viz. to number the ſtars, and leave the heavens as an inheritance to poſterity: he foretold the eclipſes both of the ſun and moon for 600 years; and on his obſervations is founded that noble work of Ptolemy, intitled Μεγαλη Συνταξις.

The Saracens, on their conqueſt of Egypt, got a tincture of *aſtronomy*, which they carried with them out of Africa into Spain; and by this means, *aſtronomy*, after a long exile, was at length introduced afreſh into Europe.

From this time, *aſtronomy* began to improve very conſiderably, being cultivated by the greateſt geniuſes, and patronized by the greateſt princes.—Alphonſus, king of Caſtile, enriched it with thoſe tables which ſtill bear his name. See TABLE.

Copernicus re-eſtabliſhed the ancient Pythagorean ſyſtem; and Tycho Brahe publiſhed a catalogue of 770 fixed ſtars, from his own obſervations.

Kepler, from Tycho's labours, ſoon after diſcovered the true theory of the world, and the phyſical laws by which the heavenly bodies move.

Galileo firſt introduced teleſcopes into *aſtronomy*, and by their means diſcovered the ſatellites of Jupiter; the various phaſes of Saturn, the mountains of the moon, the ſpots in the ſun, and its revolution about its axis. See SATELLITE, and TELESCOPE.

Add, that Hevelius, from his own curious obſervations, furniſhed a catalogue of fixed ſtars, much more complete than Tycho's. Huygens and Caſſini diſcovered the ſatellites of Saturn, and his ring. And Gaſſendus, Horrox, Bullialdus, Ward, Ricciolus, Gaſcoign, &c. each contributed very conſiderably to the improvement of *aſtronomy*.

The immortal Newton firſt demonſtrated, from phyſical conſiderations, the great law that regulates all the heavenly motions, ſets bounds to the planets' orbs, and determines their greateſt excurſions from the ſun, and their neareſt approaches to it. It was he firſt taught the world whence aroſe that conſtant and regular proportion obſerved by both primary and ſecondary planets, in their circulation round their central bodies; and their diſtances compared with their periods. He has alſo given us a new theory of the moon, which accurately anſwers all her inequalities, and accounts for them from the laws of gravity and mechaniſm. See NEWTONIAN, and ATTRACTION.

Dr. Halley obliged the world with the *aſtronomy* of comets, and with a catalogue of the ſtars in the ſouthern hemiſphere; and was a very great benefactor to *aſtronomy*, by his obſervations: to which may be added, that he printed a new ſet of aſtronomical tables, more accurate than any before publiſhed.

Mr. Flamſteed upwards of forty years watched the motions of the ſtars; and has given us a great number of curious obſervations of the ſun, moon, and planets; beſides a noble catalogue of 3000 fixed ſtars; which is more than double the number in that of Hevelius.—Nothing ſeemed wanting to *aſtronomy*, but an univerſal and complete theory of the celeſtial *phænomena*, explained according to their true motions, and phyſical cauſes, which has been performed by Dr. Gregory.

ASTRONOMY is ſometimes divided, with reſpect to its different ſtates, into *new* and *old*.

ASTRONOMY, *ancient*, is ſuch as the art ſtood under Ptolemy, and his followers; with all the *apparatus* of ſolid orbs, epicycles, excentrics, deferents, trepidations, &c.

The ancient *aſtronomy* is delivered by Claud. Ptolemy, who died A. D. 147, in his Μεγαλη Συνταξις; tranſlated, in 827, into Arabic; and by G. Trapezuntius into Latin. An epitome of it, for the uſe of learners, was made by Purbachius, and his ſcholar Regiomontanus, in 1550, containing the whole doctrine of the heavenly motions, their magnitudes, eclipſes, &c.—On the model hereof, Albategni, the Arab, compiled another work, on the knowledge of the ſtars, publiſhed in Latin in 1575.

ASTRONOMY, *new*, is ſuch as the art has been ſince Copernicus; by whom thoſe fictitious machines were thrown out; and the conſtitution of the heavens reduced to more ſimple, natural, and certain principles.

The modern *aſtronomy* is delivered by Copernicus, in his ſix books of Celeſtial Revolutions, publiſhed in the year 1566, wherein, by retrieving Pythagoras's and Philolaus's *dogma* of the motion of the earth, he laid the foundation of a juſter ſyſtem: in Kepler's Commentaries of the Motions of Mars, publiſhed in 1609, wherein, in lieu of the circular orbits admitted by all former aſtronomers, he propoſed the elliptic theory; which, in his epitome of the Copernican *aſtronomy*, publiſhed in 1635, he applied to all the planets: in Iſh. Bullialdus's Aſtronomia Philolaica, publiſhed in 1645, wherein he endeavoured to amend Kepler's theory, and render the calculus more exact and geometrical: ſome errors committed by Bullialdus were pointed out by Dr. Seth Ward, in his Inquiry into the Philolaic Aſtronomy, Inquiſitio in Aſtronomiæ Philolaicæ Fundamenta, publiſhed in 1653, and corrected by himſelf in his Foundations of the Philolaic Aſtronomy more clearly explained, in 1657: in Ward's Aſtronomia Geometrica, publiſhed in 1656, wherein a geometrical method is propoſed of computing the planets motions; though not conſiſtent with the true laws of their motions eſtabliſhed by Kepler. The ſame was propoſed the year following by the count de Pagan. The truth is, Kepler himſelf does not ſeem to have been ignorant of it; but he rather choſe to ſet it aſide, as finding it contrary to nature: in Newton's Aſtronomia Britannica, publiſhed in 1657, and Street's Aſtronomia Carolina, in 1661, both upon Ward's hypotheſis: in Vin. Wing's Aſtronomia Britannica, publiſhed in 1669, wherein, proceeding on Bullialdus's principles, he gives juſt examples of all the precepts in practical *aſtronomy*, well accommodated to the capacity of learners.

In Ricciolus's Almageſtum Novum, publiſhed in 1651, we have the ſeveral hypotheſes of all the aſtronomers, ancient as well as modern.—And in Dr. Gregory's Elementa Aſtronomiæ Phyſicæ & Geometricæ, in 1702, the whole modern aſtronomy, as founded on the diſcoveries of Copernicus, Kepler, and Sir Iſaac Newton.—The *Marrow* of the old *aſtronomy* is given by Tacquet; and of the new *aſtronomy* by Whiſton, in his Prælectiones Aſtronomicæ, in 1707. For novices in the art, Mercator's Inſtitutiones Aſtronomicæ, publiſhed in 1676, which contains the whole doctrine, both according to the ancients and moderns; and Dr. Keill's Introductio ad veram Aſtronomiam, in 1718, which only takes in the modern are the beſt calculated: to which might be added, Long's, and Ferguſon's Aſtronomy, of more modern date.

ASTROPECTEN, in *Natural Hiſtory*, a name given by ſome authors, to a ſpecies of STAR-*fiſh*, compoſed of a body, or central *nucleus*, furrowed in the manner of the ſhells of the common ſcallop, and parting into five principal rays, from each of which there iſſue ſeveral tranſverſe proceſſes, covered with a hairy down.

ASTROPODIA; ſee ASTERIA, STAR-*ſtone*.

ASTROSCOPE, ASTROSCOPIUM, a kind of aſtronomical inſtrument, compoſed of two cones, on whoſe ſurface the conſtellations, with their ſtars, are delineated, by means whereof the ſtars may eaſily be known.

The *aſtroſcope* is the invention of Wil. Schukhard, formerly profeſſor of mathematics at Tubingen, who publiſhed a treatiſe expreſly on it, in 1698.

ASTROSCOPIA, from αϛηρ, *ſtar*, and σκοπεω, *I conſider*; the art of obſerving, and examining the ſtars, by means of teleſcopes, in order to diſcover their nature and properties.

Huygens improved this art conſiderably, in his Aſtroſcopia Compendiaria Tubi Optici molimine liberata; where he ſhews how to manage the largeſt glaſſes without help of a tube. See TELESCOPE.

ASTROTHEMATA, in *Aſtrology*, the places or poſitions of the ſtars in a theme of the heavens. Vital. Lex. Math.

ASTROTHESIA, from αϛηρ, and τιθημι, *I place*; is uſed by ſome for a conſtellation, or image in the heavens, compoſed of ſeveral ſtars.

ASTRUM, or ASTRON, a conſtellation, or aſſemblage of ſtars. In which ſenſe it is diſtinguiſhed from *aſter*, which denotes a ſingle ſtar.

Some apply the term in a more particular ſenſe, to the Great Dog, or rather to the great bright ſtar in his mouth. Vital.

ASTURIS, in *Zoology*, a name by which ſome authors have called the *accipiter* PALUMBARIUS, or GOSHAWK. Ray.

ASTYNOMI; ſee AGORANOMUS.

ASYLUM, a ſanctuary, or place of refuge, where a criminal who ſhelters himſelf is deemed inviolable, and not to be touched by any officer of juſtice.

The word is compounded of the privative particle α, and συλαω, *I hurt*; becauſe no perſon could be taken out of an *aſylum* without SACRILEGE.

The firſt *aſylum* was eſtabliſhed at Athens, by the deſcendants of Hercules, to ſhelter themſelves from the fury of his enemies.

The temples, altars, ſtatues, and tombs of heroes, were, anciently, the ordinary retreat of thoſe who found themſelves aggrieved by the rigour of the laws, or oppreſſed by the violence of tyrants: but temples were held the moſt ſacred and inviolable refuge. It was ſuppoſed, that the gods took upon them to puniſh the criminal who thus threw himſelf upon them; and that it would be a great impiety in man to take vengeance out of the hands of the immortals.

The Iſraelites had their cities of refuge, which were of God's own appointment; where the guilty, who had not committed any deliberate crime, found ſafety and protection. As to the heathens, they allowed refuge and impunity, even to the vileſt and moſt flagrant offenders, ſome out of ſuperſtition, and others for the ſake of peopling their cities; and it was by this means, and with ſuch inhabitants, that Thebes, Athens, and Rome, were firſt ſtocked. We even read of *aſylums* at Lyons and Vienne among the ancient Gauls; and there are ſome cities in Germany which ſtill preſerve the ancient right of *aſylum*.

Hence, on the medals of ſeveral ancient cities, particularly in Syria, we meet with the inſcription, ΑΣΥΛΟΙ, to which is added, ΙΕΡΑΙ. This quality of *aſylum* was given them, according to M. Spanheim, in regard to their temples, and of the gods revered by them.

The ſame qualities have alſo been given to deities: thus Diana of Epheſus is called *ασυλος*. Add, that the camp formed by Romulus and Remus was called *aſylum*, and afterwards became a city, in which was a temple erected to the god Aſylæus, Θεος Ασυλαιος.

The emperors Honorius and Theodoſius granting the like immunities to churches, the biſhops and monks laid hold of a certain tract or territory, without which they fixed the bounds of the ſecular juriſdiction: and ſo well did they manage their privileges, that convents, in a little time, became next akin to fortreſſes; where the moſt glaring villains were in ſafety, and braved the power of the magiſtrate.

Theſe privileges, at length, were extended not only to the churches and church-yards, but alſo to the biſhops houſes, whence the criminal could not be removed without a legal aſſurance of life, and an entire remiſſion of the crime. The reaſon of the extenſion was, that they might not be obliged to live altogether in the churches, &c. where ſeveral of the occaſions of life could not be decently performed.

But, at length, theſe *aſyla*, or ſanctuaries, were alſo ſtripped of moſt of their immunities, becauſe they ſerved to make guilt and libertinage more bold and daring. In England, particularly, they were entirely aboliſhed. See SANCTUARY.

ASYLUM, in the *Hiſtory of Inſects*. See GAD-*fly*.

ASYMMETRY, a want of proportion, or correſpondence between the parts of a thing. See SYMMETRY.

The word is derived from the privative *α*, *συν*, *with*, and *μετρον*, *meaſure*, q. d. *without meaſure*.

In *Mathematics*, the term is particularly uſed for what we more uſually call *incommenſurability*; which is when between two quantities there is no common meaſure: as between the ſide, and diagonal of a ſquare. In numbers, ſurd roots, as $\sqrt{2}$, &c. are incommenſurable to rational numbers.

ASYMPTOTE, in *Geometry*, a line which continually approaches nearer and nearer to another; yet will never meet with it, though indefinitely prolonged. See LINE.

The word is compounded of the privative *α*, *συν*, *with*, and *πτοω*, from *πιπτω*, *I fall*; q. d. *incoincident*, or which never meet. Some Latin authors call theſe lines *intactæ*.

Bertinus enumerates divers ſorts of *aſymptotes*; ſome ſtraight, others curve; ſome concave, others convex, &c. and further, propoſes an inſtrument for deſcribing them. Though, in ſtrictneſs, the term *aſymptotes* ſeems appropriated to right lines.

ASYMPTOTES, then, are properly right lines, which approach nearer and nearer to ſome curve, of which they are ſaid to be the *aſymptotes*; but which, though they and their curve were indefinitely continued, would never meet.

Aſymptotes may be conceived as tangents to their curves at an infinite diſtance.

Two curves are alſo ſaid to be *aſymptotical*, when they thus continually approach, without a poſſibility of meeting.

Thus two parabolas, whoſe axes are in the ſame right line, are *aſymptotical* to one another.

Of curves of the ſecond kind, that is, the conic ſections, only the hyperbola has *aſymptotes*, which are two in number, long ago demonſtrated by Apollonius Pergæus.

All curves of the third kind have at leaſt one *aſymptote*; but they may have three; and all curves of the fourth kind may have four *aſymptotes*.

The conchoid, ciſſoid, and logarithmic curve, though not reputed geometrical curves, have each alſo one *aſymptote*.

The nature of *aſymptotes* will be eaſily conceived in the inſtance of the *aſymptote* of a conchoid. Suppoſe MMAM, &c. (*Tab. Analyſis, fig.* 1.) be a part of a conchoid, C its pole, and the right line BD, ſo drawn that the parts QM, EA, OM, &c. of right lines drawn from the pole C, are equal to each other; then will the line BD be an *aſymptote* of the curve: becauſe the perpendicular MI, &c. is ſhorter than MO, and MR than MQ, &c. ſo that the two lines continually approach; yet the points M, &c. and R, &c. can never coincide, ſince there is ſtill a portion of a line to keep them aſunder; which portion of a line is infinitely diviſible, and conſequently muſt be diminiſhed infinitely before it becomes nothing.

ASYMPTOTES *of the* **HYPERBOLA** are thus deſcribed. Suppoſe a right line DE (*Tab. Conics, fig.* 20.) drawn through the vertex A of the hyperbola, parallel to the ordinate M*m*, and equal to the conjugate axis, viz. the part DA, or AE to the ſemi-axis: then, two right lines drawn from the centre C of the hyperbola, through the points D and E, viz. the right lines CF and CG, are *aſymptotes* of the curve.

If the hyperbola GMR (*fig.* 12. N° 2.) be of any kind whoſe nature with regard to the curve, and its *aſymptote*, is expreſſed by this general equation, $x^m y^n = a^{m+n}$; and the right line PM be drawn any where parallel to the *aſymptote* CS, and the parallelogram PCOM, be completed: this parallelogram is to the hyperbolic ſpace PMGB, contained under the determinate line PM, the curve of the hyperbola GM indefinitely continued towards G, and the part PB of the *aſymptote* indefinitely continued the ſame way, as $m-n$ is to n: and ſo if m be greater than n, the ſaid ſpace is ſquareable; but when $m=n$, as it will be in the common hyperbola, the ratio of the foregoing parallelogram to that ſpace is as 0 to 1; that is, the ſpace is infinitely greater than the parallelogram, and ſo cannot be obtained: and when m is leſs than n, the parallelogram will be to the ſpace as a negative number to a poſitive one, and the ſaid ſpace is ſquareable.

ASYMPTOTE *of a logarithmic curve.* If MS (*fig.* 33.) be the logarithmic curve, PR an *aſymptote*, PT the ſubtangent, and MP an ordinate; then will the indeterminate ſpace $RPMS = PM \times PT$; and the ſolid, generated by the rotation of this curve about the *aſymptote* VP, will be half of a cylinder whoſe altitude is equal to the length of the ſubtangent, and the ſemidiameter of the baſe equal to the ordinate QV.

ASYMPTOTES, by ſome, are diſtinguiſhed into various orders.

An *aſymptote* is ſaid to be of the *firſt order*, when it coincides with the baſe of the curvilinear figure: of the *ſecond order*, when it is a right line parallel to the baſe: of the *third order*, when it is a right line oblique to the baſe: of the *fourth order*, when it is a common parabola, that has its axis perpendicular to the baſe: and, in general, of the *order* $r+2$, when it is a parabola, the ordinate of which is always as a power of the baſe, whoſe exponent is r.

The *aſymptote* is oblique to the baſe, when the ratio of the firſt fluxion of the ordinate to the fluxion of the baſe, approaches to an aſſignable ratio, as its limit; but it is parallel to the baſe, or coincides with it, when this limit is not aſſignable.

The determination of the *aſymptotes* of curves, is a curious part of the higher geometry. Mr. de Fontenelle has given ſeveral theorems relating to this ſubject, in his Geometrie de l'Infini. But this matter is treated of with greater accuracy by Mr. Maclaurin, in his Fluxions, book i. chap. 10. where he has been careful to avoid the modern paradoxes concerning infinites and infiniteſimals.

The areas bounded by curves, and their *aſymptotes*, though indefinitely extended, ſometimes have limits to which they may approach, ſo as to differ leſs from thoſe limits, than by any given quantity. This happens in hyperbolas of all kinds, except the firſt, or Apollonian. The ſame is alſo true of the area, compriſed between the logarithmic curve and its *aſymptote*. See LOGARITHMIC *curve*. Thoſe who do not ſcruple to ſuppoſe the curve and its *aſymptote* to be infinitely produced, ſay, that the infinitely extended area becomes equal to its limit.

The *aſymptotical* area in the common or Apollonian hyperbola, and in many other curves, has no limit; and it is uſual to ſay, theſe areas are infinitely great; by which, however, no more is meant, than that the curve, and its *aſymptote*, may be extended, till the ſpace comprehended between them exceeds any given magnitude. Some authors, and Dr. Wallis among the reſt, have talked of ſome of theſe areas, as if they were more than infinite. This happened from an analogy they imagined between poſitive, nothing, and negative, and what is finite, infinite, and more than infinite. See HYPERBOLA.

Solids generated by hyperbolic areas, revolving about their *aſymptotes*, have ſometimes alſo their limits; and ſometimes they may be produced, till they exceed any given ſolid. See Art. 307, 309, of the above mentioned author.

When a curve, and its *aſymptote*, are ſuppoſed to be produced infinitely, and the area, compriſed between them, to revolve about the *aſymptote*, the ſurface generated will be finite, or infinite, according as the area of the generating figure is finite or infinite.

For the *aſymptotes* of curves, deſcribed by the interſections of right lines revolving about given poles, ſee Mr. Maclaurin's Fluxions, art. 313. ſeq.

Asymptote, *parabolic*; ſee Parabolic *aſymptote*.

ASYMPTOTIC *ſpaces*; ſee Hyperbola.

ASYNDETON, a figure in *Grammar*, implying a defect, or want of conjunctions in a ſentence.

The word is derived from the privative α, and συνδεω, *colligo, I bind together*.

As, in the inſtance, *veni, vidi, vici, I came, I ſaw, I conquered*; where the copulative *et, and*, is omitted: or in that of Cicero concerning Catiline, *abiit, exceſſit, evaſit, erupit*: or in that verſe of Virgil,

Ferte citi flammas, date vela impellite remos.

Aſyndeton ſtands oppoſed to *polyſyndeton*, where the copulatives are multiplied.

ATABULUS, in *Phyſiology*, a kind of wind in Apulia, of a dry pinching quality, and very noxious in its effects.

The ancient naturaliſts ſpeak of the *atabulus* in terms of horror, on account of the ravage it made among the fruits of the earth, which it ſcorched, or withered up.

ATAIR; ſee Alcair.

ATAMASCO *lily*, in *Botany*; ſee Amaryllis.

ATANTA, in *Botany*, a name given by the people of Guinea to a kind of *ſumach*, called, by Petiver, RHUS *Guineenſe trifoliatum ſerratum ſcabium*, from its being trifoliate, and having rough and ſerrated leaves. This ſomewhat reſembles the hoary trifoliate African *ſumach* of Plukenet; but it differs in this, that its leaves are edged with prickles, whereas thoſe of Plukenet's kind are only deeply ſinuated. The people of Guinea are very fond of this, for its medicinal virtues; they give it as a reſtorative, boiled in water. Phil. Tranſ. Nº 232.

ATARAXY, a term much uſed by the *Sceptics*, and *Stoics*, to denote that calmneſs, and tranquillity of mind, and that firmneſs of judgment, which ſets us free from any agitations or emotions ariſing from ſelf-opinion, and the knowledge we imagine ourſelves poſſeſſed of.

The word is compounded of αταρ, *but*, and ταξις, *order*.

In this *ataraxy*, they ſuppoſed the ſovereign good, or higheſt bliſs in this life to conſiſt.

ATAXY, a want of order or regularity.

The word is compounded of the privative α, and ταξις, *order*.

Ataxia is chiefly uſed in *Medicine*, where the order of the critical days, or other *phænomena* of a diſeaſe, are inverted.

The phyſicians have frequent recourſe to an *ataxy*, or irregularity of the ſpirits, when at a loſs to account for any diſorder in the body. The ſpirits, Dr. Drake obſerves, being always at hand, are forced to bear the blame of a thouſand things they are innocent of.

ATCHE, in *Commerce*, a ſmall ſilver coin, current in the ſtates of the Grand Seignor, equal to about a third part of the Engliſh penny.

The *atche* is the ſmalleſt coin uſed in Turky; where there is no copper money current, except in the province of Babylon.

Some call the *atche* the little *aſper*: it is ſtamped like the *para*, with Arabic characters. Three or four *atches* are commonly given in exchange for the *para*.

ATCHIEVEMENT, in *Heraldry*, the coat of arms of any perſon, or family, duly marſhalled, with its external ornaments, or ſupporters, helmet, wreath, creſt, and motto.

The word is formed of the French, *achevement, finiſhing, conſummation, perfection*.

Such are thoſe uſually hung out on the fronts of houſes after the death of ſome conſiderable perſon, now corruptly called *hatchments*.

ATEGAR, a weapon among the Saxons, which ſeems to have been a hand-dart. The word comes from the Saxon *aëton, to fling*, or *throw*, and *gar, a weapon*.

ATELLANÆ, in *Antiquity*, a kind of comic and ſatiric pieces, preſented on the Roman theatre; ſomewhat leſs ludicrous than the farces on the Engliſh ſtage, and yet leſs grave and ſerious than the Greek and Latin comedies and tragedies.

The *Atellanæ*, or *fabulæ Atellanæ* of the Romans, anſwered to the *ſatyræ* among the Greeks.

They were thus called from *Atella*, a city of Tuſcany, where they were firſt repreſented; and from whence, on account of their mirth and humour, they were introduced into Rome. But they became at length ſo licentious, and impudent, that the ſenate was obliged to ſuppreſs them.

ATELEIA, denotes an exemption from tribute, taxes, or other burdens.

Ατελεια λειτυργηματων, is particularly uſed, in ſome *Ancient Laws*, for an exemption from offices, granted the Egyptian clergy by Conſtantius.

ATH, Atha, or Athe, among our Anglo-Saxon anceſtors, ſignifies an *oath*, eſpecially that taken by way of purgation.

In this ſenſe we meet with breaking of *ath*, privilege of *ath, atha*, and *ordela*.

ATHAMADULET, or Athemadaulet, the prime, or chief miniſter in the Perſian empire.

The *athamadulet* is much the ſame with the grand viſier in Turky; excepting that he has not the command of the army, which the viſier has.

The *athamadulet* is great chancellor of the kingdom, preſident of the council, ſuperintendant of the finances; and has the charge of all foreign affairs. He is in effect viceroy, or adminiſtrator of the kingdom: he iſſues the king's mandates, or orders, in this ſtyle, *Bende derga ali il alia etmadaulet*, that is, *I, who am the ſupport of the power, the creature of this port, the higheſt of all ports, &c.*

ATHAMANTA, in *Botany*; ſee Spignel.

ATHANASIA, among the *Ancient Phyſicians*, an epithet given to a kind of antidotes, ſuppoſed to have the power of prolonging life, even to immortality.

In the Auguſtan diſpenſatory, we ſtill find a medicine under the appellation of *athanaſia magna*, commended againſt dyſenteries and hæmorrhages.

Athanasia, in *Botany*, is uſed by ſome authors for TANZY.

ATHANASIAN *Creed*. See Creed, Trinity, and Trinitarians.

ATHANATI, an order of ſoldiers among the ancient Perſians.

The word is Greek, and ſignifies *immortal*; being compounded of the privative α, and ϑανατος, *death*.

The *athanati* were a body of cavalry, conſiſting of ten thouſand men, always complete, becauſe, when any one of them died, another was immediately put into his place.—It was for this reaſon that they were called *athanati* by the Greeks, by the Latins *immortales*.

ATHANOR, in *Chemiſtry*, a large immoveable furnace, built of brick and earth, and covered with a tower at the top; proper to maintain a temperate and equal degree of heat, for a conſiderable time.

The word *athanor* is borrowed from the Arabs, who call an oven *tanneron*, from the Hebrew תנור, *tannour, an oven, or furnace*: whence, with the additional particle *al*, אלתנור, *altannour*, &c.—Others chooſe to derive the name from αθανατος, *immortal*, becauſe of its durable fire.

The heat of the *athanor* is increaſed or diminiſhed by opening or ſhutting a regiſter. It is made to communicate its heat by tubes, or apertures, at the ſide of the hearth, or fire-place, to ſeveral adjacent veſſels; by which means different operations are carried on at the ſame time.

The *athanor* is alſo called *piger Henricus, ſlow Harry*; becauſe chiefly uſed in the ſlower operations; and becauſe, when once filled with coals, it keeps burning a long time; whence the Greeks call it ακηδης, q. d. *giving no trouble*, as it does not need to be continually attended.—It is alſo called the *philoſophical furnace*, or *furnace of arcana*; ſometimes *uterus chymicus*, or *ſpagiricus*, and, popularly, the *tower furnace, furnus turritus*.

The *lamp* FURNACE, which is a true *athanor*, may be ſucceſsfully uſed in operations which do not require much heat.

ATHEIST, a perſon who does not believe the exiſtence of a God, nor a Providence; and who has no religion, true, or falſe.

The word is derived from the privative α, and Θεος, *God*.

In general, a man is ſaid to be an *atheiſt*, who owns no being ſuperior to nature, that is, to men, and the other ſenſible beings in the world.

In this ſenſe, Spinoſa may be ſaid to be an *atheiſt*; and it is an impropriety to rank him, as the learned commonly do, among *deiſts*; ſince he allows of no other God beſide nature, or the univerſe, of which mankind makes a part; and there is no *atheiſt* but allows of the exiſtence of the world, and of his own exiſtence in particular.

Plato diſtinguiſhes three kinds of *atheiſts*.—Some, who deny, abſolutely, that there are any gods; others, who allow the exiſtence of gods, but maintain that they do not concern themſelves with human affairs, and ſo deny a Providence; and others, who believe there are gods, but think they are eaſily appeaſed, and that they may remit the greateſt crimes for the ſmalleſt ſupplication.

Some diſtinguiſh *ſpeculative atheiſts*, or thoſe who are ſo from principle, and theory—from *practical atheiſts*, whoſe wicked lives lead them to believe, or rather to wiſh, that there were no God.

Cicero repreſents it as a probable opinion, that they who apply themſelves to the ſtudy of *philoſophy* believe there are no gods.—This muſt, doubtleſs, be meant of the *academic philoſophy*, to which Cicero himſelf was attached, and which doubted of every thing: on the contrary, the *Newtonian philoſophers* are continually recurring to a Deity, whom they always find at the end of their chain of natural cauſes. Some foreigners have even charged them with making too much uſe of the notion of a God in *philoſophy*, contrary to the rule of Horace:

Nec Deus interſit, niſi dignus vindice nodus.

Among us, the philoſophers have been the principal advocates for the exiſtence of a Deity. Witneſs the writings of Sir Iſaac Newton, Boyle, Ray, Cheyne, Nieuwentyt, &c. To which may be added divers others, who, though of the clergy (as was alſo Ray), yet have diſtinguiſhed themſelves by their philoſophical pieces, in behalf of the exiſtence of a God; e. gr. Derham, Bentley, Whiſton, Samuel and John Clarke, Fenelon, &c. So true is that ſaying of Lord Bacon, that though a ſmattering of philoſophy may lead a man into *atheiſm*, a deep draught will certainly bring him back again to the belief of a God and Providence.

ATHELING, among our Saxon anceſtors, was a title of honour properly belonging to the heir apparent, or preſumptive to the crown.

The word is formed from the Saxon *ætheling*, of *æthel*, *noble*.—It is ſometimes alſo written *adeling*, *edling*, *ethling*, and *etheling*.

King Edward the Confeſſor, being without iſſue, and intending to make Edgar, to whom he was great uncle by the mother's ſide, his heir, firſt gave him the honourable appellation of *Atheling*.

Antiquaries obſerve, that it was frequent among the Saxons to annex the word *ling* or *ing* to a Chriſtian name, to denote the ſon, or younger; as *Edmundling*, for the ſon of Edmund; *Edgaring*, for the ſon of Edgar: on which footing ſome have thought *Atheling* might primarily import the ſon of a nobleman, or prince.—But, in reality, *Atheling*, when applied to the heir of the crown, ſeems rather to denote a perſon endowed with noble qualities, than the ſon of a nobleman, and correſponds to the *nobilis Cæſar* among the Romans.

ATHENA, in the *Ancient Phyſic*, a plaſter, or liniment, commended againſt wounds of the head and nerves, of which we find deſcriptions given by Oribaſius, Ælius, and Ægineta.

ATHENÆA, a feaſt of the ancient Greeks, held in honour of Minerva, who was called Αθηνη.

Theſe were afterwards called PANATHENÆA.

ATHENÆUM, in *Antiquity*, a public place wherein the profeſſors of the liberal arts held their aſſemblies, the rhetoricians declaimed, and the poets rehearſed their verſes.

The word is derived from *Athens*, a learned city, where many of theſe aſſemblies were held; or from the name of Pallas, Αθηνη, *goddeſs of Science*; intimating, that *Athenæum* was a place conſecrated to Pallas, or ſet apart for the exerciſes over which ſhe preſides.

The *Athenæa* were built in form of amphitheatres; and were all encompaſſed with ſeats, which Sidonius calls *cunei*.

The three moſt celebrated *Athenæa* were thoſe at Athens, at Rome, and at Lyons; the ſecond of which, according to Aurelius Victor, was built by the emperor Adrian.

ATHENATORIUM, among *Chemiſts*, a thick glaſs cover, placed on a cucurbit, having a ſlender umbo, or prominent part, which enters like a ſtopple, within the neck of the cucurbit.

ATHENIPPUM, in the *Ancient Phyſic*, a collyrium, commended againſt divers diſeaſes of the eyes; thus denominated from its inventor Athenippus.

Its deſcription is given by Scribonius Largus, and by Gorræus after him.

Galen mentions another *athenippum*, of a different compoſition, by which it appears, this was a denomination common to ſeveral collyriums.

ATHERINA, in *Ichthyology*, a name given by Rondeletius, and ſome other authors, to the *hepſetus*, or *anguella*, a ſmall fiſh, common on the ſhores of the Mediterranean; but by Bellonius appropriated to a fiſh of a different genus. It is of the order of *abdominales* in the Linnæan arrangement, and comprehends two ſpecies, viz. the *hepſetus* and *menidia*; the latter of which is found in the freſh waters of Carolina, and is called by Garden, *ſilver-fiſh*.

ATHEROMA, in *Medicine*, a kind of tumour, of a pappy conſiſtence, without pain, or diſcolouring the ſkin.

The *atheroma* is contained in a *cyſtis*, or membranous bag; and does not give way when touched with the finger, nor retain any dent after preſſure.

The *atheroma* is thus called from αθηρα, a kind of pap, or pulp, which the matter of this tumour reſembles.—It is near akin to the *meliceres* and *ſteatoma*; and is cured, like them, by ſection.

ATHLETÆ, in *Antiquity*, perſons of ſtrength and agility, diſciplined to perform in the public games.

The word is formed from αθλος, *certamen*, *combat*; whence alſo αθλον, *the prize*, or *reward* adjudged the victor.

Under *athletæ* were comprehended wreſtlers, boxers, runners, leapers, throwers of the diſk, and thoſe practiſed in other exerciſes, exhibited in the Olympic, Pythian, and other ſolemn ſports; for the conquerors in which, there were eſtabliſhed prizes.

From the five uſual exerciſes, the *athletæ* were alſo denominated πενταθλοι, and by the Latins *quinquertiones*; at leaſt ſuch as profeſſed them all.

ATHLETIC *crown*; ſee CROWN.

ATHLETIC *habit*, denotes a ſtrong hale conſtitution of body, which was the object the *athletæ* aimed at, and to which their diet correſponded.

ATHLETIC *weight*; ſee WEIGHT.

ATHLIPTOS, in *Medicine*, from α negative, and θλιβειν, *to preſs*. *Uncompreſſed* αθλιπτος εισβολη, as Galen ſays, is an expreſſion uſed by ſome to ſignify the approach of a feveriſh paroxyſm without compreſſions.

ATHLOTHETA, in *Antiquity*, an officer appointed to ſuperintend the public games, and adjudge the prizes.

The *athlotheta* was the ſame with what was otherwiſe called *æſymneta*, *brabeuta*, *agonarcha*, *agonotheta*, &c.

ATHNACH, the name of one of the principal of the Hebrew ACCENTS, which ſerves not only to regulate the voice, but to diſtinguiſh the numbers of a ſentence, whence its name *athnach*, i. e. *reſpiratio*: on this account it is called *king* and *pauſe*, and anſwers to our colon, and ſometimes to a note of interrogation: it is marked under a letter thus (‸).

ATHWART, in *Navigation*, is ſynonymous with acroſs the line of the courſe.

ATHWART *the fore-foot*, is a phraſe that denotes the flight of a cannon-ball from one ſhip acroſs the courſe of another, to intercept the latter, and oblige her to ſhorten ſail, that the former may come near enough to examine her.

ATHWART-*hauſe*, expreſſes the ſituation of a ſhip, when ſhe is driven by wind or tide, or any other accident, acroſs the fore-part of another.

ATHWART-*ſhips*, reaching acroſs ſhips from one ſide to the other.

ATIA; ſee ODIO *et* ATIA.

ATIBAR; thus the inhabitants of the kingdom of Gago, in Africa, call gold-duſt; from which word the Europeans, and eſpecially the French, have compoſed the word *tibir*, which alſo ſignifies gold-duſt among thoſe who trade in that commodity.

ATINGA GUACU MUCU, in *Zoology*, the name of a Braſilian bird of the ſtarling kind. It reſembles the thruſh in ſize. See *Tab. of Birds*, N° 31.

ATIZOE, in the writings of the *Ancient Naturaliſts*, a name of a ſtone uſed in the conſecration and anointing of kings. Pliny deſcribes it to have been of a lenticular figure, and of the ſize of three fingers, of a bright ſilvery colour, and of a pleaſant ſmell. He ſays it was found in India, and in ſome other places. Agricola is of opinion, it was a kind of bitumen.

ATLANTIC *Ocean*; ſee OCEAN.

ATLANTIDES, in *Aſtronomy*, a denomination given to the Pleiades, or ſeven ſtars, ſometimes alſo called *vergiliæ*. They are thus called, as being ſuppoſed by the poets to have been the daughters either of Atlas, or his brother Heſperus, who were tranſlated into heaven.

ATLANTIS, in *Antiquity*, an iſland ſpoken of by Plato, and many other writers, under ſome extraordinary circumſtances; and rendered famous by a controverſy among the moderns, concerning its place and exiſtence. The *Atlantis* took its name from Atlas, Neptune's eldeſt ſon, who, they tell us, ſucceeded his father in the government of it.

The moſt diſtinct account of this celebrated country is given us in Plato's Timæus and Critias; which amounts, in a few words, to what follows. "The *Atlantis* was a large iſland in the Weſtern ocean, ſituate before, or oppoſite to, the ſtreights of Gades. Out of this iſland there was an eaſy paſſage into ſome others, which lay near a large continent, exceeding all Europe and Aſia. Neptune ſettled in this iſland, which he diſtributed among his ten ſons: to the youngeſt fell the extremity of the iſland called *Gadir*, which in the language of the country ſignifies *fertile*, or *abundant in ſheep*. The deſcendants of Neptune reigned here from father to ſon, for a great number of generations, in the order of primogeniture, during the ſpace of 9000 years. They alſo poſſeſſed ſeveral other iſlands; and paſſing into Europe and Africa, ſubdued all Lybia as far as Egypt, and all Europe to Aſia Minor. At length the iſland ſunk under water; and, for a long time afterwards, the ſea thereabouts was full of flats and ſhelves."

The learned Rudbeck, profeſſor in the univerſity of Upſal, in an expreſs treatiſe, intitled, Atlantica, ſive Manheim, maintains, very ſtrenuouſly, that Plato's *Atlantis* is Sweden and Norway; and attributes to his country, whatever the ancients have ſaid of their *Atlantis*, or *Atlantic* iſland.—Others will have America to be the *Atlantis*; and hence infer, that the new world was not unknown to the ancients: but what Plato ſays, does by no means ſupport this ſuppoſition. America ſhould rather ſeem to be the vaſt continent beyond the *Atlantis*, and the other iſlands mentioned by Plato.

Kircher, in his Mundus Subterraneus; and Beckman, in his Hiſtory of Iſlands, chap. 5. advance the moſt probable opinion.—The *Atlantis*, according to them, was a large iſland which extended from the Canaries to the Azores; and theſe iſlands are the remains thereof not ſwallowed up by the ſea.

Atlantis, *New*, is the name of a fictitious, philoſophical commonwealth, of which a deſcription has been given by lord Bacon.

The *New Atlantis* is ſuppoſed to be an iſland in the South-ſea, to which the author was driven, in a voyage from Peru to Japan. The compoſition is an ingenious fable, formed after the manner of the Utopia of Sir Thomas More, or Campanella's City of the Sun. Its chief deſign is to exhibit a model or deſcription of a college, inſtituted for the interpretation of nature, and the production of great and marvellous works, for the benefit of men, under the name of Solomon's houſe, or the college of the ſix days work. Thus much, at leaſt, is finiſhed; and with great beauty and magnificence. The author propoſed alſo a frame of laws, or of the beſt ſtate or mould of a commonwealth. But this part is not executed. Bac. Works, tom. iii. p. 235.

ATLAS, in *Geography*, a celebrated mountain in Africa, which is ſo high, that it ſeems to bear the heavens. Hence the fable, in which *Atlas*, the king of this country, is ſaid to bear the heavens on his ſhoulders: thus he is repreſented in the famous ſtatue at the Farneſe palace at Rome.

Atlas, in *Architecture*, is a name given to thoſe figures, or half-figures of men, ſometimes uſed inſtead of columns, or pilaſters; to ſupport any member of architecture, as a balcony, or the like.

Theſe are otherwiſe called TELAMONES.

Atlas, in *Anatomy*, the name of the firſt *vertebra* of the neck, which ſupports the head. See *Tab. Anat. (Oſteol.) fig.* 6.

The *atlas* has no ſpinal *apophyſes*; becauſe the motions of the head do not turn on this *vertebra*, but on the ſecond. As it is obliged to turn about as often as the head moves round, had there been any ſpinal *apophyſes*, it would have incommoded the motion of the muſcles in the extenſion of the head.—It is alſo of a finer and firmer texture than the other *vertebræ*; and differs farther from them, in that thoſe receive at one end, and are received at the other; whereas this receives at both extremes; for two eminences of the *occiput* are inſerted within its two upper cavities, which makes its articulation with the head: and, at the ſame time, two other eminences of the ſecond *vertebra* are received within its two lower cavities, by means of which they are articulated together.

Atlas is alſo a title given to books of univerſal geography, containing maps of the known parts of the world; as if they were viewed from the top of that celebrated mountain, which the ancients eſteemed the higheſt in the world; or rather on account of their holding the whole world like *Atlas*.

Atlas, in *Commerce*, a ſilk ſattin manufactured in the Eaſt Indies.

It muſt be owned that the manufacture of theſe ſilks is wonderful, eſpecially of the flowered *atlaſſes*; in which the gold and ſilk are worked together in ſuch a manner, as no workman in Europe can imitate: yet they are far from having that fine gloſs and luſtre, which the French know how to give their ſilks.

In the Chineſe manufactures of this ſort, they gild paper on one ſide with leaf gold, then cut it into long ſlips, and weave it into their ſilks; which makes them with very little coſt look very rich and fine. The ſame long ſlips are twiſted or turned about ſilk threads ſo artificially, as to look finer than gold thread, though it be of no great value.

Atlas, a ſpecies of beetle.

ATMOSPHERE, an appendage of our earth; conſiſting of a thin, fluid, elaſtic ſubſtance, called *air*, which ſurrounds the terraqueous globe to a conſiderable height, gravitates towards its centre, on its ſurface, is carried along with it round the ſun, and partakes of all its motions both annual and diurnal.

By *atmoſphere* is uſually underſtood the whole maſs, or aſſemblage of ambient air: though, among ſome of the more accurate writers, the *atmoſphere* is reſtrained to that part of the air next the earth, which receives vapours and exhalations, and refracts the rays of light.

The farther or higher ſpaces, though perhaps not wholly deſtitute of air, are ſuppoſed to be poſſeſſed by a finer ſubſtance called *ether*, and are hence called *etherial regions*.

The word is formed of ατμος, *vapour*, and σφαιρα, *a ſphere*. See Ether and Heavens. And for the nature, conſtitution, properties, and different ſtates and uſes of the *atmoſphere*, ſee the article Air.

A late eminent author conſiders the *atmoſphere* as a large chemical veſſel, wherein the matter of all the kinds of ſublunary bodies is copiouſly floating; and thus expoſed to the continual action of that immence ſurface the ſun; whence proceed innumerable operations, ſublimations, ſeparations, compoſitions, digeſtions, fermentations, putrefactions, &c.

We have a large apparatus of inſtruments, contrived for indicating and meaſuring the ſtate and alterations of the *atmoſphere*; as ANEMOMETERS, BAROMETERS, HYGROMETERS, MANOMETERS, THERMOMETERS, &c.

The *atmoſphere* inſinuates itſelf into all the vacuities of bodies; and thus becomes the great ſpring of moſt of the mutations here below; as GENERATION, CORRUPTION, DISSOLUTION, &c.

It is one of the great diſcoveries of the modern philoſophers, that the ſeveral motions attributed by the ancients to a *fuga vacui*, are really owing to the PRESSURE of the *atmoſphere*.

Galileo, having obſerved that there was a certain ſtandard altitude, beyond which no water could be elevated by pumping, took an occaſion from thence to call in queſtion the doctrine of the ſchools, which aſcribed the aſcent of water in pumps, to the *fuga vacui*, and in the room thereof he happily ſubſtituted the hypotheſis of the air's preſſure and gravitation. It was to him, indeed, little better than an hypotheſis, ſince it had not then thoſe confirmations from experiments, which were afterwards found out by his ſcholar Torricellius, and other ſucceeding philoſophers, particularly Mr. Boyle.

Atmosphere, *the electricity of it.* Beſide thoſe large quantities of the electric matter, with which the clouds are charged in a thunder-ſtorm, it has been obſerved, firſt by M. Monnier in 1752, and afterwards repeatedly and with peculiar attention by others, that the *atmoſphere* is ſeldom or ever wholly deſtitute of the electrical fluid; but the quantity is moſt conſiderable, and may moſt eaſily be drawn from the air, when it is in its drieſt ſtate. A perſon electrified negatively may ſatisfy himſelf of this, by extending his arm in the open air, and preſenting a long ſharp needle with its point upwards; for the electric matter collected from the remoter air will appear luminous, as it converges to the point of the needle. Mr. Canton's balls are likewiſe an excellent contrivance for the ſame purpoſe, and may be made uſe of, not only for determining the electricity of the *atmoſphere* in general, but the poſitive or negative quality of it. But there is no electrician, whoſe obſervations in this way have been conducted with greater accuracy, and farther purſued, than S. Beccaria. From him we learn, that the *atmoſphere* diſcovers no ſigns of electricity in windy and clear weather, nor in moiſt weather without rain, nor when the ſky is covered with diſtinct and black clouds with a ſlow motion; but he always obſerved a moderate, though interrupted electricity, for the moſt part of the poſitive kind, in a clear ſky when the weather was calm, and in rainy weather without lightning, a little before the rain fell, and during the continuance of it, till the rain was almoſt over. And the electricity was ſtronger, as his rods were higher, and the ſtrings which were extended and inſulated in the open air were longer. Beccaria's Eſſay on Atmoſpheric Electricity, annexed to the Engliſh tranſlation of his Artificial Elect. p. 421, &c. See LIGHTNING, RAIN, VAPOURS, &c.

ATMOSPHERE, *figure of it.* The *atmoſphere* envelops all parts of the ſurface of our globe; if therefore both the one and the other continued at reſt, and were not endowed with a diurnal motion round their axis, then the *atmoſphere* would be exactly ſpherical, according to all the laws of gravity; for all the points of the ſurface of a fluid in a ſtate of reſt, muſt be equally removed from its center. But the earth and the ambient *atmoſphere* are inveſted with a diurnal motion, which carries both the one and the other round their axis. As the different parts of the earth have a centrifugal force, the tendency of which is more conſiderable, and that of the centripetal leſs, as the parts are more remote from the axis; the figure of the *atmoſphere* muſt become an oblate ſpheroid; becauſe the parts that correſpond to the equator, are farther removed from the axis, than the parts which correſpond to the poles.

Beſides, the *figure* of the *atmoſphere* muſt repreſent a ſpheroid, becauſe the ſun ſtrikes more directly the *air* which encompaſſes the equator, and is comprehended between the two tropics, than that which pertains to the polar regions. Whence it follows, that the maſs of *air*, or part of the *atmoſphere*, adjoining to the poles, being leſs heated, cannot expand ſo much, nor reach ſo high. Nevertheleſs, as the ſame force which contributes to elevate the *air*, diminiſhes its preſſure on the ſurface of the earth, higher columns of it at or near the equator, all other circumſtances being the ſame, may be no heavier than thoſe that are lower at or near the poles.

ATMOSPHERE, *weight of it.* Organical bodies are peculiarly affected by this preſſure: to this, in part, plants owe their VEGETATION; and animals their RESPIRATION, CIRCULATION, NUTRITION, &c.

To this alſo we owe ſeveral conſiderable alterations in the animal œconomy, with regard to health, life, diſeaſe, &c. See AIR.

And hence, a calculation of the preciſe quantity of this preſſure becomes a point worthy of attention.—Our bodies, then, are equally preſſed on by the incumbent *atmoſphere*; and the weight they ſuſtain is equal to a cylinder of air, whoſe baſe is equal to the ſuperficies of our bodies.—Now, a cylinder of air of the height of the *atmoſphere*, when greateſt, is known to be equal to a cylinder of water of the ſame baſe, and 35 feet high; or a cylinder of mercury $30\frac{1}{2}$ inches, as appears from the Torricellian experiment; as alſo from the height to which water aſcends in pumps, ſyphons, &c.

Hence it follows, that every foot ſquare of the ſurface of our bodies, is preſſed by a weight of air equal to 35 cubical feet of water, or $30\frac{1}{2}$ cubical inches of mercury; and a cubical foot of water being found by experiment to weigh $62\frac{1}{2}$ pounds, the compaſs of a foot ſquare upon the ſurface of our bodies, ſuſtains a quantity of air equal to $2187\frac{1}{2}$ pounds; for $02\frac{1}{2} \times 35$ is $=2187\frac{1}{2}$: and ſo many feet ſquare as the ſurface of our bodies contains, ſo many times $2187\frac{1}{2}$ pounds does that body bear.

Hence, if a man's body contain 15 ſquare feet, which is near the truth, he will ſuſtain a weight equal to $32812\frac{1}{2}$ pounds; which is above $14\frac{1}{2}$ tons for the greateſt load, or the weight of air when it is the heavieſt.

Mr. Cotes has given us a computation of the *weight* of all the air which preſſes upon the whole ſurface of the earth. He finds this weight to be equal to that of a globe of lead of ſixty miles diameter. The computation proceeds on theſe principles: That the weight of a column of air, reaching to the top of the *atmoſphere*, is moſt commonly equal to a column of water, having the ſame baſis, and the altitude of 34 feet; that the ſemi-diameter of the earth is equal to 20,949,655 feet; and that the ſpecific gravity of water is to that of lead as 1000 to 11,325. Cotes Hydroſt. Lect. p. 112.

By an eaſy calculation, ſuppoſing a column of mercury $29\frac{1}{2}$ feet high at the mean denſity of the *atmoſphere*, and one inch thick, to weigh 15 pounds, there will be a preſſure on every ſquare foot of $144 \times 15 = 2160$ pounds: on the ſurface of a body of 15 ſquare feet, 32400lb or more than $14\frac{1}{2}$ tons. And as the earth's ſurface contains in round numbers 200,000,000 ſquare miles, and every ſquare mile 27,878,400 ſquare feet; there muſt be 5,575,680,000,000,000 ſquare feet on the earth's ſurface; which multiplied by 2160 pounds, the preſſure on a ſquare foot, gives 12,043,468,800,000,000,000 pounds for the preſſure or weight of the whole *atmoſphere*.

The difference of the weight of the air which our bodies ſuſtain at one time more than at another, is alſo very great.

The whole weight of air which preſſes upon our bodies when the mercury is higheſt in the barometer, is equal to $32812\frac{1}{2}$ pounds. Whence the difference between the greateſt and the leaſt preſſure of air upon our bodies, may be proved to be equal to $3280\frac{1}{2}$ pounds.

The difference of the air's weight, at different times, is readily meaſured by the different height to which the mercury is raiſed in the barometer; and the greateſt variation of the height of the mercury being three inches, a column of air of any aſſignable baſe equal to the weight of a cylinder of mercury of the ſame baſe, and of the altitude of three inches, will be taken off from the preſſure upon a body of an equal baſe, at ſuch times as the mercury is three inches lower in the barometer; ſo that every inch ſquare of the ſurface of our bodies is preſſed upon at one time more than another, by a weight of air equal to the weight of three cubical inches of mercury.

Now a cubical foot of water being $62\frac{1}{2}$ pounds, a cubical foot of mercury is 875 pounds = 5040000 grains; and as 5040000 grains are to a cubical foot, or 1728 cubical inches, ſo are 2916 grains to one cubical inch; therefore a maſs of mercury of a foot ſquare = 144 ſquare inches, and three inches high, muſt contain 432 cubical inches of mercury, which multiplied by 2916, the number of grains in a cubical inch of mercury, gives 1259712 grains. And this weight does a foot ſquare of the ſurface of our bodies ſuſtain at one time more than at another.

Suppoſe again the ſurface of the human body = 15 feet ſquare, then would the body ſuſtain at one time more than at another a weight $= 15 \times 1259712$ grains = 18895680 grains = 3280 pounds 6 ounces, which is near $1\frac{1}{2}$ ton.

Hence, it is ſo far from being a wonder, that we ſometimes ſuffer in our health by a change of weather, that it is the greateſt wonder we do not ſuffer oftener and more by ſuch changes.—For when we conſider, that our bodies are ſometimes preſſed upon by near a ton and a half weight more than at another, and that the variation of the additional preſſure of many pounds, is often very ſudden; it is ſurpriſing that every ſuch change does not entirely break the frame of our bodies to pieces.

In effect, the veſſels of our bodies being ſo much ſtraitened, by an increaſed preſſure, would ſtagnate the blood, and the circulation would quite ceaſe, if nature had not wiſely contrived, that, when the reſiſtance to the circulating blood is greateſt, the *impetus* by which the heart contracts ſhould be ſo too.—For, upon an increaſe of the weight of the air, the lungs will be more forcibly expanded, and thereby the blood will be more intimately broken and divided, ſo that it becomes fitter for the more fluid ſecretions, ſuch as that of the nervous fluid; by which the HEART will be more ſtrongly contracted. And the blood's motion towards the ſurface of the body being obſtructed, it will paſs in greater quantity to the brain, where the preſſure of the air is taken off by the *cranium*; upon which account alſo, more ſpirits will be ſeparated, and the heart on that account too be more enabled to carry on the CIRCULATION, through all paſſable canals; whilſt ſome others, towards the ſurface, are obſtructed.

The moſt conſiderable alteration made in the blood, upon the air's greater or leſſer preſſure on the ſurface of our bodies, is its rendering the blood more or leſs compact, and making it croud into a leſs, or expand into a greater ſpace, in the veſſels which it enters.—For the air contained in the blood always keeps itſelf *in æquilibrio* with the external air that preſſes upon our bodies; and this it does by a conſtant *niſus* to unbend itſelf, which is always proportionable to the compreſſing weight by which it was bent: ſo that if the compreſſion of weight of the circumambient air be ever ſo little abated, the air contained within the blood unfolds its ſpring, and forces the BLOOD to take up a larger ſpace than it did before.

The reaſon we are not ſenſible of this preſſure is explained in the following manner by Borellus, De Mot. nat. a grav. fac. prop. 29, &c. After ſaying that ſand, perfectly rammed in a hard veſſel, is not capable, by any means, of being penetrated or parted, not even by a wedge; and likewiſe that water, contained in a bladder compreſſed equally on all ſides, cannot yield or give way in any part; he proceeds, “ In like manner,
“ within the ſkin of an animal are contained a diverſity
“ of parts, ſome hard, as bones; others ſoft, as muſ-
“ cles, nerves, membranes, &c. others fluid, as blood,
“ fat, &c. Now it is not poſſible the bones ſhould be
“ broke or diſplaced in the body, unleſs the weight lay
“ heavier on one part than on another, as we ſome-
“ times ſee in porters. If the preſſure be ſubdivided,
“ ſo that it lie equally all around, upwards, downwards,
“ and ſideways, and no part of the ſkin be exempt

“therefrom; it is evidently impoſſible any fracture or luxation ſhould follow. The ſame may be obſerved of the muſcles and nerves; which, though ſoft, yet being compoſed of ſolid fibres, do mutually ſuſtain each other, and reſiſt the common weight. The ſame holds of blood, and the other humours; and as water does not admit any manifeſt condenſation, ſo the animal humours contained in their veſſels may ſuffer an attrition from an impulſe made in one or more particular places, but can never be forced out of their veſſels by an univerſal compreſſion.—It follows, that as none of the parts undergo either ſeparation, luxation, contuſion, or any other change of ſituation; it is impoſſible any ſenſe of pain ſhould enſue, which can only be the effect of a ſolution of continuity. This is confirmed by what we ſee in DIVERS,” &c.

The ſame is farther confirmed by Mr. Boyle; who, including a young frog in a veſſel half full of water, and intruding ſo much air as that the water might ſuſtain eight times the weight it otherwiſe would; yet the animalcule, notwithſtanding the great tenderneſs of its ſkin, did not ſeem to be at all affected thereby.

For the effects of the removal of the preſſure of the *atmoſphere*, ſee AIR-*pump*.—For the cauſe of the variations in the weight and preſſure of the *atmoſphere*, ſee BAROMETER.

ATMOSPHERE, *height of it.* The *height* of the *atmoſphere* is a point about which the modern naturaliſts have been very ſolicitous.—Had not the air an elaſtic power, but were it every where of the ſame denſity, from the ſurface of the earth to the extreme limit of the *atmoſphere*, like water, which is equally denſe at all depths; it being above obſerved, that the weight of the column of air, reaching to the top of the *atmoſphere*, is equal to the weight of the mercury contained in the barometer; and the proportion of weight likewiſe being known between equal bulks of air and mercury; it were eaſy to find the height of ſuch column, and conſequently that of the *atmoſphere* itſelf.—For a column of air, one inch high, being to an equal column of mercury as 1 to 11200; it is evident, that 11200 ſuch columns of air, that is, a column of 933 feet high, is equal in weight to one inch of mercury: and conſequently the 30 inches of mercury, ſuſtained in the barometer, require a column of air 27990 feet high; whence the height of the *atmoſphere* would only be 27990 feet, or little more than five Engliſh miles high.

But the air, by its elaſtic property, expands and contracts; and it being found by repeated experiments in England, France, and Italy, that the ſpaces it takes up, when compreſſed by different weights, are reciprocally proportional to thoſe weights themſelves; or, that the air takes up the leſs ſpace, the more it is preſſed: it follows, that the air in the upper regions of the *atmoſphere*, where the weight is ſo much leſs, muſt be much rarer than nearer the ſurface of the earth; and, conſequently, that the height of the *atmoſphere* muſt be much greater than is above aſſigned.

Mr. Cotes, in his Hydroſtatical Lectures, lect. ix. has demonſtrated, in a very familiar and intelligible manner, that, if any number of diſtances from the ſurface of the earth be taken in an arithmetical progreſſion, the denſities of the air at thoſe diſtances will be in a geometrical progreſſion. Let $xa\alpha x$ (*Tab. Pneumatics, fig.* 22.) repreſent a veſſel reaching from the ſurface of the earth $a\alpha$ to the top of the *atmoſphere* xx; and let the ſide ax be divided into inches ab, bc, cd, &c. and let the lines bk, cl, dm, &c. be drawn parallel to $a\alpha$. It is evident that the air contained between theſe parallel lines becomes rarer as we aſcend, becauſe every aſcending parallel ſucceſſively is preſſed by a leſs column of ſuperincumbent air than the next below it. Suppoſe then that the air ak is every where uniform, but denſer than the air bl, and ſo upwards. Let the air bl be reduced into a leſs ſpace by βq, ſo as to become of equal denſity with the air ak, by making the ſpace bq leſs than bl, in the proportion that the air bl is leſs denſe than the air ak. And let a ſimilar conſtruction be continued, ſo as to reduce every inch breadth of air to the ſame denſity with the air ak. The ſpaces ak, bq, cr, &c. will evidently be as the denſities of the ſeveral inches of air, ak, bl, cm, &c. and the quantity or weight of the ſuperincumbent air belonging to each of theſe ſpaces, and reaching to the top of the *atmoſphere*, will always be as the ſum of all the ſpaces ſituated above any ſpace propoſed; the quantity or weight being, by the conſtruction of the figure, as the ſpace which it poſſeſſes. Since then the denſity of the air is as the force which compreſſes it, and this force is the quantity of ſuperincumbent air, the denſities of the air between $a\alpha$ and bk, bk and cl, cl and dm, &c. are to each other as the quantities of air above $a\alpha$, bk, cl, &c. up to the extremity of the *atmoſphere*. But theſe denſities, by what we have already ſhown, are as the ſpaces ak, bq, cr, &c. and the quantities of ſuperincumbent air are as the ſpaces $xb\beta qrstvx$, $xc\gamma rstvx$, $xd\delta stvx$, &c.; therefore the ſpaces ak, bq, cr, &c. are to each other reſpectively as the ſpaces $xb\beta qrstvx$, $xc\gamma rstvx$, $xd\delta stvx$, &c. Now the former ſpaces ak, bq, cr being the differences of the latter, and mutually proportional, are, by a well-known theorem in proportion, in a geometrical progreſſion; as the diſtances ab, ac, ad are in an arithmetical progreſſion. And thus the denſities of the air belonging to every one of the inches, continued to the extremity of the *atmoſphere*, decreaſe in the ſame geometrical progreſſion; and every the leaſt variation of altitude will cauſe the ſame proportional variation of denſity in the air. As the rarity of the air is reciprocally as its denſity, we may conclude that if the diſtances from the earth increaſe in an arithmetical progreſſion, the different degrees of rarity of the air increaſe in a geometrical progreſſion. Whence it is obvious, that the diſtances are every where proportional to the logarithms of the correſponding rarities.

This law was firſt obſerved and demonſtrated by Dr. Halley, from the nature of the hyperbola; and afterwards by Dr. Gregory, by means of the logarithmic line. See Phil. Tranſ. Nº 181. or Abr. ibid. vol. ii. p. 13. and Greg. Aſtron. lib. v. prop. 3.

By this propoſition, having made two or three barometrical obſervations of the rarity of the air at two or three different heights, it is eaſy to find its rarity at any other height, or the height correſponding to any rarity; and conſequently the altitude of the whole *atmoſphere*, ſuppoſing the utmoſt degree of rarity known, beyond which the air cannot go.

Upon theſe principles the following table is calculated; ſuppoſing firſt as a mean of the obſervations at the Puy de Domme in France, and thoſe on Snowdon-hill in Wales, that at the altitude of ſeven miles, the air is four times rarer than at the ſurface of the earth.

At the altitude of		Miles above the ſurface of the earth, the air is		Times rarer than at the earth's ſurface.

It might be eaſily ſhewn, by purſuing the calculation in this table, that a cubic inch of the air we breathe would be ſo much rarified at the altitude of 500 miles, that it would fill a ſphere equal in diameter to the orbit of Saturn.

But it is to be obſerved, that theſe computations of the rarity of the *atmoſphere*, at different heights, are founded on this principle, that the denſity of the air is every where proportionable to the ſuperincumbent weight. And this rule holds true only upon the ſuppoſition, that the heat is uniform, at different diſtances from the earth; for if the air be hotter in one part than in another, the air will be more rarified in the hotter part, than it will be in the cooler, although preſſed by the ſame weight, or at the ſame altitude above the earth's ſurface.

It muſt not be here omitted, that ſome obſervations made by Caſſini, and his aſſociates, ſeem to render this method precarious.—In continuing the meridian line of the obſervatory at Paris, they meaſured the altitudes of ſeveral mountains with great accuracy; noting the height of the barometer at the top of each; and found, that the rarefactions of the air, as you aſcend from the level of the earth, are much greater than they ought to be, according to this proportion.

Suſpecting, therefore, the juſtneſs of the experiments, the Royal Academy made divers others, under great dilatations of air, far exceeding the rarities found on the tops of the mountains; the reſult whereof was, that they all exactly anſwered the proportion of the incumbent weights. Whence it ſhould follow, that the higher air about the tops of mountains is of a different nature, and obſerves a different law from that near the earth.

The reaſon hereof may be owing to the great quantity of groſs vapours and exhalations here, more than there; which vapours being leſs elaſtic, and not capable of ſo much rarefaction as the pure air above, the rarefactions of the pure air increaſe in a greater ratio than the weights diminiſh.—M. Fontenelle, however, from ſome experiments made by M. de la Hire, accounts for the *phænomenon* in a different manner; alledging, that the elaſtic power of air is increaſed by the admixture of humidity therewith; and conſequently, that the air near the tops of mountains, being moiſter than that below, becomes thereby more elaſtic, and rarefies in a greater ratio than naturally and in a drier ſtate it would.—But Dr. Jurin ſhews, that the experiments produced to ſupport this ſyſtem are by no means concluſive. Append. ad Varenii Geograph.

M. Bouguer likewiſe, in the Memoirs of the Royal Academy of Sciences at Paris for the year 1753, intimated his opinion, that the condenſations of the *atmoſphere* did not obſerve the ſame law at different heights; and endeavoured to account for the variation, by ſuppoſing that particles of air at different heights are poſſeſſed of unequal degrees of elaſticity. If this were the caſe, it would be impoſſible to apply the barometer to the menſuration of heights with any degree of certainty. But M. De Luc has ſhewn, by his more accurate experiments, that this pretended inequality of ſpring in the particles of air does not ſubſiſt; and that its condenſations and dilatations follow the ſame law uniformly at all heights and in all climates, excepting only the differences that are cauſed by heat, and other local circumſtances. He has alſo given a rule for the meaſurement of heights by the barometer, deduced from a greater number of experiments, and much more accurate, than any hitherto publiſhed. In order to give the reader a juſt idea of the method which he purſued in inveſtigating and applying his rule, it is neceſſary to obſerve, that the difference of the elevation of any two places, will be as the logarithm of the ratio of the denſities of the air at each; and ſince the denſity is every where as the compreſſing force, and this again as the length of the column of quickſilver ſuſtained by it in the barometer, the difference of elevation will be as the logarithm of the ratio of the altitudes of the quickſilver at the ſame time in the two different ſtations, or as the difference of the tabular logarithms of the numbers by which theſe altitudes would be expreſſed in any given meaſure. This is an obvious conſequence of the law of rarefaction already demonſtrated, waving the conſideration of the accelerative force of gravity, which may be conſidered as uniform at any diſtances ſubject to obſervation and experiment. Premiſing this theorem, M. De Luc prepared a barometer of the ſyphon kind, as beſt adapted to correct the error ariſing from the repulſion of the quickſilver by the glaſs tube, by boiling the quickſilver after it was put into the tube, and by other precautions, in order to purge it of air and moiſture; and in order to make proper allowances for the variations of the denſity of quickſilver by heat and cold, he provided two thermometers, one attached to the frame of the barometer itſelf, and the other made for being expoſed to the open air, in order to ſhew its degree of heat. That he might be able to judge of the allowance requiſite to be made for any variation of heat or cold, he heated the air in his room, in the winter ſeaſon, to as great a degree as poſſible, and noted the riſe of the barometer, owing to the diminution of its ſpecific gravity by heat; and he alſo obſerved the height of the thermometer, both before and after the room was heated. The barometer in this experiment was at 27 French inches; and he infers from it, that an increaſe of heat from freezing to that of boiling water, will raiſe the mercury in the barometer 6 lines, or $\frac{1}{54}$th part of the whole. If the barometer is higher than 27 inches, the variation will increaſe in the ſame proportion; therefore, calling the height of the barometer B, the whole riſe for an increaſe of heat from freezing to boiling water, will be $\frac{B}{54}$; and as it will be leſs for a leſs difference of heat, if the number of degrees on the thermometer between boiling and freezing water be called K, and the riſe of the thermometer from any given point be called H, the correſpondent riſe of the barometer will be $\frac{B}{54} \times \frac{H}{K}$ by the increaſe of heat from the given point by the number of degrees H. If the heat decreaſed, then H would ſignify the degrees of decreaſe in heat, and the barometer would ſink by $\frac{B}{54} \times \frac{H}{K}$. M. De Luc made the fixed temperature of heat, by means of which he reduced his obſervations of the barometer, $\frac{1}{8}$th of the interval from freezing to boiling water above the given point; and if the thermometer was higher than this degree, he ſubtracted $\frac{B}{54} \times \frac{H}{K}$; if it was lower, he added it to the obſerved altitude of the barometer; and thus obtained the exact height of the barometer, ſuch as it would have been, if the denſity of its quickſilver had been the ſame as anſwers to the fixed degree of temperature. He thus corrected the heights of his barometer, at the bottom and at the top of a hill, for the particular degree of heat indicated by the thermometer attached to the barometer at each ſtation; and theſe corrected heights he made uſe of in his ſubſequent calculations. The two altitudes of the barometer are repreſented by B and *b*, and the logarithms of theſe quantities are taken in the four firſt places of figures after the characteriſtic, or by conſidering the remaining figures as decimals; C is aſſumed to repreſent the mean height of a thermometer, expoſed to the air at the top and bottom of the hill, the freezing point being 0, and that of boiling water 80; and M. De Luc finds, by his experiments, that the height of the hill will be given in French toiſes, when C is 16¾, by ſimply taking the difference of the logarithms of the heights of the barometer, or it will be equal to log. B − log. *b*; and in any other degree of heat, it will be greater or leſs in proportion as the rarity of the air is greater or leſs than in the fixed temperature; or, greater or leſs by $\frac{1}{215}$th part of the whole for every degree of the thermometer reckoned from the fixed temperature 16¾. And therefore the height of the hill will be expreſſed in French meaſure by this *formula*,

$$\text{log. B} - \text{log. } b + \text{log. B} - \text{log. } b \times \frac{\text{C} - 16\tfrac{3}{4}}{215} = \overline{\text{log B} - \text{log. } b} \times \overline{1 + \frac{\text{C} - 16\tfrac{3}{4}}{215}}.$$

Mr. Maſkelyne and Dr. Horſley have reduced this *formula* to Engliſh meaſure, to the ſcale of Fahrenheit's thermometer, and likewiſe to thermometers of different ſcales. Dr. Horſley has evinced the agreement of M. De Luc's concluſions with the geometrical theory of the *atmoſphere* founded on the law of gravitation. The rule reſulting from the *formula* adapted to Fahrenheit's thermometer, is thus expreſſed by Mr. Maſkelyne in common language: Take the difference of the tabular logarithms of the obſerved heights of the barometer, at the two ſtations, conſidering the four firſt figures excluſive of the index as whole numbers, and the remaining figures as decimals; ſubtract or add $\frac{452}{1000}$th of the difference of the altitude of the Fahrenheit's thermometer, attached to the barometer at the two ſtations, as it was higheſt at the lower or upper ſtation; and thus you will have the height of the upper ſtation above the lower, in Engliſh fathom, nearly. This height may be corrected by the following proportion: as 449 is to the difference of the mean altitude of Fahrenheit's thermometer expoſed to the air at the two ſtations from 40°, ſo is the height of the upper ſtation found nearly to the correction, which is to be added or ſubtracted, as the mean altitude of the thermometer was higher or lower than 40°; and the ſum or difference will give the true height of the upper ſtation above the lower in Engliſh fathom: and multiplying by 6, it will be had in Engliſh feet.

The rule adapted to particular ſcales will be as follows: From or to the difference of the tabular logarithms, as in the former caſe, ſubtract or add the difference of the altitude of the thermometer of a particular ſcale, attached to the barometer, at the two ſtations, as it was higheſt at the lower or upper ſtation; the difference or ſum will give the height nearly, in Engliſh fathom: then ſay, as 1000 is to the ſum of the altitudes of the thermometer of a particular ſcale expoſed to the air at both ſtations, ſo is the height of the upper ſtation above the lower, already found, to a fourth quantity; which added or ſubtracted, as the aforeſaid ſum of the altitudes of the thermometer is poſitive or negative, will give the true height in fathom; and multiplying by 6, in Engliſh feet.

M. De Luc found that the height of the *atmoſphere*, ſuppoſing its limits where the mercury in the barometer, would ſtand only at one line, and the thermometer indicating 0 in his ſcale, 17° in that of Reaumur, and about 70° in Fahrenheit's, is 25105,450 toiſes, or 11 leagues and 3 toiſes: and in the ſame circumſtances, if the mercury in the barometer ſunk to $\frac{1}{10}$ of a line, the height of that part of the *atmoſphere* would be 35105,450 toiſes.

M. De Luc's Recherches ſur les Modifications de l' Atmoſphere, vol. ii. Phil. Tranſ. vol. lxiv. part i. Nº 20 and 30. See BAROMETER.

M. De la Hire, after Kepler, has recourſe to the more ancient method of aſcertaining the height of the *atmoſphere*; viz. from the conſideration of the CREPUSCULA.

It appears, from the obſervations of aſtronomers, of the duration of twilight, and of the magnitude of the terreſtrial ſhadow in lunar eclipſes, that the effect of the *atmoſphere* to reflect and intercept the light of the ſun, is ſenſible to the altitude of between 40 and 50 miles. So far then we may be certain that the *atmoſphere* reaches; and at that altitude we may collect, from what has been already ſaid, that the air is above 10,000 times rarer than at the ſurface of the earth. How much further the *atmoſphere* may extend, we are altogether ignorant. Cotes's Hydroſt. Lect. p. 123 and 125.

It is allowed, by aſtronomers, that when the ſun is 18° below the horizon, we begin or ceaſe to ſee the TWILIGHT: now the ray whereby we ſee it can be no other than a horizontal line, or a tangent to the earth in the place where the obſerver is; but this ray cannot come directly from the ſun, which is under the horizon; and muſt therefore be a ray reflected to us by the laſt inner and concave ſurface of the *atmoſphere*. We are to ſuppoſe that the ſun, when 18° below the horizon, emits a ray which is a tangent to the earth, and ſtrikes upon this laſt ſurface of the *atmoſphere*, and is thence reflected to our eye, being ſtill a tangent, and horizontal.—If there were no *atmoſphere*, there would be no CREPUSCULUM; and conſequently, if the *atmoſphere* were not ſo high as it is, the *crepuſculum* would begin and end when the ſun is at a leſs diſtance from the horizon than 18°, and contrarily.—Hence we gather, that the largeneſs of the arch, by which the ſun is depreſſed when the *crepuſculum* begins or ends, determines the height of the *atmoſphere*. We are to note, however, that 32′ muſt be ſubtracted from the arch of 18° for the refraction which raiſes the ſun ſo much higher than he would be; and 16′ more for the height of the upper limb of the ſun, which is ſuppoſed to ſend the ray above his centre, which is ſuppoſed to be 18° low. The remaining arch, therefore, which determines the height of the *atmoſphere*, is only 17° 12′.

Two rays, one direct, and the other reflected, but both tangents to the earth, muſt neceſſarily meet in the *atmoſphere* at the point of reflexion, and comprehend an arch between them of 17° 12′, whereof they are tangents.—Hence it follows, from the nature of the circle, that a line drawn from the centre of the earth, and cutting the arch in two, will go to the point of concurrence of thoſe two rays; and as it is eaſy to find the exceſs of this line above the ſemidiameter of the earth, which is known, it is eaſy to find the height of the *atmoſphere*, which is only that exceſs.—On this principle M. De la Hire diſcovers the height of the *atmoſphere* to be 37223 fathoms, or near 17 French leagues. The ſame method was alſo made uſe of by Kepler, who only rejected it, becauſe it gave the height of the *atmoſphere* 20 times greater than he otherwiſe allowed it.

It muſt be added, that in this calculus the direct and reflected rays are ſuppoſed to be right lines; whereas, in fact, they are curves, formed by the perpetual refraction the rays undergo in paſſing through a ſeries of different denſities of air.—Computing then upon them, as two ſimilar curves, or rather as a ſingle curve, one extreme whereof is a tangent to the earth; its vertex, equally diſtant from both the extremes, determines the height of the *atmoſphere*; which, therefore, will be found ſomewhat lower than in the former caſe; the point of concurrence of two right lines, which are here only tangents to the curve, the one at one end, and the other at the other, being higher than the vertex of the curve. In this way, M. De la Hire finds the *atmoſphere* 36362 fathoms, or 16 leagues. Hiſt. de l' Acad. Roy. de Scienc. an. 1713. p. 71. See REFRACTION, &c.

The *atmoſphere* has a refractive power, which is the cauſe of many *phænomena*. Alhazen the Arabian, who lived about A. D. 1100, ſeems to have been more inquiſitive into the nature of refraction than the preceding writers. But neither Alhazen, nor his follower Vitellio, knew any thing of its juſt quantity, which was not known to any tolerable degree of exactneſs, till Tycho Brahe, with incredible diligence, ſettled it.

Neither did Tycho, nor Kepler, diſcover in what manner the rays of light were refracted by the *atmoſphere*. Tycho thought the refraction was chiefly cauſed by denſe vapours, very near the earth's ſurface. Kepler placed the cauſe wholly at the top of the *atmoſphere*, which he took to be uniformly denſe; and thence he determined its altitude to be little more than that of the higheſt mountains. But the true conſtitution of the denſity of the *atmoſphere*, deduced afterwards from the Torricellian experiment, afforded a juſter idea of theſe refractions, eſpecially after it appeared, by a repetition of M. Lowthorp's experiment, that the air's refractive power is proportionable to its denſity.

By this variation of the air's denſity, a ray of light, in paſſing through the *atmoſphere*, is continually refracted at every point, and thereby deſcribes a curve, and not a ſtraight line, as it would have done were there no *atmoſphere*, or were its denſity uniform.

This refractive power of the *atmoſphere* increaſes the altitude of the ſtars, and contracts their intervals; it alſo cauſes the ſun and moon to appear of an oval figure, when near the horizon. But it is to be obſerved, that the horizontal moon appears oval but rarely, eſpecially in the evenings of warm weather, the refractions being then ſmaller. Vid. Smith's Optics. See alſo REFRACTION.

The *atmoſphere*, or air, has alſo a reflective power; and this power is the cauſe that enlightens objects ſo uniformly on all ſides. The abſence of this power would occaſion a ſtrange alteration in the appearances of things, their ſhadows would be ſo very dark, and their ſides enlightened by the ſun ſo very bright, that, probably, we could ſee no more of them than their bright halves; ſo that, for a view of the other halves, we muſt turn them half round, or, if immoveable, muſt wait till the ſun could come round upon them. Such a pellucid unreflective *atmoſphere* would indeed have been very commodious for aſtronomical obſervations upon the courſe of the ſun and planets among the fixed ſtars, viſible by day as well as by night; but then ſuch a ſudden tranſition from darkneſs to light, and from light to darkneſs immediately, upon the riſing and ſetting of the ſun, without any twilight, and even upon turning from or to the ſun at noon-day, would have been very inconvenient and offenſive to our eyes.

Thus, though the *atmoſphere* is greatly aſſiſtant to the illumination of objects, yet it muſt alſo be obſerved, that it ſtops a great deal of light. By M. Bouguer's experiments, it ſeems that the light of the moon is frequently 2000 times weaker in the horizon, than at the altitude of 66 degrees; and that the proportion of her lights at the altitudes of 66 and 19 degrees, is about 3 to 2. The lights of the ſun muſt bear the ſame proportion to each other at thoſe heights; which M. Bouguer made choice of, as being the meridian heights of the ſun, at the ſummer and winter ſolſtices, in the latitude of Croiſic in France. Smith's Optics, Rem. 95.

It has been ſaid that a ray of light, paſſing through the *atmoſphere*, deſcribes a curve. M. De la Hire took great pains to demonſtrate, that, ſuppoſing the denſity of the *atmoſphere* proportional to its weight, this curve is a cycloid: and he ſays, that if the ray be a tangent to the *atmoſphere*, the diameter of its generating circle will be the height of the *atmoſphere*; and that this diameter increaſes, till at laſt, when the rays are perpendicular, it becomes infinite, or the circle degenerates into a right line. This reaſoning ſuppoſes that the ſurface of the *atmoſphere* is a plane; but ſince it is a curve, he obſerves that theſe cycloids become in fact epicycloids. Hermannus has detected the error of M. De la Hire, and ſhewn that this curve is infinitely extended, and has an aſymptote: and Dr. Brook Taylor obſerves, that this curve is one of the moſt intricate and perplexed that can well be propoſed. Method. Increm. p. 168, &c.

This ingenious author computes the refractive power of the air to be to the force of gravity at the ſurface of the earth, as 320 millions to 1.

F. De Lana thought he had contrived an *aeronautic* machine for navigating the *atmoſphere*: Sturmius, who examined it, declared it not to be impracticable: but Dr. Hook was of a different opinion, and detected the fallacy of the contrivance. Roger Bacon long before propoſed ſomething of the ſame kind. The great ſecret of this art, is to contrive an engine ſo far lighter than air, that it will raiſe itſelf in the *atmoſphere*, and together with itſelf, buoy up and carry men with it. The principle on which it is to be effected, is by exhauſting the air of a very thin and light, yet firm, metalline veſſel, with an air-pump.

But the hopes of ſucceſs in ſuch an enterprize will appear very ſmall, if it be conſidered, that if a globe were to be formed of braſs, of the thickneſs only of $\frac{1}{12}$ of an inch, that globe muſt be above 277 feet in diameter to ſwim in the air; and if, as De Lana ſuppoſes, the diameter of the globe were but 25 feet, the thickneſs of the metal could not exceed $\frac{1}{33}$ of an inch. Vid. Herman. Phoronom. p. 158.

ATMOSPHERE, *lunar*.—The moon was formerly thought to be ſurrounded, like the earth, with a changeable *atmoſphere*; but this is juſtly denied by modern aſtronomers, who, in watching the moon's appulſe to any ſtar her way, have found that the ſtar retains its full brightneſs till the inſtant of its being hid by the edge of the moon: whereas, if the moon were ſurrounded with an *atmoſphere*, the ſtar (ſeen through it) would appear to grow dimmer and dimmer, as the moon came nearer and nearer to it, becauſe it would be gradually ſeen through parts of her *atmoſphere* more and more denſe, as they muſt be, the nearer they are to the moon.

For the reality of the *atmoſpheres* of the other planets, ſee PLANET.

For the *atmoſpheres* of comets, and the ſun, ſee COMET, SUN, MACULÆ, and ZODIACAL *light*.

ATMOSPHERE *of ſolid* or *conſiſtent bodies*, is a kind of ſphere formed by the effluvia, or minute corpuſcles, emitted from them.

Mr. Boyle endeavours to ſhew that all bodies, even the hardeſt and moſt coherent, as gems, &c. have their *atmoſpheres*. See GEM.

ATMOSPHERE, in *Electricity*, denotes that medium which was conceived to be diffuſed over the ſurface of electrified bodies, and to conſiſt of effluvia iſſuing from them; whereby other bodies immerged in it became endued with an electricity contrary to that of the body to which the *atmoſphere* belongs. This was firſt taken notice of at a very early period in the hiſtory of this ſcience, by Otto Guericke, and afterward by the academicians *del Cimento*, who contrived to render the electric *atmoſphere* viſible, by means of ſmoke attracted by, and uniting itſelf to a piece of amber, and gently riſing from it, and vaniſhing as the amber cooled. But Dr. Franklin exhibited this electric *atmoſphere* with greater advantage, by dropping roſin on hot iron plates held under bodies electrified, from which the ſmoke aroſe and encompaſſed the bodies, giving them a very beautiful appearance. He made other obſervations on theſe *atmoſpheres*; he took notice that they and the air did not ſeem to exclude one another; that they were immoveably retained by the bodies from which they iſſued; and that the ſame body, in different circumſtances of dilatation and contraction, is capable of receiving or retaining more or leſs of the electric fluid on its ſurface. However, the theory of electrical *atmoſpheres* was not ſufficiently explained and underſtood for a conſiderable time; and the inveſtigation led to many very curious experiments and obſervations. Mr. Canton took the lead, and was followed by Dr. Franklin; Meſſ. Wilcke and Epinus proſecuted the inquiry, and completed the diſcovery. The experiments of the two former gentlemen prepared the way for the concluſion that was afterward drawn from them by the latter, though they retained the common opinion of electric *atmoſpheres*, and endeavoured to explain the *phænomena* by it. The concluſion was, that the electric fluid, when there is a redundancy of it in any body, repels the electric fluid in any other body, when they are brought within the ſphere of each other's influence, and drives it into the remote parts of the body, or quite out of it, if there be any outlet for that purpoſe. By *atmoſphere*, M. Epinus ſays, no more is to be underſtood than the ſphere of action belonging to any body, or the neighbouring air electrified by it. Sig. Beccaria concurs in the ſame opinion, that electrified bodies have no other *atmoſphere* than the electricity communicated to the neighbouring air, and which goes with the air, and not with the electrified bodies. And Mr. Canton likewiſe, having relinquiſhed the opinion that electrical *atmoſpheres* were compoſed of effluvia from excited or electrified bodies, maintained that they only reſult from an alteration in the ſtate of the electric fluid contained in, or belonging to the air ſurrounding theſe bodies to a certain diſtance; for inſtance, that excited glaſs repels the electric fluid from it, and conſequently, beyond that diſtance makes it more denſe; whereas excited wax attracts the electric fluid exiſting in the air nearer to it, making it rarer than it was before. In the courſe of experiments that were performed on this occaſion, Meſſ. Wilcke and Epinus ſucceeded in charging a plate of air, by ſuſpending large boards of wood covered with tin, with the flat ſides parallel to one another, and at ſome inches aſunder: for they found, that, upon electrifying one of the boards poſitively, the other was always negative; and a ſhock was produced by forming a communication between the upper and lower plates. Beccaria has largely conſidered the ſubject of electric *atmoſpheres*, in his Artificial Electricity, p. 179, &c. Eng. edit. Dr. Prieſtley's Hiſt. of Electricity, vol. ii. ſect. 5. See CONDUCTOR, *luminous*.

ATOCION, in *Ancient Naturaliſts*, denotes an abortive medicine, or a medicament proper to expel the *fœtus* after conception.

ATOLLENS *oculi*, in *Anatomy*, a name given by Albinus to one of his *quatuor recti muſculi oculi*. This is the muſcle called by Molinett, and others, the *ſuperbus*, and by Cowper, the *elevator oculi*.

ATOM, in *Philoſophy*, a part, or particle of matter, ſo minute as to be indiviſible.

The word is formed of the privative *α*, and τεμνω, *I divide*.

Atoms are properly the *minima naturæ*, the laſt or ultimate particles into which bodies are diviſible; and are conceived as the firſt rudiments, or component parts of all phyſical magnitude; or the pre-exiſtent and incorruptible matter whereof bodies were formed.

The notion of *atoms* ariſes hence, that matter is not diviſible *in infinitum*.

And hence the Peripatetics are led to deny the reality of *atoms*, together with that of mathematical points: an *atom*, ſay they, either has parts, or it has none: if it hath none, it is a mere mathematical point; if it hath, then do theſe parts alſo conſiſt of others, and ſo on to infinity.

But this is to recede from the genuine character of *atoms*, which are not eſteemed indiviſible, becauſe of their want of bigneſs, or parts (for all phyſical magnitude muſt have three dimenſions, length, breadth, and thickneſs; and all extenſion is diviſible); but they are indiviſible on account of their ſolidity, hardneſs, and impenetrability, which preclude all diviſion, and leave no vacancy for the admiſſion of any foreign force to ſeparate or diſunite them.

As *atoms* are the firſt matter, it is neceſſary they ſhould be indiſſolvible, in order to their being incorruptible.—Sir Iſaac Newton adds, that it is alſo required they be immutable, in order to the world's continuing in the ſame ſtate, and bodies being of the ſame nature now as formerly.

Hence the ancients were alſo led to maintain *atoms* eternal: becauſe what is immutable, muſt be eternal.

They alſo added gravity, and, in conſequence thereof, motion, to their *atoms*: and farther, obſerving that *atoms* thus falling perpendicularly, could not join or unite together; they ſuperadded a fortuitous or ſide motion, and furniſhed them with certain hooked parts, in order to enable them to catch and hang the better together.—And from a caſual or fortuitous jumble of theſe *atoms*, they ſuppoſed the whole univerſe to be formed.

ATOMICAL *philoſophy* denotes the doctrine of atoms; or a method of accounting for the origin and formation of all things, from the ſuppoſition of atoms, endued with gravity and motion.

The *atomical* philoſophy was firſt broached and taught by Moſchus, a Sidonian, ſome time before the Trojan war.—Leucippus and Democritus probably learnt it from him.—But it was moſt cultivated and improved by Epicurus; whence it became alſo denominated the *Epicurean* philoſophy.

It has been ſince retrieved by Gaſſendus, and others; and is now eſpouſed and adhered to by a great part of the philoſophical world, under the denomination of the CORPUSCULAR *philoſophy*.

ATOMOS, a ſpecies of the *crab* inſect.

ATONEMENT. See EXPIATION, LUSTRATION, PROPITIATION, and SACRIFICE.

ATONICS, in *Grammar*, words unaccented. See ACCENT.

ATONY, in *Medicine*, &c. a want of tone or TENSION; or a relaxation of the SOLIDS of a human body; occaſioning a loſs of ſtrength, faintings, &c. See FIBRE, RELAXATION, &c.

The word is compounded of the privative *α*, and τονος, *tone*; of τεινω, *tendo*, *I ſtretch*.

ATRABILARIÆ *capſulæ*. See CAPSULÆ.

ATRA BILIS, in the *Ancient Medicine*, black or aduſt bile.

Atra bilis was one of the great humours of the ancient phyſicians; whence aroſe the *atrabilary*, one of their TEMPERAMENTS; anſwering to what we call MELANCHOLY. See BILE, and HUMOUR.

The ancients, ſays Dr. Percival, ſuppoſed the *atra bilis* to be derived either from the dregs of the blood, or from yellow bile highly concocted. A celebrated modern anatomiſt thinks it is blood which, having lodged ſome time in the inteſtinal canal, has acquired blackneſs and putridity. Is it not more probable that, in general, it is no other than gall become acrid by ſtagnation in the *veſica fellea*, and rendered viſcid by the abſorption of its fluid parts? When diſcharged into the *duodenum* in this ſtate, it occaſions univerſal diſorder, till evacuated by vomiting or purging. Eſſ. vol. ii. p. 110.

ATRA *dies*, in *Antiquity*, denotes a fatal day, whereon the Romans received ſome memorable defeat.

The word literally imports a *black day*; a denomination taken from the colour, which is the emblem of death, and mourning. Whence the Thracians had a cuſtom of marking all their happy days with white ſtones, or *calculi*;

calculi; and their unhappy days with black ones, which they caſt, at the cloſe of each day, into an urn. At the perſon's death, the ſtones were taken out, and from a compariſon of the numbers of each complexion, a judgment was made of the felicity or infelicity of his courſe of life.

The *dies atræ*, or *atri*, were afterwards denominated *nefaſti*, and *poſteri*.

Such, in particular, was the day when the tribunes were defeated by the Gauls, at the river Allia, and loſt the city; alſo that whereon the battle of Cannæ was fought; and ſeveral others marked in the Roman calendar, as *atræ*, or *unfortunate*.

ATRACTYLIS, in *Botany*. See *Diſtaff* THISTLE.

ATRAGENE, the name by which the *viorna*, or *traveller's joy*, a ſmall winding ſhrub, common in hedges, is known in the ſhops. In the Linnæan ſyſtem, it is a genus of the *polyandria polygynia* claſs of plants, with a four-leaved calyx, twelve petals, and tailed ſeed.

ATRAMENTA; ſee INKS.

ATRAPHAXIS, in *Botany*; a genus of the *hexandria digynia* claſs. We have no Engliſh name for this plant. Its characters are, that the flower hath a permanent empalement; with two roundiſh ſinuated petals larger than the empalement, which are permanent. It hath ſix capillary *ſtamina*: in the center is ſituated a compreſſed germen, which afterward becomes a roundiſh compreſſed ſeed, ſhut up in the empalement. Miller mentions two ſpecies.

ATRESIA, from α and τϱαω, whence τιτϱαω, *to perforate*; in *Medicine*, imperforation, or the ſtate of thoſe perſons who want ſome natural aperture.

ATRETI, thoſe perſons, of either ſex, in whom the *anus*, or genitals, are imperforate, or cloſe, whether naturally, or occaſioned by ſome accident, or diſeaſe, as the growth of ſome fleſhy excreſcence, or a membrane which ſtops the orifice.

ATRICAPILLA, in *Zoology*, the name of a little bird, commonly known by the name of the *black-cap*, and called, by ſome other authors, *ficedula*, *ſycalis*, or *melanchoryphus*, and by the Italians *caponegro*. See MELANCHORYPHUS.

ATRICES, or ATTRICES, in *Medicine*, ſmall tubercles about the *anus*, which ſometimes diſappear, and then return again, at leaſt while in their early ſtate.

The *atrices* are ranked in the number of *condylomata*, or *fici*. Some authors alſo give the denomination *atrici* to a kind of latent wounds in the extremity of the *rectum*, which however do not *perforate* the ſame.

ATRICILLA, in *Ichthyology*, a ſpecies of the LARUS.

ATRIENSES, in *Antiquity*, a kind of ſervants, or officers, in the great families at Rome, who had the care and inſpection of the *atria*, and the things lodged therein.

Theſe are otherwiſe called *atriarii*, though ſome make a diſtinction between *atrienſes* and *atriarii*; ſuggeſting that the latter were an inferior order of ſervants, perhaps aſſiſtants of the *atrienſes*, and employed in the more ſervile offices of the *atrium*, as to attend at the door, ſweep the area, &c.

The *atrienſes* are repreſented as ſervants of authority and command over the reſt: they acted as procurators, or agents, of their maſter, in ſelling his goods, &c. To their care were committed the ſtatues and images of the maſter's anceſtors, &c. which were placed round the *atrium*; and which they carried in proceſſion at funerals, &c.

In the villas, or country-houſes, the *atrienſes* had the care of the other furniture, and utenſils, particularly thoſe of metal, which they were to keep bright from ruſt. Other things they were to hang from time to time in the ſun, to keep them dry, &c. They were cloathed in a ſhort white linen habit, to diſtinguiſh them, and prevent their loitering from home.

ATRIP, in *Nautical Language*, is applied either to the anchor or ſails. The anchor is *atrip*, when it is drawn out of the ground in a perpendicular direction, either by the cable or buoy-rope. The top-ſails are *atrip*, when they are hoiſted up to the maſt-head, or to their utmoſt extent.

ATRIPLEX, in *Botany*; ſee ORACH.

ATRIUM, in *Eccleſiaſtical Antiquity*, denotes an open place, or court, before a church, making part of what was called the *narthex*, or *ante-temple*.

The *atrium* in the ancient churches was a large area, or ſquare plat of ground, ſurrounded with a portico or cloyſter, ſituate between the porch or veſtible of the church, and the body of the church.

Some have miſtakenly confounded the *atrium* with the porch or veſtible, from which it was diſtinct; others with the *narthex*, of which it was only a part.

The *atrium* was the manſion of thoſe who were not ſuffered to enter further into the church. More particularly, it was the place where the firſt claſs of penitents ſtood, to beg the prayers of the faithful, as they went into the church.

ATRIUM is alſo uſed, in the *Canon Law*, for the cemetery, or church-yard.

In this ſenſe we find a law, prohibiting buildings to be raiſed in *atrio eccleſiæ*, except for the clergy; which the gloſſary explains thus; id eſt *in cæmeterio*, which includes the ſpace of forty paces around a large church, or thirty round a little church, or chapel.

ATROPA, in *Botany*; ſee *Deadly* NIGHTSHADE.

ATROPHY, a diſeaſe wherein the body, or ſome of its parts, do not receive the neceſſary nutriment, but dwindle or waſte inceſſantly.

The word is compounded of the privative α, and τϱεφω, *I nouriſh*; q. d. *privation of nouriſhment*.

An *atrophy* is either nervous, or the effect of evacuations.

A nervous *atrophy* or conſumption, is that which owes its original to a bad and morbid ſtate of the ſpirits; and to the weakneſs or deſtruction of the tone of the nerves; from whence an imbecillity, and an univerſal conſumption in the whole habit of the body, ultimately proceeding from a want of due aſſimilation of the nutritious juice: ſo from the beginning of the diſeaſe, there is to be found a want of appetite, and a bad digeſtion in the ſtomach, from an imperfect elaboration and volatilization of the chyle. Which ſort of *atrophy* may juſtly be reckoned one of the fatal ſymptoms of the ſcurvy.

An *atrophy* from inanition, is that which derives its original from a preternatural defect or ſubtraction of the nutritious juice, and that long and habitual; which differs according to the variety of the outlets formed in the body, either by nature or art, by which this precious liquor either has, or may run off and be waſted.

There is alſo a ſpecies of ſymptomatical conſumption, which, though it immediately proceeds from a preternatural and ill ſtate of the blood and ſpirits, yet has a mediate dependance upon ſome other preceding diſeaſe, which impreſſed that morbid diſpoſition on the ſpirits and humours.

ATROPHY, *ſigns of it*. An *atrophy* is known by a general languor both of body and mind; a depraved and unhealthy look of the face; a light and unſettled ſleep; an uncertain appetite, ſometimes voracious, ſometimes nauſeating all things, but uſually moſt deſirous of cold foods; a ſtraitneſs of the breaſt, and an uneaſineſs after eating; great internal heat, and dryneſs of the tongue. The bowels are uſually lubricous and moiſt, and throw out the food half undigeſted: in ſome caſes, however, they are obſerved to be dry and coſtive. The urine often appears to be a chylous matter: the abdomen is tumid and hard in the firſt ſtages of the diſeaſe, but afterwards it becomes more flaccid, and then on feeling it there may be ſeveral nodes and lumps perceived. The body by degrees waſtes away, and there is a continual feveriſhneſs and thirſt, and that eſpecially in the nighttime: and theſe ſymptoms often increaſe to that violence, as plainly to reſemble a hectic, and bring on an equal loſs of ſtrength and ſpirits.

Sometimes the *atrophy* ariſes from worms, and then the whole face is always pale; the noſtrils are full of a mucous matter, and ſometimes become excoriated; the appetite is voracious, and the patient feels an inſufferable reſtleſſneſs when hungry, which goes off, and generally becomes inclined to ſleep after a full meal. When this is the caſe in young ſubjects, the rickets and ſwellings about the joints uſually ſucceed the other ſymptoms, and crookedneſs of the legs, gibboſity of the back, and various diſtortions of the ſpine, follow it: theſe often put an end to the *atrophy*; but as they continue, and become laſting deformities, they are a very unhappy remedy.

ATROPHY, *perſons ſubject to atrophies*. Children, while young, are very ſubject to this diſeaſe, and often fall into it from improper food: the uſe of heavy and fæculent malt liquors, and of acids, which coagulate the milk, that uſually makes a large part of their nutriment. The ſuppreſſion of their ſweats is another frequent cauſe of *atrophies*, eſpecially when occaſioned by large draughts of cold liquors when they are hot in the night, and ſometimes by an improper uſe of aſtringents to ſtop thoſe *diarrhœas* to which they are frequently ſubject. Youths more grown up are often thrown into an *atrophy* by eating voraciouſly of crude, thick, heavy, and obſtruent diet, or from the drinking ſpirituous liquors: ſometimes from their having been injudiciouſly treated in fevers, and ſometimes from their being violently infeſted with worms in their bowels. Men in more mature age uſually fall into it after being debilitated by other illneſſes, and by the remains of the cauſes of thoſe illneſſes being left in the body; and by nothing oftener are reduced to this diſtempered ſtate, than by inordinate *hæmorrhages*. Perſons who are ſcrophulous, or have infarctions of the external glands, are alſo uſually at one time or other afflicted with this infarction of the internal ones, and few eſcape it that labour under any other violent concretions of the internal parts.

ATROPHY, *prognoſtics*. A recent *atrophy* is not difficult of cure; and even the moſt inveterate one, though ſtubborn enough, is always much leſs dangerous and difficult of cure than an hectic. The more complicated this diſeaſe is, the more difficult it always is in the cure; and it is hence that grown perſons are not ſo eaſily or ſo often cured as children, becauſe with them it is uſually complicated with many other diſorders; and, in general, that *atrophy* which is brought on by *hæmorrhages*, or by ill-treated illneſſes, is much more difficult of cure than that which ariſes from a wrong diet. And, finally, in *atrophies* ariſing from worms, when they are deſtroyed, the diſeaſe uſually ceaſes.

ATROPHY, *method of cure*. All ſymptomatical conſumptions are evidently incurable, unleſs a particular reſpect be firſt had to the diſtempers upon which they depend; but if theſe are once removed by art, this kind of conſumption ceaſes of conſequence; and therefore the cure of this conſumption is to be ſought for in the cure of thoſe diſtempers which are the cauſes of it.

The firſt thing to be done in general is, to thoroughly abſterge and cleanſe the *primæ viæ* by gentle purges, among which nothing is ſo proper as calomel, aſſiſted by ſyrup of rhubarb, or the like; and theſe purgatives are afterwards to be repeated at different intervals, during the courſe of the cure. After the firſt purges, reſolvent and attenuating medicines are to be given; and, finally, the preparations of ſteel, decoctions of *arum* and pimpernel root, with ground-ivy, are very beneficial, as is alſo the juice of ground-ivy given alone; and the reſolvent ſalts, as tartar of vitriol, nitre, and the like, with ſome of the aperient tinctures of ſteel.

An *atrophy* differs from a hectic in this, that there is in it only an infarction of the meſenteric glands, whereas in the other caſe they are generally ulcerated: and in degree the difference alſo is manifeſt, all the ſymptoms being more violent in the hectic than in the ſimple *atrophy*.

It ſhould alſo be diſtinguiſhed from leanneſs, the rickets, and that weakneſs and conſumption of children, who pine away only for want of a due ſupply from the breaſt.

Dr. Thomas Short, in his New Obſervations, Moral, Natural, Medical, &c. recommends milk and cyder in the *atrophy*.

ATTACHING, or **ATTACHMENT**, in *Law*, the taking or apprehending a perſon or thing, either by commandment, or writ.

The word is formed of the French *attacher*, *to faſten*, *tye*; and that from the corrupt Latin *attachiare*, of *attexere*, *to weave to*; or rather, as others think, from the Celtic *tach*, *a nail*; and *tacha*, *to nail*; or the Saxon *tæcan*, *to take*.

Lambard makes this difference between an *arreſt* and an *attachment*; that an *arreſt* proceeds out of an inferior court by precept only, and an *attachment* out of a higher court, either by precept, or writ; and that a precept to *arreſt* hath theſe formal words, *duci facias*, &c. and a writ of *attachment* theſe, *præcipimus tibi quod attachies talem, & habeas eum coram nobis*.

By this it appears, that he who *arreſts* carries the party *arreſted* to another higher perſon, to be diſpoſed of forthwith; whereas he that *attaches* keeps the party *attached*, and preſents him in court at the day aſſigned in the *attachment*.

There is this farther difference, that an *arreſt* lies only upon the body of a man; and an *attachment* ſometimes on his goods too: for a man may be *attached* by an hundred ſheep.

Moreover, *attachment* is a kind of proceſs by which courts of law proceed againſt their own officers and others, in caſes of contempt, &c.

ATTACHMENT *by writ* differs from *diſtreſs* in this, that an *attachment* does not reach lands, as a *diſtreſs* does; and that a *diſtreſs* does not touch the body, which an *attachment* does.—Yet the two are frequently confounded together.

In the moſt common uſe, an *attachment* is an apprehenſion of a man by his body, to bring him to anſwer the action of the plaintiff.—A *diſtreſs*, with a writ, is the taking of a man; a *diſtreſs*, without a writ, is the taking of a man's goods for ſome real cauſe; as rent, ſervice, &c.

ATTACHMENT *out of the Chancery* is had of courſe, upon an *affidavit* made that the defendant was ſerved with a *ſubpœna*, and appears not; or iſſueth upon not performing ſome order or decree.

After the return of this *attachment* by the ſheriff, *quod non eſt inventus in balliva ſua*; another *attachment*, with proclamation, iſſues: and if he appear not thereupon, a commiſſion of rebellion.

ATTACHMENT *of the Foreſt*, is one of the three courts held in the foreſt.

The loweſt court is called the court of *attachment*, or woodmote-court, the mean ſwein-mote, the higheſt, the juſtice in eyre's ſeat.

The court of *attachments* ſeems ſo called, becauſe the verderors of the foreſt have therein no other authority, but to receive the *attachments* of offenders againſt vert and veniſon taken by the foreſters, and to inrol them, that they may be preſented or puniſhed at the next juſtice-ſeat.

This *attachment* is by three means: by goods and chattels; by body, pledges, and mainprize; or by body only.—This court is held every forty days throughout the year; whence it is alſo denominated *forty days court*.

ATTACHMENT *of privilege* is, by virtue of a man's privilege, to call another to that court whereto he himſelf belongs, and in reſpect whereof he is privileged to anſwer ſome action.

ATTACHMENT, *foreign*, is an *attachment* of goods or money found within a liberty or city, to ſatisfy ſome creditor within ſuch city or liberty.

By the cuſtom of ſome places, particularly of London, a man may *attach* money or goods in the hands of a ſtranger: as, if A owes B 10*l.* and C owes A 10*l.* B may *attach* the 10*l.* in the hands of C, to ſatisfy himſelf.

ATTACHIAMENTA *bonorum*, in our *Ancient Law-books*, denotes a diſtreſs taken upon the goods or chattels of any perſon ſued for a perſonal eſtate, or debt, by the legal *attachiators* or bailiffs, as a ſecurity to anſwer the action.

ATTACHIAMENTA *de ſpinis & boſco*, ſignifies an ancient privilege granted to the other officers of foreſts, to take to their own uſe, thorns, bruſh, and windfalls, within their own precincts or liberties.

ATTACK, an attempt upon any perſon or thing; or the act of beginning a combat or diſpute.

ATTACK, in the *Military Art*, is an attempt or engagement to force a poſt, a body of troops, or the like.

We ſay to begin, to make, ſuſtain an *attack*, &c. Several authors have written of the art of *attacking* and DEFENCE.

ATTACK *of a ſiege*, is an effort made by the beſiegers with trenches, mines, galleries, &c. to make themſelves maſters of a fortreſs, in *attacking* one of its ſides. See FORTIFICATION, and SIEGE.

It is a rule always to *attack* on the weakeſt ſide; unleſs there be ſuperior reaſons for the contrary—as was the caſe at the ſiege of Liſle: in which the part where prince Eugene made his *attack*, was the ſtrongeſt in the whole place.

In ſieges there are ſometimes one, ſometimes two, or at moſt three *attacks*.—The *attacks*, where they are ſeveral, ought to have a communication.

ATTACK, *falſe*, is that which is not ſo vigorouſly proſecuted; ſerving only to make a diverſion among the beſieged, and to oblige them to divide their forces, that the true *attack* may be carried on with greater ſucceſs.

ATTACK *in flank*, is to *attack* both ſides of the baſtion.

ATTACK, *line of*; ſee LINE.

ATTAGEN, ατταγας, or ατταγην, in *Zoology*, an Aſiatic partridge, called by ſome a *francolin:* a bird which is repreſented both by Martial and Ariſtophanes, as the ſweeteſt which was dreſſed at the public feaſts. From theſe circumſtances, the *attagen* appears to be the ſame with our *gor-cock*, *moor-cock*, or *red-game*.

Trallian recommends this bird in a *phthiſis*; Galen, in nephritic complaints; and Avicenna believed it increaſed the ſeminal ſecretions.—The inſide of the gizzard of this bird is extremely fragrant when freſh killed.

The *red-game* lives chiefly on vegetables, and uſes but little exerciſe, being ſcarcely ever on the wing, unleſs to avoid danger. Hence it does not abound with highly exalted ſalts. It is a very agreeable and wholeſome food.

ATTAINDER, in *Law*, is when a man has committed felony, treaſon, or other crime, and judgment is paſſed upon him for the ſame.

The children of a perſon attainted of treaſon cannot be heirs to him, or any other anceſtor; and, if he were noble before, his poſterity are hereby degraded, and made baſe: nor can this corruption of blood be ſalved but by an act of parliament, unleſs the judgment be reverſed by a writ of error.

Our ancient laws make this difference between *attainder* and *conviction*, that a man was ſaid to be *convicted* preſently upon the verdict; but not *attainted* till it appeared he was no clerk, or being a clerk, and demanded by his ordinary, could not purge himſelf.—Add, that *attainder* is more extenſive than *conviction*; *conviction* being only by the jury, whereas *attainder* may alſo be by outlawry, confeſſion of the party, or the like.

A man is *attainted* two ways; by *appearance*, or by *proceſs*.

Attainder by appearance is either by confeſſion, by battle, or by verdict.—Confeſſion, from which *attaint* proceeds, is twofold; one at the bar before the judges, when the priſoner, upon his indictment read, owns himſelf guilty, never putting himſelf on his jury. The other is before the coroner, in ſanctuary; where he, upon his confeſſion, was in former times conſtrained to abjure the realm; which is alſo called *attainder by abjuration*.

Attainder by battle is when the party appealed by another, chooſing rather to try the truth by combat than by jury, is vanquiſhed.

Attainder by proceſs, otherwiſe called *attainder by default*, or *attainder by outlawry*, is where a party flies, or does not appear after being five times publicly called in the county-court, and at laſt, upon his default, is pronounced or returned outlawed.

Attainder by verdict, is when the priſoner at the bar, anſwering not guilty to the indictment, hath an inqueſt of life and death paſſed on him, and is by the verdict of the jury pronounced guilty.

Attainder, *bill of*, is a bill brought into parliament for *attainting*, condemning, and executing a perſon for high treaſon.

ATTAINT, Attincta, in *Law*, a writ which lies after judgment, againſt a jury that hath given a falſe verdict, contrary to the evidence, in any court of record, be the action real or perſonal, if the debt or damages exceed 40*s*.

If the verdict be found falſe, the judgment anciently was, that the jurors meadows ſhould be plowed up, their houſes broken down, their woods grubbed up, their lands and tenements forfeited to the king, their goods and chattels forfeited, their bodies be caſt into gaol, and that they ſhould become for ever infamous. But by the ſtatute 11 Hen. VII. c. 24. revived by 23 Hen. VIII. c. 3. a more moderate puniſhment was inflicted upon *attainted* jurors; viz. perpetual infamy; and if the cauſe of action were above 40*l*. value, a forfeiture of 20*l*. apiece by the jurors; or if under 40*l*. then 5*l*. a-piece; to be divided between the king and the party injured.

If it paſſed againſt him that brought the *attaint*, he ſhall be impriſoned, and grievouſly ranſomed at the king's will.—But the practice of ſetting aſide verdicts upon motion, and granting new trials, has ſo far ſuperſeded the uſe of *attaints*, that no inſtance of it occurs later than 1593.

Attaint, among *Farriers*, ſignifies a knock or hurt in a horſe's leg; proceeding either from a blow with another horſe's foot, or from an over-reach in froſty weather, when a horſe, being rough-ſhod, or having ſhoes with long calkers, ſtrikes his hinder-foot againſt his fore-leg. The farriers diſtinguiſh *upper attaints*, given by the toe of the hind-foot upon the ſinew of the fore-leg; and *nether attaints*, or over-reachers on the paſtern-joint, which are little bladders like wind-galls, coming either by a wrench, a ſtrain, an over-reach, or the like. The uſual place is in the heel or fruſh.

ATTAINTED, Attaintus, or Attinctus, in *Law*, is uſed for a perſon found guilty of ſome crime or offence, particularly of felony or treaſon, by due courſe of law.

Yet a man is ſaid to be *attainted* of perjury, *attainted* of diſſeiſin; and ſo it is uſed in French; as, *eſtre atteint, & vaincu en aucun cas*, is *to be caſt in any cauſe*.

ATTELABUS, a genus of inſects belonging to the order of *coleoptera* in the Linnæan ſyſtem.

ATTALICÆ *veſtes*, in *Antiquity*, garments made of a kind of cloth of gold.

They took the denomination from Attalus, ſurnamed Philometer, a wealthy king of Pergamus, who was the firſt, according to Pliny, who procured gold to be woven into cloth. Hiſt. Nat. lib. iii. c. 48.

ATTALUS, and Attalicus, in the *Ancient Phyſic*, epithets given to certain medicines, deſcribed by Galen, but now out of uſe.

ATTELLANÆ; ſee Atellanæ.

ATTEMPERATION, in *Rhetoric*, &c. the caſting a reſtriction, or ſoftening, on ſomething ſaid by the *formulas, Fama eſt, ut perhibent, &c.*

ATTENDANT, or Attendent, in a general ſenſe; ſee Assistant, Retinue, and Satellites.

Attendant, Attendens, in *Law*, ſignifies one that owes duty, or ſervice to another, or depends in ſome manner upon him.

Thus if there be lord meſne and tenant; and the tenant hold of the meſne by a penny; and the meſne hold over by two pence: if the meſne releaſe to the tenant all his right in the land, and the tenant die, his wife ſhall be endowed of the land, and ſhall be *attendant* to the heir, of the third part of the penny, not of the third part of the two pence; ſhe being to be endowed of the beſt poſſeſſion of her huſband.

Where the wife is endowed by the guardian, ſhe ſhall be *attendant* to the guardian, and to the heir at his full age.

ATTENTION, Attentio, a due application of the ear, or the mind, to any thing ſaid, or done, in order to acquire a knowledge thereof.

The word is compounded of *ad, to*; and *tendo, I ſtretch*.

Attention of mind is not properly an act of the underſtanding, but rather of the will, by which it calls the underſtanding from the conſideration of other objects, and directs it to the thing in hand. Nevertheleſs, our *attention* is not always voluntary: an intereſting object ſeizes, and fixes it beyond the power of controul.

Attention, in reſpect of hearing, is the ſtretching or ſtraining of the *membrana tympani*, ſo as to make it more ſuſceptible of ſounds, and better prepared to catch even a feeble agitation of the air. Or it is the adjuſting the tenſion of that membrane to the degree of loudneſs or lowneſs of the ſound to which we are attentive.

ATTENUANTS, or Attenuating *medicines*, are ſuch as ſubtilize and break the humours into finer parts; and thus diſpoſe them for motion, circulation, excretion, &c.

Attenuants ſtand oppoſed to *incraſſants*, or thickeners, medicines which condenſe, inſpiſſate, &c.

Theſe medicines are of the utmoſt importance in the practice of phyſic, as a little reflection upon their natures, qualities, and manners of operation, will eaſily convince us. To this claſs belong the roots of *arum, aſarabacca, acorus*, elecampane, and florentine *orris*; the leaves of brook-lime, ſcurvy-graſs, water-creſs, Indian creſſes, dittander, fumitory, marſh-trefoil, ſmall centaury; all the ſpecies of garlic, onion, and leek, and the wood and bark of *guaiacum*; among the ſpices, pepper, and ginger; among the ſeeds, thoſe of muſtard, ſcurvy-graſs, and creſſes; among the gums, *galbanum, ammoniacum*, myrrh, and benjamin. Among the chemical preparations, the moſt powerful *attenuants* are calomel, *æthiops*, flower of brimſtone, the fixed alcaline ſalts, the ſalts of the purging waters, vitriolated tartar, regenerated tartar, and a ſolution of crabs eyes, nitre, and *ſal ammoniac*; the volatile ſalt and urinous ſpirit of *ſal ammoniac* alſo; to which may be added, oxymel of ſquills, and the acrid tincture of antimony. Medicated ſprings alſo belong to this claſs of medicines, becauſe they, beſide their diluting and aperient natures, are alſo highly *attenuating*. Infuſions in form of tea, from the quantity of warm water they conſiſt of, are alſo very efficacious *attenuants*, and are very powerful in the diſuniting coaleſcent molecules. Of this claſs alſo are ſweet whey, and a multitude of other leſs uſed and leſs powerful medicines.

Of theſe, ſome act upon the fluid, and others upon the ſolid parts of the human body. Thoſe which act upon the fluids, by mere contact, are very few in number, being only the watery diluents, which are of ſingular efficacy in colliquating the viſcid and glutinous humours. All the other medicines mentioned as *attenuants* act only on the ſolids, by increaſing their tone, augmenting their ſtrength, heightening their contractile force, and adding to the elaſticity and ſyſtolic motion of the veſſels; by which means they preſs and impel more vigorouſly their contained fluids, and by that means divide and break them, by driving them forcibly through ſmall paſſages.

Attenuating and *inciding* medicines are of very extenſive uſe in phyſic, and come under different denominations, according to the different effects they produce. Thus, when tenacious and viſcid juices not only ſtagnate in the cavities of the veſſels, but obſtruct the minute ducts of the *viſcera* and emunctories, theſe medicines, by their *inciding* and *attenuating* quality, diſcharge the humours, and remove the obſtructions; for which reaſon they are not improperly called *aperients*; and they deſerve alſo, in theſe caſes, the names of *antiſcorbutics*, and *ſweeteners of the blood*.

Attenuants produce ſo great a variety of effects, that it is proper we ſhould be well acquainted with their ſeveral kinds, as appropriated to the ſeveral diſorders, and know which will prove moſt ſerviceable in each. The diſſolving and *attenuating* of viſcid crudities in the ſtomach and *primæ viæ*, is well anſwered by the roots of *arum, acorus*, pepper, ginger, and the like; as alſo by *ſal ammoniac*, vitriolated tartar, the fixed alcaline ſalts, and the ſimple or dulcified ſpirit of ſalt. When crude and unconcocted humours are to be evacuated by ſtool, this intention is very well anſwered by the neutral ſalts, as the ſalts of the purging waters, and the *ſal polycreſtum*, with a ſufficient quantity of a watery vehicle.

When viſcid humours, occaſioning diſorders of the breaſt, are to be *attenuated* and expectorated, the intention is moſt effectually anſwered by elecampane and orrice roots; and by *gum ammoniacum*, myrrh, or benjamin, and balſam of Peru; or by regenerated tartar, oxymel of ſquills, a ſolution of crabs eyes in diſtilled vinegar, and the ſyrups of tobacco, and the like.

When the maſs of blood is tainted by thick and tenacious *ſordes*, and the emunctories are by that means obſtructed, and the humours contaminated by a ſaline ſulphureous and ſcorbutic dyſcracy, the moſt efficacious of the *attenuants* are the horſe-radiſh, ſcurvy-graſs, water and garden creſſes, muſtard, *gum ammoniacum*, benjamin, myrrh, the oil of fixed nitre, oil of tartar *per deliquium*, ſolutions of nitre, ſpirit of *ſal ammoniac*, ſalt of wormwood with lemon-juice, and the ſalts of the medicinal waters.

When grumous or coagulated blood, occaſioned by contuſions or blows, is to be *attenuated*, and again diſſolved, the intention is admirably anſwered by the roots of Solomon's ſeal, vinegar, and crabs eyes, the regenerated tartar, and nitre prepared with antimony.

And in caſes where the lymph has acquired a preternatural thickneſs and viſcidity, eſpecially if from a venereal taint, the curative intention is moſt effectually anſwered by *guaiacum*, the acrid tincture of antimony, calomel, *æthiops* mineral, and the like; which, when ſkilfully uſed, are of ſingular efficacy in diſſolving and *attenuating* the viſcid juices impacted in the glands of the liver. Hoffman.

ATTENUATION, the act of *attenuating*; that is, of making any fluid thinner, and leſs conſiſtent, than it was before.

The word is compounded of *ad*, and *tenuis*, *thin*.

Attenuation is defined more generally by Chauvin, the dividing or ſeparating of the minute parts of any body, which before, by their mutual *nexus* or implication, formed a more continuous maſs.—Accordingly, among *Alchemiſts*, we ſometimes find the word uſed for pulverization, or the act of reducing a body into an impalpable powder, by grinding, pounding, or the like.

ATTERMINING, in our *Old Writers*, is uſed for a time, or term, granted for payment of a debt, according to Blount.

ATTESTATION, the giving teſtimony, or evidence, of the truth of any thing; eſpecially in writing.

The word is compounded of *ad*, *to*, and *teſtis*, *witneſs*.

Miracles need be well *atteſted*, to gain credit.

ATTIC, ſomething relating to Attica, or the city of Athens.—In matters of *Philology* we uſe, *Attic* ſalt, *ſales Attici*, meaning a delicate, poignant kind of wit and humour, peculiar to the Athenian writers.—*Attic* witneſs, was a witneſs incapable of corruption; ſo an *Attic* muſe was an excellent one, &c.

Attic is alſo uſed in *Architecture* for a kind of building, wherein there is no roof or covering to be ſeen; thus called becauſe uſual at Athens.

Attic, or Attic *Order*, is alſo a kind of little order, after the manner of a pedeſtal, raiſed upon another larger order; by way of crowning, or to finiſh the building.—See *Tab. Archit. fig.* 4c. (C.) which exhibits an *Attic order* with pilaſters.

An *Attic* is ſometimes alſo uſed for the conveniency of having a wardrobe, or the like; and inſtead of regular columns, has only pilaſters of a particular form; and ſometimes no pilaſters at all.

There are alſo *Attics* uſed for high altars.—The order takes its name from Athens, where it was firſt practiſed.

Attic *of a roof*, is a little ſtory or pedeſtal, either of ſtone or wood covered with lead, ſerving as a kind of parapet to a terrace, platform, or the like.

Attic *Baſe*, is a peculiar kind of baſe uſed by the *Ancient Architects*, in the Doric order; and which *Modern Architects* have given to the Doric column.

The *Attic baſe* is the ſame with Palladio's *Ionic baſe*.

The *Attic* is the moſt beautiful of all the baſes. See Base.

Attic *continued*, is that which encompaſſes the whole circumference of a building, without any interruption; following all the jets, the returns of the pavilions, &c.

Attic *interpoſed*, is that ſituate between two tall ſtories, ſometimes adorned with columns, or pilaſters.

Attic *Year*; ſee Year.

ATTILLUS, a river-fiſh, of the STURGEON-kind, called by ſome *adello*, *adano*, and *adeno*. It grows to a very large ſize, and when full-grown, caſts its ſcales, and never has any freſh ones in their place, but remains perfectly ſmooth; in which it differs from the common *ſturgeon*. But it ſeems not to differ in any eſſential point from the HUSO *Germanorum*. It is an eatable fiſh, but is greatly inferior in taſte to the *ſturgeon*. Willughby.

ATTINGA, a ſpecies of the *diodon* in the order of NANTES.

ATTIRE, in *Botany*, is uſed by ſome to denote the third part or diviſion of the flower of a plant; the other two being the *empalement*, and the *foliation*.

The *attire* is of two kinds; *ſeminiform*, and *florid*.—The *ſeminiform attire* conſiſts of two parts; chives, or *ſtamina*; and ſummits, or *apices*; one upon each *ſtamen*.

The *florid attire* is uſually called the *thrums*, as in the flowers of marigold, tanſy, &c.—Thoſe thrums are called *ſuits*, which conſiſt of two, but moſt times of three pieces.—And the outer part of the ſuit is the *floret*, whoſe body is divided at the top like a cowſlip-flower, into five parts, or diſtinct leaves.

Attire, in *Hunting*, denotes the HEAD or horns of a deer.

The *attire* of a ſtag, if perfect, conſiſts of bur, pearls, beam, gutters, antler, ſur-antler, royal, ſur-royal, and croches.—Of a buck, of the bur, beam, brow-antler, advancer, palm, and ſpellers.

ATTITUDE, in *Painting* and *Sculpture*, the poſture, or geſture, of a figure, or ſtatue; or the diſpoſition of its parts, by which we diſcover the action it is engaged in, and the very ſentiment ſuppoſed to be in the mind of the perſon repreſented.

The word comes from the Italian *attitudine*, which ſignifies *the ſame*; and that from the Latin *aptitudo*, *fitneſs*.

The repreſenting of this action and ſentiment in a ſtrong and lively manner, makes what they call a *good expreſſion*.

ATTOLLENS, in *Anatomy*, a name common to ſeveral muſcles, whoſe office or action is to raiſe the parts they belong to.

The word is compounded of the Latin *ad*, *to*, and *tollo*, *I lift*.

The *attollens*, or *attollent* muſcles, are otherwiſe called *levators* and *elevators*.

ATTMELLA; ſee Ahmella.

ATTORNARE, in the original ſenſe, ſignified to turn over money and goods, that is, to aſſign and appropriate them to certain perſons, or uſe. This is properly called *attornare rem*.

Attornare *perſonam*, denotes to depute a repreſentative, or proxy, to appear and act for another.

Thus in trials at *Common Law*, the plaintiff, or defendant, retained *attornatum ſuum poſitum in loco ſuo ad lucrandum vel perdendum*.

ATTORNATO *faciendo vel recipiendo*, in the *Common Law*, a writ to command a ſheriff, or ſteward, of a county-court, or hundred-court, to receive and admit an *attorney* to appear for the perſon that oweth ſuit of court. F. N. B. 156. Every perſon that owes ſuit to the county-court, court-baron, &c. may make an *attorney* to do his ſuit. Stat. 20 H. III. c. 10.

ATTORNEY, Atturnatus, or Attornatus, in *Law*, a perſon appointed by another to do ſomething in his ſtead; particularly to ſolicit and carry on a law-ſuit.

The word is compounded of the Latin *ad*, *to*; and the French *tourner*, *to turn*; q. d. *to turn a buſineſs over to another*.—The ancient Latin name, according to Bracton, is *reſponſalis*.

Attorneys, in *Common Law*, are much the ſame with *procurators*, *proctors*, or *ſynodics*, in the *Civil Law*.

Attorneys are properly thoſe who ſue out writs or proceſs, or commence, carry on, and defend actions, or other proceedings, in the names of other perſons, in any of the courts of common law.—They are diſtinguiſhed from *ſolicitors*, who do the like buſineſs in courts of equity; as the chancery, equity-court in the exchequer, chamber-court of the duchy, or the like.

None are to be admitted to act either as the one or the other, without having ſerved a clerkſhip of five years, taken the oath provided in that caſe, and been enrolled.—Judges of the ſaid courts of law are to examine into the capacity of the *attorneys*; and thoſe of the courts of equity, into the capacity of the *ſolicitors*. 2 G. II. c. 23.

Anciently, thoſe of authority in courts had it in their power whether or no to ſuffer men to appear or ſue by another than themſelves; as appears from Fitz. de Nat. Brev. in the writ, *Dedimus poteſtatem de atturnato faciendo*; where it appears, that men were driven to procure the king's writs, or letters patent, to appoint *attorneys* for them: but it is ſince provided by parliament, that it ſhall be lawful to appoint an *attorney* without any circuition: as appears by ſeveral ſtatutes. 20 H. III. c. 10. 6 Ed. I. c. 8. &c.

There is a great diverſity of writs in the table of the regiſter, wherein the king commands the judges to admit of *attorneys*; whereby there aroſe ſo many unſkilful *attorneys*, and ſo many miſchiefs thereby, that for reſtraining them, it was enacted, 4 H. IV. c. 18. that the judges ſhould examine them, and diſplace the unſkilful; and again, 33 H. VI. c. 7. that there ſhould be but a certain number of *attorneys* in Norfolk and Suffolk. And many ſubſequent ſtatutes have brought them under farther regulations. 3 Jac. I. c. 7. 12 G. I. c. 29. 2 G. II. c. 23. 22 G. II. c. 46. 23 G. II. c. 26.

Attorney is either *general* or *ſpecial.*

ATTORNEY-*general*, is he who is appointed to manage the affairs, or ſuits of a community; or rather, he who is appointed to conduct all the ſuits in general, whether of a community, or a particular perſon.

Such is the *attorney-general* of the king, who is the ſame as the *procurator Cæſaris* in the Roman empire. See PROCURATOR.

To him come warrants for making out patents, pardons, &c.

He is at the head of managing all law-affairs of the crown, either in criminal proſecutions, or otherwiſe; eſpecially in matters of treaſon, ſedition, &c. In all courts he pleads within the bar; but, when a privy counſellor, he cannot plead in any court, but on the king's affairs, without obtaining a privy-ſeal for ſo doing.

ATTORNEY-*ſpecial*, is he who is employed in one or more cauſes particularly ſpecified.

Attorneys are alſo diſtinguiſhed, with reſpect to the courts, into *attorneys at large*, and *attorneys ſpecial*, belonging to this or that court only.—No man can practiſe as an *attorney* in any particular court, unleſs he is admitted and ſworn an *attorney* of that court.

ATTORNEY *of the duchy court of Lancaſter*, *atturnatus curiæ ducatus Lancaſtriæ*, is the ſecond officer in that court; being there, for his ſkill in law, placed as aſſeſſor to the chancellor of the court.

ATTORNEY, *Letter of.* See LETTER.

ATTORNEY, *Warrant of.* See WARRANT.

ATTOURNMENT, or **ATTORNMENT**, in *Law*, a transferring of duty and ſervice to another lord; or an acknowledgment which a tenant makes of homage and ſervice to a new lord.

Thus, when one is tenant for life, and he in reverſion grants his right to another, it is neceſſary the tenant for life agree thereto, which is called *attournment*; and without which nothing paſſes by the grant.—If the grant be by fine, in court of record, the tenant ſhall be compelled to *attourn.* Stat. 27 H. VIII.

The words uſed in *attournment* are theſe: *I agree to the grant made to you*; or, more commonly, *I attourn to you by force of the ſame grant*; or, *I become your tenant*; *or deliver to the grantee a penny by way of attournment.* Lyttel. lib. 3.

Attournment is either by word, or by act; voluntary, or compulſory; by the writ *per quæ ſervitia*, or by diſtreſs.—It may be made to the lord himſelf, or to his ſteward, in court.

There is alſo *attournment* in deed, and *attournment* in law. *Attournment* in law is an act, which though it be not an expreſs *attournment*, yet, in intendment of law, is of equal force.

This was a large topic in our *Common Law*; but now much of this learning is out of uſe: and by a late ſtatute it is enacted, that all grants and conveyances of manors, lands, rents, reverſions, &c. by fine or otherwiſe, ſhall be good without the *attournment* of the tenants of ſuch lands, or of the particular tenant upon whoſe eſtate any ſuch reverſion, &c. ſhall be expectant or depending. But notice muſt be given of the grant to the tenant; before which he ſhall not be prejudiced by payment of any rent to the grantor, or for breach of the condition for non-payment. Stat. 4 and 5 Ann, c. 16. And *attournments* of lands, &c. made by tenants to ſtrangers, ſhall be void, and their landlord's poſſeſſion not affected thereby. Though this ſhall not extend to vacate any *attournment* made purſuant to a judgment at law, or with conſent of the landlord; or on a forfeited mortgage, &c. by 11 G. II. c. 19.

ATTRACTION, **ATTRACTIO**, or **TRACTIO**, in *Mechanics*, the act of a moving power, whereby a moveable is *drawn*, or brought nearer to the mover.

The word is compounded of *ad*, *to*, and *traho*, *I draw.*

As ACTION and RE-ACTION are always equal, and contrary; it follows, that, in all *attraction*, the mover is drawn towards the moveable, as much as the moveable towards the mover.

ATTRACTION, or **ATTRACTIVE** *force*, in the *Ancient Phyſics*, denotes a natural power ſuppoſed to be inherent in certain bodies, whereby they act on other diſtant bodies, and draw them toward themſelves.

This the Peripatetics call the *motion of attraction*; and on many occaſions, SUCTION; and produce various inſtances where they ſuppoſe it to obtain.—Thus the air, in reſpiration, is taken in, according to them, by *attraction of ſuction*; ſo is the ſmoke through a pipe of tobacco; and the milk out of the mother's breaſt: thus alſo it is, that the blood and humours riſe in a cupping-glaſs, water in a pump, and ſmoke in chimneys; ſo vapours and exhalations are attracted by the ſun, iron by the magnet, ſtraws by amber, and electrical bodies, &c. But the later philoſophers generally explode the notion of *attraction*; aſſerting, that a body cannot act where it is not; and that all motion is performed by a mere impulſion.—Accordingly, moſt of the effects which the ancients attributed to this unknown part of *attraction*, the moderns have diſcovered to be owing to more ſenſible and obvious cauſes; particularly the preſſure of the AIR. To this are owing the *phænomena* of inſpiration, ſmoaking, ſucking, cupping-glaſſes, pumps, vapours, exhalations, &c.

The power oppoſite to *attraction* is called REPULSION; which is alſo argued to have ſome place in natural things.

ATTRACTION, or **ATTRACTIVE** *power*, is more particularly uſed, in the *Newtonian Philoſophy*, for a power, or principle, whereby all bodies, and the particles of all bodies, mutually tend towards each other.—Or, more juſtly, *attraction* is the effect of ſuch power, whereby every particle of matter tends towards every other particle.

Attraction, its laws, *phænomena*, &c. form the chief ſubject of Sir Iſaac Newton's philoſophy. See NEWTONIAN *Philoſophy.*

The principle of *attraction*, in the Newtonian ſenſe of it, ſeems to have been firſt ſurmiſed by Copernicus. “As “for gravity,” ſays Copernicus, “I conſider it as no- “thing more than a certain natural appetence *(appetentia)* “that the Creator has impreſſed upon all the parts of “matter, in order to their uniting or coaleſcing into a “globular form, for their better preſervation; and it is “credible that the ſame power is alſo inherent in the “ſun and moon, and planets, that thoſe bodies may “conſtantly retain that round figure in which we be- “hold them.” De Rev. Orb. Cœleſt. lib. i. cap. 9. And Kepler calls gravity a corporeal and mutual affection between ſimilar bodies, in order to their union. Aſt. Nov. in Introd. And he pronounces more poſitively, that no bodies whatſoever were abſolutely light, but only relatively ſo; and conſequently, that all matter was ſubjected to the law of gravitation. Ibid.

The firſt in this country who adopted the notion of *attraction*, was Dr. Gilbert, in his book De Magnete; and the next was the celebrated Lord Bacon. Nov. Organ. lib. ii. aphor. 36. 45. 48. Sylv. cent. i. exp. 33. In France it was received by Fermat and Roberval; and in Italy by Galilæo and Borelli. But till Sir Iſaac Newton appeared, this principle was very imperfectly defined and applied.

It muſt be obſerved, that though this great author makes uſe of the word *attraction*, in common with the ſchool philoſophers; yet he very ſtudiouſly diſtinguiſhes between the ideas.—The ancient *attraction* was ſuppoſed a kind of quality, inherent in certain bodies themſelves; and ariſing from their particular or ſpecific forms.

The Newtonian *attraction* is a more indefinite principle; denoting, not any particular kind or manner of action, nor the phyſical cauſe of ſuch action; but only a tendency in the general, a *conatus accedendi*, to whatever cauſe, phyſical or metaphyſical, ſuch effect be owing; whether to a power inherent in the bodies themſelves, or to the impulſe of an external agent.

Accordingly, that author, in his Philoſoph. Nat. Prin. Math. notes, “that he uſes the words *attraction*, *impulſe*, “and *propenſion* to the centre, indifferently; and cautions “the reader not to imagine, that by *attraction* he expreſſes “the *modus* of the action, or the efficient cauſe thereof; “as if there were any proper powers in the centres, “which in reality are only mathematical points; or, as “if centres could attract.” Lib. i. p. 5.—So he “con- “ſiders centripetal powers as *attractions*; though, phy- “ſically ſpeaking, it were perhaps more juſt to call them “*impulſes.*” Ib. p. 147. He adds, “that what he calls “*attraction* may poſſibly be effected by impulſe, though “not a common or corporeal impulſe; or after ſome “other manner unknown to us.” Optic. p. 322.

Attraction, if conſidered as a quality ariſing from the ſpecific forms of bodies, ought, together with ſympathy, antipathy, and the whole tribe of occult qualities, to be exploded. But when we have ſet theſe aſide, there will remain innumerable *phænomena* of nature, and particularly the gravity or weight of bodies, or their tendency to a centre, which argue a principle of action ſeemingly diſtinct from impulſe; where, at leaſt, there is no ſenſible impulſion concerned. Nay, what is more, this action, in ſome reſpects, differs from all impulſion we know of; impulſe being always found to act in proportion to the ſurfaces of bodies; whereas gravity acts according to their ſolid content, and conſequently muſt ariſe from ſome cauſe that penetrates or pervades the whole ſubſtance thereof.—This unknown principle, unknown, we mean, in reſpect of its cauſe; for its *phænomena* and effects are moſt obvious, with all the ſpecies and modifications thereof, we call *attraction*; which is a general name, under which all mutual tendencies, where no phyſical impulſe appears, and which cannot, therefore, be accounted for from any known laws of nature, may be ranged.

And hence ariſe divers particular kinds of *attraction*; as, GRAVITY, MAGNETISM, ELECTRICITY, &c. which are ſo many different principles, acting by different laws; and only agreeing in this, that we do not ſee any phyſical cauſes thereof: but that, as to our ſenſes, they may really ariſe from ſome power or efficacy in ſuch bodies, whereby they are enabled to act, even upon diſtant bodies; though our reaſon abſolutely diſallows of any ſuch action.

Attraction may be divided, with reſpect to the law it obſerves, into two kinds.—1. That which extends to a ſenſible diſtance.—Such are the *attraction* of GRAVITY, found in all bodies: and the *attraction* of MAGNETISM, and ELECTRICITY, found in particular bodies.—The ſeveral laws and *phænomena* of each, ſee under their reſpective articles.

The *attraction* of GRAVITY, called alſo among mathematicians the *centripetal force*, is one of the greateſt and moſt univerſal principles in all nature. We ſee and feel it operate on bodies near the earth, and find, by obſervation, that the ſame power (i. e. a power which acts in the ſame manner, and by the ſame rules, viz. always proportionably to the quantities of matter, and as the ſquares of the diſtances reciprocally) does alſo obtain in the moon, and the other planets primary and ſecondary, as well as in the comets: and even that this is the very power whereby they are all retained in their orbits, &c. And hence, as gravity is found in all the bodies which come under our obſervation, it is eaſily inferred, by one of the ſettled rules of philoſophizing, that it obtains in all others; and as it is found to be as the quantity of matter in each body, it muſt be in every particle thereof; and hence, every particle in nature is proved to *attract* every other particle, &c. See the demonſtration hereof laid down at large, with the application of the principle to the celeſtial motions, under the articles CENTRIFUGAL, CENTRIPETAL, COMET, MOON, NEWTONIAN *Philoſophy*, PLANET, SATELLITE, SUN, &c.

From this *attraction* ariſes all the motion, and conſequently all the mutation, in the great world.—By this, heavy bodies deſcend, and light ones aſcend; by this projectiles are directed, vapours and exhalations riſe, and rains, &c. fall. By this rivers glide, the air preſſes, the ocean ſwells, &c. In effect, the motions ariſing from this principle make the ſubject of that extenſive branch of mathematics, called MECHANICS, or STATICS; with the parts or appendages thereof, HYDROSTATICS, PNEUMATICS. See MATHEMATICS, PHILOSOPHY, &c.

2. That which does not extend to ſenſible diſtances.—Such is found to obtain in the minute particles whereof bodies are compoſed, which attract each other at, or extremely near, the point of contact, with a force much ſuperior to that of gravity; but which at any diſtance from it decreaſes much faſter than the power of gravity.—This power, a late ingenious author chooſes to call the *attraction of* COHESION; as being that whereby the atoms or inſenſible particles of bodies are united into ſenſible maſſes.

This latter kind of *attraction* owns Sir Iſaac Newton for its diſcoverer; as the former does, for its improver.—The laws of motion, percuſſion, &c. in ſenſible bodies under various circumſtances, as falling, projected, &c. aſcertained by the later philoſophers, do not reach to thoſe more remote, inteſtine motions of the component particles of the ſame bodies, whereon the changes of the texture, colour, properties, &c. of bodies depend: ſo that our philoſophy, if it were only founded on the principle of gravitation, and carried ſo far as that would lead us, would neceſſarily be very deficient.

But, beſide the common laws of ſenſible maſſes, the minute parts they are compoſed of are found ſubject to ſome others, which have been but lately taken notice of, and are even yet very imperfectly known. Sir Iſaac Newton, to whoſe happy penetration we owe the hint, contents himſelf to eſtabliſh, that there are ſuch motions in the *minima naturæ*, and that they flow from certain powers or forces, not reducible to any of thoſe in the great world. —In virtue of theſe powers, he ſhews, "That the ſmall
" particles act on one another, even at a diſtance; and
" that many of the *phænomena* of nature are the reſult
" thereof. Senſible bodies, we have already obſerved,
" act on one another divers ways; and as we thus per-
" ceive the tenour and courſe of nature, it appears highly
" probable, that there may be other powers of the like
" kind; nature being very uniform and conſiſtent with
" herſelf.—Thoſe juſt mentioned reach to ſenſible diſ-
" tances, and ſo have been obſerved by vulgar eyes: but
" there may be others, which reach to ſuch ſmall diſ-
" tances as have hitherto eſcaped obſervation; and it is
" probable electricity may reach to ſuch diſtances, even
" without being excited by friction."

The great author juſt mentioned proceeds to confirm the reality of theſe ſuſpicions from a great number of *phænomena* and experiments, which plainly argue ſuch powers and actions between the particles, e. gr. of ſalts and water, oil of vitriol and water, *aqua fortis* and iron, ſpirit of vitriol and ſalt-petre. He alſo ſhews, that theſe powers, &c. are unequally ſtrong between different bodies; ſtronger, e. gr. between the particles of ſalt of tartar and thoſe of *aqua fortis*, than thoſe of ſilver; between *aqua fortis* and *lapis calaminaris*, than iron; between iron than copper, copper than ſilver, or mercury. So ſpirit of vitriol acts on water, but more on iron or copper, &c.

The other experiments which countenance the exiſtence of ſuch principle of *attraction* in the particles of matter, are innumerable; many of them the reader will find enumerated under the articles ACID, MATTER, MENSTRUUM, SALT, &c.

Theſe actions, in virtue whereof the particles of the bodies above-mentioned tend towards each other, the author calls by a general, indefinite name, *attraction*, which is equally applicable to all actions, whereby diſtant bodies tend towards one another, whether by impulſe, or by any other more latent power: and from hence he accounts for an infinity of *phænomena*, otherwiſe inexplicable, to which the principle of gravity is inadequate.—Such are COHESION, DISSOLUTION, COAGULATION, CRYSTALLIZATIGN, the ASCENT of fluids in capillary tubes, *animal* SECRETION, FLUIDITY, FIXITY, FERMENTATION, &c. See SPHERICITY, &c.

" Thus (adds our immortal author) will nature be found
" very conformable to herſelf, and very ſimple; per-
" forming all the great motions of the heavenly bodies,
" by the *attraction* of GRAVITY, which intercedes thoſe
" bodies, and almoſt all the ſmall ones of their parts, by
" ſome other attractive power diffuſed through the par-
" ticles thereof.—Without ſuch principles, there never
" would have been any motion in the world; and with-
" out the continuance thereof, motion would ſoon periſh,
" there being otherwiſe a great decreaſe or diminution
" thereof, which is only ſupplied by theſe active princi-
" ples." Optics, p. 373.

We need not ſay how unjuſt it is in the generality of foreign philoſophers, to declare againſt a principle which furniſhes ſo beautiful a view; for no other reaſon, but becauſe they cannot conceive how one body ſhould act on another at a diſtance.—It is certain, philoſophy allows of no action but what is by immediate contact and impulſion (for how can a body exert any active power there, where it does not exiſt? to ſuppoſe this of any thing, even the Supreme Being himſelf, would perhaps imply a contradiction): yet we ſee effects without ſeeing any ſuch impulſe; and where there are effects, we can eaſily infer there are cauſes, whether we ſee them or no. But a man may conſider ſuch effects, without entering into the conſideration of the cauſes; as, indeed, it ſeems the buſineſs of a philoſopher to do: for to exclude a number of *phænomena* which we do ſee, will be to leave a great chaſm in the hiſtory of nature; and to argue about actions which we do not ſee, will be to build caſtles in the air.—It follows, therefore, that the *phænomena* of *attraction* are matter of phyſical conſideration, and as ſuch intitled to a ſhare in the ſyſtem of PHYSICS; but that the cauſes thereof will only become ſo, when they become ſenſible; i. e. when they appear to be the effect of ſome other higher cauſes (for a cauſe is no otherwiſe ſeen than as itſelf is an effect, ſo that the firſt cauſe muſt from the nature of things be inviſible): we are therefore at liberty to ſuppoſe the cauſes of *attractions* what we pleaſe, without any injury to the effects.—The illuſtrious author himſelf ſeems a little irreſolute as to the cauſes, inclining, ſometimes, to attribute *gravity* to the action of an immaterial cauſe; Optics, p. 343, &c. and ſometimes to that of a material one. Ib. p. 325.

In his philoſophy, the reſearch into cauſes is the laſt thing; and never comes under conſideration till the laws and *phænomena* of the effect be ſettled; it being to theſe *phænomena* that the cauſe is to be accommodated.—The cauſe even of any, the groſſeſt, and moſt ſenſible action, is not adequately known: how impulſe or percuſſion itſelf produces its effect, i. e. how motion is communicated by body to body, confounds the deepeſt philoſophers; yet is impulſe received not only into *philoſophy*, but into *mathematics*; and accordingly the laws and *phænomena* of its effects make the greateſt part of common *mechanics*.

The other ſpecies of *attraction*, therefore, in which no impulſe is remarkable, when their *phænomena* are ſufficiently aſcertained, have the ſame title to be promoted from *phyſical* to *mathematical* conſideration; and this, without any previous inquiry into their cauſes, which our conceptions may not be proportionate to: let their cauſes be occult, as all cauſes, ſtrictly ſpeaking, are, ſo that their effects, which alone immediately concern us, be but apparent. See CAUSE.

Our noble countryman, then, far from adulterating philoſophy with any thing foreign, or metaphyſical, as many have reproached him with doing, has the glory of having thrown every thing of this kind out of his ſyſtem, and of having opened a new ſource of ſublimer *mechanics*, which, duly cultivated, might be of infinitely greater extent than all the *mechanics* yet known: it is hence alone we muſt expect to learn the manner of the changes, productions, generations, corruptions, &c. of natural things; with all that ſcene of wonders opened to us by the operations of *chemiſtry*.

Some of our own countrymen have proſecuted the diſcovery with laudable zeal: Dr. Keil, particularly, has endeavoured to deduce ſome of the laws of this new action, and applied them to ſolve divers of the more general *phænomena* of bodies, as *coheſion*, *fluidity*, *elaſticity*, *ſoftneſs*, *fermentation*, *coagulation*, &c. And Dr. Freind, ſeconding him, has made a further application of the ſame principles, to account at once for almoſt all the *phænomena* that *chemiſtry* preſents.—So that ſome philoſophers are inclined to think that the new mechanics ſhould ſeem already raiſed to a complete ſcience; and that nothing now can occur, but what we have an immediate ſolution of, from the *attractive force*.

But this ſeems a little too precipitate; a principle ſo fertile ſhould have been further explored; its particular laws, limits, &c. more induſtriouſly detected, and laid down, before we had proceeded to the application.—*Attraction*, in the groſs, is ſo complex a thing, that it may ſolve a thouſand different *phænomena* alike: the notion is but one degree more ſimple and preciſe than action itſelf; and till more of its properties are aſcertained, it were better to apply it leſs, and ſtudy it more.—It may be added, that ſome of Sir Iſaac Newton's followers have been charged with falling into that error, which he induſtriouſly avoided, viz. of conſidering *attraction* as a cauſe or active property in bodies, not merely as a *phænomenon* or effect.

As a ſpecimen of the extent of the principle, and the manner of applying it, we ſhall here ſubjoin the principal laws and conditions of it; as deduced by Sir Iſaac Newton, Dr. Keil, Dr. Freind, &c.

Theor. I. Beſides that *attractive* power whereby the planets and comets are retained in their orbits, there is another, by which the ſeveral particles whereof bodies conſiſt, attract, and are mutually attracted by, each other. This theorem, we have already obſerved, is demonſtrable from a great number of *phænomena*.—We ſhall here only mention a few eaſy and obvious ones; as, the ſpherical figure aſſumed by the drops of fluids, which can only ariſe from ſuch principle: the uniting and incorporating of two ſpherules of quickſilver into one, upon the firſt touch, or extremely near approach, of their ſurfaces: the riſing of water up the ſides of a glaſs bubble immerged therein, higher than the level of the other water, or of mercury up a ſphere of iron, or the like.

As to the juſt law of this *attraction*, it is not yet determined: only this we know in the general, that the force, in receding from the point of contact, is diminiſhed in a greater proportion than that of the duplicate ratio of the diſtances, which is the law of gravity. Becauſe, if the diminution were only in ſuch duplicate ratio, the *attraction* at any ſmall aſſignable diſtance would be nearly the ſame as at the point of contact: whereas experience teaches, that this *attraction* almoſt vaniſhes, and ceaſes to have any effect, at the ſmalleſt aſſignable diſtance.—But whether to fix on a triplicate, quadruplicate, or ſome other proportion to the increaſing diſtance, is not aſcertained by experiment.

II. The quantity of *attraction*, in all bodies, is exactly proportional to the quantity of matter in the *attracting* body; as being in reality the reſult or ſum of the united forces of the *attractions* of all thoſe ſingle particles, of which it is compoſed; or, in other words, *attraction* in all bodies is, *cæteris paribus*, as their ſolidities.

Hence, 1. At equal diſtances the *attractions* of homogeneal ſpheres will be as their magnitudes.—And,

2. At any diſtance whatever, the *attraction* is as the ſphere divided by the ſquare of the diſtance.

This law, it muſt be noted, only holds in reſpect of atoms, or the ſmalleſt conſtituent particles, ſometimes called *particles of the laſt compoſition*; and not of corpuſcles or compoſitions made up of theſe; for they may be ſo put together, as that the moſt ſolid corpuſcles may form the lighteſt particles, i. e. the unfitneſs of their ſurfaces for intimate contact may occaſion ſuch great interſtices, as will make their bulks large in proportion to their matter.

III. If a body conſiſts of particles, every one of which has an *attractive* power decreaſing in a triplicate, or more than a triplicate ratio of their diſtances; the force wherewith a particle is attracted by that body in the point of contact, or at an infinitely little diſtance from the contact, will be infinitely greater, than if that particle were placed at a given diſtance from the body.

IV. Upon the ſame ſuppoſition, if the *attractive* force, at any aſſignable diſtance, hath a finite ratio to its gravity, this force in the point of contact, or at an infinitely ſmall diſtance, will be infinitely greater than its power of gravity.

V. But if in the point of contact the *attractive* force of bodies hath a finite ratio to their gravity; this force in any aſſignable diſtance is infinitely leſs than the power of gravity; and therefore it becomes nothing.

VI. The *attractive* force of every particle of matter, in the point of contact, almoſt infinitely exceeds the power of gravity, but is not infinitely greater than that power; and therefore, in a given diſtance, the *attractive* force will vaniſh to nothing.

This *attractive* power, therefore, thus ſuperadded to matter, only extends to ſpaces extremely minute, and vaniſhes at greater diſtances; whence, the motion of the heavenly bodies, which are at a prodigious diſtance from each other, cannot be diſturbed by it, but will continually go on, as if there were no ſuch power in bodies.

Where this *attracting* power ceaſes, there, according to Sir Iſaac Newton, does a repelling power commence; or rather, the *attracting* does thenceforward become a *repelling* power.

VII. Suppoſing a corpuſcle to touch any body, the force whereby that corpuſcle is impelled, that is, the force with which it coheres to that body, will be proportionable to the quantity of contact; for the parts, farther removed from the point of contact, contribute nothing towards its COHESION.

Hence, according to the difference in the contact of particles, there will be different degrees of coheſion; but the powers of coheſion are greateſt when the touching ſurfaces are planes; in which caſe, *cæteris paribus*, the force by which one corpuſcle adheres to others will be as the parts of the touching ſurfaces.

Hence it appears why two perfectly poliſhed marbles, joined together by their plain ſurfaces, cannot be forced aſunder, but by a weight which much exceeds that of the incumbent air.

Hence alſo may be drawn a ſolution of that famous problem concerning the coheſion of the parts of matter.

VIII. The power of *attraction* in the ſmall particles increaſes, as the bulk and weight of the particles diminiſhes. For, the force only acting at or near the point of contact, the *momentum* muſt be as the quantity of contact, that is, as the denſity of the particles, and the largeneſs of their ſurfaces: but the ſurfaces of bodies increaſe or decreaſe as the ſquares, and the ſolidities, as the cubes, of the diameters. Conſequently the ſmalleſt particles, having the largeſt ſurfaces in proportion to their ſolidities, are capable of more contact, &c. Thoſe corpuſcles are moſt eaſily ſeparated from one another, whoſe contacts are the feweſt and the leaſt, as in ſpheres infinitely ſmall.

Hence we have the cauſe of FLUIDITY.

IX. The force whereby any corpuſcle is drawn to another nearly adjacent body, ſuffers no change in its quantity, let the matter of the *attracting* body be increaſed or diminiſhed; ſuppoſing the ſame denſity to remain in the body, and the diſtance of the corpuſcle to continue the ſame.

For ſince the *attractive* powers of particles are diffuſed only through the ſmalleſt ſpaces, it is manifeſt, that the remoter parts at C, D, and E (*Tab. Nat. Hiſt. fig.* 22.) contribute nothing towards *attracting* the corpuſcle A: and therefore the corpuſcle will be attracted with the ſame force towards B, whether theſe parts remain, or be taken away; or, laſtly, whether others be added to them.

Hence, particles will have different *attractive* forces, according to their different ſtructure and compoſition; thus a particle perforated will not attract ſo ſtrongly as if entire. So, again, the different figures into which a particle is formed, will occaſion a diverſity of power: thus a ſphere will attract more than a cone, cylinder, &c.

X. Suppoſe a body of ſuch a texture as that the particles of the laſt compoſition, by an external force, ſuch as a weight compreſſing them, or an impulſe given by another body, may be a little removed from their original contact, but ſo as not to acquire new ones; the particles by their *attractive* force tending to one another, will ſoon return to their original contacts.—But when the ſame contacts and poſitions of the particles which compoſe any body, return, the ſame figure of the body will alſo be reſtored; and therefore bodies which have loſt their original figures, may recover them by *attraction*.

Hence appears the cauſe of ELASTICITY.—For, where the contiguous particles of a body have by any external violence been forced from their former points of contact, to extremely ſmall diſtances; as ſoon as that force is taken off, the ſeparated particles muſt return to their former contact: by which means the body will reſume its figure, &c.

XI. But if the texture of a body be ſuch, that the particles, by an impreſſed force being removed from their contacts, come immediately into others of the ſame degree, that body cannot reſtore itſelf to its original figure. Hence we underſtand what texture that is, wherein the SOFTNESS of bodies conſiſts.

XII. The bulk of a body heavier than water may be ſo far diminiſhed, that it ſhall remain ſuſpended in water, without deſcending by its own gravity.

Hence it appears why ſaline, metallic, and other ſuch-like particles, when reduced to ſmall dimenſions, are ſuſpended in their *menſtrua*.

XIII. Greater bodies approach one another with a leſs velocity than ſmaller.—For the force with which two bodies A and B (*Tab. Nat. Hiſt. fig.* 23. N° 2.) approach, reſides only in the neareſt particles; the more remote having nothing to do therein. No greater force, therefore, will be applied to move the bodies A and B, than to move the particles *c* and *d*; but the velocities of bodies moved by the ſame force are in a reciprocal ratio of the bodies: wherefore the velocity with which the body A tends towards B is to the velocity with which the particle *c* detached from the body would tend towards the ſame B, as the particle *c* is to the body A; conſequently the velocity of the body A is much leſs than would be the velocity of the particle *c* detached from the body.

Hence it is, that the motion of large bodies is naturally ſo ſlow and languid, that an ambient fluid, and other circumjacent bodies, generally retard them; whilſt the leſſer go on more briſkly, and produce a greater number of effects; ſo much greater is the *attractive* energy in ſmaller bodies than in the larger.—Hence again appears the reaſon of that chemical axiom: *ſalts do not act till they are diſſolved.*

XIV. If a corpuſcle placed in a fluid be equally attracted every way by the circumambient particles, no motion of the corpuſcle will enſue.—But if it be attracted by ſome particles more than others, it will tend to that part where the attraction is greateſt; and the motion produced will correſpond to the inequality of the *attraction*; viz. the greater the inequality, the greater the motion, and *vice verſa.*

XV. Corpuſcles floating in a fluid, and attracting each other more than the particles of the fluid that lie between them, will force away the particles of the fluid, and ruſh to one another with a force equal to that by which their mutual *attraction* exceeds that of the particles of the fluid.

XVI. If a body be immerged in a fluid whoſe parts more ſtrongly attract the particles of the body than they do one another; and if there be a number of pores or interſtices in the body pervious to the particles of the fluid; the fluid will immediately diffuſe itſelf through thoſe pores. And if the connexion of the parts of the body be not ſo ſtrong, but that it may be overcome by the force of the particles ruſhing within it; there will be a diſſolution of the body.

Hence, for a *menſtruum* to be able to diſſolve any given body, there are three things required. 1. That the parts of the body attract the particles of the *menſtruum* more ſtrongly than theſe attract each other. 2. That the body have pores or interſtices open and pervious to the particles of the *menſtruum.* 3. That the coheſion of the particles, which conſtitute the body, be not ſtrong enough to reſiſt the irruption of the particles of the MENSTRUUM.

XVII. SALTS are bodies endued with a great attractive force, though among them be interſperſed many interſtices, which lie open to the particles of water; theſe are therefore ſtrongly attracted by thoſe ſaline particles, ſo that they forcibly ruſh into them, ſeparate their contacts, and diſſolve the contexture of the ſalts.

XVIII. If the corpuſcles be more attracted by the particles of the fluid than by each other, they will recede from each other, and be diffuſed through the whole fluid.

Thus, if a little ſalt be diſſolved in a deal of water, the particles of the ſalt, though ſpecifically heavier than water, will evenly diffuſe themſelves through the whole water, ſo as to make it as ſaline at top as bottom.—Does not this imply, that the parts of the ſalt have a *centrifugal*, or *repulſive* force, by which they fly from one another; or rather, that they attract the water more ſtrongly than they do one another? For as all things aſcend in water, which are leſs attracted than water by the gravity of the earth, ſo all the particles of ſalt floating in water, which are leſs attracted by any particle of ſalt than water is, muſt recede from the particle, and give way to the more attracted water. Newt. Opt. p. 363.

XIX. Corpuſcles, or little bodies, ſwimming in a fluid, and tending towards each other; if they be ſuppoſed elaſtic, will fly back again after their congreſs, till, ſtriking on other corpuſcles, they be again reflected towards the firſt; whence will ariſe innnmerable other conflicts with other corpuſcles, and a continued ſeries of percuſſions and reboundings.—But, by the *attractive* power, the velocity of ſuch corpuſcles will be continually increaſed; ſo that the *inteſtine* MOTION of the parts will at length become evident to ſenſe.

Add, that in proportion as the corpuſcles *attract* each other with a greater or leſs force, and as their elaſticity is in a greater or leſs degree, their motions will be different, and become ſenſible at various times, and in various degrees.

XX. If corpuſcles that *attract* each other happen mutually to touch, there will not ariſe any motion, becauſe they cannot come nearer. If they be placed at a very little diſtance from each other, a motion will ariſe; but if further removed, the force wherewith they *attract* each other will not exceed that wherewith they *attract* the particles of the intermediate fluid; and therefore no motion will be produced.

On theſe principles depend all the *phænomena* of *fermentation* and EBULLITION.

Hence appears the reaſon why oil of vitriol, when a little water is poured on it, works, and grows hot: for the ſaline corpuſcles are a little disjointed from their mutual contact, by the infuſed water; whence, as they *attract* each other more ſtrongly than they do the particles of water, and as they are not equally *attracted* on every ſide, there muſt of neceſſity ariſe a motion.

Hence alſo appears the reaſon of that uncommon ebullition, occaſioned by adding ſteel-filings to the aforeſaid mixture. For the particles of ſteel are extremely elaſtic; whence there muſt ariſe a very ſtrong reflexion.

Hence alſo we ſee the reaſon why ſome *menſtrua* act more ſtrongly, and diſſolve bodies ſooner, when diluted with water.

XXI. If corpuſcles mutually *attracting* each another have no elaſtic power, they will not be reflected back from each other; but will form a *congeries*, or little maſſes; whence a COAGULUM will ariſe.

If the gravity of the particles thus amaſſed exceed the gravity of the fluid, a PRECIPITATION will ſucceed.—Precipitation may alſo ariſe from an increaſe or diminution of the gravity of the *menſtruum* wherein the corpuſcles are immerged.

XXII. If corpuſcles ſwimming in a fluid, and mutually *attracting* each other, have ſuch a figure, as that in ſome given parts they have a greater *attractive* power than in others, and their contact greater in thoſe parts than in others; thoſe corpuſcles will unite into bodies with given figures; and thence will ariſe CRYSTALLIZATION.

XXIII. Particles immerged in a fluid moved with a ſwift or ſlow progreſſive motion, will attract each other in the ſame manner as if the fluid were at reſt; but if all the parts of the fluid do not move equally, the *attractions* will be diſturbed.

Hence it is, that many ſalts will not *cryſtallize*, till the water wherein they are diſſolved is cold.

XXIV. If between two particles of a fluid there happen to be a corpuſcle whoſe two oppoſite ſides have a ſtrong *attractive* power, that intermediate corpuſcle will agglutinate or faſten the particles of the fluid to itſelf.—And ſeveral ſuch corpuſcles diffuſed through the fluid will fix all its particles into a firm body; and the fluid will be frozen, or reduced into ice.

XXV. By the ſame principle of *attraction* and *repulſion*, moſt of the *phænomena* of ELECTRICITY may be accounted for.

It will in ſome degree appear in the courſe of this work, under the various articles referred to, or comprized in it, how far the principles, contained in theſe ſeveral theorems, are well founded; where they will properly apply to the explication of the *phænomena* of nature, and how far any of them are confirmed and illuſtrated by later obſervations and diſcoveries.

ATTRACTION, *center of.* See CENTER.

ATTRACTION *of mountains.* According to the Newtonian theory of *attraction*, this principle pervades the minuteſt particles of matter, and the combined action of all the parts of the earth, forms the *attraction* of the whole. For the ſame reaſon, therefore, that a heavy body tends downwards in a perpendicular to the earth's ſurface, conſidered as ſmooth and even, it muſt be *attracted* towards the centre of a neighbouring mountain, by a force proportional to the quantity of matter contained in it; and the effect of this *attraction*, or the accelerative force produced by it, muſt depend on the nearneſs or diſtance of the mountain from the gravitating body, becauſe this force increaſes as the ſquares of the diſtances decreaſe. Upon theſe principles it is obvious, that the plumb-line of a quadrant, or of any other aſtronomical inſtrument, muſt be deflected from its proper ſituation, by a ſmall quantity, towards the mountain, and the apparent altitudes and zenith diſtances of the ſtars, taken with the inſtrument, be altered accordingly: e. g. if the zenith diſtance of a ſtar on the meridian were obſerved at two ſtations under the ſame meridian, one on the ſouth ſide of a mountain, the other on the north; and the plumb-line of the inſtrument were *attracted* out of its vertical poſition by the mountain, the ſtar muſt appear too much to the north, by the obſervation at the ſouthern ſtation, and too much to the ſouth by that at the northern ſtation; and conſequently the difference of the latitudes of the two ſtations reſulting from theſe obſervations would be greater than it really is. If then the true difference of their latitudes be determined by meaſuring the diſtance between the two ſtations on the ground, the exceſs of the difference found by the obſervations of the ſtar above that found by this meaſurement, muſt have been produced by the *attraction* of the mountain; and the half of it will be the effect of ſuch *attraction* on the plumb-line at each obſervation, provided that the mountain attracts equally on both ſides.

The firſt hint for determining the quantity of this *attraction* was ſuggeſted by Sir Iſaac Newton in his Treatiſe of the Syſtem of the World; and the firſt experiment for this purpoſe was conducted by M. Bouguer, and M. de la Condamine, in the year 1738. Whilſt they were employed in meaſuring three degrees of the meridian, near Quito in Peru, they endeavoured to aſcertain the effect of the *attraction* of Chimboraco, a mountain in that neighbourhood, which, by a rough computation, they ſuppoſed to be equal to about the 2000th part of the *attraction* of the whole earth. By obſerving the altitudes of fixed ſtars at two ſtations, one on the ſouth ſide of the mountain, and the other on the weſt, they found the quantity of 7½″ in favour of the *attraction* of the mountain by a mean of their obſervations; whereas the plumb-line, according to the theory, ſhould have declined from the true vertical line 1′ 43″. However, though the general reſult is favourable to the Newtonian doctrine, the experiment was performed under ſo many diſadvantages, as not to afford the ſatisfaction which was to be wiſhed. And M. Bouguer terminates his account of their obſervations, with expreſſing his wiſhes, that the experiment might be repeated under more favourable circumſtances either in France or in England. Figure de la Terre.

Nothing was afterwards done, till Mr. Maſkelyne, the aſtronomer royal, made a propoſal to the Royal Society for this purpoſe in the year 1772; and in 1774 he was deputed to make the trial, accompanied with proper aſſiſtants, and furniſhed with the moſt accurate inſtruments. He made choice of the mountain Schehallien, in Scotland, for the ſcene of his operations; the direction of which is nearly from eaſt to weſt, its mean height above the ſurrounding valley about 2000 feet, and its higheſt part above the level of the ſea 3550 feet. Two ſtations for obſervations were ſelected, one on the north, and the other on the ſouth ſide of the mountain. Every circumſtance that could contribute to the accuracy of the experiment was regarded; and from obſervations of ten ſtars near the zenith, Mr. Maſkelyne found the apparent difference of the altitudes of the two ſtations to be 54″,6; and from a meaſurement by triangles, formed from two baſes on different ſides of the mountain, he found the diſtance of their parallels to be 4364 feet, which, in the latitude of Schehallien, viz. 56° 40′, anſwer to an arch of the meridian of 43″, leſs by 11″,6 than that found by the ſector. Its half, therefore, or 5″,8, is the mean effect of the *attraction* of the mountain. From this experiment, conducted with great aſſiduity and accuracy, and terminated to the eſtabliſhment of the Newtonian theory, Mr. Maſkelyne infers, that the mountain Schehallien exerts a ſenſible *attraction*; and therefore that every mountain, and every particle of the earth, is endued with the ſame property, in proportion to its quantity of matter. The law of the variation of this force in the inverſe ratio of the ſquares of the diſtances is likewiſe confirmed by it; for if the force of the *attraction* of the hill had been only to that of the earth, as the matter in the hill to that of the earth, and had not been greatly increaſed by the near approach to its centre, the *attraction* muſt have been wholly inſenſible. And he infers alſo, that the mean denſity of the earth is at leaſt double of that at the ſurface, and conſequently, that the denſity of the internal parts of the earth is much greater than that of thoſe near the ſurface; and the whole quantity of matter in the earth will be at leaſt twice as great as if it were compoſed of matter of the ſame denſity with that at the ſurface; and therefore that the hypotheſis of thoſe naturaliſts, who ſuppoſe the earth to be only a great hollow ſhell of matter, is groundleſs. And finally, that the ſenſible deflections in the plumb-lines of aſtronomical inſtruments, by the denſity of the ſuperficial parts of the earth, muſt cauſe apparent inequalities in the menſurations of degrees in the meridian. He candidly acknowledges, after all, that a ſingle experiment is not ſufficient to aſcertain a matter of ſuch importance, and recommends other experiments of a ſimilar kind to be repeated in various places, and attended with different circumſtances. Schehallien may differ in its internal conſtitution from other mountains, as there is no appearance of its ever having been a volcano, which is the caſe of many others. Phil. Tranſ. vol. lxv. part 2. N° 48 and 49.

Attractive *power*, or *force*. See **Power** and **Attraction**.

The *attractive virtue* in loadſtone is communicable, by *touching*, to iron or ſteel.

ATTRACTIVES, or **Attractive** *remedies*, denote medicines which are to be externally applied, and which by their activity and warmth penetrate the pores, and mix with and rarefy any obſtructed matter, ſo as to render it fit for diſcharge, upon laying open the part by a cauſtic or inciſion.

Attrahents are the ſame with what we otherwiſe call *drawers*, *ripeners*, *maturants*, and *digeſtives*.

The principal ſimples belonging to this claſs are, the ſeveral kinds of fats or *adipes*, the dungs of pigeons and cows, bran, yeſt, herring, melilot, tobacco, oil, pitch, reſin, frankincenſe, &c. See each under its proper article.

In many inſtances, as the matter rarefies and grows more fluid by means of ſuch medicines, the refluent blood is apt to waſh it back into the common maſs; which ſometimes does great miſchief; or by making it take up more room upon its rarefaction, it occaſions it to diſtend more the parts in which it is contained: upon which a ſenſe of pain is excited, and thereby a greater concourſe of fluid, and conſequently an increaſe of the tumour.—So that medicines under this denomination require the moſt careful management.

ATTRIBUTE, from *attribuo*, in a general ſenſe, that which agrees to ſome perſon, or thing; or a quality, which determines ſomething to be after a certain manner.

Thus, underſtanding is an *attribute* of mind; figure, an *attribute* of body, &c.—Spinoza makes the ſoul and the body to be of the ſame ſubſtance; with this only difference, that the ſoul is to be conceived under the *attribute* of thought, and the body under that of extenſion.

Of the ſeveral *attributes* belonging to any ſubſtance, that which preſents itſelf firſt, and which the mind conceives as the foundation of all the reſt, is called its *eſſential attribute*.

Thus, extenſion is by ſome, and ſolidity by others, made the eſſential *attribute* of body or matter.

The other *attributes* are called *accidental* ones: e. gr. roundneſs in wood, or learning in a man.—Mr. Locke endeavours to prove, that thinking, which the Carteſians make the eſſential *attribute* of the mind, is only an accidental one.

Attribute, in *Logic*, is an epithet given to any ſubject; or it is any predicate thereof; or whatever may be affirmed or denied of any thing.

Every propoſition conſiſts of a ſubject, an *attribute*, and a *copula*, or conjunctive particle. See **Proposition**.

Attributes are uſually divided into *poſitive*, which give a thing ſomewhat; as when we ſay of a man, that he is *animate*: and negative; as when we ſay of a ſtone, that it is *inanimate*.

Others, again, divide them into *common*, which agree to ſeveral different things; as *animal*, which agrees both to man and brute; and *proper*, as *thought*, &c. which agrees only to ſpirit, *rationality* to man, &c.

Attributes, in *Theology*, denotes the ſeveral qualities, and perfections, which we conceive in God; and which conſtitute his proper eſſence; as juſtice, goodneſs, wiſdom, &c.

The heathen mythologiſts divided the deity into as many diſtinct beings as he has *attributes*: thus the *power* of God was called *Jupiter*; the *wrath* of God, *Juno*; the abſolute *will* of God, *Fate*, or *Deſtiny*, to which even his very power is ſubject.

Attributes, in *Painting* and *Sculpture*, are ſymbols added to figures and ſtatues, to denote their particular office and character.

Thus the *club* is an *attribute* of Hercules; the *palm* is an *attribute* of victory; the *peacock* of Juno; the *eagle* of Jupiter; the *trident* of Neptune; the *balance* of Juſtice; the *olive* of Peace, &c.

ATTRIBUTIVES, in *Grammar*, are words which are ſignificant of *attributes*; and thus include adjectives, verbs, and participles, which are *attributes* of ſubſtances, and adverbs, which denote the *attributes* only of *attributes*. Mr. Harris, who has introduced this diſtribution of words, denominates the former *attributives* of the firſt order, and the latter *attributives* of the ſecond order. Harris's Hermes.

ATTRITION, *triture*, or *friction*, expreſſes ſuch a motion of bodies againſt one another, as ſtrikes off ſome ſuperficial particles; whereby they gradually become leſs and leſs.

The word is formed of *atterere, to wear.*

The grinding and poliſhing of bodies is performed by *attrition.*

The effects of *attrition* in exciting heat, light, electricity, &c. ſee under ELECTRICITY, FIRE, HEAT, and LIGHT.

ATTRITION is alſo frequently uſed for the friction or rubbing of ſuch ſimple bodies one againſt another, as will not wear out, but will occaſion ſome particular determinations of the fluids they contain.

Thus, the various ſenſations of hunger, pain, or pleaſure, are ſaid to be occaſioned by the *attritions* of the organs formed for ſuch impreſſions.

ATTRITION, among *Divines*, denotes a ſorrow or regret for having offended God; ariſing from a ſenſe of the odiouſneſs of ſin, and the apprehenſions of puniſhment; i. e. of the loſs of heaven, and the pains of hell.

Attrition is eſteemed the loweſt degree of repentance, being a ſtep ſhort of contrition, which ſuppoſes the love of God an ingredient or motive of our ſorrow and repentance. See CONTRITION.

ATTROW, in *Botany*, a name given by the people of Guinea to a plant which they uſe in caſes of ſwellings, boiling the leaves in water, and uſing the decoction by way of a fomentation.

It is a ſpecies of KALI, and is called by Petiver *kali Guineenſee foliis polygoni, floribus verticilli in modum diſpoſitis*, from its leaves reſembling the common knot-graſs, and its flowers growing in rundles round the ſtalks. Phil. Tranſ. N° 232.

ATTRUMMAPHOC, in *Botany*, a name given by the people of Guinea to a ſhrub which they uſe in medicine; they boil it in water, and give the decoction in the venereal diſeaſe. The juice of it, when freſh preſſed out, is alſo uſed, ſnuffed up the noſtrils, to promote ſneezing, and cure ſeveral diſorders of the head and eyes. Phil. Tranſ. N° 232.

It is a ſpecies of COLUTEA, called by Petiver COLUTEA *lanuginoſa floribus parvis ſiliquis piloſis deorſum tendentibus*; and Dr. Herman calls it an *aſtragalus*.

ATTURNATO *faciendo vel recipiendo*; ſee ATTORNATO, &c.

ATYPOS, from α, *negative*, and τυπος, *form* or *tenor*, *erratic*, or *irregular*, a word uſed by the old writers in medicine, for ſuch diſeaſes as did not obſerve any regularity in their periods.

Others have alſo uſed the ſame word in a very different ſenſe, namely, for deformities and irregularities in the limbs; and others, for perſons, who from ſome defects in the organs of ſpeech, cannot articulate certain particular ſounds.

AVA AVA, a plant ſo called by the inhabitants of Otaheite, in the South Sea, from the leaves of which they expreſs an intoxicating juice. It is drank very freely by the chiefs, and other conſiderable perſons, who vie with each other in drinking the greateſt number of draughts, each draught being about a pint; but it is carefully kept from their women. Hawkeſworth's Voyages, vol. ii. p. 200.

AVANIA, in the *Turkiſh Legiſlature*, a fine for crimes, and on deaths, paid to the governor of the place. In the places where ſeveral nations live together under a Turkiſh governor, he takes this profitable method of puniſhing all crimes among the Chriſtians, or Jews, unleſs it be the murder of a Turk. Pocock's Eg. vol. ii. part 2. p. 30.

AVANT, a French prepoſition, ſignifying *before*, or any priority either in reſpect of time, or place; ſometimes uſed, in compoſition, in our language, but more uſually contracted, and wrote *vaunt*, or *vant*, or even VAN.

AVANT *foſſe*, &c. See VAN *foſſe*.

AVANT *guard*, &c. See *Van* GUARD, &c.

AVANTE, among the *Old Writers* in *Phyſic*, a name given to a diſeaſe, ſeeming, from their accounts of it, the ſame we call HYPOCHONDRIASM.

AVANTURINE, in *Natural Hiſtory*, a yellowiſh ſtone full of ſparkles, reſembling gold, very common in France. An artificial imitation of it is made by mixing ſparkles of copper with glaſs, whilſt it is in fuſion, which is uſed by enamellers, and to ſprinkle as ſand upon writings.

AVARAMO TEMO, in *Botany*, the name of a ſiliquoſe tree, which grows in the Braſils. The bark is externally of a cineritious, and internally of a deep red colour; and is the only part of the plant uſed by the ſkilful for medicinal purpoſes; though the ſame aſtringent qualities are by ſome applied to the leaves; for the bark, which is of a bitter taſte, whether reduced to a powder, or boiled and uſed by way of fomentation, happily cures inveterate and obſtinate ulcers, and, as it is ſaid, has been found to cure cancers themſelves, by means of its remarkably cleanſing and drying nature.

Beſide theſe purpoſes, it is alſo made choice of on account of its effectually aſtringent quality, for baths deſigned to ſtrengthen and invigorate the muſcular parts of the body, when weakened, or too much relaxed. Ray ſays it is much uſed by courtezans for contracting the *pudenda*.

AVARIA, in the Turkiſh and Perſian dominions, a ſum of money exacted from the Chriſtians or Europeans, to be quit of ſome falſe accuſation framed on purpoſe.

AVAST, a term frequently uſed on board a ſhip, ſignifying to ſtop, hold, or ſtay.

The word is formed of the Italian *voſta*, or *baſta*, *it is enough, it ſuffices*.

AVAUNCHERS, among *Hunters*, the ſecond branches of a hart's horn.

AUBAINE, in the French *Cuſtoms*, a right veſted in the king, of being heir to a foreigner, who dies within his dominions.

The word is formed of *aubain*, a *foreigner*; which Menage derives further from the Latin, *alibi natus*; Cujas, from *advena*, which is the name foreigners bear in the capitularies of Charlemagne; Du-Cange, from *Albanus*, a Scot, or Iriſhman; becauſe theſe were anciently much given to travelling and living abroad.

The king of France, by the right of *aubaine*, claims the inheritance of all foreigners in his dominions; excluſive of all other lords, and even of any teſtament the deceaſed could make. An embaſſador, though not naturalized, is not ſubject to the right of *aubaine*. The Swiſs, Savoyards, Scots, and Portugueſe, are alſo exempted from the *aubaine*, as being reputed natives and regnicoles.

AUBIER, anciently AUBOUR. Thus the French call that ſoft and whitiſh ſubſtance, which lies all round the tree between the bark and the ſolid wood; and for which we have no particular name in Engliſh. Mr. Barkley thinks it performs the office of veins. It may be conſidered as a third bark, and ſo ſome call it, whoſe fibres are leſs cloſe or compact than thoſe of the former; and is properly the lard or fat of the tree. It hardens by means of the juice that diſcharges itſelf there, and of the ſap which flows in it, ſo that it becomes by little and little, as it were, imperceptibly a part of the woody ſubſtance of the tree; that is to ſay, it is converted into ſolid wood. There are few trees but have ſome of that *aubier*, or whitiſh ſubſtance, which is more or leſs thick, according to the ſituation in which the trees happen to be planted; for the more they are expoſed to the hot rays of the ſun, the leſs of that ſubſtance will be found in them. In the oak it is ſeldom above an inch, or an inch and a half thick. It has been obſerved that when a tree is cut down, or dies in the ground, the *aubier* remains always of the ſame conſiſtency, without ever being turned into ſolid wood.

That ſubſtance is liable to rot; and therefore merchants, who cauſe timber to be ſquared, ought to be very careful that as little *aubier* be left upon it as poſſible.

AUBIN, in *Horſemanſhip*, a kind of broken gait, or pace, between an amble and a gallop; reputed a defect in a horſe.

AUCTIO, AUCTION; this was originally a kind of ſale, among the ancient Romans, performed by the public crier *ſub haſta*, that is, under a ſpear ſtuck up on that occaſion, and by ſome magiſtrate, who made good the ſale by delivery of the goods.

This was termed *auctio*, q. d. *increaſe*; becauſe, according to Sigonius, the goods were ſold to him, *qui plurimum rem augeret*, who would bid moſt for them.

AUCTION *by inch of candle*. See CANDLE.

AUCTORATI, in Roman *Antiquity*, an appellation given to ſuch as entered the liſt as gladiators, and who received wages; or who hired themſelves, for money, to perform in the games, or ſpectacles.

The *auctorati* degraded themſelves by the act; and became ſervile and infamous.

AUCTORATI *milites* alſo denoted ſoldiers bound by oath, and the receipt of wages, to ſerve in war.

In this ſenſe *auctorati* ſtand oppoſed to *exauctorati*, who were diſbanded.

The ſtipend they received for their ſervice, was denominated *auctoramentum*.

AUCTORITAS *ſenatus*, in the Roman *Antiquity*. See SENATUS *auctoritas*.

AUDIANISM, the ſyſtem or ſentiments of Audius, and his followers; particularly as to the belief of the human figure of the deity. See ANTHROPOMORPHITES.

AUDIENCE, in a general ſenſe. See HEARING.

The word is formed from *audire, to hear*.

Audience is alſo uſed for the ceremonies practiſed in courts, at the admiſſion of embaſſadors, and public miniſters, to a hearing.

Such an embaſſador ſent to demand *audience*; took his *audience* of leave to depart, &c.

In England, *audience* is given to embaſſadors in the preſence chamber; to envoys and reſidents, in a gallery, cloſet, or any place, where the king happens to be.

At their admiſſion, the way, in all courts, is to make three bows; after which they cover, and ſit down, the king firſt covering, and ſitting down, and giving them the ſign to put on their hats.—When the king cares not to have them be covered and ſit, he continues uncovered himſelf, and ſtanding all the while; which is taken as a ſlight and an affront.—After the firſt *audience*, it does not look well to be too haſty in demanding another.

At Conſtantinople, miniſters uſually have *audience* of the prime vizir; in his abſence the *caimacan* admits them to *audience*.

Audience is alſo the name of a court of juſtice, eſtabliſhed by the Spaniards in America; anſwering in effect to the parliaments of France.

They judge without appeal, and have each a certain diſtrict, which ordinarily takes in ſeveral provinces, called alſo *audiences*, from the names of the tribunal to which they belong.

Hence Sanſon divides Spain into as many of theſe *audiences* as there are of thoſe tribunals.—New Spain comprehends three *audiences*, thoſe of Guadalajara, Mexico, and Guatimala.

Audience is alſo the name of one of the eccleſiaſtical courts in England, which is held where-ever the archbiſhop calls a cauſe to his own hearing.

The two archbiſhops have their courts of *audience*. That of the archbiſhop of Canterbury is under the direction of the dean of the arches, who is official of the *audience*, and keeps his court in the hall of Doctors Commons.

The court of *audience* is chiefly concerned in differences ariſing upon elections, conſecrations, inſtitutions, marriages, &c.

Audiences, *chamber of*. See Chamber.

AUDIENDO *&* *terminando*, a writ, or rather commiſſion, directed to certain perſons, when an inſurrection or great miſdemeanour is committed in any place, for the appeaſing and puniſhment thereof.

AUDIENTS, or Auditores, in *Church Hiſtory*, an order of *catechumens*; conſiſting of thoſe who were newly inſtructed in the myſteries of the Chriſtian religion, and not yet admitted to baptiſm.

AUDIT, a regular hearing and examining of an account, by officers appointed for that purpoſe. See Auditor.

AUDITA *querela*, a writ which lies againſt him, who has taken a ſtatute-merchant, or a recognizance in the nature of a ſtatute-ſtaple, or a judgment, or a recognizance of another; and has aſked, or obtained, execution of the ſame from the mayor and bailiffs, before whom it was entered; at the complaint of the party, who entered the ſame, upon ſuggeſtion of ſome juſt cauſe why execution ſhould not be granted; as a releaſe, or other exception.

To writs of execution the defendant cannot plead; ſo that if there be any matter ſince the judgment to diſcharge him of the execution, he is to have *audita querela*: upon which the juſtices ſhall hear the complaint, and do right; and *audita querela* cannot be brought on a releaſe, until judgment is entered of record. 1 Mod. 111.

This writ is granted by the lord chancellor, upon view of the exception ſuggeſted, to the judges of either bench, willing them to grant ſummons to the ſheriff of the county where the creditor is, for his appearance at a certain day before them.

But the indulgence now ſhewn by the courts in granting a ſummary relief upon motion, in caſes of evident oppreſſion, has almoſt rendered uſeleſs this writ, and driven it quite out of practice.

AUDITIONALIS *ſcholaſticus*, in *Middle Age Writers*, is uſed for an advocate who pleads cauſes for his clients in audiences. Du-Cange.

AUDITOR, a hearer, one who liſtens or attends to any thing.

Auditors, in *Church Hiſtory*. See Audients.

The *auditors* formed one branch of the Manichean ſect, which was divided into *elect* and *auditors*; correſponding, according to ſome writers, to *clergy* and *laity*; and according to others, to the *faithful* and *catechumens* among the catholics. By the Manichean rule, a different courſe of life was preſcribed to the *elect* from that of the *auditors*. The latter might eat fleſh, drink wine, bathe, marry, traffic, poſſeſs eſtates, bear magiſtracy, and the like; all which things were forbidden to the *elect*. The *auditors* were obliged to maintain the *elect*, and kneeled down to aſk their bleſſing. Beauſobre obſerves, that the *elect* were eccleſiaſtics, and in general ſuch as made profeſſion of obſerving certain counſels, called evangelic; ſuch as the clergy and monks; and they were called the *perfect* by Theodoret. The *auditors* were the laity, and ſo denominated, becauſe they heard in the church, whilſt others taught and inſtructed.

Auditor is alſo uſed for ſeveral officers, appointed to *audit*, to hear accounts, pleadings, &c.

Anciently the word *auditor* was alſo uſed for a *judge*, and even for an *inquiſitor*, appointed by judges to examine, and find out the truth of ſome matter in conteſt. *Notaries* are alſo frequently called *auditores*.

Auditor, in our *Law*, is an officer of the king, or ſome other great perſon, who yearly, by examining the accounts of under officers accountable, makes up a general book, with the difference between the receipts and charge, and their allowances or *allocations*.

Auditors *of the revenue*, or *of the exchequer*, are officers who take the accounts of thoſe who collect the revenues, taxes, &c. raiſed by parliament; as alſo of the ſheriffs, eſcheators, collectors, tenants, and cuſtomers; and ſet them down, and perfect them.

Auditors *of the preſt*, or *impreſt*, are officers in the exchequer, who take and make up the great accounts of Ireland, Berwick, the mint, cuſtoms, ward-robe, firſt-fruits, naval and military expences, and of all moneys impreſſed to any man for the king's ſervice.

Auditor *of the receipts* is an officer of the exchequer, who files the tellers bills, and makes an entry of them, and gives the lord-treaſurer a certificate of the money received the week before; who preſents the eſtimate or balance to the king.

He makes debentures to every teller, before they receive any money, and takes their accounts. He keeps the black book of receipts, and the treaſurer's key of the treaſury (where the ancient leagues of the realm, and many records of the king's bench, and common-pleas, are repoſited); and ſees every teller's money locked up in the new treaſury.

There are alſo *auditors* of the firſt fruits; of the principality of Wales; of the duchy of Cornwall, &c. See First-*fruits*, &c.

Auditor *of the rota*, the apoſtolic chamber, the chatelet, &c. See Rota, Chamber, &c.

Auditors, *conventual*, *collegiate*, &c. were officers formerly appointed among the religious, to examine and paſs the accounts of the houſe.

AUDITORY, in an adjective ſenſe, ſomething belonging to the ſenſe of hearing.

Auditory, Audience, is alſo a collective name, denoting an aſſembly of perſons, hearing or attending to a perſon who ſpeaks in public.

Auditory is alſo uſed for the ſeat or bench where a magiſtrate, or judge, hears cauſes.

At Rome, the ſeveral magiſtrates had *auditories*, or ſeats of juſtice, according to their dignity.—Thoſe of the ſuperior officers were called *tribunals*; thoſe of the inferior, *ſubſellia*.

The *pedanei* had their benches or *auditories* in the portico of the imperial palace.—Thoſe of the Hebrews, at the gates of cities.—The judges appointed by the ancient lords diſtributed juſtice under an elm, which was uſually planted before the manor-houſe, and ſerved them for an *auditory*.

Auditory, Auditorium, in the *Ancient Churches*, was that part of the church where the *audientes* ſtood to hear, and be inſtructed.

The *auditorium* was that part now called *navis eccleſiæ*. See Nave.

In the primitive times, the church was ſo ſtrict in keeping the people together in that place, that the perſon who went from thence in ſermon-time was ordered by the council of Carthage to be excommunicated.

Auditorius, *meatus*, or Auditory paſſage, in *Anatomy*, called alſo *aurium alveare*, on account of the *cerumen* collected in it. See Meatus *auditorius*.

Auditory *nerves*, in *Anatomy*, a pair of nerves ariſing from the *medulla oblongata*, and diſtributed, the one to the ear, the other to the tongue, eye, &c. See *Tab. Anat.* (*Oſteol.*) *fig.* 5. *lit. pp.*

The ſoft and ſpongy branch of the *auditory nerve*, being diffuſed through the labyrinth and *tympanum* of the ear, is the immediate organ of the ſenſe of hearing.

The *auditory nerves* make the ſeventh conjugation, according to the way of reckoning of the moderns; and the fifth, according to the ancients.

Anatomiſts obſerve a ſingular mark of the wiſdom and contrivance of the Creator, in the *auditory nerves* being thus diſpatched to different parts; an admirable and uſeful conſent being hereby eſtabliſhed between them.—Hence it is, that moſt animals, upon hearing any uncouth ſound, found, are ſound to erect their ears, and prepare them to catch it; to open their eyes; to ſtand upon the watch; and to be ready with the mouth to call out, or teſtify their danger: accordingly moſt animals, when ſurpriſed or terrified, ſhriek or cry out, &c.

Dr. Willis (*Anat. Cerebr.* cap. 17.) obſerves a further uſe of this nervous communication between the ear and the mouth; which is, that the voice may correſpond with the hearing, and be a kind of echo thereof; that what is heard with one of the two nerves, may be readily expreſſed with the voice, by the help of the other.

AVELLANA, in *Botany*. See CORYLUS and HAZLE-*nut*.

AVELLANA *purgatrix*, in the *Materia Medica*, the fruit of a ſpecies of RICINUS. See CATAPUTIA and BEN.

AVELLANDA, in *Botany*, a name given by the Spaniards to the roots of the TARSI, or ſweet CYPERUS. Theſe are eſculent, and of a very delicious taſte; they ſeem to have had the name from their likeneſs to the *avellana nux*, or hazel-nut. Garcias, and ſome others, have thought that the CURCAS of Malabar was the ſame with the *avellanda* of Europe. But this does not ſeem to be the caſe; for the *curcas* is a fruit probably the ſame with the fruit BEL, deſcribed by the Arabians; and though of the ſame ſize and ſhape with the *avellanda*, has a hard coat like the common filbert. The *curcas* of Egypt is indeed a root, but it is very different from theſe, being as long and as thick as a man's arm.

AVELLANE, or *croſs* AVELLANE, in *Heraldry*, a form of croſs, which reſembles four filberds in their huſks or caſes, joined together at the great end. See CROSS.

Hence its name; a filberd in Latin being *nux avellana*.—Syl. Morgan ſays, it is this croſs which enſigns the mound of authority, or the ſovereign's globe.

AVE-MARIA, or AVE-MARY, the angel Gabriel's ſalutations of the Virgin, at his bringing her the tidings of the incarnation; thus called, as beginning with theſe words, *Ave*, *Maria*, q. d. *Hail*, *Mary*.

The *ave-mary* is a prayer or *formula* of devotion very uſual in the Romiſh church. It was added to their prayers by order of pope John XXII. in the fourteenth century.—Their chaplets and roſaries are divided into ſo many *ave-marys*, and ſo many *pater-noſters*; and hence the beads themſelves, which indicate them, are alſo called *aves*, or *ave-marys*.

AVENA, in *Botany*. See OAT.

AVENS, in *Botany*. See HERB-*bennet*.

AVENAGE, in *Law*, a certain quantity of oats, paid to a landlord, in lieu of ſome other duties; or, as a rent, from the tenant.

The word is formed of the Latin, *avena*, *oats*.

AVENOR, an officer under the maſter of the horſe; who, by order or warrant from him, ſwears in all the officers belonging to the royal ſtables. See MASTER *of the horſe*.

The *avenor* alſo makes up the accounts of the ſtables, and iſſues debentures for paying the officers and ſervants.

In a ſtat. Car. II. we find the *avenor* mentioned, as an officer who provides oats for the ſtables.—In the Rot. Parl. Edw. III. we alſo read of *avenor* of the queen, of the prince, &c.

AVENTURÆ, in our *Ancient Writers*, ſignify TOURNAMENTS, or military exerciſes on horſeback.

AVENTURE, or rather ADVENTURE, in our *Law Books*, a miſchance, cauſing the death of a man, without felony; as, when he is ſuddenly drowned, or burnt by an accident or miſchance, falling into the water or fire. See MISAVENTURE, and CHANCE-MEDLEY.

AVENUE, in *Fortification*, an opening or inlet into a fort, baſtion, or the like place, or the paſſes and ways to and from it. See FORT and BASTION.

The word is formed of *avenir*, or *advenir*, *to arrive at*.

AVENUE, in *Gardening*, is a walk planted on each ſide with trees, and leading to ſome place.

All *avenues*, Mortimer ſays, ſhould lead to the front of an houſe, garden-gate, highway-gate, or wood, and terminate in a proſpect.—In an *avenue* to an houſe, whatever the length of the walk is, it ought to be as wide as the whole breadth of the front; and if wider it is ſo much the better: and *avenues* to woods and proſpects ought not to be leſs than ſixty feet wide.

The trees moſt proper for *avenues* with us, are the Engliſh elm, the lime, the horſe-cheſnut, the common cheſnut, the beech, and the *abele*. The Engliſh elm will do in all grounds, except ſuch as are very wet and ſhallow; and this is preferred to all other trees, becauſe it will bear cutting, heading, or lopping in any manner, better than moſt others. The rough or ſmooth Dutch elm is approved by ſome, becauſe of its quick growth; this is a tree which will bear removing very well; it is alſo green almoſt as ſoon as any plant whatever in ſpring, and continues ſo as long as any, and it makes an incomparable hedge, and is preferable to all other trees for lofty eſpaliers. The lime is valued for its regular growth, and fine ſhade: the horſe-cheſnut is proper for all places that are not too much expoſed to rough winds. The common cheſnut will do very well in a good ſoil, and riſes to a conſiderable height, when planted ſomewhat cloſe, though when it ſtands ſingle, it is rather inclined to ſpread than to grow tall. The beech is a beautiful tree, and naturally grows well with us in its wild ſtate, but it is leſs to be choſen for *avenues* than the before-mentioned, becauſe it does not bear tranſplanting well, but is very ſubject to miſcarry. Laſtly, the *abele* is fit for any ſoil, and is the quickeſt grower of any foreſt tree. It ſeldom fails in tranſplanting, and ſucceeds very well in wet ſoils, in which the others are apt to fail. The oak is but little uſed for *avenues*, becauſe of its ſlow growth.

The old method of planting *avenues* was with regular rows of trees, and this has been always kept to till of late; but we have now a much more magnificent way of planting *avenues*; this is by ſetting the trees in clumps, or platoons, making the opening much wider than before, and placing the clumps of trees at about three hundred feet diſtance from one another. In each of theſe clumps there ſhould be planted either ſeven or nine trees; but it is to be obſerved, that this is only to be practiſed where the *avenue* is to be of ſome conſiderable length, for in ſhort walks this will not appear ſo ſightly as ſingle rows of trees. The *avenues* made by clumps are fitteſt of all for parks. The trees in each clump ſhould be planted about thirty feet aſunder, and a trench ſhould be thrown up round the whole clump, to prevent the deer from coming to the trees to bark them.

AVER-*land*, in our *Old Writers*, ſeems to have been ſuch lands as the tenants did plough and manure, *cum averiis ſuis*, for the proper uſe of a monaſtery, or the lords of the ſoil.

AVERA, in *Doomſday-Book*, denotes a day's work of a ploughman, or other labourer, which the king's tenants in his demeſne lands were obliged to pay the ſheriff.

AVERAGE, in *Agriculture*, a term uſed by the farmers in many parts of England, for the breaking of corn-fields, eddiſh, or roughings.

In this ſenſe, it may be derived from *haver*, an Engliſh name for oats, or from *aveira*, *beaſts*, being as much as feeding for cattle or paſturage. Ray.

AVERAGE, AVERAGIUM, in *Law*, that duty or ſervice which the tenant is to pay the king, or other lord, by his beaſts and carriages.

The word is derived from the baſe Latin *averia*, *cattle* or *goods*; or the French *œuvre*, *work*.

AVERAGE, or AVERIDGE, in *Navigation* and *Commerce*, is uſed to denote the damage which happens to ſhips and their cargoes, from the time of their loading and ſailing, till their return and unlading. It is divided into three kinds. 1. The ſimple *average*, which conſiſts in the extraordinary expences incurred for the ſhip, ſuch as the loſs of anchors, maſts, and rigging, by common accidents at ſea; or for the merchandiſe; ſuch as the damages which they have ſuſtained by ſtorms, capture, ſhipwreck, wet, or rotting; all which muſt be defrayed by the thing that ſuffered the damage. 2. The large and common *average*, being expences incurred, and damage ſuſtained, for the common ſecurity, both of the merchandiſe and ſhip, which are to be borne by the ſhip and cargo: ſuch are ranſom-money, goods thrown overboard, expences of unlading, or entering into a river or harbour, and the proviſions and hire of the ſailors, when the ſhip is detained by embargo. 3. The ſmall *averages*, which are charges of towing and piloting the ſhip, one third of which muſt be charged to the ſhip, and two thirds to the cargo.

AVERAGE is more particularly uſed for the quota or proportion which each merchant or proprietor in the ſhip or loading is adjudged, upon a reaſonable eſtimation, to contribute to a common *average*.

Such ſum ſhall be divided among the ſeveral claimers, by way of *average*, in proportion to their reſpective intereſts and demands. 10 A. cap. 17.

AVERAGE is alſo a ſmall duty, which thoſe merchants who ſend goods in another man's ſhip pay to the maſter thereof, for his care of them, over and above the freight.

Hence, in bills of lading it is expreſſed.—Paying ſo much freight for the ſaid goods, with *primage* and *average* accuſtomed.

AVER-CORN, in *Ancient Writings*, ſuch corn as by cuſtom is brought by the tenant's carriages, to the lord's granary.

AVERDUPOIS *pound*. See POUND.

AVERDUPOIS *weight*. See WEIGHT.

AVERIA, in our *Law Books*, properly ſignify oxen or horſes uſed for the plough; but, in a general ſenſe, any cattle.

When mention is made of one beaſt, they ſay, *quidam equus*, *vel quidam bos*: when of two or more, they do not ſay, *equi* or *boves*, but *averia*.

AVERIA, *replegiare de* AVERIIS. See REPLEGIARE.

AVERIIS *captis in Withernam*, a writ for the taking of cattle to his uſe, who hath cattle unlawfully diſtrained by another, and driven out of the county where they were taken, ſo that they cannot be replevied by the ſheriff. Reg. Orig. 82. If the cattle are put into any ſtrong place in the ſame county, the ſheriff may take the *poſſe comitatus*, and break into it, to make the replevin. But when they are driven out of the county, he hath no authority to purſue them.

AVERMENT, in *Law*, uſually ſignifies an offer of the defendant to make good or juſtify an exception, pleaded in abatement or bar of the plaintiff's action.

The word alſo ſometimes ſignifies the act, as well as the offer, of juſtifying the exception.

Averment is two-fold, *general* and *particular*.

AVERMENT, *general*, is the concluſion of every plea to the writ, or in bar of replications, or other pleadings (for counts, or avowries in nature of counts, need not to be *averred*) containing matter affirmative; and ought to be with theſe words, *hoc paratus eſt verificare*.

AVERMENT, *particular*, is, when the life of a tenant for life, or tenant in tail, is *averred*, &c.—An *averment* contains as well the matter as the form thereof.

AVERNI, among the *Ancient Naturaliſts*, certain lakes, grottoes, and other places, which infect the air with poiſonous ſteams or vapours; called alſo *mephites*.

The word is formed of the privative α, and ορνις, *bird*; as intimating that birds could not fly over them, but dropped down dead. *Avernus*, q. d. *aornus*, *locus ſine avibus*.

Averni are ſaid to be frequent in Hungary, on account of the abundance of mines therein.

The Grotta del Cani, in Italy, is a famous one.

But the moſt celebrated *avernus* was, a lake near Baiæ, in Campania, by the modern Italians called Lago di Tripergola.—The fumes it emitted are repreſented by the ancients as being of ſo malignant a nature, that birds could not fly over it, but ſunk down dead; which ſome later writers have choſen to attribute to this, that the ſulphureous effluvia hereof not being of conſiſtence to ſuſtain the birds, they dropped by their own weight. This circumſtance, joined with the great depth of the lake, occaſioned the ancients to take it for the gate or entrance of hell; and accordingly Virgil makes Æneas deſcend this way into the infernal regions.—Vibius Sequeſter ſays, there is no bottom to be found of it. See HELL.

Next to the Baiæ, ſays Strabo, lies the Lucrine bay; and within it the lake *Avernus*; which is a deep, darkſome lake, with a narrow entry from the outer bay: it is ſurrounded with ſteep banks, that hang threatening over it, and is only acceſſible by the narrow paſſage, through which you ſail in. Theſe banks were anciently quite overgrown with a wild wood, impenetrable by a human foot. Its gloomy ſhade impreſſed an awful ſuperſtition upon the minds of the beholders; whence it was reputed the ſeat of the Cimmerians, who dwelt in perpetual night. Whoever ſailed hither, firſt did ſacrifice; and endeavoured to propitiate the infernal powers, with the aſſiſtance of ſome prieſts, who attended upon the place, and directed the myſtic performance. Within, a fountain of pure water broke out juſt over the ſea; but no creature ever taſted of it, believing it to be a vein of the river Styx: ſomewhere near this fountain was the oracle; and the hot waters, frequent in theſe parts, made them think they were branches of the burning Phlegethon.

AVERPENNY, q. d. AVERAGE-PENNY, money contributed towards the king's averages; or money given to be freed thereof. See AVERAGE.

AVERRHOA, in *Botany*, the name of a genus of plants, of the *decandria pentagynia* claſs, the characters of which are theſe: the perianthium is ſmall, erect, and compoſed of five leaves. The flower is compoſed of five lanceolated petals, which ſtand erect on the lower part, and are expanded at the top. The ſtamina are ten ſetaceous filaments, half of which are of the length of the flower, and the other half ſhorter; theſe ſtand alternately together, and are terminated by roundiſh *apices*, or *antheræ*. The germen of the piſtil is oblong, and faintly pentangular; the ſtyles are five in number, and are ſetaceous and erect; and the ſtigmata are ſimple. The fruit is a turbinated pomum, obtuſely pentangular, having five cells, and in each of them ſeveral ſeeds of an angular form, ſeparated by membranes.

AVERRHOISTS, a ſect of peripatetic philoſophers, who appeared in Italy ſome time before the reſtoration of learning, and attacked the natural immortality of the ſoul.

They took their denomination from Averrhoes, a celebrated interpreter of Ariſtotle, born at Cordova in Spain, in the twelfth century, from whom they borrowed their diſtinguiſhing doctrine. The founder of this ſect, Averrhoes, is ſometimes called the Commentator, by way of eminence, as being ſuppoſed to have entered beſt of all the commentators into the ſentiments of the philoſopher; inſomuch that ſome have pretended the ſoul of Ariſtotle had migrated into the body of Averrhoes.

AVERRUNCIATION, from *averrunco*, *I prune*, in *Agriculture*, the act of cutting or lopping off the ſuperfluous branches of trees. See PRUNING.

AVERRUNCI, from *averrunco*, *I avert*, in *Antiquity*, an order of deities among the Romans, whoſe peculiar office was to avert dangers and evils.

The Egyptians had alſo their *dii averrunci*, or *apotropæi*, who were pictured in a menacing poſture, and ſometimes with whips in their hands.—Iſis was a divinity of this kind; as is ſhewn by Kircher. See Oedip. Ægypt. t. iii. p. 487.

AVERSION, abhorrence, diſlike. See ANTIPATHY.

The word is compounded of *a*, *from*; and *vertere*, *to turn*.

AVERSIONE *vænire*, or *locare*, in *Writers of the Civil Law*, ſeems to denote the ſelling, or letting things in the lump, without fixing particular prices for each piece.

AVERTI, in *Horſemanſhip*, is applied to a regular ſtep or motion enjoined in the leſſons.

In this ſenſe they ſay, *pas averti*, ſometimes *pas ecouté*, and *pas d'ecole*, which all denote the ſame.

The word is mere French, and ſignifies *adviſed*.

AVERY, a place where oats, or provender, are kept for the king's horſes. See AVERIA.

AUGES, in *Aſtronomy*, two points in a planet's orbit, otherwiſe called *apſides*. See APSIS.

One of the *auges* is particularly denominated the *apogee*, the other *perigee*.

AUGITES, among *Ancient Naturaliſts*, a kind of gem, of a pale green colour, inferior in value to the topaz.

It is uſually ſuppoſed the ſame with the *callais* or *calais*, though this was diſputed even in Pliny's time.

AUGMENT, in the Greek *Grammar*, an accident of certain tenſes; being either the prefixing of a ſyllable, or an increaſe of the quantity of the initial vowels. There are two kinds of *augments*.—*Temporale*, or *of a letter*; when a ſhort vowel is changed into a long one; or a diphthong into another longer one: thus called, becauſe the time of its pronunciation is now lengthened.

Augmentum ſyllabicum, or *of a ſyllable*, is when a letter, viz. ε, is added at the beginning of the word; ſo that the number of ſyllables is increaſed.

AUGMENTS, in *Mathematics*. See FLUXIONS and MOMENTS.

AUGMENTATION, in a general ſenſe, the act of *augmenting*; that is, of adding or joining ſomething to another, to render it larger, or more conſiderable.

The governors of the bounty of queen Anne, for the *augmentation of the maintenance of the poor clergy*, by virtue of the ſeveral acts of parliament, made for that purpoſe, are empowered to augment all livings not exceeding 50*l.* *per annum*; and the number of livings following were certified to be capable of *augmentation*.

1071	Livings not exceeding 10*l.* *per annum*, which may be augmented (with the bounty alone) ſix times each, purſuant to the preſent rules of the governors, which will make 6426 *augmentations*.	6426
1467	Livings above 10*l.* and not exceeding 20*l.* *per annum*, may be augmented four times each, which will make 5868 *augmentations*.	5868
1126	Livings above 20*l.* and not exceeding 30*l.* *per annum*, may be augmented three times each, which will make 3378 *augmentations*.	3378
1049	Livings above 30*l.* and not exceeding 40*l.* *per annum*, may be augmented twice each, which will make 2098 *augmentations*.	2098
884	Livings above 40*l.* and not exceeding 50*l.* *per annum*, may be each once augmented, which will make 884 *augmentations*.	884
5597	Total number of *augmentations*, which muſt be made (by the bounty alone) before the livings already certified will exceed 50*l.* *per annum*.	18654

Computing the clear amount of the bounty to make 55 *augmentations* yearly, it will be 339 years, from the year 1714, (which was the firſt year in which any livings were augmented) before all the ſmall livings above certified can exceed 50*l.* *per annum*; and if it be computed, that one half of ſuch *augmentations* may be made in conjunction with other benefactors (which is very improbable) it will require 226 years before all the livings above certified will exceed 50*l.* *per annum*.

AUGMENTATION is alſo uſed for the *augment*, i. e. for the additament, or the thing added. Such a miniſter petitioned the king for an *augmentation* of ſalary, wages, &c.

Augmentation, *court of.* See Court, &c.

Augmentations, in *Heraldry*, are additional charges to a coat armour frequently given as particular marks of honour, and generally borne, either on an eſcutcheon, or a canton.—Such are the arms of Ulſter, borne by all the baronets of England.

AUGRE, or **Awgre**, a carpenter's and joiner's inſtrument, ſerving to bore large, round holes.

The *augre* conſiſts of a wooden *handle*, and an iron *blade*, terminated at bottom with a ſteel *bit*.

AUGSBURG *confeſſion*. See Augustan.

AUGUR, in *Antiquity*, a miniſter of religion among the Romans, appointed to take *auguries* or preſages concerning futurity from birds, beaſts, and the appearances of the heavens.

The word is by ſome derived from *avis*, *bird*, and *garritus*, *chattering*; whence the original office of the *augurs* is ſuppoſed to have been to obſerve, and take indications from, the noiſe, calling, ſinging, chirping, and chattering, of birds. Agreeably to which, *augur* is commonly diſtinguiſhed from AUSPEX, as the latter was ſuppoſed employed in obſerving the flight of birds.—Pezron derives it from the Celtic *au*, *liver*, and *gur*, *man*; ſo that according to him an *augur* was properly a perſon who inſpected the entrails, and divined by means of the liver. On which principle, *augur* would have been the ſame with ARUSPICES.

The *augurs* made a college or community, which at firſt conſiſted of three perſons (one for each tribe); then of four (when Servius Tullius increaſed the tribes to that number); then of nine (four of them patricians, and five plebeians): laſtly, Sylla made the number fifteen.—Cato was of the college of *augurs*.

They bore an *augural* ſtaff, or wand, called *lituus*, as the enſign of their office and authority. No affair of moment could be reſolved on, without firſt conſulting them; and their advice, be it what it would, was, by a decree of the ſenate, appointed to be exactly and religiouſly obſerved.

AUGURAL, ſomething relating to the AUGURS.

The *augural* inſtruments are repreſented on ſeveral ancient medals. Evelyn on Medals, chap. ii.

Augural *ſupper*, *cæna auguralis*, that given by a prieſt on his firſt admiſſion into the order, called alſo by Varro *adjicialis*. De Re Ruſtic. lib. iii. cap. 6.

Augural *books*, *libri augurales*, thoſe wherein the diſcipline and rules of *augury* were laid down. Cic. de Divin. lib. i. cap. 33.

AUGURALE, the place in a camp where the general took *auſpicia*. This anſwered to the *auguratorium* in the city.

Augurale is alſo uſed, in Seneca, for the enſign or badge of an *augur*, as the *lituus*. De Tranquil. cap. xii.

AUGURATORIUM, a building on the Palatine mount, where public *auguries* were taken.

This is alſo called *auguraculum*, and *arx*.

AUGURY, the diſcipline of the *augurs*, or the practice of conſulting the gods, and learning their will, by divers kinds of omens.

The obſervation of *auguries* is very ancient, as having been prohibited by Moſes in Leviticus.—The cup put in Benjamin's ſack, in Egypt, is ſaid to have been that uſed by Joſeph to take *auguries* by.

Augury, in its more general ſignification, compriſes all the different kinds of divination; which Varro diſtinguiſhes into four ſpecies of *augury*, according to the four elements.—*Pyromancy*, or *augury* by fire; *aëromancy*, or *augury* by the air; *hydromancy*, or *augury* by the water; and *geomancy*, or *augury* by the earth.

The particular branches are, *alectoromancy*, *anthropomancy*, *belomancy*, *catoptromancy*, *capnomancy*, *gaſtromancy*, *geomancy*, *aruſpicina*, *libanomancy*, *lecanomancy*, *necromancy*, &c. See each deſcribed under its proper article.

AUGUST, **Augustus**, in a general ſenſe, ſomething majeſtick, venerable, or ſacred.

The title *Auguſtus* was firſt given by the Roman ſenate to Octavius, after his being confirmed by them in the ſovereign power.—It was conceived as expreſſing ſomething divine, or elevated above the pitch of mankind, being derived from the verb *augeo*, *I increaſe*, *tanquam ſupra humanam ſortem auctus*.

The ſucceſſors of Octavius aſſumed the ſame quality; ſo that thenceforward EMPEROR and *Auguſtus* were the ſame thing: they became ſynonymous terms.

The preſumptive heir of the empire, or he who was deſtined to ſucceed to the dignity, was firſt created Cæſar; which was a ſtep neceſſary to arrive at that of *Auguſtus* or emperor.—Yet F. Pagi maintains the reverſe; viz. that it was neceſſary to be *Auguſtus* previouſly to the being Cæsar.

The EMPRESSES alſo took the quality of *Auguſtæ*; and even ſome ladies of the imperial family, who had never been wives of emperors, but mothers or daughters.

On medals and coins, ſome of the ancient kings of France are alſo found with the appellation *Auguſti*; particularly Childebert, Clothaire, and Clovis: add, that the wife of this laſt, Chrotechilda, is alſo called by Herric, in his book of the miracles of St. Germain, indifferently, either *Auguſta*, or *queen*.

August, in reſpect of *Chronology*, denotes the eighth month of the Julian year.

This was called in the ancient Roman calendar, *ſextilis*, as being the ſixth from March, from which the Romans began their computation. The emperor Auguſtus changed the name, and gave it his own; not that it was the month in which he was born, but becauſe it had been fortunate to him, by ſeveral victories which he had gained in it.

Our Saxon anceſtors called it *Weod-monath*, that is, *weedmonth*, on account of the plenty of weeds in this ſeaſon. Spelman.

This month is eſteemed one of the richeſt in the whole year, becauſe of the harveſt of the ſeveral ſorts of grain which is produced in that ſeaſon. Hence is to be derived the French proverb, *a man has made his Auguſt*; which proverb is much uſed among merchants to ſignify that a man has been ſucceſsful in trade, and got an eſtate.

August is alſo uſed, in *Middle Age Writers*, for a power, or licence, of going out of a city in harveſt-time to reap, &c. Du-Cange.

AUGUSTA, *Hiſtoria*, is the hiſtory of the Roman emperors from the time of Adrian to Carinus, that is, from the year of our Lord 157, to 285, compoſed by ſix Latin writers, Æl. Spartianus, Julius Capitolinus, Æl. Lampridius, Vulcatius Gallicanus, Trebellius Pollio, and Flavius Vopiſcus. Fabr. Bibl. Lat. cap. 6.

AUGUSTALES, or *Sodales* Augustales, or *Flamines* Augustales, were the prieſts of Auguſtus, appointed after the deification of that emperor by Tiberius, to perform the ſervice of the new god.

AUGUSTALIA, in *Antiquity*, a feaſt inſtituted in honour of the emperor Auguſtus.

This feſtival was firſt eſtabliſhed in the year of Rome 835, being the fourth after he had ended all his wars, and ſettled the affairs of Sicily, Greece, Aſia, Syria, and the Parthians. The day whereon he made his entry into Rome, being the 4th of the ides of October, was appointed to be kept a feaſt; and was called *Auguſtalis*.

Augustalia was alſo a name given to the games celebrated in honour of the ſame prince, on the 4th of the ides of October.

AUGUSTALIS, or *Præfectus* Augustalis, a Roman magiſtrate who was appointed to govern Egypt, with a power much like that of a proconſul in other provinces.

AUGUSTAN, relating to Auguſtus, or Auguſta.

Augustan *æra*. See Actian.

Augustan *confeſſion* denotes a celebrated confeſſion of faith, drawn up by Luther and Melancthon, on behalf of themſelves, and other ancient reformers, and preſented in 1530 to the emperor Charles V. at the diet of Auguſta or Augſburgh, in the name of the evangelic body. This *confeſſion* contains twenty-eight chapters, of which the greateſt part is employed in repreſenting, with perſpicuity and truth, the religious opinions of the proteſtants, and the reſt in pointing out the errors and abuſes that occaſioned their ſeparation from the church of Rome.

AUGUSTATICUM, in *Middle Age Writers*, denotes a largeſs, or donative, of an emperor, to the people, or ſoldiery.

AUGUSTEUM *marmor*, in the *Natural Hiſtory of the Ancients*, a name given to the common green and white marble, ſo frequent in uſe with us for tables, &c. and called by our artificers Egyptian marble.

AUGUSTINE, **Augustinus**, of Janſenius, is a celebrated treatiſe of that author, biſhop of Ypres, intituled, Cornelii Janſenii, Epiſcopi Iprenſis, Auguſtinus, in three volumes, folio, printed at Louvain in 1640; the firſt tome whereof contains a diſcourſe againſt *Pelagianiſm*; and the ſecond, divers treatiſes of reaſon; the uſe of authority in theological matters; the ſtate of innocence; fall of nature by ſin; grace, &c.—From theſe ſeveral treatiſes were collected the five famous propoſitions, enumerated under the article Jansenism.

AUGUSTINS, or **Augustinians**, an order of religious; thus called from St. Auguſtin, whoſe rule they obſerve.

The *Auguſtins*, popularly alſo called *Auſtin friers*, were originally hermits, whom pope Alexander IV. firſt congregated into one body, under their general Lanfranc, in 1256.

Soon after their inſtitution, this order was brought into England, where they had about thirty-two houſes at the time of their ſuppreſſion.

The *Auguſtins* are clothed in black, and make one of the four orders of mendicants.

From theſe aroſe a reform, under the denomination of *bare-foot Auguſtins*, or *Minorites*, or *Friers minor*.

There are alſo canons regular of St. *Auguſtin*, who are clothed in white, excepting their cope, which is black.

At Paris they are known under the denomination of, *religious of* GENEVIEVE; that abbey being the chief of the order.

There are alſo nuns and canoneſſes, who obſerve the rules of St. Auguſtin.

AUGUSTINIANS are alſo thoſe divines who maintain, on the authority of St. Auguſtin, that GRACE is effectual from its nature, abſolutely and morally, and not relatively and gradually. See EFFICACIOUS.

They are divided into rigid and relaxed.

AU-GUY-L'AN-NEUF, or AUGILLANNEUF. See MISLETO.

AVIARY, a houſe or apartment kept for the keeping, feeding, and propagating of birds.

The word is formed of *avis*, *bird*.

AVICENNIA, in *Botany*, a genus of the *didynamia angioſpermia* claſs, the calyx of which is divided into five ſegments, the corolla is bilabiate, the capſule is coriaceous and rhomboidal, containing a ſingle ſeed.

AVIGNON-*berry*, called alſo *French berry*, is the fruit of a ſhrub by ſome authors called LYCIUM; growing plentifully near Avignon, and in other parts of France.

The berry is ſomewhat leſs than a pea; its colour is green, approaching towards a yellow; and it is of an aſtringent and bitter taſte.—It is much uſed by the dyers, who ſtain a yellow colour with it; and by the painters, who alſo make a fine golden yellow of it. See BOX-*thorn*.

AVIS, *bird*, in *Zoology*. See BIRD.

AVIS *Indica*. See APUS.

AVIS *longa*, a name given by Nieremberg to the *hoitlallotl* of the Americans, a bird very remarkable for the ſwiftneſs of its running.

AVIS *nivea*, a name under which Nieremberg has deſcribed an American bird, of the ſize of a thruſh, brown and black on the back, and yellow under the belly; it imitates the human voice, and is called, by the natives, CEOAN.

AVIS *pennipulchra*, the name of an American bird, deſcribed by Nieremberg, and called by the Indians *quetzaltototl*. It is of the ſize of a pigeon, and is all over its body of the more beautiful colours of the peacock. There are, beſide this ſpecies, three or four others. Mr. Ray has, however, ranged all theſe under the number of birds, the accounts of which he is either dubious about, or ſuſpicious of the truth of.

AVIS *ſcica*. See HOACTLI.

AVIS *tropicorum*, the name of a bird, commonly called alſo, in Engliſh, the TROPIC *bird*, of the ſize of the common duck.

It is only found about the *tropics*, and thence has its name. See *Tab. of Birds*, Nº 52.

AVIS *venti*, the bird of the wind. See HEATOTOTL.

AVIS *Paradiſi*. See PARADISE.

AVIS, *knights d'Avis*, an order of knighthood in Portugal, eſtabliſhed about the year 1162.

When the city of Evora was taken from the Moors, in the reign of the firſt king of Portugal, it was garriſoned by ſeveral perſons who aſſumed the title of knights of St. Mary of Evora, which was ſoon after changed for that of *knights d'Avis*, which the king gave them, and whither they removed from Evora. The badge of the order is a green croſs flory, and they obſerve the rule of St. Benedict.

AVISO, an advice, piece of intelligence, or advertiſement, to notify ſome event or matter worthy of knowledge.

The word is Italian, *adviſo*; and is chiefly uſed in matters of commerce.

AUK, in *Zoology*, a name given by ſome to a bird called the ALKA in Latin, and more commonly known among us by the name of the RAZOR-BILL, a web-footed fowl, wanting the hinder toe.

AUL. See AWL.

AULA, in our *Ancient Law Books*, ſignifies a court baron. —*Aula ibidem tenta quarto die Auguſt.* &c.

Aula eccleſiæ is ſometimes uſed for what we now call *navis eccleſiæ*. See NAVE.

AULA *regia*, or *regis*, a court eſtabliſhed by William the Conqueror in his own hall, compoſed of the king's great officers of ſtate, who reſided in his palace, and were uſually attendant on his perſon. This court was regulated by the article which forms the eleventh chapter of Magna Charta, and eſtabliſhed in Weſtminſter-hall, where it hath ever ſince continued. See COURT *of King's Bench*.

AULETES, αυλητης, in *Antiquity*, denotes a flute-player. One of the Ptolemies, kings of Egypt, father of Cleopatra, bore the ſurname, or denomination, of *auletes*.

AULIC, AULICA, an act which a young divine maintains in ſome foreign univerſities, upon the admiſſion of a new doctor of divinity.

It is ſo called from the Latin, *aula*, a *hall*; it being in the hall of the univerſity that this act is uſually held.

The perſon who preſides at the diſputation, is the ſame that is to take the doctor's cap.

AULIC, AULICUS, is alſo an appellation, given to certain officers of the emperor, who compoſe a ſuperior court or council, which has an univerſal juriſdiction, and without appeal, over all the ſubjects of the empire, in all proceſſes entered therein.

We ſay, *aulic* council, the *aulic* court or chamber, *aulic* counſellor, &c.

The *aulic* council is eſtabliſhed by the emperor, who nominates the officers; but the elector of Mentz has a right of viſiting it.—It is compoſed of a preſident, who is a catholic; a vice-chancellor, preſented by the elector of Mentz, and of eighteen aſſeſſors, or counſellors, nine whereof are proteſtants, and nine Romaniſts.

They are divided into two benches, one whereof is taken up by nobles, and the other by lawyers.—They hold their aſſemblies in the preſence of the emperor; and for that reaſon are called *juſtitium imperatoris*, the *emperor's juſtice*: and *aulic council*, becauſe theirs follows the emperor's court, *aula*, and has its reſidence in the place where he is.—This court claſhes a little with the imperial chamber of Spires; in that they are preventive of each other; it not being allowed to remove any cauſe from the one to the other.

Nor can the emperor himſelf hinder or ſuſpend the deciſions of either court; much leſs call any cauſe before himſelf, which has been once before them, without the conſent of the ſtates of the empire. Yet, in ſome caſes, the ſame council forbears making any peremptory concluſion, without the emperor's participation; and only decrees thus, *Fiat votum ad Cæſarem*; that is, make a report hereof to the emperor in his privy-council.

AULNEGER, or ALNAGER. See ALNAGER.

AULO, a Grecian long meaſure. See MEASURE.

AULOS, in *Zoology*, a name by which ſeveral of the ancient writers have called the SOLEN, or RAZOR-*fiſh*.

AUMONE, or ALMS. See ALMS.

AUNCEL-*weight*, *quaſi Handſal-weight*, an ancient kind of balance, conſiſting of ſcales hanging on hooks faſtened at each end of a beam or ſtaff, which a man lifts up on his hand or fore-finger, and ſo diſcovers the equality or difference between the weight and the thing weighed.

There being great deceits practiſed in theſe weights, they were prohibited by ſeveral ſtatutes; and the even balance alone commanded.

The word is ſtill uſed in ſome parts of England, to ſignify meat ſold by poiſing in the hand, without putting it into the ſcales.

AUNCESTOR. *Aſſiſe of Mort d'*AUNCESTOR. See ASSISE.

AUNCESTRAL *homage*. See HOMAGE.

AUNE, in *Commerce*, a long MEASURE, uſed in France, and other countries; of different lengths in different places. See ELL.

AVOCADO, a name given to a ſpecies of bay. See BAY-*tree*.

AVOCATORIA, a mandate of the emperor of Germany, directed to ſome prince or ſubject of the empire, to ſtop his unlawful proceedings in any cauſe brought by way of appeal before him.

AVOIDANCE, in *Law*, has two ſignifications: the one when a benefice becomes void of an incumbent; the other, when we ſay in pleadings in chancery, confeſſed or *avoided*, traverſed or denied, &c. See VOIDANCE.

AVOIRDUPOIS, or AVERDUPOIS *weight*, a kind of weight uſed in England; the pound whereof contains ſixteen ounces. See WEIGHT.

The proportion of a pound *avoirdupois* to a pound *troy*, is as 17 to 14; or the *avoirdupois* pound contains 7000 grains, and the *troy* pound 5760.

All the larger and coarſer commodities are weighed by *avoirdupois* weight; as groceries, cheeſe, wool, lead, hops, &c.

AVOSETTA, in *Ornithology*. See RECURNIROSTRA.

AVOWEE, ADVOCATUS. See ADVOWEE, and ADVOCATE.

The *avowee* is he to whom the right of advowſon of any church belongs, ſo that he may preſent thereto in his own name: he is thus called by way of diſtinction from thoſe who ſometimes preſent in another man's name, as a guardian, who preſents in the name of his ward; as alſo from thoſe who only have the lands whereto an advowſon belongs for term of life or years, by intruſion or diſſeiſin.

AVOWRY, in *Law*, is where one takes a diſtreſs for rent, or other thing; and the other ſues replevin. In which caſe the taker ſhall juſtify, in his plea, for what cauſe he took it; and if he took it in his own right, he is to ſhew it, and ſo *avow* the taking; which is called his *avowry*. If he took it in the right of another, when he has ſhewed the cauſe, he is to make conuſance of the taking, as being a bailiff or ſervant to him in whoſe right he did it.

AU-PIS-ALLER, a French phraſe, ſometimes uſed among Engliſh writers, ſignifying, *at the worſt*.

AURA, among *Phyſiologiſts*, an airy EXHALATION or VAPOUR.

The word is derived from the Greek *αυρα*, *gale.*

Aura, in *Chemiſtry*, a certain fine and pure ſpirit, found in every animal or vegetable body; but ſo ſubtle, as only to be perceptible by its ſmell and taſte, or other effects, not found in any other but that body. This *aura* exhibits the proper character of the body, and is lodged in the oil of the body, to prevent its being diſſipated and thrown off; and hence it is that all the ancient alchemiſts ſay ſpirit reſides in ſulphur. Boerhaave Ch. p. 168.

Aura, in *Ornithology*, a ſpecies of VULTUR.

Auræ, in *Mythology*, a name given by the Romans to the nymphs of the air. They are moſtly to be found in the ancient paintings of cielings; where they are repreſented as light and airy; generally with long robes, and flying veils, of ſome lively colour or other, and fluttering about in the rare and pleaſing element aſſigned to them. They are ſportive and happy in themſelves, and well-wiſhers to mankind.

AURANTIUM, in *Botany*. See ORANGE-*tree*.

AURANTIUS *piſcis*, in *Ichthyology*, a name given by Nieremberg to the DORADO, or dolphin, a ſpecies of the CORYPHÆNA, diſtinguiſhed from the others by its forked tail.

Auraria *functio*, *penſio*, or *præſtatio*, a tax or tribute to be paid in gold.

The collector hereof was denominated *ſuſceptor aurarius*, or *chryſypodectes*.

AURATA, in *Zoology*. See GILT-*head*.

AURATUS *eques*. See EQUES.

AUREA *Alexandrina*, in *Pharmacy*, a kind of opiate, or antidote, compoſed of a great number of ingredients, which was in great fame among the ancient writers.

It is called *aurea*, from the gold (*aurum*) which is an ingredient in its compoſition; and *Alexandrina*, as having been firſt invented by a phyſician named Alexander.—It is reputed a good preſervative againſt the colic and apoplexy.

AURELIA, in *Natural Hiſtory*, the name of that ſtate, otherwiſe called chryſalis, in which butterflies, and ſeveral other animals, paſs the time between their caterpillar or other creeping ſtate, and their winged one.

In this ſtate no creatures afford ſo beautiful a variety as the butter-fly kinds; and they all paſs through this middle ſtate, without one exception.

The figure of the *aurelia* or chryſalis, generally, approaches to that of a cone, or at leaſt the hinder part of it is of this ſhape; and the creature, while in this ſtate, ſeems to have neither legs nor wings, nor has any power of walking. It ſeems, indeed, to have hardly ſo much as life. It takes no nouriſhment in this ſtate, nor has it any organs for taking any; and indeed its poſterior part is all that ſeems animated, this having a power of giving itſelf ſome motions. The external covering of the chryſalis is cartilaginous, and conſiderably large, and is uſually ſmooth and gloſſy; but ſome few of them have a few hairs, ſome are alſo as hairy as the caterpillars from which they are produced, and others are rough, or, as it were, chagreened all over.

In all of theſe there may be diſtinguiſhed two ſides; the one of which is the back, the other the belly of the animal; and on the anterior part of the latter, there may always be diſtinguiſhed certain little elevations running in ridges, and reſembling the fillets wound about mummies. The part whence theſe have their origin, is eſteemed the head of the animal; the other ſide or back is ſmooth, and is of a rounded figure in moſt of the chryſaliſes; but ſome have ridges on the anterior part and ſides of this part; and theſe uſually terminate in a point, and make an angular appearance on the chryſalis.

From this difference is drawn the firſt general diſtinction of theſe bodies. They are by this divided into two claſſes; the round and the angular kinds. The firſt kind are by the French naturaliſts called alſo *feves*, from the common cuſtom of calling the *chryſalis* of the ſilk worm, which is round, by this name.

There is ſomething more regular in this diſtinction alſo than might be at firſt conceived; for the diviſion is continued from the fly-ſtate: the rounded chryſaliſes being almoſt all produced by the *phalenæ* or moths; and the angular ones by the *papilios*, or day-flies. There are ſeveral ſubordinate diſtinctions of theſe kinds, but in general they are leſs different from one another than the caterpillars from whence they are produced.

The head of thoſe of the firſt claſs uſually terminates itſelf by two angular parts, which ſtand ſeparate one from the other, and reſemble a pair of horns. On the back, eminences and marks are diſcovered, which imagination may form into eyes, noſe, chin, and other parts of the human face.

There are a great variety, and a great deal of beauty in the figures and arrangement of the eminences and ſpots on the other parts of the body of the chryſalis of different kinds. It is a general obſervation, that thoſe chryſaliſes which are terminated by a ſingle horn, afford day-butterflies of the kind of thoſe which have buttoned *antennæ*, and whoſe wings, in a ſtate of reſt, cover the under part of the body, and which uſe all their ſix legs in walking, thoſe of many other kinds uſing only four of them. Thoſe chryſaliſes, which are terminated by two angular bodies, and which are covered with a great number of ſpines, and have the figure of a human face on their back in the greateſt perfection, afford butterflies of the day-kind, and of that claſs, the characters of which are, their walking on four legs, and uſing the other two, that is, the anterior part, in the manner of arms or hands. The chryſaliſes, which have two angular bodies on their heads, but ſhorter than thoſe of the preceding, and whoſe back ſhews but a faint ſketch of the human face, and which have fewer ſpines, and thoſe leſs ſharp, always turn into that ſort of butterfly, the upper wings of which are divided into ſegments, one of which is ſo long as to repreſent a tail, and whoſe under-wings are folded over the upper part of the back. A careful obſervation will eſtabliſh many more rules of this kind, which are not ſo perfect as to be free from all exceptions, yet are of great uſe, as they teach us in general what ſort of fly we are to expect from the chryſalis, of which we know not the caterpillar, and therefore can only judge from appearances.

Theſe are the principal differences of the angular chryſaliſes; the round ones alſo have their different marks not leſs regular than thoſe.

The greater number of the round chryſaliſes have the hinder part of their body of the figure of a cone; but the upper end, which ought to be its circular plane baſe, is uſually bent and rounded into a ſort of knee: this is uſually called the head of the chryſalis; but there are alſo ſome of this kind, the head of which is terminated by a nearly plane ſurface: ſome of the creeping ten-legged caterpillars give chryſaliſes of this kind, which have each of them two eminences that ſeem to bring them towards the angular kind.

Among the angular chryſaliſes there are ſome whoſe colours ſeem as worthy our obſervation as the ſhapes of the others. Many of them appear ſuperbly clothed in gold. Theſe elegant ſpecies have obtained the name of chryſalis and *aurelia*, which are derived from Greek and Latin words, ſignifying gold; and from theſe all other bodies of the ſame kind have been called by the ſame names, though leſs or not at all entitled to them. As ſome kinds are thus gilded all over, ſo others are ornamented with this gay appearance in a more ſparing manner, having only a few ſpots of it in different places on their back and belly. Some ſpecies alſo have ſilver in the place of gold, either extending itſelf all over them, or forming ſome particular ſpots upon their back and belly. Theſe obvious marks, however, are not to be depended upon as certain characters of diſtinction, for accidents in the formation of the chryſalis may alter them; and thoſe which naturally would have been gilded all over, may be ſometimes only ſo in part, and either theſe or the others may by accidents be ſo formed as to ſhew nothing of this kind at all, but be only of a duſky brown. Thoſe, however, which have neither ſilver nor gold to recommend them to your eyes, do not want other colours, and thoſe beautifully variegated. Some of them are all over of an elegant green, as is the chryſalis of the fennel-caterpillar; others of an elegant yellow, and ſome of a bright greeniſh tinge, variegated with ſpots of a ſhining black; we have a very beautiful inſtance of this laſt kind in the chryſalis of the elegant cabbage-caterpillar. The general colour of the chryſalis of the common butterflies, however, is brown.

Some alſo are of a fine deep black, and of theſe many are ſo ſmooth and gloſſy, that they are equal to the fineſt Indian japan. The common caterpillar of the fig-tree gives an inſtance of one of theſe beautiful gloſſy ones; the caterpillar of the vine affords another of theſe fine black chryſaliſes.

The rounded chryſaliſes do not afford any thing of that variety of colouring ſo remarkably beautiful in the angular ones; they are uſually of a duſky yellow, in different ſhades, and are often variouſly ſpotted with black: but theſe, as well as all other chryſaliſes, before they arrive at their fixed colour, paſs through ſeveral other temporary ones, ſome being of a different colour when firſt produced from the caterpillar, from what they are a few days afterwards; and ſome varying ſo greatly, though only in degree, as not to be diſtinguiſhable, by the moſt converſant eye, from what they were when firſt produced. The green rough caterpillar of the cabbage has a chryſalis which is green at firſt, and from that gradually goes through all the ſhades of green to a faint yellow, which is its laſting colour; and one of the oak caterpillars yields a chryſalis beautifully ſpotted with red at its firſt appearance, but theſe ſpots change to brown for their fixed colour:

lour: the third day from their formation uſually fixes their laſting colours; and if they are obſerved to turn black in any part after this time, it is a ſign that they are dead or dying.

The ſeveral ſpecies of inſects, as a fly, ſpider, and an ant, do not differ more evidently from one another, in regard to appearance, than do a caterpillar, its chryſalis, and a butterfly produced from it; yet it is certain that theſe are all the product of the ſame individual egg; and nothing is more certain than that the creature which was for a while a caterpillar, is, after a certain time, a chryſalis, and then a butterfly. Theſe great changes produced in ſo ſudden a manner, ſeem like the *metamorphoſes* recorded in the fables of the ancients; and indeed it is very probable that thoſe fables firſt took their origin from ſuch changes.

The parts being diſtinguiſhable in the chryſalis, we eaſily find the difference of the ſpecies or claſs of the fly that is to proceed from it. The naked eye ſhews whether it be one of thoſe that have, or of thoſe that have not a trunk, and the aſſiſtance of a microſcope ſhews the *antennæ* ſo diſtinctly, that we are able to diſcern whether it belongs to the day or night claſs; and often to what genus, if not the very ſpecies: nay, in the plumoſe horned kinds, we may ſee by the *antennæ* whether a male or female *phalena* is to be produced from the chryſalis, the horns of the female being in this ſtate evidently narrower, and appearing leſs elevated above the common ſurface of the body, than thoſe of the male.

All theſe parts of the chryſalis, however, though ſeen very diſtinctly, are laid cloſe to one another, and ſeem to form only one maſs; each of them is covered with its own peculiar membrane in this ſtate, and all are ſurrounded together by a common one, and it is only through theſe that we ſee them, or rather we ſee on theſe the figures of all the parts moulded within, and therefore it requires attention to diſtinguiſh them. The chryſalis is ſoft when firſt produced, and is wetted on the front with a viſcous liquor; its ſkin, though very tender at firſt, dries and hardens by degrees; but this viſcous liquor, which ſurrounds the wings, legs, &c. hardens almoſt immediately, and in conſequence faſtens all thoſe limbs, &c. into a maſs, which were before looſe from one another; this liquor as it hardens loſes its tranſparence, and becomes brown; ſo that it is only while it is yet moiſt that theſe parts are to be ſeen diſtinct.

It is evident from the whole, that the chryſalis is no other than a butterfly, the parts of which are hid under certain membranes, which faſten them together, and when the limbs are arrived at their due ſtrength they become able to break through theſe membranes, and then expand and arrange themſelves in their proper order.

The firſt *metamorphoſis* therefore differs in nothing from the ſecond, except that the butterfly comes from the body of the caterpillar in a weak ſtate, with limbs unable to perform their offices; whereas it comes from the chryſalis perfect.

M. Reamur has given us many curious obſervations on the ſtructure and uſes of the ſeveral coverings that attend the varieties of the caterpillar kind in this ſtate.

The creatures in general remain wholly immoveable in this ſtate, and ſeem to have no buſineſs in it, but a patient attendance on the time when they are to become butterflies; and this is a change that can happen to them only as their parts, before extremely ſoft and weak, are capable of hardening and becoming firm by degrees, by the tranſpiration of that abundant humidity which before kept them ſoft; and this is proved by an experiment of M. Reaumur, who incloſing ſome chryſaliſes in a glaſs tube, found, after ſome time, a ſmall quantity of water at the bottom of it, which could have come there no other way but from the bottom of the incloſed animal.

This tranſpiration depends greatly on the temperature of the air: it is augmented by heat, and diminiſhed by cold; but it has alſo its peculiarities in regard to the ſeveral ſpecies of butterfly to which the chryſalis belongs.

According to theſe obſervations, the time of the duration of the animal in the chryſalis ſtate muſt be in different ſpecies very different; and there is indeed this wide difference in the extremes, that ſome ſpecies remain only eight days in this ſtate, and others eight months.

We know that the caterpillar changes its ſkin four or five times during its living in that ſtate; and that all theſe ſkins are at firſt produced with it from the egg, lying cloſely over one another. It parts with or throws off all theſe one by one, as the butterfly, which is the real animal all this time within, grows more and more perfect in the ſeveral firſt changes. When it throws off one, it appears in another ſkin of exactly the ſame form; but at its final change from this appearance, that is, when it throws off the laſt ſkin, as the creature within is now arrived at ſuch a degree of perfection as to need no farther taking of nouriſhment, there is no farther need of teeth, or any other of the parts of a caterpillar. The creature in this laſt change proceeds in the very ſame manner as in all the former, the ſkin opening at the back, and the animal making its way out in this ſhape. If a caterpillar, when about to throw off this laſt ſkin, be thrown into ſpirits of wine, and left there for a few days, the membranes within will harden, and the creature may be afterwards carefully opened, and the chryſalis taken out, in which the form of the tender butterfly may be traced in all its lineaments, and its eyes, legs, &c. evidently ſeen. It is not neceſſary however to ſeize upon this exact time for proving the exiſtence of the chryſalis or butterfly in the caterpillar; for if one of theſe animals be thrown into ſpirit of wine, or into vinegar, ſome days before that time, and left there for the fleſh to harden, it may afterwards be diſſected, and all the lineaments of the butterfly traced out in it; the wings, legs, *antennæ*, &c. being as evident here, and as large as in the chryſalis. Reaumur's Hiſt. Inſect. vol. i. p. 2. 28.

It is very plain from this, that the change of the caterpillar into a chryſalis is not the work of a moment, but is carrying on for a long time before, even from the very hatching of the creature from the egg. The parts of the butterfly are not however diſpoſed in exactly the ſame manner while in the body of the caterpillar, as when left naked in the form of the chryſalis; for the wings are proportionably longer and narrower, being wound up into the form of a cord, and the *antennæ* are rolled up on the head; the trunk alſo is twiſted up, and laid upon the head; but this in a very different manner from what it is in the perfect animal, and very different from that which it lies in within the chryſalis; ſo that the firſt formation of the butterfly in the caterpillar by time arrives at a proper change of the diſpoſition of its parts, in order to its being a chryſalis. The very eggs, hereafter to be depoſited by the butterfly, are alſo to be found not only in the chryſalis, but in the caterpillar itſelf, arranged in their natural, regular order. They are indeed in this ſtate very ſmall and pellucid; but after the change into the chryſalis, they have their proper colour.

As ſoon as the ſeveral parts of the butterfly therefore are arrived at a ſtate proper for being expoſed to the more open air, they are thrown out from the body of the caterpillar, ſurrounded only with their membranes; and as ſoon as they are arrived after this at a proper degree of ſtrength and ſolidity, they labour to break through theſe thinner coverings, and to appear in their proper and natural form. The time of their duration in this ſtate of chryſalis is very uncertain, ſome remaining in it only a few days, others ſeveral months, and ſome almoſt a year in appearance. But there is a fallacy in this, that many are not aware of. It is natural to think, that as ſoon as the creature has incloſed itſelf in its ſhell, be that of what matter it will, it undergoes the change into the chryſalis ſtate. And this is the caſe with the generality; yet there are ſome which are eight or nine months in the ſhell before they become chryſaliſes, ſo that their duration in the real chryſalis ſtate is much ſhorter than it naturally appears to be. M. Reaumur carefully watched the auriculated caterpillar of the oak into its ſeveral changes, and particularly from its chryſalis, which is of this laſt kind, into the fly; and has given an account of the method of this, as an inſtance of the general courſe of nature in theſe operations.

The membranes which envelope the creature in this chryſalis ſtate are at firſt tough and firm, and immediately touch the ſeveral parts of the incloſed animal; but by degrees, as theſe parts harden, they become covered, ſome with hairs, and others with ſcales. Theſe, as they continue to grow, by degrees fall off the ſeveral particular membranes which cover the parts on which they are placed, to a greater diſtance, and by degrees wholly looſen them from the limbs. This is one reaſon of thoſe membranes drying and becoming brittle.

The middle of the upper part of the CORCELET is uſually marked with a line, which runs in a longitudinal direction; and this part is always more elevated than the reſt, even in the conic kinds, which are no otherwiſe angular. This line is in ſome very bold and plain, in others it is ſo faint as not to be diſtinguiſhable without glaſſes; but it is always in the midſt of that line that the ſhell begins to open. The motion of the head of the butterfly backwards firſt occaſions this crack, and a few repetitions of the ſame motions open it the whole length of the line.

The clearing itſelf however entirely is a work of more time in this caſe, than is the paſſing of the chryſalis out of the body of the caterpillar. In that caſe there is a crack ſufficiently large in the ſkin of the back, and the whole chryſalis being looſe comes out at once. But in this caſe every particular limb, and part of the body, has its ſeparate caſe; and though theſe are almoſt inconceivably thin and tender, yet it is neceſſary that every part be drawn out of them before it appear naked to the open air. As ſoon as all this is effected, and the animal is at full liberty, it either continues ſome time upon the remains of its covering, or creeps a little way diſtant from it, and there reſts. The wings are what we principally admire in this creature. Theſe are at this time ſo extremely folded up, and placed in ſo narrow a compaſs, that the creature ſeems to have none at all; but they by degrees expand and unfold themſelves, and, finally, in a quarter of an hour, or half an hour at the utmoſt, they appear at their full ſize, and in all their beauty. The manner of this ſudden unfolding of the wings is this: the ſmall figure they make when the creature firſt comes out of its membranes, does not prevent the obſerving that they are at that time conſiderably thick. This is owing to its being a large wing folded up in the niceſt manner, and with folds ſo arranged, as to be by no means ſenſible to the eye, for the wing is never ſeen to unfold; but when obſerved in the moſt accurate manner, ſeems to grow under the eye to this extent. When the creature is firſt produced from the ſhell, it is every where moiſt and tender; even its wings have no ſtrength or ſtiffneſs till they extend themſelves; but they then dry by degrees, and with the other parts become rigid and firm. But if any accident prevents the wings from expanding at their proper time, that is, as ſoon as the creature is out of its ſhell, they never afterwards are able to extend themſelves, but the creature continues to wear them in their contracted and wholly uſeleſs ſtate; and very often when the wings are in part extended before ſuch an accident happens, it ſtops them in a partial extenſion, and the creature muſt be contented to paſs its whole life with them in that manner.

M. Reaumur has proved that heat and cold make great differences in the time of hatching of the butterfly from the chryſalis ſtate: and this he particularly tried with great accuracy and attention, by putting them in veſſels in warm rooms, and in ice-houſes; and it ſeemed wholly owing to the haſtening or retarding the evaporation of the abundant humidity of the animal in the chryſalis ſtate, that it ſooner or later appeared in the butterfly form. He varniſhed over ſome chryſaliſes, in order to try what would be the effect of thus wholly preventing their tranſpiration; and the conſequence was, that the butterfly came forth from theſe two months later than their natural time. Thus was the duration of the animal in this ſtate lengthened, that is, its exiſtence was lengthened, but that without any advantage to the creature, ſince it was in the time of its ſtate of inaction, and probably of inſenſibility.

Though this was of no conſequence, M. Reaumur deduces from it a hint that ſeems to be of ſome uſe. He obſerves that hen's eggs, of which we make ſo many uſes, and eat in ſo many forms, are properly a ſort of chryſalis of the animal; their germ, after they are impregnated by the cock, containing the young animal alive, and waiting only a due degree of warmth to be hatched and appear in its own form. Eggs tranſpire, notwithſtanding the hardneſs of their ſhells; and when they have been long kept, there is a void found near one of their ends, between the ſhell and the internal membrane; this is a mark of their being ſtale, and is the effect of an evaporation of part of their humidity: and the ſame varniſh which had been uſed to the chryſaliſes, being tried on eggs, was found to preſerve them for two years, as freſh as if laid but the ſame day, and ſuch as the niceſt palate could not diſtinguiſh from thoſe that were ſo. See Eggs.

It is not yet known how much farther this uſeful ſpeculation might be carried, and whether it might not be of great uſe even to human life, to invent ſomething that ſhould act in the manner of this varniſh, by being rubbed over the body, as the *athletæ* did of old, and the ſavages of the Weſt Indies do at this time, without knowing why. But to return to the inſects which are the ſubjects of this article: their third ſtate, that in which they are winged, is always very ſhort, and ſeems deſtined for no other action but the propagation of the ſpecies. See Generation, and Papilio.

AURELIANA, in *Botany*, a name given by ſome to a ſpecies of *panax*. See Ginseng.

AUREOLA, the crown of glory, given by painters and ſtatuaries to ſaints, martyrs, and confeſſors, as a mark of the victory which they have obtained.

F. Sirmond ſays, this cuſtom was borrowed from the heathens, who uſed to encompaſs the heads of their deities with ſuch rays.

AUREUS, the Roman gold coin, equivalent to 25 denarii, or 100 *ſeſterces*. Suet. in Oth. c. iv. Tacit. Hiſt. lib. i. Beverin. de Ponder. p. 33, ſeq.

In *Modern* and *Middle Age Writers*, it is called *ſolidus*, or *ſolidus aureus*.

The *aureus*, according to Arbuthnot, generally weighed double the denarius: whence it muſt have been worth, according to the firſt proportion of coinage mentioned by Pliny, 1 *l.* 4 *s.* 3 *d* ¼ ſterling.—According to the proportion that now obtains among us, 1 *l.* 0 *s.* 9 *d.* Plin. lib. xxxiii. c. 3. Arbuth. Tab. 25.—Ainſworth, however, makes the *aurei (denarii)* of the higher empire, weigh only five penny-weights; and under the lower empire, little more than half ſo much.

The weight of the *aureus* was gradually diminiſhed by the emperors. The conſular *aureus* weighed at a mean 126 troy grains, 40 of them being contained in the Roman pound: the imperial *aureus*, being 45 to the pound, weighed 112 grains; and the *ſolidus*, being 72 to the pound, weighed 70 grains. Phil. Tranſ. vol. lxi. part ii. art. 42. See Coin, and Denarius.

AURICHALCUM; ſee Orichalcum.

AURICLE, Auricula, in *Anatomy*, the external ear; or that part of the ear which is prominent from the head. The word is a diminutive of *auris*, *ear*; q. d. *little ear*.

For the ſtructure and variety of the *auricle*, with the ſeveral parts thereof, their names, &c. ſee Ear.

Auricle is alſo applied to two appendages of the heart; being two muſcular caps, covering the two ventricles thereof; thus called from the reſemblance they bear to the external ear.

They move regularly, like the heart, only in an inverted order; their *ſyſtole* correſponding to the *diaſtole* of the heart, and *vice verſa*. See *Tab. Anat. (Splanch.) fig.* 12. *lit. d.* See alſo farther of their ſtructure and office under the article Heart.

AURICULA, or Auricula *urſi*, in *Botany*, bear's *ear*, a ſpecies of primula in the Linnæan ſyſtem. To enumerate the varieties of this plant, would be almoſt endleſs and impoſſible; for every year produces vaſt quantities of new flowers, differing in ſhape, ſize, and colour: in the leaves of theſe plants alſo, there is as great a variety, ſo that the ſkilful floriſt is often capable of diſtinguiſhing the particular ſorts thereby.

But as it ſeldom happens that ſuch of theſe flowers as are at one time in great eſteem, continue to be regarded a few years after (there being ſtill finer or larger flowers produced from ſeeds, which are what the floriſts chiefly ſeek after) it would be needleſs to mention any of them. Suffice it therefore to give the characters of a good *auricula*. 1. The ſtem of the flower ſhould be lofty and ſtrong. 2. The footſtalk of the ſingle flower ſhould be ſhort, that the umbel may be regular and cloſe. 3. The pipe or neck of each flower ſhould be ſhort, and the flowers large, and regularly ſpread; being no ways inclinable to cup. 4. The colours ſhould be very bright and well mixed. 5. The eye of the flower ſhould be large, round, and of a good white or yellow: and the tube or neck not too wide.

All the flowers of this kind that want any of the above mentioned properties, are now rejected by every good floriſt: for as the varieties every year increaſe from ſeeds, ſo the bad ones are turned out to make room for better.

The time for ſowing the ſeed is commonly in Auguſt; but if it be ſown before Chriſtmas, it will be time enough. The beſt ſoil for it is a good light freſh ſandy mould, mixed with very rotten neat's dung, or very rotten dung from the bottom of an old hot-bed.

The manner of propagating theſe flowers when obtained, is from off-ſets or ſlips, taken from the old roots in April, when the flowers are in bloom. Thoſe plants which have ſtrong ſingle heads, always produce the largeſt cluſters of flowers; therefore the curious floriſts pull off the off-ſets, as ſoon as it can be done with ſafety to the plant, to encourage them to flower the ſtronger.

Theſe are the rules for propagating theſe plants; but in order to have them flower in perfection, the following rules muſt alſo be obſerved.

1. The plants muſt be preſerved from too much wet in winter, and muſt have free air, and not too much ſun. 2. In the beginning of February, if the weather be mild, the earth in your *auricula*-pots muſt be taken off as far as may be, without diſturbing the roots, and new freſh earth laid in its place. 3. The pots muſt be covered with matting in the night, to defend them from froſts while the plants are budding. 4. When the ſtalk begins to be long, they muſt be defended from haſty rains, yet not kept too much under cover, which draws up the ſtalk too long, and makes it weak; and they muſt be watered frequently, a little at a time, and none of the wet muſt be ſuffered to fall on the plant. Laſtly, when the flowers begin to open, the pots ſhould be removed to a ſtage of ſhelves, one over another, placed under cover, open to the morning-ſun, but ſheltered from the mid-day's ſun. Here they may remain till their flowers are paſt, and then they muſt be ſet out to have the benefit of the rains and free air, for the ripening of the ſeed, which muſt be ſaved carefully, and ſpread on papers, and laid to dry. Miller.

Though this herb is ſeldom kept in the ſhops, it nevertheleſs ſtands recommended as a vulnerary, and as ſuch is found of ſervice, both for internal and external purpoſes. Mixed with ointments and plaſters, it is reckoned good in ruptures. Four or ſix ſpoonfuls of the water, in which it has been boiled, taken every morning, is ſaid to cure coughs and ulcers of the lungs. The juice of its flowers removes ſpots of the face, and beautifies the ſkin; and with the ſame intention ſome diſtil a water from it. James.

Auricula, in *Zoology*; ſee **Earwig**.

Auricula *Judæ*, or *Jew's ear*, a kind of *fungus*, or muſhroom, ſomewhat reſembling, in figure, a human ear.

It grows on old elder-trees, the tree on which, as ſome pretend, Judas hanged himſelf; and hence, they think, the name is derived.

This *fungus* ſteeped in water, and applied to the eyes, is ſaid to free them of inflammations: but its chief uſe is under the form of a gargle in decoctions, againſt inflammations of the throat, or ſwelling of the tonſils.

AURICULÆ *Alvearium*; ſee **Alvearium**.

Auriculæ *primus muſculus*, in *Anatomy*, the name given by Fallopius to one of the muſcles of the head, called by Albinus the *attollens auriculam*, and by Winſlow the superior *auriculæ*.

Auriculæ *ſecundus muſculus*, in *Anatomy*, a name given by Fallopius, and others, to the muſcles of the ears, called, by Albinus, *retrahentes auriculam*. Theſe are three in number, and ſo like one another, that they are eaſily miſtaken for one. Riolanus calls them the *proprii auris externæ*.

Auriculam *Retrahens*; ſee **Retrahens**.

AURICULAR, ſomething that relates to the ears.

Thus we ſay, an *auricular* witneſs, *auritus teſtis, a witneſs by hearſay*.

Auricular *Confeſſion*, is that made in the ear, privately.

Auricular *Medicines*, are ſuch as are ſuited to the cure of the diſtempers of the ear.

AURICULARIS *Abductor*; ſee **Abductor**.

The finger next the little finger is alſo called *auricularis*, by the Greeks ωτιτης, becauſe uſed in picking the ear.

AURICULATED *Leaf*, in *Botany*, is a leaf which has a lobe on each ſide towards the baſe.

AURIFLAMMA, in the *French Hiſtory*, properly denotes a flag, or ſtandard, belonging to the abbey of St. Dennis, ſuſpended over the tomb of that ſaint, which the religious, on occaſion of any war in defence of their lands, or rights, took down, with great ceremony, and gave it to their protector, or advocate, to be borne at the head of their forces. Du-Cange.

Auriflamma is alſo ſometimes uſed to denote the chief flag, or ſtandard, in any army.

AURIGA, in *Aſtronomy*, the *Waggoner*; a conſtellation of ſtars in the northern hemiſphere: whoſe ſtars, in Ptolemy's catalogue, are 14; in Tycho's, 27; in Hevelius's, 40; in the Britannic catalogue, 66: the names, ſituations, longitudes, latitudes, magnitudes, &c. whereof are as follow:

Names and ſituations of the ſtars.	Bayer's Cha.	Signs.	Longitud.			Latitude. North.			Magnitude.

AURIGRAPHUS, from *aurum, gold*, and γραφω, *I write*; in *Middle Age writers*, a copiſt, or calligrapher, who wrote in gold letters.

AURIPIGMENTUM, called alſo **orpiment**.

AURIS, the ear. See **Ear**.

Aurium *abſciſſio*, cutting off the ears, was a puniſhment inflicted, by the Saxon laws, on thoſe who robbed churches; and, afterwards, on every thief; and, at length, on divers other criminals.

Auris *aſini*, *aſs's ears*, a name given, by *Naturaliſts*, to a ſpecies of ſea-ſhell, ſuppoſed to reſemble the ear of an aſs. See **Murex**.

Auris *marina*. See **Ear-***ſhell*.

Auris *porci*, *hog's ear*, in *Natural Hiſtory*, a name given by authors to a ſea-ſhell, a ſpecies of the **murex** kind.

Auris *elevator*; ſee **Elevator**.—*Auris externus*; ſee **Externus**.—*Auris obliquus*; ſee **Obliquus**.—*Auris tinnitus*; ſee **Tinnitus**.

AURISCALPIUM, an inſtrument wherewith to pick and cleanſe the ear from wax; and ſerving alſo for ſome other operations relating to diſorders of that part.

The word is compounded of *auris, ear*, and *ſcalpo, I ſcratch*, or *prick*.

AURORA, the morning twilight; or that faint light which begins to appear in a morning, when the ſun is within eighteen degrees of the horizon.

The poets have perſoniſied, and even made it a goddeſs; repreſenting her with a chariot, roſy fingers, &c.

Accordingly *Aurora* is the daughter of Titan and Terra.

Aurora *Borealis*, or **Aurora** *Septentrionalis*, the northern dawn, or light, is an extraordinary **meteor**, or luminous appearance, ſhewing itſelf in the night-time, in the northern part of the heavens.

It is uſually of a reddiſh colour, inclining to yellow, and ſends out frequent coruſcations of pale light, which ſeem to riſe from the horizon in a pyramidal undulating form, and ſhoot, with great velocity, up to the zenith.

The *Aurora borealis* appears moſt commonly in form of an arch; chiefly in the ſpring and autumn; after a dry year.—The arch is partly bright, partly dark; but generally

rally tranſparent. And the matter of which it conſiſts is alſo found to have no effect on the rays of light which paſs through it. Dr. Hamilton obſerves, that he could plainly diſcern the ſmalleſt ſpeck in the Pleiades through the denſity of thoſe clouds which formed part of the *Aurora borealis* in 1763, without the leaſt diminution of its ſplendour, or increaſe of twinkling. Phil. Eſſays, Eſſ. iii. p. 106.

Sometimes it produces an *iris.*—M. Godin judges, that moſt of the extraordinary meteors and appearances in the ſkies, related as prodigies by hiſtorians, e. gr. battles, and the like, may be probably enough reduced to the claſs of AURORÆ *boreales.* Vid. Hiſt. Acad. R. Scienc. an. 1762. p. 405.

This kind of METEOR never appears near the equator, and was ſo rare in England, that none are recorded in our annals ſince that remarkable one, November 14, 1574, till the ſurpriſing *Aurora borealis*, March 6, 1716, which appeared for three nights ſucceſſively, but by far more ſtrongly on the firſt.—Indeed, in the years 1707, and 1708, five ſmall ones were obſerved in little more than eighteen months.

Hence it ſhould ſeem, that the air, or earth, or both, are not at all times diſpoſed to produce this *phænomenon*, for though it is poſſible it may happen in the day-time, in bright moon-ſhine, or in cloudy weather, and ſo paſs unobſerved; yet that it ſhould appear ſo frequent at ſome times, and ſo ſeldom at others, cannot well this way be accounted for.—That in March 1716, was viſible to the weſt of Ireland, and the confines of Ruſſia, and to the eaſt of Poland; extending at leaſt near 30° of longitude, and from about the 50th degree in latitude, over almoſt all the north of Europe; and in all places at the ſame time, it exhibited the like wondrous appearances.

Many attempts have been made to aſſign the cauſe of this *phænomenon.*—Dr. Halley imagines the watery vapours, or *effluvia*, rarified exceedingly by ſubterraneous fire, and tinged with ſulphureous ſtreams, which many naturaliſts have ſuppoſed to be the cauſe of earthquakes, may alſo be the cauſe of this appearance: or that it is produced by a kind of ſubtile matter, freely pervading the pores of the earth, and which, entering into it nearer the ſouthern pole, paſſes out again with ſome force, into the *æther* at the ſame diſtance from the northern; the obliquity of its direction being proportioned to its diſtance from the pole. This ſubtile matter, by becoming ſome way or other more denſe, or having its velocity increaſed, may be capable of producing a ſmall degree of light, after the manner of *effluvia* from electric bodies, which, by a ſtrong and quick friction, emit light in the dark: to which ſort of light this ſeems to have a great affinity. Phil. Tranſ. N° 347.—See Mr. Cotes's deſcription of this *phænomenon*, and method of explaining it, by ſtreams emitted from the heterogeneous and fermenting vapours of the atmoſphere, in Smith's Optics, p. 69, &c. or Phil. Tranſ. abr. vol. vi. part ii.

The celebrated M. de Mairan, in an expreſs treatiſe on the *Aurora borealis*, publiſhed in 1731, aſſigns its cauſe to be the ZODIACAL *light*, which, according to him, is no other than the ſun's atmoſphere: this light happening, on ſome occaſions, to meet the upper parts of our air, on the ſide of the limits where univerſal gravity begins to act more forcibly towards the earth than towards the ſun, falls into our atmoſphere, to a greater or leſs depth, as its ſpecific gravity is greater or leſs, compared with the air through which it paſſes. Vid. Tract. Phyſ. & Hiſt. del Aurore Boreal. Suite des Mem. del Acad. R. des Scienc. ann. 1731. p. 3. ſeq.—There is an abſtract of Mr. Mairan's Phyſical and Hiſtorical Treatiſe of the *Aurora borealis*, in the Phil. Tranſ. N° 433. or Abridg. vol. viii. p. 540.

Mr. Euler thinks the cauſe of the *Aurora borealis* not owing to the zodiacal light, as Mr. de Mairan ſuppoſes; but to particles of our atmoſphere, driven beyond its limits by the impulſe of the light of the ſun. On this ſuppoſition, he endeavours to account for the *phænomena* obſerved concerning this light. He ſuppoſes the zodiacal light, and the tails of comets, to be owing to a ſimilar cauſe. See TAIL *of comets*, and ZODIACAL *light*.

This light ſometimes appears remarkably red, as it happened Dec. 5, 1737, of which we have very full accounts from divers parts of Europe, in the Phil. Tranſ. N° 459. ſect. 7. p. 583—606.

Ever ſince the identity of lightning, and of the electric matter, has been aſcertained, philoſophers have been naturally led to ſeek the explication of aerial meteors in the principles of electricity; and there is now no doubt but moſt of them, and eſpecially the *Aurora borealis*, are electrical *phænomena.* Beſide the more obvious and known appearances which conſtitute a reſemblance between this meteor and the electric matter whereby lightning is produced, it has been obſerved, that the *Aurora* occaſions a very ſenſible fluctuation in the magnetic needle; and that, when it has extended lower than uſual into the atmoſphere, the flaſhes have been attended with various ſounds of rumbling and hiſſing, taken notice of both by Sig. Beccaria and M. Meſſier. Mr. Canton, ſoon after he had obtained electricity from the clouds, offered a conjecture, that the *Aurora borealis* is occaſioned by the daſhing of electric fire from poſitive towards negative clouds at a great diſtance, through the upper part of the atmoſphere where the reſiſtance is leaſt. And he ſuppoſes, that the *Aurora*, which happens at the time when the magnetic needle is diſturbed by the heat of the earth, is the electricity of the heated air above it; and this appears chiefly in the northern regions, as the alteration in the heat of the air in thoſe parts will be the greateſt: nor is this hypotheſis improbable, when it is conſidered, that electricity is the cauſe of thunder and lightning; that it has been extracted from the air at the time of an *Aurora borealis*; that the inhabitants of the northern countries obſerve it to be remarkably ſtrong, when a ſudden thaw ſucceeds very ſevere cold weather; and that the *tourmalin* is known to emit and abſorb the electric fluid only by the increaſe or diminution of its heat. Poſitive and negative electricity in the air, with a proper quantity of moiſture to ſerve as a conductor, will account for this and other meteors, ſometimes ſeen in a ſerene ſky. Mr. Canton has ſince contrived to exhibit this meteor by means of the *torricellian* vacuum, in a glaſs tube about three feet long, and ſealed hermetically. When one end of the tube is held in the hand, and the other applied to the conductor, the whole tube will be illuminated from end to end; and will continue luminous without interruption for a conſiderable time, after it has been removed from the conductor. If, after this, it be drawn through the hand either way, the light will be uncommonly intenſe, and without the leaſt interruption from one hand to the other, even to its whole length. And though a great part of the electricity is diſcharged by this operation, it will ſtill flaſh at intervals, when held only at one extremity, and kept quite ſtill; but if it be graſped by the other hand at the ſame time in a different place, ſtrong flaſhes of light will hardly ever fail to dart from one end to the other, and theſe will continue twenty-four hours and longer, without any freſh excitation. An arched double barometer of a conſiderable height is an improvement of this contrivance, for exhibiting the appearance of an *Aurora borealis*, by means of the electric fire. Signior Beccaria, who has purſued his obſervations on atmoſpherical electricity farther than any of his aſſociates in theſe inquiries, conjectures that there is a conſtant and regular circulation of the electric fluid from north to ſouth; and he thinks, that the *Aurora borealis* may be this electric matter performing its circulation in ſuch a ſtate of the atmoſphere as renders it viſible, or approaching nearer to the earth than uſual. Dr. Franklin ſuppoſes, that the electrical fire diſcharged into the polar regions from many leagues of vaporiſed air raiſed from the ocean between the tropics, accounts for the *Aurora borealis*; and that it appears firſt, where it is firſt in motion, i. e. in the moſt northern part, and the appearance proceeds ſouthward, though the fire really moves northward. Franklin's Exper. and Obſ. 1769. p. 49. Phil. Tranſ. vol. xlviii. part i. p. 358. part ii. p. 784. Ib. vol. li. part i. p. 403. Lettere dell' Ellettriciſmo, p. 269; or Prieſtley's Hiſt. of Electricity, vol. i. See alſo an ingenious ſolution of this *phænomenon*, on the ſame principles, by Dr. Hamilton, Phil. Eſſays, Eſſ. iii.

We read of an *Aurora Auſtralis*, a kind of light ſeen in the ſky, towards the ſouth, ſomewhat reſembling thoſe often ſeen towards the north. See Phil. Tranſ. N° 461. ſect. 23, 24, and 25. and vol. liv. N° 53.

AURORA *ſurgens*, a phraſe uſed by *Alchemiſts*, to expreſs the multiplicative virtue of the philoſophers ſtone.

AURUM, in *Natural Hiſtory*, denotes gold. See GOLD.

The word is chiefly uſed among us as applied to certain chemical preparations, whereof gold is the baſis, or principal ingredient.—Such are the *aurum potabile*, *aurum fulminans*, &c.

AURUM *fulminans* is a preparation of gold; thus called, becauſe when caſt in the fire, it produces a violent noiſe, like thunder. It conſiſts of gold diſſolved in *aqua regia*, and precipitated by oil of tartar *per deliquium*, or volatile ſpirit of *ſal ammoniac*. The powder being waſhed in warm water, and dried to the conſiſtence of a paſte, is afterwards formed into little grains of the bigneſs of hemp-ſeed.

It is inflammable, not only by fire, but alſo by a gentle warmth; and gives a report much louder than that of gun-powder.

Its effect is commonly ſaid to be principally downwards; in oppoſition to gunpowder, which is chiefly upwards: but this rather ſeems a vulgar error.

A ſcruple of this powder acts more forcibly than half a pound of gunpowder: a ſingle grain laid on the point of a knife, and lighted at a candle, goes off with a greater noiſe than a muſquet.—It is ſaid to conſume even to the very laſt atom.—Dr. Black attributes the increaſe of weight, and alſo the exploſive property of this powder, to adhering fixable air.

This is a very dangerous preparation, and ſhould be uſed with great caution.

AURUM *moſaicum*, *muſicum*, or *muſivum*, a preparation in *Pharmacy*; thus called from its golden colour and appearance. It is made of mercury, tin, *ſal ammoniac*, and flowers of ſulphur; by grinding, mixing, and then ſetting them three hours in a ſand-heat.—The dirty ſublimate being taken off, the *aurum moſaicum* is found at the bottom of the matraſs, as the *reſiduum*.

It is recommended in moſt chronical and nervous caſes; and particularly convulſions of children.—Its doſe is from four grains to a ſcruple.

Aurum moſaicum is tin ſublimated by means of mercury, which receives its golden colour merely by the degree of heat proper for the operation. No other metal is ſublimated in this manner, except zinc, which may be ſubſtituted in place of the tin, and which led M. Homberg to ſay, that zinc contains tin.

Aurum moſaicum weighs about one-twelfth more than the tin originally employed. It is uſed as a pigment, and for mixing with glaſs, to imitate the ſpangles of the LAPIS *lazuli*; for which laſt purpoſe, ſhining *talc* is alſo made uſe of.—The *aurum moſaicum* is alſo called *aurum muſivum*.—See ſome very curious experiments to ſhew the nature of this preparation, in the Phil. Tranſ. vol. lxvi. 1771. N° 15. where the curious may find various recipes for making it, and a deſcription of the cheapeſt apparatus.

AURUM *potabile*, or *tincture of gold*; a medicine formerly in great requeſt, but at preſent rarely if ever uſed. It is prepared by mixing eſſential oil of roſemary with a ſolution of gold in *aqua regia*; and after ſhaking the veſſel, the gold will be retained in the oil, ſwimming on the top. This oil is ſeparated by inclination, and afterward digeſted for a month, in highly-rectified ſpirit of wine.

But after all, this is not a genuine tincture of gold; being only the gold divided into very ſmall parts by the *ſpiculæ* of the *aqua regia*, ſwimming in the oil of roſemary. Nor can there be any radical tincture of gold, which may not, by evaporating the oil, be reduced to a powder; and the powder, by melting, reduced into gold. The virtues of this tincture are entirely owing to the oil of roſemary.

The very name of *potable gold* impoſes on a great many people, and gives an opportunity to empirics to cheat them with impunity; for they draw tinctures from ſome ingredients whoſe colours come near to that of gold, and ſell them at an exorbitant rate, under the title of *aurum potabile*. This ſort of deceit is what generally ſucceeds beſt; for patients are prepoſſeſſed in favour of ſuch medicines as coſt much, carry great names, and have a ſpecious appearance. It often happens that theſe tinctures, which go by the name of *aurum potabile*, produce ſome good effects, becauſe they can make them with ſuch ſpirituous *menſtrua*, as comfort the heart, and expel ill humours by perſpiration: then the effect is extolled for a miracle, and attributed to the imaginary gold.

AURUM *reginæ*; ſee QUEEN-*gold*.

AURUM *ſophiſticum*, *mimic gold*, a chemical preparation, made as follows: take fine diſtilled verdigreaſe eight ounces, crude Alexandrian tutty four ounces, borax twelve ounces, ſalt-petre one ounce and a half; pulverize and mix them all together, tempering them with oil to the conſiſtence of a plaſter; then put a German crucible into a wind-furnace, heat it red-hot, and putting your maſs into it, let it be covered, and the furnace filled with coals over the crucible. When the maſs is melted, let it cool of itſelf, then break the crucible, and you will find at the bottom a fine *regulus*, like gold, weighing about four ounces, which being malleable, may be wrought into any form.

AURUM *vegetabile*, a name given to SAFFRON.

AUSCULTARE, in *Ancient Cuſtoms*.—Becauſe the reading of prayers with a graceful tone, or accent, makes ſome impreſſion on the hearers; there was anciently a perſon appointed, in monaſteries, to hear the monks read and ſing, who inſtructed them how to perform, before they were admitted to read or chant publicly in the church, or before the people.—This was called *auſcultare*, q. d. *to hear*, or *liſten*.

AUSPEX, a name originally given to thoſe who were afterwards denominated AUGURS.

In which ſenſe, the word is ſuppoſed to be formed from *avis*, *bird*, and *inſpicere*, *to inſpect*; *auſpices*, q. d. *aviſpices*.

Some will therefore have *auſpices* properly to denote thoſe who foretold future events from the ſight of birds.

AUSPICIUM, AUSPICY, the ſame with AUGURY.

Servius, indeed, diſtinguiſhes between *auſpicy* and *augury*; making *auſpicy* comprehend the conſideration of all things; *augury* only of certain things: he adds, that the former was allowed a man any where abroad, whereas the latter might only be performed in his native place. And it is certain, that conſuls, generals, and others, who took omens out of Rome, were properly ſaid *auſpicari*: nevertheleſs, cuſtom appears to have over-ruled this diſtinction.

AUSTERE, implies a rough aſtringent taſte; ſuch as that of vitriol, alum, &c.

The word comes from αυϛηρος, which ſignifies the ſame.

Auſtere things differ from *acerb*, or ſour ones, in that they conſtringe the mouth and tongue ſomewhat leſs, and are devoid of acidity.

AUSTERITY, AUSTERENESS *of taſte*, that which denominates a ſapid body AUSTERE.

AUSTERITY, among *Moral Writers*, ſometimes denotes *rigour* in the inflicting of puniſhments.

We ſay, *auſterity* of manners; the *auſterities* of the monaſtic life. The *auſterity* of the Roman cenſors kept the people in their duty. The greateſt *auſterity* of the Carthuſians is perpetual ſolitude.

AUSTIN-*Friers*; ſee HERMITS.

AUSTRAL, AUSTRALIS, the ſame with *ſouthern*.

The word is derived from *auſter*, *ſouth wind*.

Thus *auſtral ſigns* are the ſix laſt SIGNS of the zodiac; ſo called, becauſe they are on the ſouth ſide of the equinoctial.

AUSTRALIS *Corona*; ſee CORONA *Auſtralis*.

AUSTRALIS *Piſcis*, is a conſtellation of the ſouthern hemiſphere, not viſible in our latitude; whoſe ſtars, in Ptolemy's catalogue, are 18; and in the Britannic catalogue, 24: the longitudes and latitudes, &c. of which are as follow:

Situation of the ſtars.	Bayer's Cha.	Signs.	Longitud.			Latitude.			Magnitude.

AUSTRIACA SYDERA, a name given by Maupertuis to the ſpots in the ſun, as ſuppoſing them to be ſmall ſtars between the ſun and us.

AUSTRO AFRICUS, the ſouth-ſouth-weſt point, or wind.

AUSTROMANCY, AUSTROMANTIA, properly denotes ſoothſaying, or a vain method of predicting futurity, from obſervations of the winds.

AUSTURCUS, and OSTURCUS, a GOSHAWK; from whence we uſually call a falconer, who keeps that kind of hawks, an *oſtringer*. In ancient deeds, there has been reſerved as a rent to the lord, *unum auſturcum*.

AUTER *droit*, in *Law*, is where perſons ſue, or are ſued, in another's right; as executors, adminiſtrators, &c.

AUTER *vie*; a perſon who holds an eſtate by the life of another, is uſually called tenant *per auter vie*. Lytt. ſect. 56.

AUTERFOITS *acquit*, in *Law*, a plea by a criminal, that he was heretofore *acquitted* of the ſame treaſon or felony. For one ſhall not be brought in danger of his life, for the ſame offence, more than once. 3 Inſt. 213. But by ſtat. 3 Hen. VII. c. 1. this plea ſhall be no bar to the proſecution of any *appeal*.

Auterfoits *attaint*, a plea of former attainder, which is a good plea in bar, whether it be for the ſame or any other felony, under ſome exceptions; ſo that this plea is never good, but when a ſecond trial would be quite ſuperfluous.

Auterfoits *convict*, a plea upon a former conviction for the ſame identical crime, though no judgment was, or ever will be given: and this is a good plea in bar to an indictment.

AUTHENTIC, ſomething of received authority. It alſo ſignifies ſomething ſolemn, and celebrated; clothed in all its formalities; and atteſted by proper perſons to whom credit has been regularly given.

AUTHENTICATING, the puniſhing an adultreſs, by public whipping, and ſhutting her up in a convent for two years; after which, if the huſband be not willing to take her back, ſhe is ſhaven, veiled, and ſhut up for life.

It is thus called, as being the puniſhment preſcribed in the *authentics*.

If the huſband die within the two years, ſhe ſeems to have a right to petition the court for her liberty: at leaſt, another man, willing to marry her, may petition, and probably obtain it.

AUTHENTICS, Authenticæ, in the *Civil Law*, is a name given to the Novels of Juſtinian. See Novel.

The reaſon of the denomination is not well known.—Alciat will have it to have been firſt given them by Accurſius. The Novels were originally compoſed in Greek, and afterwards tranſlated into Latin by the patrician Julian, who alſo reduced them into fewer words, and leſs compaſs. And in the time of Bulgarus, there was a ſecond verſion made, more exact and literal, though not quite ſo elegant as the former.

This tranſlation, ſays the author juſt cited, being preferred by Accurſius, he called it *authentica*, by way of preference to that of Julian, as being more conformable to the original. They are hereby diſtinguiſhed from ſome other publications of later imperial conſtitutions, which are not regarded as of much authority.

AUTHOR, Auctor, properly denotes one who created or produced any thing; and is applied, by way of eminence, to the firſt cauſe; viz. God.

The word is formed of αυτος, *ipſe*; or rather from the Latin participle *auctus*, of *augeo*, *I increaſe*.

We ſay, the *Author* of nature; *Author* of the univerſe, &c.

The term *author* is ſometimes uſed in the ſame ſenſe with *inſtitutor* or *inventor*.—Polydore Virgil has wrote eight books of the *authors* or *inventors* of things, &c. See Invention.—Pythagoras is held the *author* of the *dogma* of *metempſychoſis*.

Author, in matters of *Literature*, denotes a perſon who has wrote or compoſed ſome book or writing.

We ſay, the ſacred *authors*; anonymous *authors*; ancient and modern *authors*; the Latin *authors* pillaged the Greeks, &c.—An original *author*, is he who firſt treated of any point or ſubject; who did not follow any other perſon, imitate any model either in the matter or the manner of what he has wrote. See Original.

AUTHORITY, Auctoritas, in a general ſenſe, denotes a right or power to command, and make one's ſelf obeyed.

In this ſenſe we ſay, the ſupreme or ſovereign *authority*; abſolute or deſpotic *authority*; the royal *authority*; the epiſcopal *authority*; the *authority* of the church, of a father, &c. The *authority* of Scripture, of a creed, confeſſion, or the like.

Authority is alſo uſed for the teſtimony of an author or writing.

The word is alſo particularly underſtood of an apophthegm, or ſentence of ſome great or eminent perſon, quoted in a diſcourſe, either by way of proof, or embelliſhment.

Authority alſo includes rules, laws, canons, decrees, deciſions, &c. alleged in confirmation of a matter in diſpute.

Paſſages quoted from Ariſtotle were of great *authority* in the ſchools: texts of Scripture are of deciſive *authority*.

Authorities make a ſpecies of arguments called by rhetoricians *inartificial* or *extrinſic arguments*.

For the uſe and effect of *authorities*, ſee Evidence, Faith, Prejudice, Probability, Reason, Revelation, &c.

Authority, in *Law*, is a power to do ſomething, conveyed by word or writing; as alſo by writ, warrant, commiſſion, letter of attorney, &c. and ſometimes by law.

Authority, or **Authorities**, likewiſe denote the treatiſes of ancient authors, ſuch as Glanvil, Bracton, Britton, the author of the book Fleta, Lyttelton, Fitzherbert, Coke, and others, which are cited as *authority*; and furniſh evidence that caſes have formerly happened in which particular points were determined, which are now become ſettled and firſt principles.

AUTO *da fé*. See Act *of Faith*.

AUTOCABDALI, in *Antiquity*, an order of muſicians, who wore an ivy crown, or garland.

Scaliger ſeems to rank them in the number of *mimi*.

AUTOCEPHALUS, a perſon who is his own ruler or maſter, and who has no other over him.

The word is compounded of αυτος, *ipſe*, and κεφαλη, *caput*, *head*.

This denomination was given, by the Greeks, to certain archbiſhops, who were exempted from the juriſdiction of patriarchs.—Such was the archbiſhop of Cyprus, by a general decree of the council of Epheſus, which freed him from the juriſdiction of the patriarch of Antioch.

There were ſeveral other biſhops in the Eaſt, who were *autocephali*; and in the Weſt, thoſe of Ravenna pretended to the ſame right.—The ſixth council, canon 39, ſays, that the *autocephali* have the ſame authority with patriarchs; but this is not to be underſtood in the full latitude of the words; but only as intimating, that the *autocephali* have the ſame authority over their biſhops that patriarchs had over their archbiſhops: in which ſenſe, only, they are equal to patriarchs.

AUTOCHTHONES, from αυτος, *ipſe*, and χθων, *terra*; an appellation aſſumed by ſome nations, importing, that they ſprung, or were produced, from the ſame ſoil which they ſtill inhabited.

In this ſenſe, *autochthones* amounts to the ſame with *aborigines*.

In this ſenſe it was that the Greeks, and eſpecially the Athenians, pretended to be *autochthones*, and, as a badge thereof, wore a golden graſshopper woven in their hair, an inſect ſuppoſed to have the ſame origin.

AUTOCRATOR, from αυτος, and κρατος, *power*; a perſon veſted with an abſolute independent power, by which he is rendered unaccountable to any other for his actions.

The power of the Athenian generals, or commanders, was uſually limited; ſo that, at the expiration of their office, they were liable to render an account of their adminiſtration. But, on ſome extraordinary occaſions, they were exempted from this reſtraint, and ſent with a full and uncontroulable authority: in which caſe, they were ſtyled αυτοκρατορες.

The ſame people alſo applied the name to ſome of their ambaſſadors, who were veſted with a full power of determining matters according to their own diſcretion, and reſembled our *plenipotentiaries*.

Autocrator was alſo a title given to the Roman emperors, firſt to Julius, and afterwards to his ſucceſſors, like that of Cæſar, or Auguſtus.

AUTODIDACTUS, from αυτος, and διδασκω, *I teach*; a perſon ſelf-taught.

It is uſed in divers ſenſes, ſometimes to denote a perſon who received his knowledge immediately from heaven, without any help or ſtudy. In which ſenſe the word occurs in Homer, and Clemens Alexandrinus.—Sometimes for him who acquires his knowledge without either inſtruction by word of mouth, or reading of books. Such were the inventors of ſciences and laws.—Sometimes, and that moſt uſually, for him who arrives at learning by the uſe of books alone, without the aſſiſtance of any maſter, or inſtruction *vivâ voce*.

AUTOGLYPHUS *lapis*, a ſtone, mentioned by Plutarch and ſome other of the ancients, as having naturally impreſſed on it the figure of Cybele. It is ſaid to have been found in Sagaris, a river of Perſia. Doubtleſs, if any ſuch ſtone ever exiſted, the prieſts had got it made to deceive the people.

AUTOGRAPHUM, the very hand-writing of any perſon; or the original of a treatiſe, or diſcourſe.—The word is uſed in oppoſition to a *copy*.

The word is formed of αυτος, and γραφω, *ſcribo*.

AUTOLITHOTOMUS, he who cuts himſelf for the ſtone. See Lithotomy.

Of this we have a very extraordinary inſtance given by Reiſelius, in the Ephemerides of the Academy Naturæ Curioſorum, an. 3. obſ. 190.

AUTOMATON, or **Automatum**, a ſelf-moving engine; or a machine which has the principle of motion within itſelf.

The word is compounded of αυτος, *ipſe*, and μαομαι, *I am excited*, or *ready*; whence αυτοματος, *ſpontaneous*.

Such were Archytas's flying dove, mentioned by Aulus Gellius, Noct. At. lib. x. c. 12. and Regiomontanus's wooden eagle, which, as hiſtorians relate, flew forth from the city, met the emperor, ſaluted him, and returned;

ed; as alſo his iron fly, which, at a feaſt, flew out of his hands, and, taking a round, returned thither again. Hakew. Apol. c. x. ſect. 1.

Among *automata* are alſo reckoned all mechanical engines which go by ſprings, weights, &c. included within them: ſuch are clocks, watches, &c. Vid. Bapt. Port. Mag. Nat. c. 19. Scalig. Subtil. 326.

AUTONOMIA, from αυτος, *ſelf*, and νομος, *law*; a power of living, or being governed by our own laws and magiſtrates. The liberty of the cities which lived under the faith and protection of the Romans, conſiſted in their *autonomia*, i. e. they were allowed to make their own laws, and elect their own magiſtrates; by whom juſtice was to be adminiſtered, and not by Roman preſidents or judges, as was done in other places, which were not indulged the *autonomia*.

AUTOPHOSPHORUS, is, by ſome, uſed to denote *phoſphorus*, on account of its kindling as it were of itſelf.

AUTOPRACTI, from αυτος, and πραττω, *I exact*; in the *Civil Law*; thoſe indulged this privilege, that they ſhould not be ſummoned or compelled to pay taxes, or tributes, by the collectors, but ſhould be left to their own free will. Du-Cange.

Of this number were men of diſtinguiſhed dignity, and thoſe eminent for their probity and honour.

AUTOPSY, ocular inſpection; or the ſeeing a thing with one's own eyes.

The word is compounded of αυτος, *one's ſelf*, and οψις, *ſight*.

AUTOPYROS, from αυτος, and πυρος, *wheat*; in the *Ancient Diet*, an epithet given to a ſpecies of bread, wherein the whole ſubſtance of the wheat was retained, without retrenching any part of the bran.

Galen deſcribes it otherwiſe, viz. as bread where only the coarſer bran was taken out.—And thus, it was a medium between the fineſt bread, called *ſimilagineus*, and the coarſeſt, called *furfuraceus*.

This was alſo called *autopyrites*, and *ſyncomiſtus*.

AUTOUR, in *Natural Hiſtory*, a ſort of bark which reſembles cinnamon, but is paler and thicker; it is of the colour of a broken nutmeg, and full of ſpangles. It comes from the Levant, and is an ingredient in the carmine dye.

AUTUMN, the third ſeaſon of the year; being that wherein the harveſt, and the fruits of the ſummer, are gathered. *Autumn* begins on the day when the ſun's meridian diſtance from the zenith, being on the decreaſe, is a mean between the greateſt and the leaſt; which in theſe countries is ſuppoſed to happen when the ſun enters Libra. Its end coincides with the beginning of *Winter*.

Divers nations have computed the years by *Autumns*; the Engliſh Saxons, by *Winters*.—Tacitus tells us, the ancient Germans were acquainted with all the other ſeaſons of the year, but had no notion of *Autumn*.

Autumn has always been reputed an unhealthy ſeaſon. Tertullian calls it *tentator valetudinum*; and the ſatiriſt ſpeaks of it in the ſame light.

Autumnus Libitinæ quæſtus acerbæ.

Autumn, in *Alchymy*, the time or ſeaſon when the operation of the philoſophers ſtone is brought to maturity and perfection.

AUTUMNAL, ſomething peculiar to *Autumn*.

Autumnal *point*, is one of the equinoctial points; being that from which the ſun begins to deſcend towards the ſouth pole.

Autumnal *equinox*, is the time when the ſun enters the *Autumnal point*. See Equinox.

Autumnal *flowers*. See Flower.

Autumnal *ſigns*, are thoſe through which the ſun paſſes during the ſeaſon of AUTUMN; Libra, Scorpio, and Sagittarius.

AUVERNAS, a very deep-coloured heady wine, made of black raiſins ſo called, which comes from Orleans. It is not fit to drink before it is above a year old; but if kept two or three years, it becomes excellent.

AUX, in *Aſtronomy*; ſee Auges.

Some uſe *aux* to denote the arch of the ecliptic, intercepted between the firſt point of Aries, and the point wherein the ſun, or a planet, is at its greateſt diſtance from the earth. Wolf. Lex. Math. p. 222.

AUXESIS, in *Mythology*, a goddeſs worſhipped by the inhabitants of Egina, and mentioned by Herodotus and Pauſanias.

Auxesis, αυξησις, *increaſe*; in *Rhetoric*, a figure whereby any thing is magnified too much. See Amplification, and Increment.

AUXILIARY, Auxiliaris, any thing that is helping or aſſiſting to another.

We ſay, *auxiliary* books; a prince is ſaid to truſt more to his own ſoldiers than to *auxiliary* troops, &c.

Auxiliary *verbs*, in *Grammar*, are ſuch as help to aſcertain or limit the ſenſe of others; that is, are prefixed to them to form or denote their moods or tenſes.

Such, in Engliſh, are *have*, *am*, or *be*; in French, *eſtre*, and *avoir*; in Italian, *ho*, and *ſono*, &c.—The *auxiliary am* ſupplies the want of PASSIVES in our language.

All the modern languages we know of, make uſe of *auxiliary verbs*.—The reaſon is, that the verbs thereof do not change their terminations or endings, as thoſe of the Latin and Greek, to denote the different tenſes or times of being, doing, or ſuffering; nor the different moods or manners of their ſignifying: ſo that, to ſupply this defect, recourſe is had to different *auxiliary verbs*.

Beſides the perfect *auxiliary verbs*, we have ſeveral defective ones; as *do*, *will*, *ſhall*, *may*, *can*, and *have*; which, by changing their terminations, ſave the neceſſity of changing thoſe of the verbs they are added to.—Thus, inſtead of *ego uro*, *tu uris*, *ille urit*, *&c.* we ſay, I *do* burn, thou *doſt* burn, he *doth* burn, &c.

AUXILIUM, in *Law*; ſee Aid.

Auxilium *curiæ*, ſignifies an order of court, for the ſummoning of one party at the ſuit of another.

Auxilium *ad filium militem faciendum, vel filiam maritandam*, was a writ directed to the ſheriff of every county, where the king or other lord had any tenants, to levy of them reaſonable aid, towards the knighting his eldeſt ſon, or the marriage of his eldeſt daughter.

AUXO, in *Mythology*, the name of one of two GRACES worſhipped by the Athenians. See Hegemone.

AUXY; the French give the name of *auxy* wool to that which is ſpun in the neighbourhood of Abbeville, by thoſe workmen who are called *houpiers*. It is a very fine and beautiful wool, which is commonly uſed to make the fineſt ſtockings.

AWAIT, in our old *Statutes*, is uſed to ſignify what we now call *waylaying*, or lying in *wait*, to execute ſome miſchief. In ſtat. 13 R. II. c. 1. it is ordained, that no charter of pardon ſhall be allowed before any juſtice, for the death of any man ſlain by *await*, or malice prepenſed, &c.

AWARD, in *Law*, the judgment of ſome perſon who is neither aſſigned by law, nor appointed by the judge, for ending a matter in controverſy; but is choſen by the parties themſelves that are at variance.

AWEIGH; ſee Atrip.

AWK; ſee Auk.

AWL, or Aul, a ſhoemaker's implement, wherewith holes are bored in leather, to facilitate the ſtitching or ſewing the ſame.—The *blade* of the *awl* is uſually a little flat, and bending; and the point ground to an acute angle.

AWME, or Aume, a Dutch MEASURE of capacity for liquids; containing eight *ſteckans*, or twenty *verges*, or *verteels*; anſwering to what in England is called a TIERCE, or one-ſixth of a *ton* of France, or one-ſeventh of an Engliſh *ton*. Arbuth. Tab. 33.

AWN, in *Botany*, Arista; the beard growing out of the huſk of corn or graſs. It is ſometimes uſed to ſignify a ſharp point terminating a leaf.

AWNING, on board a ſhip, is when a ſail, a tarpaulin, or the like, is hung over any part of the ſhip, above the decks, to keep off the ſun, rain, or wind.

In the long-boat they make an *awning*, by bringing the ſail over the yard and ſtay, and booming it out with the boat-hook.

AX, a carpenter's inſtrument, ſerving to hew wood.—The *ax* differs from the joiner's hatchet, in that it is made larger, and heavier, as ſerving to hew large ſtuff; and its edge tapering into the middle of its blade.—It is furniſhed with a long handle or helve, as being to be uſed with both hands.

AXAMENTA, in *Antiquity*, a denomination given to the verſes, or ſongs, of the *ſalii*, which they ſung in honour of all men.

The word is formed, according to ſome, from *axare*, q. d. *nominare*. Others will have the *carmina ſaliaria* to have been denominated *axamenta*, on account of their being written in *axibus*, or on wooden tables.

The *axamenta* were not compoſed, as ſome have aſſerted, but only ſung by the *ſalii*. The author of them was Numa Pompilius; and, as the ſtyle might not be altered, they grew in time ſo obſcure, that the *ſalii* themſelves did not underſtand them. Varro ſays they were ſeven hundred years old. Quint. Inſt. Or. lib. i. c. 11.

Axamenta, or Assamenta, in *Ancient Muſic*, hymns or ſongs performed wholly with human voices.

AXILLA, or Ala, in *Anatomy*, the cavity under the upper-part of the arm; commonly called the ARM-*pit*.

The word is a diminutive of *axis*, q. d. *little axis*.

Abſceſſes in the *axillæ* are uſually dangerous, on account of the many blood-veſſels, lymphatics, nerves, &c. thereabout, which form ſeveral large PLEXUS.—By the ancient laws, criminals were to be hanged by the *axillæ*, if they were under the age of puberty.

Axilla, in *Botany*, is the ſpace comprehended between the ſtems of plants and their leaves.

Hence we ſay, thoſe flowers grow in the *axillæ* of the leaves; i. e. at the baſe of the leaves, or juſt within the angle of their pedicles.

AXILLARY, in *Anatomy*, ſomething that belongs to the *axillæ*, or lies near them.

AXILLARY *artery*, is a ramification of the trunk of the ſubclavian artery; which, paſſing under the arm-pits, changes its name, and is called *axillary*.

AXILLARY *vein*, is one of the ſubclavian veins; which, paſſing under the arm-pits, divides itſelf into ſeveral branches; *ſuperior, inferior, external, internal*, &c. which are ſpread over the arm.—See *Tab. Anat. (Angeiol.) fig.* 6. *lit. m.*

AXILLARY *nerve*, called alſo the *auricular nerve*, ariſes from the laſt two cervical pairs; runs in the hollow of the *axilla*, behind the head of the *os humeri*, between the *muſculus teres major & minor, &c.*

The ſecond *vertebra* of the back is ſometimes alſo called the *axillary vertebra*; becauſe it is neareſt to the arm-pits.

AXILLARY *glands*; ſee HIRCUS, and GLANDS.

AXILLARY *leaves*, in *Botany*, expreſs ſuch as grow out of the angles formed by the branches and the ſtem.

AXINOMANCY, AXINOMANTIA, from αξινη, *ſecuris*, and μαντεια, *divinatio*; an ancient ſpecies of divination, or a method of foretelling future events by means of an ax or hatchet.

This art was in conſiderable repute among the ancients; and was performed, according to ſome, by laying an agate-ſtone on a red-hot hatchet; and alſo by fixing a hatchet on a round ſtake, ſo as to be exactly poiſed; then the names of thoſe that were ſuſpected were repeated, and he at whoſe name the hatchet moved was pronounced guilty.

AXIOM, AXIOMA, from ἀξιοω, *I am worthy*; a ſelf-evident truth; or a propoſition whoſe truth every perſon receives at firſt ſight.

Thus, that the whole is greater than a part; that a thing cannot be and not be at the ſame time; and that from nothing, nothing can ariſe, are *axioms*.

By *axioms*, called alſo *maxims*, are underſtood all common notions of the mind, whoſe evidence is ſo clear and forcible, that a man cannot deny them without renouncing common ſenſe, and natural reaſon.

The rule of *axioms* is this, that whatever propoſition expreſſes the immediate clear compariſon of two ideas without the help of a third, is an *axiom*.—On the other hand, a truth which does not ariſe from an immediate compariſon of two ideas, is no *axiom*.

Axioms in effect, ſtrictly ſpeaking, are no other than identic propoſitions.—Thus, to ſay that all right angles are equal to each other, is as much as to ſay, all right angles are right angles: ſuch equality being implied in the very definition, or the very name.

Lord Bacon propoſes a new ſcience, to conſiſt of general *axioms* under the denomination of *philoſophia prima*.

For the reaſon of the evidence of *axioms*, it may be obſerved, that knowledge being only the perception of the agreement or diſagreement of ideas; where that agreement or diſagreement is perceived immediately by itſelf, without the intervention or help of any other ideas, there our knowledge is ſelf-evident: which being ſo, not only thoſe uſually allowed for *axioms* or *maxims*, but an infinite number of other propoſitions, partake equally with them in this ſelf-evidence. Thus, that a circle is a circle, or that blue is not red, are as ſelf-evident propoſitions, as thoſe general ones, what is, is; and it is impoſſible for the ſame thing to be, and not to be. Nor can the conſideration of theſe propoſitions add any thing to the evidence or certainty of our knowledge of them. As to the agreement or diſagreement of co-exiſtence, the mind has an immediate perception of this but in very few. And therefore in this ſort we have very little intuitive knowledge; though in ſome few propoſitions we have. Two bodies cannot be in the ſame place, is a ſelf-evident propoſition: the idea of fitting a place equal to the contents of its ſuperficies, being annexed to our idea of body.

As to the relations of modes, *Mathematicians* have framed many *axioms* concerning that one relation of equality: as, that equals being taken from equals, the remainders will be equal, &c. which, however received for *axioms*, yet have not a clearer ſelf-evidence than theſe, that one and one are equal to two; that if from the five fingers of one hand you take two, and from the five fingers of the other hand two, the remaining numbers will be equal. As to real exiſtence, ſince that has no connexion with any other of our ideas, but that of ourſelves, and of a firſt being; we have not ſo much as a demonſtrative, much leſs a ſelf-evident knowledge, concerning the real EXISTENCE of other beings.

For the influence of *axioms* or general maxims on the other parts of our knowledge; the rules eſtabliſhed in the ſchools, that all reaſonings are *ex præcognitis & præconceſſis*, ſeem to lay the foundation of all other knowledge in theſe maxims, and to ſuppoſe them to be *præcognita*; which implies two things, viz. that theſe *axioms* are thoſe truths firſt known to the mind; and that on them the other parts of our knowledge depend.—But, firſt, that theſe *axioms* are not the truths firſt known to the mind, is evident from experience: for who knows not, that a child perceives that a ſtranger is not its mother, long before he knows it impoſſible for the ſame thing to be and not to be? And how many truths are there about numbers, which the mind is perfectly acquainted with, and fully convinced of, before it ever thought on thoſe general maxims? Hence it follows, that theſe magnified *axioms* are not the principles and foundations of all our other knowledge; for if there be a great many other truths as ſelf-evident as they, and a great many that we know before them, it is impoſſible that they ſhould be the principles from which we deduce all other truths.—Thus, that one and two are equal to three, is as evident, and eaſier known, than that the whole is equal to all its parts.—Nor, after the knowledge of this *axiom*, do we know that one and two are equal to three, better or more certainly than we did before. For if there be any odds in theſe ideas, the ideas of whole and parts are more obſcure, or at leaſt more difficult to be ſettled in the mind, than thoſe of one, two, or three. Either, therefore, all knowledge does not depend on *præcognita*, or general maxims, called *principles*; or elſe ſuch as theſe, that one and one are two, that two and two are four, &c. and a great part of numeration, are *axioms*. To theſe if we add all the ſelf-evident propoſitions that may be made about all our diſtinct ideas, principles will be almoſt infinite; and a great many innate principles many men never come to know all their lives.

General maxims, or *axioms*, then, may be of uſe in diſputes, to ſtop the mouths of wranglers; but they are of little in the diſcovery of unknown truths. Several general maxims are no more than bare verbal propoſitions, and teach us nothing but the reſpect and import of names one to another; as the whole is equal to all its parts: what real truth doth this teach us more, than what the ſignification of the word *totum*, or *whole*, does of itſelf import? If rightly conſidered, we may ſay, that where our ideas are clear and diſtinct, there is little or no uſe at all of maxims, to prove the agreement or diſagreement of any of them. He that needs any proof to make him certain, and give his aſſent to this propoſition, that two are equal to two, or that white is not black; will alſo have need of a proof to make him admit, that what is, is; or, that it is impoſſible for the ſame thing to be and not to be. But as maxims are of little uſe, where we have clear and diſtinct ideas; ſo they are of dangerous uſe, where our ideas are confuſed, and where we uſe words that are not annexed to clear and diſtinct ideas. Locke.

AXIOM is alſo an eſtabliſhed principle in ſome art or ſcience. Thus, it is an *axiom* in *Phyſics*, that nature does nothing in vain; that effects are proportional to their cauſes, &c. So it is an *axiom* in *Geometry*, that things equal to the ſame third are alſo equal to one another; that if to equal things you add equals, the ſums will be equal, &c. It is an *axiom* in *Optics*, that the angle of incidence is equal to the angle of reflection, &c. It is an *axiom* in *Medicine*, &c. that there is no ſincere acid in the human body, &c.

In this ſenſe, the general laws of motion are called *axioms*; as, that all motion is rectilinear, that action and reaction are equal, &c.

Theſe particular *axioms*, it may be obſerved, do not immediately ariſe from any firſt notions or ideas, but are deduced from certain hypotheſes: this is particularly obſervable in phyſical matters, wherein, as ſeveral experiments contribute to make one hypotheſis, ſo ſeveral hypotheſes contribute to one *axiom*.

AXIOM, in *Rhetoric*, is uſed by Hermogenes to denote grandeur, dignity, and ſublimity of ſtyle.

AXIOS, a form of acclamation, anciently uſed by the people in the election of biſhops. When they were all unanimous, they cried out αξιος, *he is worthy*, or αναξιος, *unworthy*.

AXIOSIS, in *Rhetoric*, denotes the third part of an exordium; ſometimes alſo called αποδοσις, and containing ſome new propoſition more nearly relating to the matter in hand, than the προτασις.

Thus in Cicero's oration *pro Milone*, the *protaſis* is, *Non poſſum non timere, judices, viſa hâc nova judicii forma*; the κατασκευη, *Nec enim ea corona conſeſſus veſter cinctus eſt, qua ſolebat*; the αξιωσις, *Sed me recreat Pompei conſilium, cujus ſapientiæ non fuerit, quem ſententiis judicum tradidit, telis militum dedere*; the baſis, βασις, *Quamobrem adeſte animis judices, & timorem, ſi quem habetis, deponite.*

AXIS properly ſignifies a line, or a long piece of iron or wood paſſing through the centre of a ſphere, which is moveable upon the ſame.

In this ſenſe we ſay, the *axis* of a ſphere, or globe; the *axis*, or *axle*-tree of a wheel, &c.

There is now a ſort of improved iron *axle*-trees made for coaches and chaiſes, which will go in all roads, wider or narrower. Some ſcrew to the end, after the French manner.

Axis, in *Anatomy*, is the ſecond *vertebra* of the neck, reckoning from the ſkull.—See *Tab. Anat.* (*Oſteol.*) *fig.* 9. It is thus called by reaſon the firſt *vertebra*, with the head, move thereon, as on an *axis*. See CARDO.

Axis, *ſpiral*, in *Architecture*, is the *axis* of a twiſted column, drawn ſpirally, in order to trace the circumvolutions without. See COLUMN, *twiſted*.

Axis *of the world*, in *Aſtronomy*.—The *axis* of the world is an imaginary right line, which is conceived to paſs through the centre of the earth, and terminating at each end in the ſurface of the mundane ſphere.

About this line as an *axis*, the ſphere, in the Ptolemaic ſyſtem, is ſuppoſed daily to revolve.

This *axis* is repreſented by the line PQ, *Tab. Aſtron. fig.* 52.—The two extreme points hereof, in the ſurface of the ſphere, viz. P and Q, are called its *poles*.

Axis *of the earth*, is a right line, upon which the earth performs its diurnal rotation, from weſt to eaſt.

Such is the line PQ, *Tab. Geog. fig.* 7.—The two extreme points hereof are alſo called *poles*.

The *axis* of the earth is a part of the *axis* of the world.—It always remains parallel to itſelf, and at right angles with the EQUATOR. See ANGLE, INCLINATION, and PARALLELISM.

Axis *of a planet*, is a line drawn through the centre thereof, about which the planet revolves.

The ſun, moon, and all the planets, except Mercury and Saturn, are known, by obſervation, to move about their ſeveral *axes*; and the like motion is eaſily inferred of thoſe two.

Axis *of the* HORIZON, the EQUATOR, ECLIPTIC, ZODIAC, &c. are right lines drawn through the centres of thoſe circles, perpendicular to their planes. See CIRCLE.

Axis, in *Botany*, a taper column placed in the centre of ſome flowers, or katkins, about which the other parts are diſpoſed.

Axis, in *Geometry*.—*Axis* of rotation, or circumvolution, is an imaginary right line, about which any plane figure is conceived to revolve, in order to generate a ſolid.

Thus, a ſphere is conceived to be formed by the rotation of a ſemicircle about its diameter or *axis*, and a right cone by that of a right-angled triangle about its perpendicular leg, which is here its *axis*.

Axis *of a circle* or *ſphere*, is a line paſſing through the centre of the circle or ſphere, and terminating at each end, in the circumference thereof.

The *axis* of a circle, &c. is otherwiſe called the *diameter* thereof. Such is the line AE, *Tab. Geom. fig.* 27.

Axis is yet more generally uſed for a right line proceeding from the vertex of a figure to the middle of the baſe thereof.

Axis *of a cylinder*, is properly that quieſcent right line, about which the parallelogram turns, by whoſe revolution the cylinder is formed.

Though, both in right and oblique cylinders, the right line joining the centres of the oppoſite baſes is alſo called the *axis of the cylinder*.

Axis *of a cone*, is the right line, or ſide, upon which the right-angled triangle forming the cone makes its motion. Hence it follows, that only a right cone can properly have an *axis*; becauſe an oblique one cannot be generated by any motion of a plane figure about a right line at reſt.

But becauſe the *axis* of a right cone is a right line drawn from the centre of its baſe to the vertex; in analogy hereto, the writers of conics do likewiſe call the like line, drawn from the centre of the baſe of an oblique cone to the vertex, the *axis* thereof.

Axis *of a conic ſection*, is a right line paſſing through the middle of the figure, and cutting all the ordinates at right angles, and into two equal parts.

Thus if AP, *Tab. Conics*, *fig.* 31. be drawn perpendicularly to FF, ſo as to divide the ſection into two equal parts; it is called the *axis of the ſection*.

Axis, *tranſverſe*, called alſo the *firſt* or *principal* **Axis** of an *ellipſis*, is the *axis* AP, laſt defined: being thus called in contradiſtinction to the *conjugate* or *ſecondary axis*.

The *tranſverſe axis* in the *ellipſis* is the longeſt; and in the *hyperbola* it cuts the curve in the points A and P, *fig.* 32.

Axis, *conjugate*, or *ſecond* **Axis** *of the ellipſis*, is the line FF, *fig.* 31. drawn through the centre of the figure C, parallel to the ordinate MN, and perpendicularly to the tranſverſe *axis* AP; being terminated at each extreme by the curve.

The *conjugate* is the ſhorter of the two *axes* of an *ellipſis*; and is not only found in the *ellipſis*, but in the *hyperbola*.

Axis, *conjugate*, or *ſecond* **Axis** *of an hyperbola*, is the right line FE, *fig.* 32. drawn through the centre parallel to the ordinates MN, MN, perpendicularly to the tranſverſe *axis* AP.—The *axis* of a *parabola* is of an indeterminate length; that is, is infinite.—The *axis* of the *ellipſis* is determinate.—The *parabola* has only one *axis*; the *ellipſis* and *hyperbola* have two.

Axis *of a magnet*, or *magnetical* **Axis**, is a line paſſing through the middle of a magnet, lengthwiſe; in ſuch manner, as that however the magnet be divided, provided the diviſion be made according to a plane, wherein ſuch line is found, the load-ſtone will be made into two load-ſtones.

The extremes of ſuch lines are called the *poles* of the ſtone.

Axis, in *Mechanics*.—The *axis* of a balance is the line upon which it moves or turns.

Axis *of oſcillation* is a right line parallel to the horizon, paſſing through the centre, about which a PENDULUM vibrates.

Axis *in peritrochio*, or *wheel* and *axle*, is one of the five mechanical powers, or ſimple machines; contrived chiefly for the raiſing of weights to a conſiderable height. It conſiſts of a circle, repreſented AB (*Tab. Mechanics*, *fig.* 44.), concentric with the baſe of a cylinder, and moveable together with it, about its *axis* EF.—This cylinder is called the *axis*; and the circle, the PERITROCHIUM; and the *radii*, or ſpokes, which are ſometimes fitted immediately into the cylinder, without any circle, the *ſcytalæ*.—Round the *axis* winds a rope, whereby the weights, &c. are to be raiſed.

The *axis in peritrochio* takes place in the motion of every machine, where a circle may be conceived deſcribed about a fixed *axis*, concentric to the plane of a cylinder, about which it is placed; as in CRANE-wheels, MILL-wheels, CAPSTANS, &c.

Axis *in peritrochio, the doctrine of it*.—1. If the power, applied to the *axis in peritrochio*, in the direction AL, *fig.* 7. perpendicular to the periphery of the wheel, or to the *ſcytala* or ſpoke, be to a weight G, as the *radius* of the *axis* CE is to the *radius* of the wheel CA, or the length of the ſpoke; the power will juſt ſuſtain the weight, i. e. the weight and the power will be *in æquilibrio*.

2. If a power, applied in F, pull down the wheel, according to the line of direction FD, which is oblique to the *radius* of the wheel, though parallel to the perpendicular direction; it will have the ſame proportion to a power which acts according to the perpendicular direction AL, which the whole ſine has to the ſine of the angle of direction DFC.

Hence, ſince the diſtance of the power in A is the *radius* CA; the angle of direction DFC being given, the diſtance DC is eaſily found.

3. Powers applied to the wheel in ſeveral points, F and K, according to the directions FD and KI, parallel to the perpendicular one AL, are to each other as the diſtances from the centre of motion CD and CI, reciprocally.

Hence, as the diſtance from the centre of motion increaſes, the power decreaſes; *&* *vice verſa*.—Hence alſo, ſince the *radius* AC is the greateſt diſtance, and agrees to the power acting according to the line of direction; the perpendicular power will be the ſmalleſt of all thoſe able to ſuſtain the weight G, according to the ſeveral lines of direction.

4. If a power acting according to the perpendicular AL, raiſe the weight G, the ſpace paſſed through by the power will be to the ſpace paſſed through by the weight, as the weight to the power.

For, in each revolution of the wheel, the power paſſes through its whole periphery; and in the ſame time the weight is raiſed a ſpace equal to the periphery of the *axis*: the ſpace of the power, therefore, is to the ſpace of the weight, as the periphery of the wheel to that of the *axis*: but the power is to the weight, as the *radius* of the *axis* to that of the wheel. Therefore, &c.

5. A power, and a weight, being given, to conſtruct an AXIS *in peritrochio*, whereby it ſhall be ſuſtained and raiſed: Let the *radius* of the *axis* be big enough to ſupport the weight without breaking. Then, as the power is to the weight, ſo make the *radius* of the wheel, or the length of the ſpoke, to the *radius* of the *axis*.

Hence, if the power be but a ſmall part of the weight, the *radius* of the wheel muſt be vaſtly great.—E. gr. Suppoſe the weight 3000, and the power 50, the *radius* of the wheel will be to that of the *axis* as 60 to 1.

This inconvenience is provided againſt by increaſing the number of wheels and *axes*; and making one turn round another, by means of teeth or pinions.

Axis *of a veſſel*, is that quieſcent right line paſſing through the middle thereof, perpendicularly to its baſe, and equally diſtant from its ſides.

Axis, in *Optics*.—*Optic axis*, or *viſual axis*, is a ray paſſing through the centre of the eye; or it is that ray, which, proceeding through the middle of the luminous cone, falls perpendicularly on the cryſtalline humour, and conſequently paſſes through the centre of the eye.

Axis, *common*, or *mean*, is a right line drawn from the point of concourſe of the two optic nerves, through the middle of the right line, which joins the extremity of the ſame optic nerves.

Axis *of a lens*, or *glaſs*, is a right line paſſing along the *axis* of that ſolid, whereof the *lens* is a ſegment.

Thus, a ſpherical convex *lens* being a ſegment of ſome ſphere, the *axis* of the *lens* is the ſame with the *axis* of the ſphere; or it is a right line paſſing through the centre thereof.

Or, the *axis* of a glaſs, is a right line joining the middle points of the two oppoſite ſurfaces of the glaſs.

Axis *of incidence*, in *Dioptrics*, is a right line drawn through the point of INCIDENCE, perpendicularly to the refracting ſurface.—Such is the line DB, *Tab. Optics*, *fig*. 56.

Axis *of refraction*, is a right line continued from the point of incidence or refraction, perpendicularly to the refracting ſurface, along the further medium. Such is the line BE.

Or, it is that made by the incident ray, perpendicularly prolonged on the ſide of the ſecond medium.

Axis, in *Zoology*, the name of a very remarkable animal, of the deer kind in all reſpects, except that neither the male nor female have horns; the tail is conſiderably long, and the whole ſhape and make extremely like thoſe of the fallow deer. The female is ſmaller than the male, and both are of a reddiſh tawney colour, variegated with ſpots of white; the belly is white. The voice is much more loud and ſhrill than that of the deer. It is very plain that this creature is neither of the red nor fallow deer kind, whence Bellonius, who ſaw it at Cairo in Egypt, was induced to call it the AXIS. Ray.

AXLE-*tree*; ſee Axis.

AXOLOTI, in *Ichthyology*, a ſingular fiſh found in the lake of Mexico. It has four feet like the lizard, no ſcales, a matrix like a woman, and the menſtrual flux. It has the taſte of an eel.

AXUNGIA, a kind of fat, the hardeſt and drieſt of any in the bodies of animals.

The word is ſuppoſed to be formed *ab axe rotarum quæ unguntur*, from its being uſed as the greaſe of wheels.

The Latins diſtinguiſh fat into *pinguedo*, and *adeps* or *ſevum*; which laſt, when old, is particularly called *axungia:* but many of our modern writers confound them.

Phyſicians make uſe of the *axungia* of the gooſe, the dog, the viper, and ſome others, eſpecially that of man, which is held by ſome to be of extraordinary ſervice in the drawing and ripening of tumours, &c.

Axungia *of glaſs*, called alſo the *gall*, and *ſalt of glaſs*, is a ſcum taken from the top of the matter of glaſs before it be thoroughly vitrified. It is uſed in cleanſing the teeth, and by farriers for clearing the eyes of horſes.

Axungia *lunæ*, an affected name given by the German chemiſts to the *terra* GOLTBERGENSIS, from their imagining that it contains ſome particles of ſilver, and owes to them its virtues in medicine.

Axungia *ſolis*, is uſed for the TERRA *Sileſiaca*, and ſaid to be good againſt the plague, peſtilential fevers, &c. Boyle.

AXYRIS, in *Botany*, a genus of the *monoecia triandria* claſs of plants. The calyx of the male flowers is a perianthium, compoſed of four patent, obtuſe leaves, divided into three ſegments, without a corolla. In the female flowers the calyx is compoſed of five obtuſe, concave, connivent, and permanent leaves, with the two exterior ones ſhorter than the reſt, without a corolla or pericarpium. The ſeed is ſingle, oblong, compreſſed, obtuſe, and contained in the cup.

AYEL, Fr. in *Law*, a writ which lies where the grandfather was ſeiſed in his demeſne the day he died, a ſtranger enters the ſame day, and diſpoſſeſſes the heir.

AYENIA, in *Botany*, a genus of the *gynandria pentandria* claſs, with a five-leaved calyx; the petals form a ſtar with long ſhoots, under which are five *antheræ*; the capſule has five cells.

AYGULA, in *Zoology*, a ſpecies of ape.

AYRY, or Aery of HAWKS, a neſt or company of *hawks:* ſo called from the old French word *aire*, which ſignifies the ſame.

AYSIAMENTA, or Ayziamenta. See Easement.

AZAB, in the *Military Orders of the Turks*, ſignifies a particular body of the ſoldiery taken in, or added firſt to the *janizaries*, but now become a ſeparate body from them.

The word, in the Oriental languages, ſignifies an unmarried perſon, and the original order of theſe was, that they ſhould be ſingle men.

The *azabs* in Egypt have been great rivals to the *janizaries*, and ſometimes they have got the better. Their inſtitution and officers are the ſame with thoſe of the *janizaries*; but with this difference, that from *oda-baſhees* they are made *ſerbajees*, and from that office *caias*, and come into the *divan*. On the contrary, among the *janizaries*, when any one is made a *ſerbajee*, it is laying him aſide, and he is no farther advanced. Pococke's Egypt.

AZABE-Kaberi, from *kaber*, *ſepulchre*, and *azab*, *torment*; denotes a temporary puniſhment, which, as the Mahometans ſay, the wicked muſt ſuffer after death. Their crimes are hereby expiated, and Mahomet opens the gate of paradiſe to all who believe in him.

AZALEA, in *Botany*, a genus of the *pentandria monogynia* claſs; American upright honey-ſuckle. The characters are, that it hath a coloured empalement, which is permanent, cut into five acute parts at the top: that the flower is funnel-ſhaped, having a long naked tube, cut into five parts; the two upper ſegments being reflexed backward, the two ſides bent inward, and the lower one turned downward: that it hath five ſlender *ſtamina* of unequal lengths, with a round *germen*, which afterward becomes a roundiſh *capſula*, having five cells filled with roundiſh ſmall ſeeds. There are two ſpecies, which grow naturally on moſt grounds in North America.

AZAMOGLANS; ſee Agemoglans.

AZAPES; ſee Asappes.

AZARECAH, a ſect of heretical muſſulmen, who acknowlege no puniſhment, temporal or ſpiritual.

AZAROLA; ſee Service-*tree*.

AZARUM, a ſmall, dry, blackiſh, ſtringy, medicinal root, much uſed in France as a ſpecific for the farcy in horſes.

The *azarum*, called alſo *nardus ſylveſtris*, grows in the Levant, Canada, and about Lyons in France. The firſt is reputed the beſt. It is given in powder, from the quantity of an ounce to two.

AZAZEL, in *Jewiſh Antiquity*. See Scape-goat.

AZED, in the *Materia Medica*, a name given by the Arabian writers to a kind of camphor, which they make the third in value, placing it after the *alcanſuri* and *abriagi*. The firſt of theſe was the fineſt of all the kinds of camphor, and was collected tolerably pure from the tree, as it grew in Canſur, the place whence it was named. The *abriagi* was the ſame camphor, rendered yet more pure by ſublimation: this was a diſcovery of one of the kings of that country, and the camphor was named from him. The third kind, or *azed*, was the ſame with what we now receive from the Indies, under the name of crude or rough camphor. The word *azed* ſignifies only large, and was uſed to expreſs the camphor formed into ſuch large cakes, as it is alſo at this time. Avicenna ſays this camphor was groſs, of a duſky colour, and much leſs bright and pellucid than the other kinds.

AZEDARACH, in *Botany*; ſee Bead-*tree*.

AZELFOGE, in *Aſtronomy*, a fixed ſtar of the ſecond magnitude, in the SWAN's *tail*.

AZIMUTH, in *Aſtronomy*. The *azimuth* of the ſun, or a ſtar, is an arch of the HORIZON, comprehended between the meridian of the place, and any given vertical, in which the ſun or ſtar is.

The word is pure Arabic, which ſignifies the ſame thing.

The *azimuth* is the complement of the eaſtern or weſtern amplitude to a quadrant.

The *azimuth* is found trigonometrically, by this proportion; as *radius* is to the tangent of the latitude, ſo is the tangent of the ſun's altitude to the coſine of the *azimuth* from the ſouth, at the time of the equinox. To find the *azimuth* by the globe, ſee Globe.

Azimuth, *magnetical*, is an arch of the horizon contained between the ſun's *azimuth* circle, and the magnetical meridian; or it is the apparent diſtance of the ſun from the north or ſouth point of the compaſs.

It is found, by obſerving the ſun with an *azimuth* compaſs, when he is about 10 or 15 degrees high, either in the forenoon or afternoon.

Azimuth *compaſs*, is an inſtrument uſed at ſea for finding the ſun's magnetical *azimuth*.

The deſcription and uſe of the *azimuth compaſs*, ſee under *Azimuth* Compass.

Azimuth *dial*, is a DIAL whoſe ſtyle or *gnomon* is at right angles to the plane of the HORIZON.

Azimuths, called alſo *vertical circles*, are great circles interſecting each other in the zenith and nadir, and cutting the horizon at right angles in all the points thereof. The HORIZON being divided into 360°, there are uſually reckoned 360 *azimuths*. Theſe *azimuths* are repreſented by the rhumbs on common ſea-charts.

On the globe theſe circles are repreſented by the quadrant of altitude, when ſcrewed in the zenith.

On theſe *azimuths* is reckoned the height of the ſtars, and the ſun, when he is not in the meridian; that is, the *azimuths* ſhew what diſtance theſe are from the HORIZON.

AZOGA *ſhips*, are thoſe Spaniſh ſhips commonly called the *quickſilver ſhips*, from their carrying quickſilver to the Spaniſh Weſt Indies, in order to extract the ſilver out of the mines in Peru and Mexico. But it is a great miſtake to imagine that theſe ſhips are abſolutely laden with quickſilver only; for though, ſtrictly ſpeaking, they are to carry no goods unleſs on the king of Spain's account, they are generally full laden, notwithſtanding this regulation,

lation, by reaſon that the merchants procure ſpecial licences of the king to load, upon paying a conſideration for ſuch licences.

AZONI, in *Mythology*, a term anciently applied to ſuch of the gods as were not the private divinities of any particular country or people; but were acknowledged as gods in every country, and worſhipped by every nation. See God.

The word is derived from the privative α, and ζωνη, *zone, country*.

Theſe *azoni* were a degree above the viſible and ſenſible gods, which were called *zonæi*; who inhabited ſome particular part of the world, and never ſtirred out of the diſtrict or zone that was aſſigned them. Such in Egypt were Seraphis, Oſiris, and Bacchus; and in Greece, the Sun, Mars, the Moon, and Pluto. They were called by the Romans *dii communes*.

AZOOPHAGUS, from α, ζωον, *animal*, and φαγω, *I eat*; in *Natural Hiſtory*, a term uſed by authors to expreſs ſuch inſects or animals as feed on herbs, never eating the fleſh of any living creature.

AZOTH, among the *Ancient Chemiſts*, ſignified the firſt matter of metals; or the mercury of a metal, more particularly that which they call the *mercury of the philoſophers*, which they pretend to draw from all ſorts of metallic bodies.

Paracelſus's *azoth*, which he boaſted of as an univerſal remedy, is pretended to have been a preparation of gold, ſilver, and mercury: a quantity of this he is ſaid to have always carried with him in the pommel of his ſword.

Azoth is alſo a name given by ſome to the *philoſophers ſtone*. When the Arabs began to cultivate the ſtudy of chemiſtry, the metaphorical and hieroglyphical manner of writing, which obtained among them, ſeems to have given riſe to a practice of calling the means made uſe of for bringing metals to perfection, by the name of medicines, and imperfect metals by the name of ſick men, and gold by that of a ſound and lively perſon. From hence the ignorant fall into the error of ſuppoſing, that theſe were to be underſtood in a literal ſenſe, eſpecially upon finding the impurities of the baſer metals called by the name of leproſies, the moſt incurable of all diſeaſes; and hence roſe that opinion, which has ſince ſpread itſelf far and wide, that the imperfect metals might be turned into gold, and the bodies of ſick men into ſound ones, by the ſame preparation. To this preparation they gave the name *azoth*, or the *philoſophers ſtone*, and to its poſſeſſors the name of adepts. Boerhaave's Chem.

AZURE, the blue colour of the ſky.

Azure, in *Heraldry*, ſignifies the blue colour in the coats of arms of all perſons under the degree of a baron.

In the eſcutcheons of noblemen, blue is called *ſapphire*; and in thoſe of ſovereign princes, *Jupiter*.—In engraving it is repreſented by ſtrokes, or hatches drawn horizontally, as repreſented in *Tab. Heraldry, fig.* 3.

The French prefer this colour to all others, becauſe the field of the arms of their kings is *azure*.

Azure is alſo uſed for a mineral colour, better known by the name of *ultramarine*: this is prepared from the lapis *lazuli*.

In propriety, however, *azure* ſhould rather denote a bright blue colour, made from the *lapis Armenus*; by our painters more uſually called Lambert's *blue*.

Azure is alſo generally applied to the blue glaſs made from the earth of cobalt, and vitrifiable matters. This glaſs, which is called smalt when in maſſes, is called *azure* only when it is reduced to a fine powder. Several kinds of *azure* are diſtinguiſhed according to its degree of beauty, by the names of *fine azure*, *powdered azure*, and *azure of four fires*. In general, the greater the intenſity of colour, and the fineneſs of powder, the more beautiful and dear it is.

Azure is employed to colour starch; hence it has alſo been called *ſtarch*-blue.

It is uſed for painting with colours, and for a blue enamel. See Zaffre.

AZURIUM, a hard chemical maſs, produced from two parts of mercury, a third part of ſulphur, and a fourth of sal *ammoniac*.

AZYGOS, in *Anatomy*, a vein ariſing out of the *cava*, otherwiſe called vena *ſine pari*, becauſe ſingle, whence its name. See *Tab. Anat.* (*Splanch.*) *fig.* 12. *litt. hh.* and alſo ſee Vein.

The vena *azygos* is the third branch of the aſcending trunk of the *cava*.—It deſcends through the right ſide of the cavity of the *thorax*, and at its arrival at the eighth or ninth *vertebra* begins to keep the middle, and ſends forth on each ſide intercoſtal branches to the interſtices of the eight lower ribs; and there is divided into two branches, the larger of which is inſerted ſometimes into the *cava*, but oftener into the *emulgent*; the other enters the *cava*, commonly a little below the *emulgent*; but is ſeldom joined to the *emulgent* itſelf.

Morgagni gives this name to a muſcle of the palate, which is uſually called staphylinus.

AZYMITES, they who communicate in bread not leavened, or fermented. See Azymus.

This appellation is given by Cerularius, to thoſe of the Latin church, upon his excommunicating them in the eleventh century. Du-Cange.

The Armenians and Maronites do alſo make uſe of *azymus*, or unleavened bread, in their office; on which account ſome Greeks call them *azymites*.

AZYMUS, ſomething not fermented, or that is made without leaven.

The word is compoſed of the privative α, and ζυμη, *ferment*.

The term *azymus* is much uſed in the diſputes betwixt thoſe of the Greek, and Romiſh church; the latter of whom contend, that the bread in the maſs ought to be *azymus, unleavened*, in imitation of the paſchal bread of the Jews, and of our Saviour, who inſtituted the ſacrament on the day of the paſſover; and the former ſtrenuouſly maintaining the contrary, from tradition, and the conſtant uſage of the church.

This diſpute was not the occaſion of the rupture between the Greek and Latin churches; Photius having broken with the popes 200 years before: though it is urged that before the time of Photius, A. D. 866, *azymus* was uſed in the Romiſh church; and that it was more generally uſed through the Weſt, for which the authority of Alcuin, who died in 794, is alleged.

St. Thomas, in 4 Sent. diſt. 2. q. 11. art. 2. quæſtiunc. 3. relates, that during the firſt ages of the church, none but unleavened bread was uſed in the euchariſt, till ſuch time as the Ebionites aroſe, who held, that all the obſervances preſcribed by Moſes, were ſtill in force: upon which, both the eaſtern and weſtern churches took to the uſe of leavened bread; and, after the extinction of that hereſy, the weſtern church returned to the *azymus*; the eaſtern pertinaciouſly adhering to the former uſage.

This account is controverted by father Sirmond, in a diſſertation on the ſubject; wherein he ſhews, that the Latins had conſtantly communicated in leavened bread, till the tenth century. And cardinal Bona, Rerum Liturgic. c. 23. p. 185, greatly diſtruſts what St. Thomas alleges.—In the council of Florence it was decreed, that the point lay at the diſcretion of the church; and that either leavened or unleavened bread might be uſed: the weſtern church has preferred the latter.

AZZALUM, in the *Ancient Phyſiology*, a ſpecies of iron, reputed the moſt excellent of all, ſuppoſed to have been brought from India, whence it was called *Indicum*, but, in reality, according to ſome, brought from China. Plin. Hiſt. Nat. lib. xxxiv. c. 14.

B.

B, The ſecond letter of our alphabet, and of moſt others.

This obſervation fails in the ancient Iriſh alphabet; where B is the firſt, and A the ſeventeenth; and in the Abyſſinian, where A is the thirteenth.

B is the firſt conſonant, and firſt mute, and in its pronunciation is ſuppoſed to reſemble the bleating of a ſheep; upon which account Pierius tells us, in his Hieroglyphics, that the Egyptians repreſented the ſound of this letter by the figure of that animal.

B is alſo one of thoſe letters which the Eaſtern grammarians call *labial*, becauſe the principal organs employed in its pronunciation are the lips. It has a near affinity with the other *labials* P and V, and is often uſed for P, both by the Armenians, and other Orientals; as in *Betrus* for *Petrus*, *apſens* for *abſens*, &c. and by the Romans for V, as in *amabit* for *amavit*, *berna* for *verna*, &c. whence aroſe that joſt of Aurelian on the emperor Bonoſus, *Non ut vivat natus eſt, ſed ut bibat.* See V.

B requires an entire cloſure and preſſure of the lips, and is pronounced by forcing them open with a ſtrong breath. This letter alſo, if it paſs through the noſe, becomes an M; as appears in thoſe who have the noſtrils ſtopt by a cold, or otherwiſe, when they endeavour to pronounce the letter M; for inſtance, *many men*, is by ſuch a one ſounded, *bany ben.* See M.

With the ancients, B ſtood for 300, as appears by this verſe:

> *Et* B *trecentum per ſe retinere videtur.*

When a line was drawn above it, $\overline{B}$, it ſtood for 3000: and with a kind of accent below it, for 200; but among the Greeks, as well as Hebrews, this letter ſignified only 2.

B F. in the preface to the Decrees, or Senatus-conſulta of the old Romans, ſignified *bonum factum.* It is often found on medals, to mark the epocha or year.

Plutarch obſerves, that the Macedonians changed Φ into B, and pronounced *Bilip*, *Beronice*, &c. for *Philip*, *Pheronice*, &c. and that thoſe of Delphos uſed B, inſtead of Π; as βαθειν for παθειν, βικρον for πικρον, &c. See P.—The modern Greeks call the *beta*, *vita.*

The Latins ſaid *ſuppono*, *oppono*, for *ſubpono*, *obpono*, and pronounced *optinuit*, though they wrote *obtinuit*, as Quintilian has obſerved.—They alſo uſed B for F or PH: thus, in an ancient inſcription, mentioned by Gruter, OBRENDARIO is uſed for OFRENDARIO. See F, &c.

In *Muſic*, b is uſed to denote a flat, or the lowering of a ſound by a ſemi-tone minor. Thus A^{b} or ^{b}A is the flat of A, or the ſemi-tone minor below A.

B, b, *quadro* or ♮, in the ſcale of muſical notes, ſignifies the ſound which is a tone above A, and a ſemi-tone below C.

In the works of the muſicians of former ages, we often meet with the mark ♮ alone, to ſignify the ſame ſound as b♮. The letter B, among them, ſignified what we now call B flat: but among modern muſicians, B is more commonly uſed for the ſound which is a tone above A; and to denote B flat, or the ſemi-tone major above A, B^{b} or ^{b}B is uſed.

B is alſo uſed as an abbreviation of *baſſo* or *baſs.* Hence, B. C. ſtands for *baſſo continuo*, or the *thorough baſs.*

B, in the chemical alphabet, denotes *mercury*, according to Raymond Lully.

B on ſome French coins denotes, that they were ſtruck at Rouen.

B is alſo uſed as a contraction for *Bachelor*; as B. A. *Bachelor of Arts*; B. LL. and B. D.

BAAL, in *Antiquity*, the ſupreme Being among the Phœnicians.

The deſcendants of Ham firſt worſhipped the ſun under this title, which they afterwards aſcribed to the patriarch who was the head of their line; making the ſun only an emblem of his influence and power. See DÆMON.

BAALIM, in *Antiquity*, inferior deities among the Phœnicians. See DÆMON.

BAALTIS, a goddeſs among the Phœnicians. Some ſuppoſe that ſhe was the ſame with the Diana of the Greeks.

BAAL-BERITH, in *Ancient Mythology*, derived from *baal*, *ſovereign*, and *berith*, *covenant*; a deity acknowledged under this title by the Carthaginians and Phœnicians in their alliances.

BAAL-GAD, BAGAD, or **BEGAD**, in *Ancient Mythology*, an idol of the Syrians, whoſe name was compoſed of *baal*, *lord*, and *gad*, *chance* or *fortune*; the god of chance or fortune. After the god of *thunder*, the god of *chance* was one of the firſt worſhipped by mankind. See Phil. Tranſ. vol. lvi. N° 2. an. 1766.

BAANITES, the followers of Baanes, who adopted and diſſeminated the Manichean notions in the ninth century, about the year 810.

BAARAS, BAHARAS, or **BACHARAS**, an extraordinary kind of root, ſaid to grow on mount Lebanon, in a valley called *Baaras* (whence the name), near the city Macheron.

By the account which Joſephus gives of it, it ſeems to be a ſort of vegetable phoſphorus; for he repreſents it as of a flame colour, emitting rays of light in the night, and diſappearing by day.

BAAT, in the language of the Siameſe, anſwering to *tical* in that of the Chineſe, denotes a weight and coin current in thoſe kingdoms. It weighs about half an ounce.

BABBLING, among *Hunters*, is when the hounds are too buſy after they have found a good ſcent.

BABOON, in *Zoology*, a large kind of ape, common in the Eaſt and Weſt Indies. The head is large, and the mouth in a particular manner furniſhed with whiſkers: the face is naked, but the back part of the head hairy. It has a very ſhort tail, and is of a dark olive colour. See PAPIO, and SIMIA.

BABYLONIAN, BABYLONIC, or **BABYLONISH** *epocha*, *gemara*, *hours*, &c. See EPOCHA, GEMARA, HOUR, &c.

The *Babylonian* monarchy, hiſtory, &c. is the ſame with what is otherwiſe denominated the *Chaldean*, or *Aſſyrian*, &c.

In *Ancient Writers*, we find frequent mention of *Babylonica texta*, a rich ſort of weavings, or hangings, denominated from the city *Babylon*, where the practice of interweaving divers colours in their hangings firſt obtained. Plin. Hiſt. Nat. lib. viii. c. 48.

Hence alſo *Babylonic* garments, *Babylonic* ſkins, *Babylonic* carpets, houſings, &c.

Babylonica ſolana, coverings laid over couches, &c. painted with gold, purple, and other colours.

BABYLONIAN, *Babylonius*, is alſo uſed in ſome *Ancient Writers* for an aſtrologer, or any thing related to aſtrology.

Hence *Babylonia cura*, the art of caſting nativities; and *numeri Babylonii*, the computations of aſtrologers. Hor. lib. i. od. 12.

BABYLONICS, in *Literary Hiſtory*, a fragment of the ancient hiſtory of the world, ending at 267 years before Chriſt; and compoſed by Beroſus or Beroſſus, a prieſt of Babylon, about the time of Alexander. Stanley Hiſt. Phil.

The *Babylonics* were very conſonant with Scripture, as Joſephus and the ancient Chriſtian chronologers aſſure us; whence the author is uſually ſuppoſed to have conſulted the Jewiſh writings. There now remain only a few imperfect extracts, preſerved chiefly by

Joſephus and Syncellus. They were forged by Annius of Viterbo. Fabr. Bib. Græc.

BABYROUSSA, in *Zoology*, the name of an animal, called by ſome *porcus Indicus*, or the Indian hog. It is of the ſize and ſhape of a ſtag. Its head and tail reſemble thoſe of a boar; and its legs and feet, the goat's. But beſides all theſe ſingularities, there is another thing in which it differs from all the other known animals, which is, that it has four *dentes exerti*, or long and crooked tuſks, two of which ariſe from the lower jaw, and the other two from the upper, making their way through the fleſh. Some have choſe to call them horns, but they are certainly more properly diſtinguiſhed by the name of teeth, as they have each their *alveolus*, from which they grow juſt in the manner of teeth, and are of the ſubſtance of ivory, not of horn. The creature is found in the iſland of Borneo.

This animal is a ſpecies of the SUS in the Linnæan ſyſtem.

BAC, in *Navigation*, is uſed for a PRAAM, or ferry-boat. The word is French.

Bac, in *Brewing*; ſee Back.

BACANTIBI, in *Eccleſiaſtical Antiquity*, wandering clerks, who ſtrolled from church to church. Bingham.

The word ſeems formed by corruption from *vacantivi*.

BACCÆ *Bermudienſes*, in the *Materia Medica*, the name of the fruit or berries of the *ſapindus*, or *ſoapberry-tree*.

BACCALARIA, in *Middle Age Writers*, denotes a kind of country-farms, conſiſting of ſeveral manſes. Du-Cange.

Baccalaria *dominicaria*, or *indominicata*, was more particularly uſed for a farm belonging to the lord, and kept in his own hands.

BACCHÆ, in *Antiquity*, the prieſteſſes of Bacchus, who celebrated the *orgia*, or myſteries of that god.

The word was alſo uſed for the ivy crowns or garlands worn by the prieſts of Bacchus, in offering ſacrifices to him.

BACCHANALIA, a religious feaſt, in honour of Bacchus, celebrated with much ſolemnity among the ancients, particularly the Athenians, who even computed their years thereby, till the commencement of the Olympiads.

The *bacchanalia* are ſometimes alſo called *orgia*, from the Greek οργη, *fury*; on account of the madneſs and enthuſiaſm wherewith the people appeared to be poſſeſſed at the time of their celebration.

They were held in autumn, and took their riſe from Egypt; whence, according to Diodorus, they were brought into Greece by Melampus.

The form and diſpoſition of the ſolemnity depended, at Athens, on the archon, and was, at firſt, exceeding ſimple; but, by degrees, it became incumbered with a number of ridiculous ceremonies, and attended with much diſſoluteneſs and debauchery; inſomuch that the Romans, who grew aſhamed of them, ſuppreſſed them by a *ſenatus-conſultum* throughout all Italy.

The women had a great ſhare in the ſolemnity, which is ſaid to have been inſtituted on their account: for a great number of them attending Bacchus to the conqueſt of the Indies, and carrying in their hands the *thyrſus*, i. e. a *little lance*, covered with ivy and vine-leaves, ſinging his victories and triumphs wherever they went; the ceremony was kept up after Bacchus's deification under the title of *bacchanalia*, and the women were inſtalled prieſteſſes thereof, under that of *bacchæ*, or *bacchantes*.

Theſe prieſteſſes, at the time of the feaſt, ran through the ſtreets, and over the mountains, covered with tygers ſkins, their hair diſhevelled, their thyrſus in one hand, and torches in the other, howling, and ſhrieking, Ευοι Σαϐοι, ευοι Βακχε, or Ιω Ιακχε, or Ιω Βακχε.

Men and women met promiſcuouſly at the feaſt, all perfectly naked, except only for the vine-leaves, and cluſters of grapes, which bound their heads and hips; here they danced and jumped tumultuouſly, and, with ſtrange geſticulations, ſung hymns to Bacchus, till, being weary and giddy, they tumbled down.

Bacchanalia, *bacchanals*, is alſo a name given to pictures, or *baſſo relievos*, whereon the feaſt is repreſented, conſiſting chiefly of dancings, nudities, and the like.

There are antique *bacchanals* ſtill ſeen on ſeveral ancient friezes. The *bacchanals* painted by Pouſin are excellent.

Some writers call the Romiſh CARNAVAL, the *Chriſtian bacchanalia*.

BACCHARACH *wine*, a name of a particular kind of wine, by ſome eſteemed a kind of Rheniſh; but Portzius, who has written expreſly on the ſubject, obſerves, that it differs from all the common Rheniſh wine, in colour, odour, taſte, and virtue.

BACCHARIS, in *Botany*, ploughman's ſpikenard; a genus of the Linnæan *ſyngeneſia polygamia ſuperflua* claſs. Its characters are, that the flower is compoſed of many hermaphrodite and female florets, which are included in one common cylindrical ſcaly empalement: that the hermaphrodite flowers are funnel-ſhaped, and have five ſlender *ſtamina* with an oval *germen*, which afterward becomes a ſingle ſhort ſeed crowned with a long down: that the female flowers have no *ſtamina*, but in other reſpects are the ſame. There are two ſorts, which grow naturally in North and South America.

Though this plant is but ſeldom uſed, yet ſome account it a good vulnerary, and uſeful in bruiſes, contuſions, ruptures, and inward wounds, pains in the ſide, and difficulty of breathing.

Baccharis was alſo the name of a ſweet ointment among the ancients, ſo called perhaps from this herb's being a principal ingredient in it.

BACCHI, in *Mechanics*, a kind of ancient machines, in form of goats, uſed by Jupiter in his wars againſt the giants.

Rudbeck deſcribes two kinds of *bacchi*, one made like the battering-ram, wherewith Jupiter demoliſhed the enemies fortifications; the other contrived to caſt fire out of, from whence the Greeks are conjectured to have framed their idea of *chimera*.

BACCHIC, ſomething relating to the ceremonies of Bacchus.

The celebrated *intaglio*, called Michael Angelo's ring, is a repreſentation of a *bacchic* feaſt.

Bacchic *ſong*, is ſometimes uſed for a *chanſon à boire*, or compoſition to inſpire jollity. But in a more proper ſenſe, it is reſtrained to a dithyrambic ode, or hymn.

Bacchica, in *Botany*, is uſed for ivy, HEDERA.

BACCHIUS, in the *Latin Poetry*, a kind of foot, conſiſting of three ſyllables; whereof the firſt is ſhort, and the two latter long; as *ĕgēſtās*.

The *bacchius* is the reverſe of a dactyl, and takes its name from that of Bacchus, becauſe frequently uſed in the hymns compoſed in his honour. It was alſo called among the ancients, *œnotrius*, *tripodius*, *ſaltans*; and by the Greeks, παριαμϐος.

BACCHUS, in *Mythology*, the name of two gods among the ancients: that in Egypt, the ſon of Ammon, and the ſame with Oſiris; and that of Thebes, the ſon of Jupiter, and Semele. The latter is the god of wine; and is repreſented under the figure of a jolly beardleſs youth, crowned with ivy and wine leaves; a ſpear wrapped with the ſame, in one hand; and with grapes, or a cup, in the other. See Bacchanalia.

Bacchus, in *Zoology*, a name given by ſome to the MYXON, a fiſh of the mullet-kind, remarkable for the red colour of its lips, and the extremity of the covering of the gills. See Mugil.

BACCIFEROUS *Plants*, are ſuch as bear berries, i. e. fruit, covered with a thin membrane, wherein is contained a pulp, which grows ſoft and moiſt when ripe, and incloſes the ſeed within its ſubſtance.

The *bacciferous* trees Mr. Ray divides into four kinds, 1. Such as bear a caliculate, or naked berry; the flower and *calix* both falling off together, and leaving the berry bare, as the ſaſſafras-tree, &c.

2. Such as have a naked monopyreneous fruit, that is, containing in it only one ſeed; as the *arbutus*, the *terebinthus*, *lentiſcus*, &c.

3. Such as have a naked, but a polypereneous fruit, that is, containing two or more kernels or ſeeds within it; as the *jaſminum*, *liguſtrum*, &c.

4. Such as have their fruit compoſed of many *acini*, or round ſoft balls, ſet cloſe together, like a bunch of grapes; as the *uva marina*, the *rubus vulgaris*, *rubus Idæus*, and the *rubus minor fructu cœruleo*.

BACCINIUM, or **Baccina**, a baſon or veſſel to hold water to waſh the hands.—The holding the baſon, or waiting at the baſon, on the day of the king's coronation, was an ancient tenure in ſerjeantry. Lib. Rub. Scaccar. f. 137.

BACCOFOE, in *Botany*, the name of a fruit very common in Guinea. It is like the banana, except that it is whiter, thicker, and ſhorter. The taſte and ſmell are both very agreeable; and ſome pretend, that on cutting it through tranſverſely, there is the figure of a crucifix on each ſide of it. Phil. Tranſ. N° 108.

BACHELOR, or **Batchelor**, **Baccalarius**, in *Middle Age Writers*, was a denomination given to thoſe who had attained to knighthood, but were not rich enough, or had not a ſufficient number of vaſſals to have their banner carried before them in battle; or, if they were of the order of bannerets, were not yet of age to diſplay their own banner; but obliged to march to war under the banner of another.

Camden and others define *bachelor*, a perſon of a middle degree, between a knight and an eſquire; of leſs age and ſtanding than the former, but ſuperior to the latter.

Others will have *bachelor* to have been a common name for all degrees between a mere gentleman and a baron.—Thus we find the lord admiral, when he was neither an earl, nor baron, denominated a *bachelor*.—"Ant it is to "weet, that when the admiral rideth to aſſemble a ſhippe "of war, or other, for the buſineſs and affairs of the

" realm, if he be a *bachelor*, he ſhall take for his day-
" wages four ſhillings ſterling; if he be an earl, or baron,
" he ſhall take wages after his eſtate and degree."

Bachelor was more peculiarly a title given to a young cavalier, who made his firſt campaign, and received the military girdle accordingly.

Bachelor was alſo a denomination given to him who had overcome another in a tournament, the firſt time he ever engaged.

Bachelors, *Knights*, were anciently ſo called, *quaſi bas chevaliers*, as being the loweſt order of knights, and inferior bannerets, &c.

At preſent theſe are called *equites aurati*, from the gilt ſpurs that are put on them at the time of their creation.—The dignity was at firſt confined to the military men, but afterwards was conferred on men of the long robe.

The ceremony is exceedingly ſimple; the candidate kneeling down, the king touches him lightly with a naked ſword, and ſays, *Sois chevalier, au nom de Dieu*; and afterwards, *Avance, chevalier*.

Bachelor is alſo uſed, in a college-ſenſe, to denote a perſon poſſeſſed of the *baccalaureate*, which is the firſt degree in the liberal arts, or ſciences.

The degree of *bachelor* was firſt introduced in the thirteenth century, by pope Gregory IX. but it remains ſtill unknown in Italy. At Oxford, before a perſon is intitled to the degree of *bachelor of arts*, he muſt have ſtudied there four years; three years more to become *maſter of arts*; and ſeven more to commence *bachelor of divinity*.

At Cambridge, to commence *bachelor of arts*, he muſt have been admitted near four years; and above three years more before he commence *maſter*; and ſeven more ſtill to become *bachelor of divinity*. He may commence *bachelor of law* after having ſtudied it ſix years.

At Paris, to paſs *bachelor in theology*, a perſon muſt have ſtudied two years in philoſophy and three years in theology, and held two acts of examination in the Sorbonne.—*Bachelors in the canon law* are admitted after two years ſtudy in the ſame, and ſuſtaining an act according to the forms.

A *bachelor of phyſic* muſt have ſtudied two years in medicine, after having been four years maſter of arts in the univerſity, and have ſtood an examination; after which he is inveſted with the fur, in order to be licenſed.

In the univerſity of Paris, before the foundation of divinity-profeſſorſhips, thoſe who had ſtudied divinity ſix years were admitted to go through their courſe, whence they were called *baccalarii curſores*; and as there were two courſes, the firſt employed in explaining the Bible, during three ſucceſſive years; the ſecond, in explaining the maſter of the ſentences for one year; thoſe who were in their Bible-courſe, were called *baccalarii Biblici*; and thoſe arrived at the ſentences, *baccalarii ſententiarii*. And, laſtly, thoſe who had gone through both, were denominated *baccalarii formati*, or *formed bachelors*.

At preſent, *formed bachelor* denotes a perſon who has taken the degree regularly after the due courſe of ſtudy and exerciſes, required by the ſtatutes; by way of oppoſition to a *current bachelor*, who is admitted in the way of grace, or by diploma.

We alſo find mention of *bachelors of the church*, *baccalarii eccleſiæ*.—The biſhop with his canons and *baccalarii*, *cum conſilio & conſenſu omnium canonicorum ſuorum & baccalariorum*.

There is ſcarce any word whoſe origin is more controverted among the critics, than that of *bachelor*, *baccalarius*, or *baccalaureus*: the two different acceptations of the word, literary and military, above recited, have each of them their advocates, who aſſert each to be the primitive ſenſe, and derive the word accordingly.

Among thoſe who hold the military *bachelor* to be the more ancient, are Cujas, who derives the word from *buccellarius*, a kind of cavalry, anciently in great eſteem. Du-Cange deduces it from *baccalaria*, a kind of fees, or farms, conſiſting of ſeveral pieces of ground, each whereof contained 12 acres, or as much as two oxen would plow; the poſſeſſors of which *baccalaria* were called *bachelors*.

Caſeneuve, and Altaſerra, derive *bachelor* from *baculus*, or *bacillus*, a ſtaff, becauſe the young cavaliers exerciſed themſelves in fighting with ſtaves. Martinius derives it from *baccalaureus*, i. e. *baccâ laureâ donatus*, in alluſion to the ancient cuſtom of crowning poets with laurel, *baccis lauri*, as was the caſe with Petrarch at Rome in 1341. Alciat and Vives are of the ſame opinion: nor is this etymology improbable.

Bachelors, in the livery companies in London, are thoſe not yet admitted to the livery.

Theſe companies generally conſiſt of a maſter, two wardens, the livery, and the *bachelors*, who are yet but in expectation of dignity in the company, and have their function only in attendance on the maſter and wardens: they are alſo called yeomen.

Bachelor is alſo a name given in the ſix companies of merchants at Paris to the elders, and ſuch as having ſerved the offices, have a right to be called by the maſters and wardens to be preſent with them, and aſſiſt them in ſome of their functions, particularly in what relates to the *chef-d'oeuvres*, or maſter-pieces of ſuch as are candidates for being admitted maſters.

Bachelor is alſo particularly uſed for a man not married, or who is yet in a ſtate of celibacy.

The Roman cenſors frequently impoſed fines on old *bachelors*. Dion Halicarnaſſeus mentions an old conſtitution, by which all perſons of full age were obliged to marry. But the moſt celebrated law of this kind was that made under Auguſtus, called the *lex Julia de maritandis ordinibus*; by which *bachelors* were made incapable of legacies or inheritances by will, unleſs from their near relations.

The Rabbins maintain, that, by the laws of Moſes, every perſon, except ſome few, are obliged in conſcience to marry at twenty years of age: this makes one of their 613 precepts. Hence thoſe maxims ſo frequent among their caſuiſts, that he who does not take the neceſſary meaſures to leave heirs behind him, is not a man, but ought to be reputed a homicide. Lycurgus was not more favourable: by his laws, *bachelors* are branded with infamy, excluded from all offices civil and military, and even from the ſhews and public ſports. At certain feaſts they were forced to appear, to be expoſed to the public deriſion, and led naked round the market-place. At one of their feaſts, the women led them in this condition to the altars, where they obliged them to make *amende honorable* to nature, accompanied with a number of blows, and laſhes with a rod at diſcretion. To complete the affront, they forced them to ſing certain ſongs compoſed in their own deriſion.

The Chriſtian religion is more indulgent to the *bachelor*-ſtate: the ancient church recommended it as preferable to, and more perfect than the matrimonial ſtate.

In the *Canon Law*, we find injunctions on *bachelors*, when arrived at puberty, either to marry or turn monks, and profeſs chaſtity in earneſt.

BACILLI, or **Baculi**, in *Medicine*, ſuch compoſitions as are made up of a cylindrical figure, like a ſtick; thus called from the Latin *baculus*, *a ſtaff*. See Lozenge.

BACK. See Dorsum.

Back-*bone*. See Spine.

Back, in the *Manege*, and among *Farriers*. A horſe's *back* ſhould be ſtraight, not hollow, which is called *ſaddle-backed*; horſes of this kind are generally light, and carry their heads high, but want in ſtrength and ſervice. A horſe with a weak *back* is apt to ſtumble.

In the French riding-ſchools, to mount a horſe *a dos*, is to mount him bare-backed, without a ſaddle.

Back, in *Brewing*, a large flat kind of tub or veſſel, wherein the wort is put to ſtand and cool before boiling.

The ingredients of beer paſs through three kinds of veſſels. They are maſhed in one, worked in another, and cooled in a third, called *backs* or *coolers*.

To gauge a brewer's Back. Moſt *backs* have their ſides ſtrait; in caſe, however, they be not, but make either an acute or obtuſe angle with the bottom, the true length and breadth muſt be carefully taken in the middle of every inch in depth; from whence the area may be found upon every tenth. For finding the area of the *back*, this rule muſt be obſerved, to multiply the length by the breadth, and divide by 282; which gives the contents in ale gallons.

To find the true dip of a Back. Becauſe *backs* are not placed level, but ſloping, for conveniency of drawing off the wort; therefore, were the dip taken in too deep a place, the ſubject would be wronged; as would the king, if it were taken in too ſhallow a part: to guard againſt which, as many dips as are thought convenient muſt be taken; theſe being added together, and divided by the number of dips, will give a mean depth. When this is done, trial being made in different parts of the *back*, until one is found which anſwers exactly to the mean depth; let a mark or notch be made at the ſide of the *back*, to point it out as the true dipping-place for the future.

The bottom of large *backs* ought to be every where equally and well ſupported, to ſecure them from warping, which elſe they will do, more and more as they grow older.

Back, in the *Diſtillery*, a veſſel in which liquor is put to be fermented.

Back *of the poſt*, in *Sea-language*. See Stern-*poſt*.

Back-*board*, in *Maritime Affairs*, of a ſemicircular figure, placed tranſverſely in the after-part of a boat, like the back of a chair, to recline againſt while ſitting in the *ſtern-ſheets*.

Back *the ſails*, to put them in a ſituation that will occaſion the ſhip to retreat or move a ſtern.

Back-*painting*, is uſed by ſome for the art of paſting of prints, and other deſigns on glaſs.

The art conſiſts chiefly in laying the print upon a piece of crown-glaſs, of ſuch a ſize as fits the print. In order to do this, the print muſt be ſoaked in clean water for forty-eight hours, if it be on very ſtrong, cloſe, and hard gummed paper; but if on a ſoft, ſpongy paper, two hours will ſometimes be ſufficient. The picture being well ſoaked, muſt be laid between four ſheets of paper, two over and two under it, that the moiſture may be drawn out of it. In the mean while, let the glaſs upon which the print is to be laid be warmed at the fire; then with a hog's-hair bruſh dipped in melted Straſburg turpentine, ſpread the turpentine ſmoothly and evenly on the glaſs. Then lay the print upon the glaſs, rubbing it gently from one end to the other, that it may lie cloſe. With the finger, rub off the paper from the back-ſide of the print, till nothing can be ſeen but the print, like a thin film left upon the glaſs, and ſet it aſide to dry. When it is dry, varniſh it over with ſome white tranſparent varniſh, that the print may be ſeen through it, which is now fit for painting.

Having prepared a variety of oil colours, which muſt be ground very fine, and tempered very ſtiff, lay ſuch colours on the tranſparent print as each particular part requires, the maſter-lines of the print guiding the pencil; and thus each colour will appear fair to the eye on the other ſide of the glaſs, and look almoſt as well as a painted piece, if it be done neatly. The chief care to be uſed in this part of the work, is that of laying the colours on thick enough, that they may be ſtruck plainly through the glaſs.

Back; *Iron* **Back** is a large plate of caſt iron, frequently adorned with figures in low relievo, intended to preſerve the ſtone-work of a chimney-back, and to reflect the heat of the fire.

BACKBEROND, or **Backberend**, in *Law Writers*, denotes a criminal caught carrying off ſomething on his back.

In this ſenſe, Bracton uſes it for a ſpecies of what the civilians call manifeſt theft, *furtum manifeſtum*.

In the *Foreſt Laws, backberond* is one of the four circumſtances, or caſes, wherein a foreſter may arreſt the body of an offender againſt vert or veniſon in the foreſt. The others are, *ſtable-ſtand*, *dog-draw*, and *bloody-hand*.

BACKING *a colt*, the operation of breaking him to the ſaddle, or bringing him to endure a rider.

To *back* a colt, they uſually take him into ploughed ground, trot him a while, to rid him of his wantonneſs; then having one to ſtay his head, and govern the chaffing rein, the maſter mounts his back, not ſuddenly, but by degrees, firſt making ſeveral offers, or half-riſings: when he bears theſe patiently, he mounts in earneſt, and ſettles in his place, cheriſhing him, &c.

Backing *Warrants*, in *Law*, denotes the ſigning of ſuch as have been iſſued by a juſtice of the peace in one county, by a juſtice of the peace in another county, which is neceſſary before they can be executed there. This practice is authoriſed by ſtatutes 23 Geo. II. c. 26. and 24 Geo. II. c. 55.

BACKS, among dealers in leather, denote the thickeſt and beſt tanned hides, uſed chiefly for ſoles of ſhoes.

Backs *of a hip*; ſee Hip.

BACK-*gammon*, a game played with dice and tables, to be learned only by obſervation and practice.

Back-*beaver*, a machine long uſed in ſeveral parts of England, particularly in Hampſhire, Wiltſhire, and Suſſex, for winnowing corn. An improved conſtruction of this machine, illuſtrated by a figure, was propoſed by Dr. Hales, in the year 1747, which, he ſays, will not only render it fit for winnowing corn ſooner and better than by any other means hitherto uſed, but alſo for clearing it of the very ſmall corn, ſeeds, blacks, ſmut-balls, &c. to ſuch perfection, as to make it proper for ſeed-corn. See Hales's Uſes of Ventilators, part ii. p. 247, &c.

Back-*nails*; ſee Nail.

Back-*ſtaff*, in *Navigation*, an inſtrument, by the French called the *Engliſh quadrant*: it was invented by Capt. Davis; and is of good uſe in taking the ſun's altitude at ſea.—It conſiſts of three vanes, A, B, and C, and of two arches (*Tab. Navigation*, *fig*. 6.). The vane at A, called the *horizon-vane*; that at B, the *ſhade-vane*; and that at C, the *ſight-vane*. The leſſer arch B is of 60 degrees, and that of C (or FG) of 30 degrees.

To uſe the **Back**-*ſtaff*. The ſhadow-vane B is ſet upon the 60 arch, to an even degree of ſome latitude, leſs by 10 or 15 degrees than you judge the complement of the ſun's altitude will be; the horizon-vane is put on at A, and the ſight-vane on the 30 arch FG: the obſerver's back being then turned to the ſun (whence the name of *back-ſtaff*, or *back quadrant*), he lifts up the inſtrument, and looks through the ſight-vane, raiſing or falling the quadrant, till the ſhadow of the upper edge of the ſhade-vane fall on the upper edge of the ſlit in the horizon-vane; and then if he can ſee the horizon through the ſaid ſlit, the obſervation is well made: but if the ſea appears inſtead of the horizon, the ſight-vane muſt be moved lower towards F: if the ſky appear, it muſt be moved upward towards G, and thus tried till it comes right: then he obſerves how many degrees and minutes are cut by that edge of the ſight-vane which anſwers to the ſight-hole, and to them adds the degrees cut by the upper edge of the ſhade-vane: the ſum is the ſun's diſtance from the zenith, or the complement of his altitude.

To find the ſun's meridian, or greateſt altitude on any day, continue the obſervation as long as the altitude is found to increaſe, which you will perceive by the appearance of the ſea, inſtead of the horizon, removing the ſight-vane lower: but when you perceive the ſky appear inſtead of the horizon, the altitude is diminiſhed; therefore, deſiſt from farther obſervation at that time, and add the degrees upon the 60 arch to the degrees and minutes upon the 30 arch, and the ſum is the zenith diſtance, or co-altitude of the ſun's upper limb.

And becauſe it is the zenith diſtance, or co-altitude of the upper limb of the ſun, not the centre that is given by the quadrant, in obſerving by the upper end of the ſhade-vane, add 16 minutes, the ſun's ſemidiameter, to that which is produced by your obſervation, and the ſum is the true zenith diſtance of the ſun's centre. If you obſerve by the lower part of the ſhadow of the ſhade-vane; then the lower limb of the ſun gives the ſhadow; and, therefore, you muſt ſubtract 16 minutes from what the inſtrument gives: but conſidering the height of the obſerver above the ſurface of the ſea, which is commonly between 16 and 20 feet, you may take 5 or 6 minutes from the 16 minutes, and make the allowance but of 10 minutes, or 12 minutes, to be added inſtead of 16 minutes.

Mr. Flamſteed contrived a glaſs *lens*, or double convex, to be placed in the middle of the ſhade-vane, which makes a ſmall bright ſpot on the ſlit of the horizon-vane, inſtead of the ſhade; which is a great improvement, if the glaſs be truly made; for, by this means, the inſtrument may be uſed in hazy weather, and a much more accurate obſervation made in clear weather than could be by the ſhadow.

Back-*ſtays of a ſhip*, are ropes belonging to the main-maſt and fore-maſt, and the maſts belonging to them, ſerving to keep them from pitching forwards, or over-board.—See *Tab. Ship. fig*. 1. *n*. 105. 63. 25.—They are divided into *breaſt-back-ſtays*, and *after-back-ſtays*.

Back-*worm*, a name given by *Sportſmen* to a diſeaſe very common to hawks, and called alſo the *filander*. The worms are lodged between the ſkin and the fleſh, and grow to a great length, ſome of them being not leſs than half a yard long. They are very troubleſome to the bird, and will at length kill it, if they be not deſtroyed in time. Their uſual place is under the ſkin of the lower part of the back, towards the rump.

There are ſeveral ſymptoms which diſcover the bird to be troubled with this diſeaſe; the principal are the ſtinking of its breath, the croaking and mourning in the night, ruffling and writhing the tail, and the ſmallneſs of the dung.

The beſt method of cure is this: ſqueeze out the juice of ſome ſtrong and well-grown wormwood, put into it as many cloves of garlic as it will conveniently cover; let the cloves be well cleaned of all ſkins, and pierced with holes; this is to ſtand a few nights, and afterwards one of the cloves is to be given, freſh taken out of the liquor every evening, for four nights together, and after a reſt of a few days, the ſame number given again, and ſo on till the diſeaſe is removed. Others give a ſcouring of waſhed aloes, muſtard-ſeed, and agaric, of each equal quantities.

BACOBA, in *Botany*, a name by which ſome authors call the banana-tree, or *muſa fructu brevieri*. Piſo.

BACON, ſwine's fleſh ſalted and dried in the chimney. Writers on this branch of œconomics give rules for the hanging, the ſalting, and curing of *bacon*, larding with *bacon*, &c.

This appears to be in general an extremely improper and unwholſome aliment, eſpecially for people who do not uſe great exerciſe; for thoſe who do, may almoſt eat any thing without injury. Swine's fleſh conſidered as an aliment is none of the beſt; and when hardened by ſalt, and dried by ſmoak, it is rendered more indigeſtible, and in conſequence of that, productive of obſtructions in a very great degree. We may add, that the fat of *bacon* frequently becomes rancid, and acrimonious, and often even excoriates the mouth and throat.

Bacon-*ſward*, denotes the thick outer ſkin taken off the lard or fat. Old hiſtorians and law writers ſpeak of the *ſervice of the bacon*, a cuſtom in the manor of Whichenovre in Staffordſhire, and priory of Dunmow in Eſſex; in the former of which places, by an ancient grant of the lord, a flitch of *bacon*, with half a quarter of wheat, was to be given to every married couple, who could ſwear, that having been married a year and a day, they would never within that time have once exchanged their mate for any other perſon on earth, however richer, fairer, or the like. But they were to bring two of their neighbours to ſwear with them, that they believed they ſwore the truth. On this the lord of another neighbouring manor, of Rudlow, was to find a horſe ſaddled, and a ſack to carry the bounty in, with drums and trumpets, as far as a day's journey out of the manor: all the tenants of the manor being ſummoned to attend, and pay ſervice to the *bacon*. Plott's Hiſt. Staff. c. x.

The *bacon of Dunmow*, firſt erected under Henry III. was on much the ſame footing; only the tenor of the oath was, that the parties had never once repented, or wiſhed themſelves unmarried again. Ib. c. x. ſect. 80.

BACTRIANUS, in *Zoology*, a ſpecies of the CAMEL.

BACTROPERATA, an ancient appellation given to philoſophers by way of contempt, denoting a man with a ſtaff and a budget.

The word is alſo written *bactropereta*. It is compounded of βακτρον, *ſtaff*, and πηρα, *bag*, or *budget*.

BACULARES, a ſect of ANABAPTISTS, ſo called, as holding it unlawful to bear a ſword, or any other arms, beſides a ſtaff.

BACULARIUS, in *Writers of the Middle Age*, an eccleſiaſtical apparitor, or verger; who carries a ſtaff, *bacculus*, in his hand, as an enſign of his office.

BACULE, in *Fortification*, a kind of portcullis, or gate, made like a pit-fall with a counterpoiſe, and ſupported by two great ſtakes. It is uſually made before the *corps de guard*, advancing near the gate.

BACULI; ſee BACILLI.

BACULI *Sti. Pauli*, or batoons of St. Paul, a kind of figured ſtones, of the ſame ſubſtance with thoſe reſembling the briſtles of ſome American *echini*, called by Dr. Plott *lapides Judaici*.

BACULOMETRY, the art of meaſuring acceſſible and inacceſſible diſtances, by the help of *baculi*, ſtaves, or rods. Schwenter has explained this art in his Geometria Practica; the rules of it are alſo laid down by Wolfius, in his Elements; Ozanam alſo gives an illuſtration of the principles of *baculometry*.

BACULOSUS *eccleſiaſticus*, in ſome *Ancient Laws*, is uſed for a biſhop or abbot, dignified with the paſtoral ſtaff, or crozier.

BACULUS *divinatorius*, or *virgula divina*, a branch of hazle-tree, of a forked figure, uſed for the diſcovery of mines, ſprings, &c. See VIRGULA *divina*.

BADGE, in *Naval Architecture*, ſignifies a ſort of ornament placed on the outſide of ſmall ſhips, very near the ſtern, containing either a window, for the convenience of the cabin, or a repreſentation of it. It is commonly decorated with marine figures, martial inſtruments, or ſuch like emblems.

BADGER, *melis*, or *taxus*, in the Linnæan ſyſtem of zoology, is a ſpecies of the *urſus*, or *bear*, with very long fore-claws.

The *badger* is called in ſome parts of England, the *brock*, the *gray*, and the *pate*. The Greeks had no name for this animal, unleſs their HYÆNA was the ſame creature.

The body of the *badger* is ſhort and thick; its neck very ſhort; and its hairs long, and very rigid, and ſtiff like hog's briſtles. Thoſe on the back are of a pale yellow near the root, brown or black in the middle, and at the extremities yellowiſh again; ſo that the creature appears, upon the whole, of a mixt colour, or what we call grey, on the back. The ſides and belly are covered with hairs, which are all over of a pale yellowiſh hue; and the legs and ſhoulders, as alſo the belly, are wholly black. It has a broad white line from the top of the head to the noſe; and on each ſide of this a very regular pyramidal black mark reaching up to the ears; and below theſe the jaws are whitiſh, ſo that the creature's face looks very oddly variegated. Its eyes are ſmall, and its ſnout wholly like a dog's. The teeth are like thoſe of a dog alſo; and the legs ſhort; its fore-feet have ſharp claws, with which it digs itſelf burrows in the earth. Its face is very like that of the fox, being broad at the top of the forehead, and ſharpening to a point at the noſe, ſo as to appear triangular in ſhape; and its cheeks are tumid, and furniſhed with ſtrong muſcles, whence it bites very hard. It feeds on inſects and ſmall animals, and on the roots of vegetables. We have them in many parts of England, particularly in the counties of Eſſex, Suſſex, and Warwickſhire.

This animal has a very ſtrong ſmell, and like the dormouſe grows fat by ſleeping. Under the tail it has a bag of ſecreted matter, which is very fœtid.

The *badger*'s ſkin is of ſome uſe in commerce. Their fat is ſold by the druggiſts, as a remedy againſt diſorders of the kidneys and the *ſciatica*; and their hair, for the making pencils for painters and gilders.

BADGER, from *bajulo*, *I carry*; a licenſed huckſter, or perſon privileged to buy corn, or other proviſions, and to carry them from one place to another to make profit of, without being reputed an ingroſſer.

In the ſtatutes he is alſo called a *kidder*, or *lader of corn*, 5 and 6 Ed. VI. c. 14. 5 El. c. 12.—We alſo read of *badgers*, or retailers of ſalt, 9 W. III. c. 6.

BADGER-*hunting*; ſee HUNTING.

BADIAGA, in the *Materia Medica*, the name of a ſort of ſpungy plant, common in the ſhops in Moſcow, and ſome other northern kingdoms.

The uſe of it is the taking away the livid marks from blows and bruiſes, which the powder of this plant is ſaid to do in a night's time.

We owe the knowledge of this medicine, and its hiſtory, to the accurate Buxbaum. He obſerves, that the plant is always found under water, and is of a very ſingular and peculiar nature.

It ſomewhat reſembles the *alcyoniums*, and ſomewhat the ſpunges, but differs greatly from both, in that it is full of ſmall round granules, reſembling ſeeds. It is of a looſe, light, and ſpungy ſtructure, and is made up of a number of fibres of an herbaceous matter, and is dry, rigid, and friable between the fingers.

This may ſerve as the generical character of the *badiaga*, of which this accurate obſerver has found three different ſpecies.—Linnæus makes it a ſpecies of ſpunge.

BADIAN, or **BADIANA**, the ſeed of the aniſe-tree that grows in China.

BADIGEON, a mixture of plaſter and free-ſtone, well ground together, and ſifted; uſed by ſtatuaries to fill up the little holes, and repair the defects in ſtones, whereof they make their ſtatues and other work.

The ſame term is alſo uſed by joiners, for ſaw-duſt mixed with ſtrong glue, wherewith they fill up the chaps, and other defects in wood, after it is wrought.

BADOUCE, in *Natural Hiſtory*, the Eaſt-Indian name of a fruit, very common in that part of the world. It is round, and of the ſize of one of our common apples; it is yellow on the outſide, and white within. It reſembles the *mangouſtan*; but its pulp is more tranſparent; its taſte is very agreeable, and has ſome reſemblance to that of our gooſeberries.

BÆCKEA, in *Botany*, a genus of the *octandria monogynia* claſs of plants; the calyx of which is a permanent perianthium, conſiſting of a ſingle funnel-ſhaped leaf, cut into five ſegments at the brim; the corolla conſiſts of five roundiſh ſpreading petals inſerted into the cup; the pericarpium is a globoſe capſule, made up of four valves, and containing four cells, in which are a few roundiſh angular ſeeds.

BÆTUS, in *Ichthyology*, a name given by Ariſtotle, and other of the ancient Greeks, to the fiſh called by the Latin writers *cottus*; particularly to that ſpecies of it which we call the *bull-head*, or the *millers-thumb*.

BÆTYLOS, or **BÆTYLION**, in *Antiquity*, a kind of ſtones worſhipped among the Greeks, Phrygians, and other nations of the Eaſt; ſuppoſed by modern naturaliſts to be the ſame with our *ceraunia*, or thunder-ſtone.

The prieſts of Cybele carried a *bætylos* on their breaſt, repreſenting the mother of the gods. But it is a miſtake to ſuppoſe, that this was the only repreſentation of the goddeſs that they carried about with them.

BAFETAS, or **BAFTAS**, a cloth made entirely of coarſe white cotton thread, which comes from the Eaſt Indies. Thoſe of Surat are the beſt.

BAG, in *Commerce*, a term uſed to ſignify different quantities of certain commodities.

A *bag* of almonds, for inſtance, is about 3 hundred weight; of aniſeeds, from 3 to 4 hundred; of pepper, from $1\frac{1}{4}$ to 3 hundred; of goats-hair, from 2 to 4 hundred; of cotton-yarn from $2\frac{1}{2}$ to $4\frac{1}{4}$, &c.

BAG, *ſaculus*, in *Medicine* and *Pharmacy*, denotes a kind of fomentation, prepared of proper ingredients, incloſed in a *bag*, to be applied externally to a part diſeaſed, for preſent relief.

Diſpenſatory writers deſcribe cordial *bags*, uſed in deliquiums; *bags* for the ſide, for the ſtomach, in weakneſſes of the ſtomach; anodyne *bags* to eaſe pain in any part.

Wines and ales are frequently medicated by putting into them *bags* full of proper ingredients.

Sweet *bags*, are compoſitions of perfumes, ſcented powders, and the like, incloſed in *bags*, to give a fragrancy to cloaths, &c.

BAG, in *Farriery*; ſee *Chewing* BALLS.

BAG, *oil*; ſee OIL.

BAG, *petty*; ſee PETTY.

BAGS, *ſand*; ſee SAND.

BAGADAT, a name by which ſome call the CARRIER pigeon, the *columba tabellaria* of Moore. This name is probably a corruption of the word Bagdat, the name of the city from whence they are ſometimes brought to Europe; being originally brought thither from Bazora.

BAGATINS, or *couriers*, a name given to the *pigeon* CARRIERS.

BAGAUDÆ, or **Bacaudæ**, an ancient faction of peaſants, or malecontents, who ravaged Gaul.

The Gauls being oppreſſed with taxes, roſe about the year of Chriſt 290, under the command of Amand and Elian; and aſſumed the name *bagaudæ*, which, according to ſome authors, ſignified, in the Gallic language, *forced rebels*; according to others, *tribute*; according to others, *robbers*; which laſt ſignification others allow the word had, but then it was only after the time of the *bagaudæ*, and doubtleſs took its riſe from them. Du-Cange.

BAGAUZE is the name which is given, in the Antilles iſlands, to the ſugar-canes, after they have paſſed through the mill. They are dried, and uſed for boiling the ſugar.

BAGGAGE is particularly uſed in the *Military Art*, for the neceſſaries, utenſils, apparel, &c. of the officers and ſoldiers. The *baggage* includes alſo women, children, ſuttlers, &c.

The *baggage* is well called by Roman writers, *impedimenta*, on account of the great trouble and expence attending it. Unleſs ſtrict diſcipline be kept, great inconveniences may ariſe from it; whence ſeveral military laws and ordinances relating to the *baggage*.

The *baggage*-waggons before a march are appointed a rendezvous, where they are marſhalled by the waggon-maſter-general, according to the rank the ſeveral regiments bear in the army. On a march, they are ſometimes ordered to follow the reſpective columns of the army, ſometimes to follow the march of the artillery, and ſometimes to make a column of themſelves. The general's *baggage* is generally firſt. If the army march from the right, the *baggage* of that wing has the van; if from the left, the *baggage* of the left has the van. Each waggon has a diſtinguiſhing flag, to ſhew to what regiment it belongs.

Packing up the **Baggage**, *vaſa colligere*, was a term among the Romans, for preparing to go to the war, or to be ready for an expedition.

The *formula* whereby the ſoldiers declared they were in readineſs, was, *vaſa conclamare.*

The Romans diſtinguiſhed two kinds of *baggage*, a *greater* and *leſs*: the *leſſer* was carried by the ſoldier on his back, and called *ſarcina*; conſiſting of the things moſt neceſſary to life, and which he could not do without. Hence *colligere ſarcinas*, packing up the *baggage*, is uſed for decamping, *caſtra movere.*

The *greater* and heavier was carried on horſes and vehicles, and called *onera.* Hence *onera vehiculorum*, *ſarcinæ hominum.* The *baggage*-horſes were denominated *ſagmentarii equi.*

The Roman ſoldiers in their marches were heavy loaden, inſomuch, that they were called by way of jeſt, *muli mariana*, and *ærumnæ.* They had four ſorts of luggage, which they never went without, viz. corn, or *buccellatum*, utenſils, *valli*, and arms.—Cicero obſerves, that they uſed to carry with them above half a month's proviſions; and we have inſtances in Livy, where they carried proviſions for a whole month. Their utenſils comprehended thoſe proper for gathering fuel, dreſſing their meat, and even for fortification, or intrenchment; and what is more, a chain for binding captives.

For arms, the foot carried a ſpear, ſhield, ſaw, baſket, *rutrum*, hatchet, *lorum*, *falx*, &c. Alſo ſtakes or pales, *valli*, for the ſudden fortifying a camp; ſometimes ſeven, or even twelve of theſe pales were carried by each man, though generally, as Polybius tells us, only three or four. On the Trajan column we ſee ſoldiers repreſented with this fardle of corn, utenſils, pales, &c. gathered into a bundle, and laid on their ſhoulders.

Thus inured to labour, they grew ſtrong, and able to undergo any fatigue in battle; the greateſt heat of which never tired them, or put them out of breath. In after-times, when diſcipline declined, this luggage was thrown on carriages, and porters ſhoulders.

The Macedonians were not leſs inured to hardſhip than the Romans: when Philip firſt formed an army, he forbid all uſe of carriages: yet with all their load, they would march in a ſummer's day, twenty miles in military rank.

BAGGING *of hops.* See **Hops.**

BAGNIO, an Italian term, ſignifying a bath: it is uſed by us for a houſe, with conveniences for bathing, ſweating, and otherwiſe cleanſing the body; and often for worſe purpoſes.

Bagnio is alſo become a general name in Turky for the priſons where their ſlaves are incloſed; it being uſual in thoſe priſons to have baths.

BAGNOLENSES, or **Bagnolians**, a ſect in the eighth century, who were thought Manichees, though they denied their errors.—They rejected the Old Teſtament, and part of the New; held the world to be eternal; and affirmed, that God did not create the ſoul when he infuſed it into the body.

They derive their name from *Bagnols*, a city in Languedoc, where they were chiefly found.

BAGOI, among the *Ancient Perſians*, were the ſame with thoſe called by the Latins, *ſpadones*, viz. a ſpecies of eunuchs, in whom the canal of the *penis* was ſo contorted by a tight *vinculum*, that they could not emit the *ſemen.*

BAGPIPE, a muſical inſtrument of the wind-kind, chiefly uſed in country places, eſpecially in the North.—It conſiſts of two principal parts; the firſt a leathern bag, which is blown up like a foot-ball, by means of a port-vent, or little tube, fitted to it, and ſtopped by a valve.

The other part conſiſts of three pipes, or flutes; the firſt called the great pipe, or drone, and the ſecond the little one, which paſs the wind only out at the bottom: the third has a reed, and is played on by compreſſing the bag under the arm, when full, and opening or ſtopping the holes, which are eight, with the fingers. The little pipe is ordinarily a foot long, that played on thirteen inches, and the port-vent ſix.

The *bagpipe* takes in the compaſs of three octaves.

This inſtrument was called by the Romans *utricularis tibia*, and the players thereon, *utricularii.* The invention of it is derived by ſome from Tubal; others aſcribe it to Pan; others to Mercury, to Faunus, to Marſyas, and to the young Sicilian ſhepherd Daphnis, who firſt compoſed paſtorals.

An anonymous French author has publiſhed a treatiſe of the *bagpipe*, *traité de la muſette*, with a new method of learning to play on it without a maſter. Fol. Par. 1672.

BAGRE, in *Ichthyology*, a ſmall bearded fiſh of the anguilliform kind, of which there are ſeveral ſpecies. It has no ſcales, but is covered over the whole body with a ſoft mucous ſkin of a ſilvery whiteneſs, and the beard, the head, and fins, are all of the ſame colour; the eyes are large, the mouth ſmall, and without teeth. It is caught in the American ſeas, and is eaten; but if any body is wounded by its thorns, it generally gives great pain, and is difficult to cure.

In the Linnæan ſyſtem, this fiſh is a ſpecies of the SILURUS.

Bagre *de Rio*, a name by which ſome call the fiſh more frequently known by the name of NHAMDIA.

BAGUETTE, in *Architecture*, a little round moulding, leſs than an aſtragal; ſometimes carved and enriched with foliages, pearls, ribbands, laurels, &c.—See *Tab. Archit. fig.* 2. and 11.

According to M. le Clerc, when the *baguette* is enriched with ornaments, it changes its name, and is called CHAPLET; and unornamented, it is a *bead.*

BAHAR, or **Barr**, a weight uſed at Ternate, Moca, in the Moluccas, Achem, and divers other parts of the Eaſt Indies.

There are two kinds, the *great*, wherewith ſpice is weighed, equal to 524lb. 9 oz. averdupois. The *little bahar* ſerves for the weighing quickſilver, vermilion, ivory, ſilk, muſk, and other precious wares, equal to 437lb. 9 oz. averdupois weight.

BAHIRA, among the *Ancient Arabs*, a name given to one of the four kinds of camels or ſheep, which for ſome reaſons of their religion, were turned out at liberty, with an ear-mark, no longer to be uſed for ſervice like other cattle.

The *bahira*, with the *ſabai*, *waſita*, and *hami*, were aboliſhed by Mahomet, as no ordinance of God.

Authors are not agreed as to the characters of the *bahira.*

BAIL, in *Law*, the ſetting at liberty one arreſted, or impriſoned upon an action either civil or criminal, under ſureties taken for his appearance at a day and place aſſigned.

It is called *bail*, becauſe hereby the party confined is *baillé*, from the Greek βαλλειν, delivered into the hands of thoſe who bind themſelves for his forthcoming: or from *bail*, uſed in the ſenſe of a guardian, into whoſe hands the party is put for ſecurity ſake.

Manwood diſtinguiſhes between *bail* and *mainpriſe* thus: he that is mainpriſed, is ſaid to be at large, and to go about at his liberty, without ward, till the time of appearance; whereas he who is let to *bail* to two or more men, is always accounted by law to be in their ward and cuſtody for the time; and they may, if they pleaſe, actually keep him in priſon.

In civil caſes every defendant is *bailable*; but in criminal matters it is otherwiſe. By the ancient common law, before and ſince the Conqueſt, all felonies were *bailable*, till murder was excepted by ſtatute. But the ſtat. Weſtm. 1. 3 Edw. I. cap. 15. takes away the power of *bailing* in treaſon, and divers inſtances of felony. And the ſtatute 1 and 2 Ph. & Mar. cap. 13. farther regulates this matter: ſo that now, no juſtices of the peace can bail, upon an accuſation of treaſon, of murder, of manſlaughter, if the priſoner be clearly the ſlayer, or an indictment be found againſt him; nor of felony, againſt thoſe who have broken priſon. Outlawed perſons, and thoſe who have abjured the realm, approvers, and perſons accuſed by them, perſons taken with the *mainour*, or in the fact of felony, perſons charged with *arſon*, and excommunicated perſons, are alſo inadmiſſible to *bail*. Thoſe who muſt be *bailed*, on offering ſufficient ſecurity, are perſons of good fame, charged with a ſuſpicion of manſlaughter, or inferior homicide; ſuch perſons, charged with petit larceny, or any felony, not before ſpecified, or with being acceſſory to any felony. Moreover, it is agreed that the court of king's bench (or any judge thereof, in time of vacation) may *bail* for any crime whatſoever, be it treaſon, murder, or any other offence, according to the circumſtances of the caſe; ſuch perſons only excepted, who are committed by either houſe of parliament during the ſeſſion, or ſuch as are committed for contempt by any of the king's ſuperior courts of juſtice.

The refuſal or delay of *bail* to perſons *bailable*, is an offence by the common law, as well as by the ſtatute Weſt. 1. 3 Edw. I. cap. 15. and the *habeas-corpus* act, 31 Car. II. cap. 2. And it is expreſly declared by ſtatute 1 W. & M. ſtat. 2. cap. 1. that exceſſive *bail* ought not to be required; though it is left with the courts to determine what *bail* is exceſſive. If the magiſtrate takes inſufficient *bail*, he is liable to be fined, if the criminal does not appear.

Bail is either *common*, or *ſpecial*.

Bail, *common*, is that given in actions of ſmall prejudice, or ſlight proof; in which caſes any nominal ſureties are taken; as John Doe, and Richard Roe: this being no other than a form of appearance.

Bail, *ſpecial*, is given in caſes of greater moment, where it is required that the ſureties be ſubſidy-men at the leaſt, and according to the value of the matter in queſtion.

It was enacted a few years ago, in compaſſion to the poor, that no perſons ſhould be held to ſpecial bail in any action brought for leſs than ten pounds.—This is obſerved as to writs iſſued out of the courts of Weſtminſter-hall.—But the marſhal's court continues to arreſt and hold to bail in actions for ſums exceeding forty ſhillings.

Bail *above*, or **Bail** *to the action*, ſucceeds the return of the writ, or the appearance of the perſon *bailed*. The perſons, who put in this *bail*, muſt be at leaſt two in number, and enter into a recognizance, whereby they do jointly and ſeverally undertake, that if the defendant be condemned in the action, he ſhall pay the coſts and condemnation, or render himſelf a priſoner, or that they will pay it for him; which recognizance is tranſmitted to the court in a ſlip of parchment, called the *bail-piece*. And, if required, the *bail* muſt juſtify themſelves by ſwearing that they are houſekeepers, and each of them worth double the ſum for which they are *bail*, after payment of all their debts.

Bail-*bond*, is a bond or obligation entered into by one or more ſureties, upon putting in *bail* to the ſheriff, inſuring the defendant's appearance at the return of the writ.

Bail *in error*, expreſſes the bail given by a perſon who brings a writ of error after verdict, or who is plaintiff in error.

Bail-*piece*. See **Bail** *above*.

Bails, *clerk of the*, is an officer belonging to the court of king's bench. He files the bail-pieces taken in that court, and attends for that purpoſe.

BAILE, or **Bale**, in the *Sea Language*.—The ſeamen call lading or caſting the water by hand out of a boat or ſhip's hold with buckets, cans, or the like, *bailing*.

When the water is thus *bailed* out, they ſay *the boat is freed*. They alſo call thoſe hoops that bear up the tilt of the boat, its *bailes*.

BAILEMENT, a term in *Law*, ſignifying the delivery of things, whether writings or goods, to another; ſometimes to be delivered back to the bailor, that is, to him who delivered them; ſometimes to the uſe of him to whom they are delivered, and ſometimes to a third perſon.

This delivery may be ſimple, as to keep for my uſe; or conditional, to be redelivered, when money is paid, &c. Upon *bailement*, or delivery of goods, theſe things are to be obſerved: if they are delivered to a man to be ſafely kept; and after, theſe goods are ſtolen from him, as he undertook to keep them ſafely, this ſhall not excuſe him; but if he undertook to keep them as his own, he ſhall be excuſed. 2 Inſt. 89. 4 Rep. 83. 1 Rol. abr. 338.

BAILIAGE is uſed for the office of a bailiff, for the place where he keeps his ſeat, and for the territory ſubject to his juriſdiction; which laſt is alſo denominated *bailiwick*.

Bailiage, *water*, or **Bailiage**, is an ancient duty received by the city of London, for all goods and merchandiſes brought into or carried out of the port.

BAILIFF, in a general ſenſe, denotes an officer appointed for the adminiſtration of juſtice within a certain diſtrict, called *bailiwick*.

The word is alſo written *baile*, *baily*, *bayly*, *baylie*, and *baillif*, in Latin *ballivus*.—It is formed from the French *baillif*, of *bail*, an old word, denoting a guardian, or governor of a youth, originally derived from the Latin *bajulus*, which ſignified the ſame.

Paſquier maintains, that *bailiffs* were originally a kind of commiſſioners, or judges delegate, ſent into the provinces to examine whether or no juſtice were well diſtributed by the counts, who were then the ordinary judges. Loyſeau, with more probability, refers the origin of *bailiffs* to the uſurpation and idleneſs of the great lords, who, having got the adminiſtration of juſtice into their own hands, and being weary of the burden, turned it over to their deputies, whom they called *bailiffs*.

Theſe *bailiffs* had at firſt the ſuperintendence of arms, of juſtice, and of the finances; but abuſing their power, they were by degrees ſtripped of it, and the greateſt part of their authority transferred to their lieutenants, who were to be men of the long robe. It is true, in France they have ſtill ſome prerogatives, as being reputed the heads of their reſpective diſtricts: in their name juſtice is adminiſtered, contracts, and other deeds paſſed, and to them is committed the command of the militia.

From theſe it was that the Engliſh *bailiffs* originally took both their name, and their office: for as the French have eight parliaments, which are ſupreme courts, whence no appeal lies, within the precincts of the ſeveral parliaments, or provinces, and in which juſtice is adminiſtered by *bailiffs*, at leaſt, by their lieutenants: ſo in England are ſeveral counties wherein juſtice was adminiſtered by a viſcount or ſheriff, who appears likewiſe to have been called *bailiff*; and his diſtrict or county, *bailiwick*. Further, the counties were again ſubdivided into hundreds; within which it is manifeſt juſtice was anciently rendered by officers called *bailiffs*. But thoſe hundred-courts are now ſwallowed up by the county-courts, certain franchiſes alone excepted, and the *bailiffs* name and office is grown into ſuch contempt, at leaſt theſe *bailiffs* of hundreds, that they are now no more than bare meſſengers, and mandatories within their liberties, to ſerve writs, and ſuch mean offices.

Bailiffs are of two kinds, *viz.* *bailiffs errant* or *itinerant*, and *bailiffs of franchiſes*.

Bailiffs *errant*, are thoſe whom the ſheriff appoints to go up and down the county to ſerve writs and warrants, ſummon county-courts, ſeſſions, aſſizes, &c. The ſheriff being anſwerable for the miſdemeanour of theſe *bailiffs*, they are uſually bound in an obligation for the due execution of their office, and thence called bound-*bailiffs*, which is vulgarly corrupted into a much more homely appellation.

Bailiffs *of franchiſes* are thoſe who are appointed by every lord within his liberty, to do ſuch offices therein, as the *bailiff* errant does at large in the county.

There are alſo *bailiffs of the foreſts*, and *bailiffs of manors*, who direct the huſbandry, fell trees, gather rents, pay quit-rents, &c.

The word *bailiff* ſtill retains ſome of its ancient ſignificancy; being applied alſo to the chief magiſtrates of ſeveral corporate towns, as Ludlow, Leominſter, &c.—And again, the government of ſome of the king's caſtles is committed to perſons called *bailiffs*; as, the *bailiff* of Dover caſtle.

We alſo meet with divers other ſpecies and denominations of *bailiffs* in theſe and the neighbouring countries; as *provincial*, *royal*, *itinerant*, and *heritable bailiffs*; *bailiffs* of France, of the empire, of boroughs, of courts baron, manors, &c.

Bailiff, *provincial*, *bailivus provincialis*, among the French, was an officer appointed to adminiſter juſtice in a certain province, or county, with an authority ſomewhat like that of our juſtice of aſſize, inſtituted by the dukes and counts in their ſeveral territories, after they had procured the inheritance of them. Theſe acted in the name, and by authority, not of the king, as juſticaries, but of the dukes, or counts, who appointed them, and whoſe deputies they were. Spelman takes them to be the ſame with what, among our Saxon anceſtors, were denominated *aldermen of counties*, and *graves* or *reves*, which afterwards became *vicecomites*, and ſheriffs.

Appeals lay from theſe to the *bailiffs* of France, *bailivi Franciæ*, who were thoſe appointed over the provinces originally belonging to the crown.

Bailiffs, *royal*, *bailivi regii*, were thoſe over provinces afterwards annexed to the crown. Something like theſe ſtill ſubſiſts in Scotland, under the title of high or heretable *bailiffs*; as thoſe of Cunningham, Carrick, and Kyle; the firſt in the families of the earls of Eglington, the ſecond of the earl of Caſſils, the third, of the earl of Loudon.

Bailiffs *of boroughs*, *bailivi burgorum*, were magiſtrates anciently in cities and towns, anſwering, in ſome meaſure, to what of later times was called *portgrave*, *mayor*, &c. Canterbury was a *bailiff* town five hundred years before it was made a mayor town. Weſtminſter, Southwark, Scarborough, &c. are ſtill governed by *bailiffs*.

Bailiffs differ in this from mayors, that the latter are always ſingle in one place, whereas there were uſually two *bailiffs* to a city, as formerly at London, and ſometimes four, as at Norwich.

Bailiff *of the empire* was anciently the vicar or regent of the empire; as appears from a letter of Henry of Flanders to pope Innocent III. wherein he ſays, the princes, barons, and knights, have elected me *bailiff of the empire*; *bailivus imperii*.

Bailiff, *water*, is an officer anciently eſtabliſhed in all port-towns, for the ſearching of ſhips; as appears from 28 Hen. VI. cap. v.

There is ſuch an officer ſtill on foot in the city of London, who ſuperviſes and ſearches all fiſh brought thither; and gathers the toll ariſing from the river of Thames.—He attends alſo on the lord-mayor in his expeditions by *water*, and hath the principal care of marſhalling the gueſts at the table.—He alſo arreſts men for debt, or other perſonal or criminal matters on the river of Thames, by warrant of his ſuperiors, &c.

BAILIWICK, Bailywick, or **Bayliwick**, the territory of a bailiff; or the place within which his juriſdiction is terminated.

BAILO, or **Balio**, a name given at Conſtantinople, to the embaſſador of Venice reſiding at the Porte; who alſo does the office of conſul of his nation.

The word is doubtleſs the remains of the word *bajulus*, which the modern Greeks and Turks have formed into *bailo*. The Venetian conſuls at Aleppo, Alexandria, Smyrna, and other parts of the Levant, are alſo denominated *bailo*.

BAIOCCO, a money in modern Rome, equivalent to a tenth part of the *julio*, or a hundredth part of the ducat.

The *baiocco* is worth about nine deniers, French money.

BAIRAM, a name given to the great annual feaſt of the Mahometans.

The word is alſo written, by ſome authors, more conformably to the oriental orthography, *beiram*. It is originally Turkiſh, and ſignifies literally, a *feaſt-day*, or *holiday*.

The Mahometans have two *bairams*, the *great*, and the *little*, which Scaliger, Erpenius, Rycaut, Hyde, Chardin, Bobovius, and other European writers, commonly interchange, giving the appellation *great* to that which the Turks call little, and *vice verſa*.

This feaſt commencing with the new moon, the Mahometans are very ſcrupulous in obſerving the time when the new moon commences; to which purpoſe, obſervers are ſent to the tops of the higheſt mountains, who, the moment they ſpy the appearance of a new moon, run to the city, and proclaim *muzodaluk, welcome news*; as it is the ſignal for beginning the feſtivity.

The ceremonies are deſcribed at large by Rycaut and Tournefort.

Bairam, *the little*, is properly that held by the pilgrims at Mecca, commencing on the tenth of Dhu Ihajia, when the victims are ſlain, and laſting three days. This is called by the Arabs, *id al adha*, that is, the feaſt of the ſacrifice, as being celebrated in memory of the ſacrifice of Abraham, whoſe ſon God redeemed with a great victim. By European writers it is called the *leſſer bairam*, as being leſs taken notice of by the generality of the people, who are not ſtruck with it, becauſe the ceremonies attending it are performed at Mecca, the only ſcene of the ſolemnity. Sale's Prel. Diſc.

The little *bairam* holds for three days, during which no work is done; but preſents paſs from one to another, with many other manifeſtations of joy. If the day after Ramadan ſhould prove ſo cloudy, as to prevent the ſight of the new moon, the *bairam* is put off to the next day, when it begins, though the moon be ſtill obſcured. When they celebrate this feaſt, after numerous ceremonies, or rather ſtrange mimicries, in their moſque, they end it with a ſolemn prayer againſt the infidels, to root out Chriſtian princes, or to arm them one againſt another, that they may have an opportunity to extend the borders of their law.

BAIT, *white*, in *Ichthyology*, a ſmall fiſh, which is caught in great plenty, during the month of July, in the river Thames, near Blackwall, and which is eſteemed very delicious. Theſe are the fry of ſome fiſh, and have been variouſly attributed to the ſhad, to the ſprat, the ſmelt, and the bleak fiſh. Pennant obſerves, that this belongs to the genus of *cyprinus*, becauſe it has only three branchioſtegous rays, and one dorſal fin; its body is compreſſed like that of the bleak; its uſual length is two inches; the under jaw is the longeſt; the irides are ſilvery, and the pupil black; the dorſal fin conſiſts of about fourteen rays; the ſide line is ſtrait; the tail forked, and the tips black. Zoology, vol. iii. p. 372.

Bait, in *Fiſhing*. *Baits* make a capital article in angling; on the choice whereof much of the ſport depends; different ſeaſons, and different game, having their appropriate *baits*. The red, or earth-worm is good for the ſmall fry moſt of the year round; and ſmall fiſh are good *baits* for pikes at all times; ſheep's blood and cheeſe are good *bait* in April; the bobs, dried waſps, and bees, are for May, brown flies for June; maggots, hornets, waſps, and bees, for July; ſnails in Auguſt; graſshoppers in September; corn, bramble-berries, and ſeeds, at the fall of the leaf; artificial paſtes are for May, June, and July, and frogs for March.

Baits are either natural or artificial.

Baits, *natural*, include all kinds of worms, as the red worm, maggot, &c. alſo frogs, graſshoppers, hornets, bees, ſnails, roaches, bleak, gudgeon, and loaches, &c.

Theſe *baits* are to be kept each ſort ſeparate, and fed with thoſe things which they like beſt.

The red worm is to be kept in rich black mould, with a little fennel chopped among it; a little ox or cow dung, newly made, is alſo a very acceptable thing to them. They may be kept in a box, with ſmall holes in it, or in a bag. Red worms, and all other ſorts, ſcour quickly, and grow very tough and bright, on putting them into a thin clout, greaſed with freſh butter, or greaſe, before they are put into moſs.

This is the beſt of all things to keep them in; but the moſs muſt be firſt very well waſhed, and the water ſqueezed dry out again. As to food, a ſpoonful of cream, dropped into the moſs once in three or four days, is better than any thing elſe. The moſs is to be changed every week, and kept in a cool place.

White large maggots are an excellent *bait* for many ſorts of fiſh, and they are to be kept on ſheep's ſuet and liver, chopped ſmall.

Frogs and graſshoppers are to be kept in wet moſs, and long graſs; and, on moiſtening this afreſh every evening, it will keep a long time. They are to have their legs and wings cut off, when they are uſed.

Live flies muſt be uſed as they are caught; but waſps, bees, hornets, and humble-bees, may be preſerved dry.

The beſt method of drying them, is putting them in an oven after the bread is drawn. Care muſt be taken that they are not ſcorched; and when they are taken out, they are to have the heads dipped in ſheep's blood. This is to be ſuffered to dry on, and then they are to be preſerved in a box. They will keep for three or four months.

Baits, *artificial*, are flies of all kinds and ſhapes, made of ſilk, feathers, and the like. The variety of which is very great; there being not only different ones for every ſeaſon and month of the year, but almoſt for every fiſh.

There are ſeveral *artificial baits*, for intoxicating of fowl, and yet without tainting or hurting the fleſh, ſo as to make it unfit to eat.

Baits, *dead*, are paſtes of divers ſorts, made of corn, cheeſe, fruits, waſps, ſheeps blood, boiled beans, &c.

Bait, *ledger*, is that which remains fixed in one certain place, while the angler may be abſent; uſed eſpecially in fiſhing for pike.

Bait, *walking*, is that which the angler attends, while he keeps moving from place to place, in queſt of the fiſh.

Baits *of hemp*, denote bundles of that plant, pulled and tied up, ready for ſteeping in water. See **Fly** and **Fishing**.

Baiting, or rather **Bating**, in *Falconry*, is when a hawk flutters with her wings, either from perch or fiſt, as if it were ſtriving to get away.

Baiting alſo denotes the act of ſmaller or weaker beaſts attacking and harraſſing greater and ſtronger ones.

In this ſenſe, we hear of the *baiting* of bulls and bears by maſtiff or bull dogs, with ſhort noſes, that they may take the better hold. Whales are *baited* by a kind of fiſh called *oriæ*, or *killers*; ten or twelve of which will attack a young whale at once, and not leave him till he is killed. Philoſoph. Tranſact. N°. 287. p. 265.

Houghton gives us the hiſtory of *bull-baiting*, a ſport-peculiar to England, and ſavouring, like ſome others, of our ancient Gothiciſm. Some of our countrymen are ſaid to be fond enough of it, to buy bulls on purpoſe, and travel with them, at great charge, to all the chief towns around. The *baiting* this animal, makes his fleſh tenderer and more digeſtible. In reality, it diſpoſes it for putrefaction, ſo that, unleſs taken in time, *baited* fleſh is ſoon loſt.

BAJULATIO, the office of a *bajulus*, or bailiff.

BAJULUS, an ancient officer in the court of the Greek emperors; whereof there were ſeveral degrees: as the grand *bajulus*, who was preceptor of the emperor, and the ſimple *bajuli*, who were ſub-preceptors.

Hence the Italians uſe the word *bajulus* of a kingdom, in the ſame ſenſe with *protector* of a kingdom among the Engliſh. The word is derived from the Latin verb *bajulare*, to carry, or bear a thing in the arms or on the ſhoulders.

Children, and eſpecially thoſe of condition, had anciently, beſide their nurſe, a woman called *gerula*, as appears from ſeveral paſſages of Tertullian; when weaned, or ready to be weaned, they had men to carry them about and take care of them, who were called *geruli*, and *bajuli*, *à gerendo & bajulando*.

Bajulus is alſo uſed by Latin writers in the ſeveral other ſenſes, wherein *bailiff* is uſed among us.

Bajulus was alſo the name of a conventual officer in the ancient monaſtries, to whom belonged the charge of gathering and diſtributing the money and legacies left for maſſes and obits; whence he was alſo denominated *bajulus obituum novorum*.

BAIZE, in *Commerce*. See **Bays**.

BAKER's *central rule*. See **Central** *rule*.

BAKING, the art of preparing bread, or of reducing meals of any kind, whether ſimple or compound, into bread.

The forms of baking among us may be reduced to two; the one for unleavened, the other for leavened bread.

The learned are in great doubt about the time when *baking* firſt became a particular profeſſion, and *bakers* were introduced. It is generally agreed they had their riſe in the Eaſt, and paſſed from Greece to Italy after the war with Pyrrhus, about the year of Rome 583. Till which time every houſewife was her own *baker:* for the word *piſtor*, which we find in Roman authors before that time, ſignified a perſon who ground or pounded the grain in a mill or mortar to prepare it for *baking*, as Varro obſerves. According to Athenæus, the Cappadocians were the moſt applauded *bakers*, after them the Lydians, then the Phœnicians.

To the foreign *bakers* brought into Rome, were added a number of freed-men, who were incorporated into a body, or, as they called it, a *college*; from which neither they nor their children were allowed to withdraw.—They held their effects in common, and could not diſpoſe of any part of them. Each bake-houſe had a *patronus*, who had the ſuperintendency thereof; and theſe *patroni* elected one out of their number each year, who had the ſuperintendence over all the reſt, and the care of the college. Out of the body of the *bakers* every now-and-then one was admitted among the ſenators.

To preſerve honour and honeſty in the college of *bakers*, they were expreſly prohibited all alliance with comedians and gladiators; each had his ſhop or bake-houſe, and they were diſtributed into fourteen regions of the city. They were excuſed from guardianſhips, and other offices, which might divert them from their employment.

By our own ſtatutes, *bakers* are declared not to be handicrafts.—No man for uſing the myſteries or ſciences of *baking*, brewing, ſurgery, or writing, ſhall be interpreted a handicraft. 22 H. VIII. cap. 13.

The *bakers* of London make the nineteenth company. They were incorporated about the year 1307, and conſiſt of a maſter, four wardens, thirty aſſiſtants, and one hundred and forty-nine on the livery, beſide the commonalty. The *bakers* of London are under the juriſdiction of the lord-mayor and aldermen.

A penalty is inflicted on *bakers* ſelling at a higher price than is ſet by the lord-mayor. See 3 Geo. II. cap. 29. and by 22 Geo. II. cap. 46. *bakers* are to ſet their marks on their bread. The aſſize of bread is regulated by ſeveral ſtatutes. See 8 Anne, cap. 18. 31 Geo. II. cap. 29. 32 Geo. II. cap. 18. 3 Geo. III. cap. 6. and 11.

The manner of *baking* at Otaheite, and in many iſlands of the South Seas, is as follows. They make fire by rubbing the end of one piece of dry wood upon the ſide of another, juſt as our carpenters whet a chiſſel; they then dig a pit in the ground about half a foot deep, and two or three yards in circumference; they pave the bottom of it with large pebble ſtones, which they lay very ſmooth and even, and then kindle a fire in it with dry leaves, and the huſks of the cocoa-nut. When the ſtones are properly heated, they take out the embers, and rake up the aſhes on every ſide, then cover the ſtones with a layer of green cocoa-nut tree leaves, and wrap up the animal that is to be dreſſed, in the leaves of the plantain. If it be a ſmall hog, or dog, they wrap them up whole; if large, they ſplit them. When placed in the pit, they cover it with hot embers, and lay upon them bread-fruit and yams wrapped up in like manner in the leaves of the plantain. Over theſe they ſpread the remainder of the embers, mixing among them ſome of the hot ſtones, with more cocoa-nut tree leaves, and then cloſe up all with earth, ſo that the heat is kept in. After a time proportioned to what is dreſſing, the oven is opened, and the meat taken out, tender, full of gravy, and, as captain Wallis thought, better in every reſpect than when it is dreſſed any other way. Having no veſſels in theſe iſlands that would bear the fire, the inhabitants of them had no idea of hot water, or its effects, and therefore always roaſted or baked their meat in the manner above related. Hawkeſworth's Account of Voyages into the Southern Hemiſphere, vol. i. p. 484.

BAKING is uſed for the expoſing a ſubſtance, incloſed in a cruſt, to the fire.

This makes an operation in pharmacy, uſed in the making of an oil of earth-worms, commended againſt arthritic, ſhooting pains. The worms, having ſtood ſome time to putrify, are covered up, together with the veſſel they are in, with a wheaten cruſt, and ſet in the oven: by which they are converted to a thick yellow oily liquor.

BAKING *porcelain*. See PORCELAIN.

BALA, in *Botany*, a name uſed by ſome authors for the *muſa*, or plantane-tree, called alſo the *banana* and *ficoides* by others.

BALAAMITES, the name of a ſect in the firſt age of Chriſtianity, of the ſame import in the Hebrew language with Nicolaitans, in the Greek. See NICOLAITANS.

BALAENA. See WHALE.

BALAM PULLI, in *Botany*, a name uſed by ſome authors for the tree whoſe fruit is the tamarind of the ſhops.

BALANCE, or BALLANCE, *libra*, one of the ſix ſimple powers in *Mechanics*, uſed principally for determining the equality, or difference of weights in heavy bodies, and conſequently their maſſes or quantities of matter.

The *balance* is of two kinds, *viz.* the *ancient* and *modern*.

The *ancient* or *Roman*, called alſo *ſtatera Romana*, or *ſteel-yard*, conſiſts of a lever or beam, moveable on a centre, and ſuſpended near one of its extremes: on one ſide the centre are applied the bodies to be weighed, and their weight is meaſured by the diviſion marked on the beam; on the other ſide is the place where a weight moveable along it keeps the *balance* in equilibrio.

The *modern balance*, now ordinarily in uſe, conſiſts of a lever or beam ſuſpended, exactly by the middle; to the extremes whereof are hung ſcales, or baſons.

In each caſe, the beam is called the *jugum*, and the two moieties thereof on each ſide the axis, the *brachia*, or *arms*; and the handle whereby it is held, *trutina*; the line on which the beam turns, or which divides its brachia, is called the *axis*; and, when conſidered with regard to the length of the brachia, is eſteemed but a point, and called the centre of the *balance*; and the places where the weights are applied, the *points of ſuſpenſion* or *application*.—That ſlender part perpendicular to the *jugum*, whereby either the *equilibrium*, or preponderancy of bodies is indicated, is called the *tongue of the balance*.

In the Roman *balance*, therefore, the weight uſed for a counterbalance is the ſame, but the points of application are various; in the common *balance*, the counterpoiſe is various, and the point of application the ſame.

The principle on which each is founded is the ſame, and may be conceived from what follows.

BALANCE, *doctrine of the*.—The beam AB (*Tab. Mechanics*, *fig*. 9.) the principal part of the *balance*, is a lever of the firſt kind, which (inſtead of reſting on a *fulcrum* at C, its centre of motion) is ſuſpended by ſomewhat faſtened to C, its centre of motion. So that the mechaniſm of the *balance* depends on the ſame theorem as that of the lever.

Hence, as the known weight is to the unknown, ſo is the diſtance of the unknown weight from the centre of motion, to the diſtance of the known weight, where the two weights will counterpoiſe each other; conſequently, the known weights ſhew the quantity of the unknown.

Or thus: the action of a weight to move a *balance* is by ſo much greater, as the point preſſed by the weight is more diſtant from the centre of the *balance*; and that action follows the proportion of the diſtance of the ſaid point from that centre. When the *balance* moves about its centre, the point B deſcribes the arch B*b* (*fig*. 10.); whilſt the point A deſcribes the arch A*a*, which is the biggeſt of the two: therefore in the motion of the *balance*, the action of the ſame weight is different, according to the point to which it is applied: hence it follows, that the proportion of the ſpace gone through by the point at A is as A*a*, and at B as B*b*, but thoſe arches are to one another, as CA, CB.

BALANCE, *varieties in the application of the*.—If the brachia of a *balance* be divided into equal parts, one ounce applied to the ninth diviſion from the centre, will equiponderate with three ounces at the third; and two ounces at the ſixth diviſion act as ſtrongly as three at the fourth, &c.

Hence it follows, that the action of a power to move a *balance* is in a *ratio* compounded of the power itſelf, and its diſtance from the centre: for that diſtance is as the ſpace gone through in the motion of the *balance*.

It may be here obſerved, that the weight equally preſſes the point of ſuſpenſion at whatever height it hangs from it, and in the ſame manner as if it was fixed at that very point: for the weight at all heights equally ſtretches the cord by which it hangs.

A *balance* is ſaid to be in *equilibrio*, when the actions of the weights upon the brachia to move the *balance*, are equal, ſo as mutually to deſtroy each other. When a *balance* is in equilibrio, the weights on each ſide are ſaid to be equiponderate: unequal weights may alſo *equiponderate*; but then the diſtances from the centre muſt be reciprocally as the weights. In which caſe, if each weight be multiplied by its diſtance, the products will be equal; which is the foundation of the ſteel-yard.

Thus in a *balance* whoſe brachia are very unequal, a ſcale hanging at the ſhorteſt, and the longeſt divided into equal parts: if ſuch a weight be applied to it, as at the firſt diviſion ſhall equiponderate with one ounce in the ſcale; and the body to be weighed be put into the ſcale, and the above-mentioned weight be moved along the longeſt *brachium*, till the *equilibrium* be found; the number of diviſions between the body and the centre ſhews the number of ounces that the body weighs, and the ſubdiviſions the parts of an ounce.

On the ſame principle alſo is founded the *deceitful balance*, which cheats by the inequality of the *brachia*: for inſtance, take two ſcales of unequal weights, in the proportion of 9 to 10, and hang one of them at the tenth diviſion of the *balance*

balance above deſcribed, and another at the ninth diviſion, ſo that there may be an *equilibrium*; if then you take any weights, which are to one another as 9 to 10, and put the firſt in the firſt ſcale, and the ſecond in the other ſcale, they will equiponderate.

Several weights hanging at ſeveral diſtances on one ſide, may equiponderate with a ſingle weight on the other ſide: to do this it is required, that the product of that weight, by its diſtance from the centre, be equal to the ſum of the products of all the other weights, each being multiplied by its diſtance from the centre.

To demonſtrate which, hang three weights of an ounce each, at the ſecond, third, and fifth diviſions from the centre, and they will equiponderate with the weight of one ſingle ounce applied to the tenth diviſion of the other *brachium*; and the weight of one ounce at the ſixth diviſion, and another of three ounces at the fourth diviſion, will equiponderate with a weight of two ounces on the other ſide at the ninth diviſion.

Several weights unequal in number, on either ſide, may equiponderate: in this caſe, if each of them be multiplied by its diſtance from the centre, the ſums of the product on either ſide will be equal; and if thoſe ſums be equal, there will be an *equilibrium*.

To prove which, hang on a weight of two ounces at the fifth diviſion, and two others, each of one ounce, at the ſecond and ſeventh; and on the other ſide hang two weights, each alſo of one ounce, at the ninth and tenth diviſions; and theſe two will equiponderate with thoſe three. A *balance* of this kind, the arms of which are equally divided, has been ſometimes called an *arithmetical balance*; becauſe the arithmetical operations of addition, ſubtraction, multiplication, diviſion, and the rule of three, may be eaſily performed by it. Graveſande Phyſices Elementa Math. vol. i. p. 50.

To the juſtneſs of a *balance* it is required, that the points of ſuſpenſion be exactly in the ſame line as the centre of the *balance*; that they be preciſely equidiſtant from that point on either ſide; that the brachia be as long as conveniently they may; that there be as little friction as poſſible in the motion of the beam and ſcales; and laſtly, that the centre of gravity of the beam be placed a little below the centre of motion.

Mr. Ludlam has contrived a *balance* of a new conſtruction for the woollen manufacturers. Their thread is made into ſkains of the ſame length; and the fineneſs of it is denominated from the number of ſkains which go to a pound; the coarſeſt being about twelve to the pound, and the fineſt near ſixty. This machine is deſigned for weighing the ſkains, in order to determine their reſpective fineneſs. It reſembles the beam of a common pair of ſcales; at one end of it is a fixed weight, called the counterpoiſe, and at the other end a hook; in ſorting, the ſkain to be examined is put upon the hook, and ſinks down more or leſs, according to its weight, till the counterpoiſe, by riſing, balances it; and then the index, or cock of the beam, points out on a graduated arch the number of ſkains of that ſort which go to the pound.

A ſcale, inſtead of the hook, might be uſed for weighing money, if the arch were properly divided for that purpoſe. See a drawing of this machine, and the explanation of the theory of it, in Phil. Tranſ. vol. lv. Nº 25, p. 205.

BALANCE *of the air*, is uſed to denote the weight of that fluid, whereby, according to its known property, it preſſes where it is leaſt reſiſted, till it be equally adjuſted in all parts.

BALANCE, *aſſay*, is a nice *balance* uſed in determining the exact weight of minute bodies. Its ſtructure is very little different from that of the common ſort; except that it is made of the beſt ſteel, and fitted for moving with the ſmalleſt weight.

BALANCE, in *Aſtronomy*. See LIBRA.

BALANCE *of a clock or watch* is that part of either, which by its motion regulates and determines the beats.—The circular part of it is called the *rim*, and its ſpindle the *verge*: there belong to it alſo two *pallets* or nuts, which play in the fangs of the crown-wheel: in pocket-watches, that ſtrong ſtud in which the lower pivot of the verge plays, and in the middle of which one pivot of the crown-wheel runs, is called the *potence*: the wrought piece which covers the *balance*, and in which the upper pivot of the *balance* plays, is the COCK: the ſmall ſpring in the new pocket-watches is called the REGULATOR.

BALANCE, *hydroſtatical*, is an inſtrument for determining the ſpecific gravities of bodies. See HYDROSTATICAL.

BALANCE, in the *Accounts of Merchants*, is, when the debtor and creditor ſides of any diſtinct account are equal. In ſuch caſe the account is ſaid to be *balanced*.

Balance of a merchant, or trader's books. This is a branch of the art of accountantſhip. In the method of keeping the books of traders, according to that excellent art of charge and diſcharge by double entry, ſuch books, if correctly kept, will always be fit for a general *balance*. For ſuch is the excellency of that method, that the books of themſelves muſt neceſſarily *balance* on the whole, though not in every diſtinct account, throughout the ledger.

BALANCE, among *Painters*. See EQUILIBRIUM.

BALANCE *of power*, in the *Political Syſtem*, originates from, and is maintained by the alliances of different nations, as their circumſtances and intereſts may require.

BALANCE *of trade* denotes an equality between the value of commodities bought of foreigners, and the value of the native productions tranſported into other nations.

It is neceſſary that this *balance* be kept in trading nations; and if it cannot be made in commodities, it muſt in ſpecie. Hereby it is, that we know whether a nation gains or loſes by foreign trade, or any branch thereof; and conſequently, whether that nation grows richer or poorer.

There are divers *methods of arriving at this knowledge.*

1. That moſt received is, by taking a ſtrict ſurvey of what proportion the value of the commodities exported bears to thoſe imported. If the exports exceed the imports, it is concluded that nation is in a gaining way, it being ſuppoſed that the overplus is imported in bullion, and ſo increaſes the treaſure of the nation.—But this method is very uncertain: by reaſon of the difficulty of obtaining a true account either of the exports or imports. (1.) Cuſtom-houſe books are no rule in this caſe; by reaſon of the running of goods, eſpecially many fine commodities of ſmall bulk, but great value: as point, lace, ribbands, ſilks, jewels, fine linens, &c. alſo wines, brandies, teas, and the like. (2.) To which add various accidents which affect the value of the ſtock either ſent out or brought in; as loſſes at ſea, markets, bankrupts, ſeizures, &c. (3.) Then, as to particular trades, there are divers countries to which the manufactures we ſend out are inconſiderable, yet the goods we import are neceſſary to the carrying on our trade in general; as the trade to Norway, &c. for timber and naval ſtores. Alſo the Eaſt India company, whoſe imports much exceed their exports; yet is their trade highly advantageous to the nation: as we ſell much of theſe imports to foreigners, and wear others, e. gr. callicoes, and ſilks, in lieu of linens and ſilks from other countries, which would coſt us dearer.

2. The ſecond method is, by obſerving the courſe of exchange, which, if generally above the intrinſic value or par of the coins of foreign countries, ſhews that we not only loſe by ſuch exchanges, but that we loſe by the general courſe of our trade.—But this method is imperfect; ſince we trade to many countries, with which there is no ſettled courſe of exchange.

3. A third way is, by obſerving the increaſe and diminution of our coin and bullion.—But this is the leaſt obvious and palpable of any; for the money ſeems to vulgar eyes moſt plentiful when there is the leaſt occaſion for it; and more ſcarce as the occaſions for employing it are more numerous and advantageous: by which means we ſeem to have moſt money when we have leaſt trade. Thus, e. gr. when the Eaſt India company have a great ſale to make, money is generally found to be ſcarce in London; becauſe the occaſion engages people to employ quantities which they had provided for that purpoſe. So, a high rate of intereſt will make money ſeem ſcarce, becauſe every man as ſoon as he can make up a ſmall ſum, employs it in the purchaſe of ſtock.

4. The fourth method (which is Sir Joſ. Child's) is derived from the increaſe, or the diminution, of our trade and ſhipping in general: for if theſe diminiſh, whatever profit particular men may make, the nation loſes; and *vice verſa*. He lays it down as an infallible rule, that in all parts of the world wherever trade is great, and continues ſo, and grows daily greater, and the ſhipping increaſes for a ſucceſſion of ages, that trade muſt be nationally profitable. Even in the caſe of a merchant, who, by driving a great trade, ruins himſelf; though he loſe, what a multitude are gainers by him? as the king, and cuſtom-houſe officers; beſides ſhipwrights, butchers, brewers, bakers, ropemakers, porters, carmen, manufacturers, mariners, &c.

BALANCE, *to*, in *Sea Language*, ſignifies to contract a ſail into a narrower compaſs, in a ſtorm, by retrenching, or folding up a part of it at one corner.

BALANCE *of the boom-main-ſail*, is performed, after all its reefs are taken in, by rolling up a ſimilar portion of the hindmoſt, or aftmoſt lower corner called the *clue*, and faſtening it ſtrongly to the boom, ſecuring it from being fretted by the cord that faſtens it.

BALANCE *of the mizen* is thus performed; the *mizen-yard* is lowered a little, a ſmall portion of the ſail is rolled up at the *peek*, or upper corner, and faſtened to the yard, about a fifth inward from the outer end, or yard-arm, towards the maſt.

BALANCE-*fiſh*, in *Zoology*, an Engliſh name for the fiſh called the *zygæna* by authors, and by ſome the *hammer-headed ſhark*, or *libella*. It is, according to the new Artedian ſyſtem, a ſpecies of the *ſqualus*, and is diſtinguiſhed, by that author, by the name of the *ſqualus*, with a very broad and tranſverſe head, reſembling a hammer.

BALANCERS, in *Natural Hiſtory*, are two ſmall oblong bodies, placed under the wings of the two-winged flies, and, in ſome meaſure, ſupplying the office of the two other wings, which thoſe of the four-winged claſs are poſſeſſed of.

BALANCIER, a machine uſed in the ſtriking of coins, medals, counters, and the like. See COINAGE.

BALANI, in *Natural Hiſtory*, the name of a genus of ſhell-fiſh, belonging to the claſs of multivalves, approaching to the ſhape of an acorn (βαλανος), and uſually growing to the ſhells of the larger ſort of ſea ſhell-fiſh: they are commonly called in Engliſh, centre ſhells. See the figure in *Table of Shells*, N° 26.

It is a very common error to miſtake the names of the multivalve ſhells, ſo far, as to confound the *balani* and *conchæ anatiferæ*, as they are called, together; though they be extremely different.

The *balani* are found affixed in cluſters to a thouſand different ſubmarine things; ſuch as the harder ſea-plants, all ſorts of teſtaceous, and cruſtaceous ſea-animals, rocks, and timber. They may be arranged under the two ſubdiſtinctions of wide and narrow-mouthed, including ſeveral ſpecies. The ſmall fiſh which nature has covered with this ſhell, is of a very admirable ſtructure. Lewenhoek acknowledges, that he never met with any animal, in which ſo many objects of wonder lay open to the naked eye as in this. It has twelve legs or arms which are crooked, and garniſhed with a great number of hairs: theſe twelve they elevate on all occaſions; and, beſide theſe, they have eight others, which are much ſmaller, and ſtand lower. Their body is, in all reſpects, like that of the *concha anatifera*. It is cartilaginous, and mucous, and of an ill taſte. The ſhell ſhapes itſelf, at the baſe, to the figure of the ſurface of whatever it grows to, and ſticks very firmly to it.

The *balanus*, in the Linnæan ſyſtem, is a ſpecies of the LEPAS.

BALANITES, in *Natural Hiſtory*, a name given by the ancients to a ſtone, ſeeming to have been one of the ſemipellucid gems. They deſcribe two ſpecies of it; the one of which was yellow, and the other green, but each having veins of a flame colour. Their deſcriptions are too ſhort for us to be able to aſcertain, what ſtones, among thoſe known at this time, they meant.

Some think the *balanites* to have been the *lapis Judaicus*, on account of its acorn-like figure and ſize. Plin. Nat. Hiſt. lib. xxxvii. cap. 10. Ed. Hardouin.

BALANUS, βαλανος, or GLANS, is ſometimes uſed by anatomiſts for the nut of the yard. Sometimes alſo the clitoris is ſo called.

BALANUS is alſo ſometimes uſed for a SUPPOSITORY.

BALANUS MYREPSICA, in the *Materia Medica*, the oily acorn. The whole nut is of a purging quality; and the dry preſſing or powder after the oil is taken out, is of a cleanſing and drying nature.

BALASS, or BALLAS, a precious ſtone, of the ruby kind; whence it is alſo denominated *ballas-ruby*.

BALATITI, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to a ſpecies of bird, by the flight of which they divine the event of things.

BALAUSTINES, BALAUSTIA, from βαλαυςειον, in *Pharmacy*, the flowers of the wild pomegranate, or *malus punica ſylveſtris*, which are very rough to the tongue and palate, and very aſtringent; and on that account are frequently uſed in diarrhœas, and other fluxes, hernias, &c.

BALBUSARDUS, in *Zoology*, the name uſed by authors for the bird called in Engliſh the *bald-buzzard*. It is of the long-winged and hawk kind, and has been deſcribed by Aldrovandus, and ſome other authors, under the name of the *haliætus* and *morphnus*, two kinds of the eagle.

It frequents the ſhores of ponds and rivers, and ſometimes of the ſea, where it preys on fiſh. It builds on the ground among reeds, and lays three or four large white eggs, little leſs than hens eggs.

BALCONY, from the French *balcon*, in *Architecture*. *Balconies* are a kind of open galleries without the walls of buildings, contrived chiefly for the convenience of looking around, ſeeing proceſſions, cavalcades, and the like.

Where there is but one, it is uſually in the middle of the front of the edifice, and level with the firſt floor: ſometimes they are made of wood, ſometimes of caſt iron; the former ſurrounded with a rail, or balluſtrade, the latter wrought in various figures in *demi-relievo*. Some are alſo made of bar iron, faſhioned in crail-work, or flouriſhes of divers fancies.

BALCONY, in a ſhip, denotes a gallery either covered or open, made abaſt, either for ornament, or convenience of the captain's cabin.

BALDACANIFER, corruptly alſo written *balcanifer*, denotes a ſtandard-bearer; chiefly in the ancient order of knights templars.

BALDACHIN, or BALDAQUIN, a piece of architecture in form of a canopy, ſupported with columns, and ſerving as a crown or covering to an altar.

The word comes from the Italian *baldacchino*, which ſignifies the ſame.

BALDACHIN, or BALDAKIN, or BALDEKIN, popularly BAUDEKIN, in *Middle Age Writers*, denotes a rich kind of cloth, made of gold warp and ſilk woof, variouſly figured. It took the denomination from its being formerly brought into theſe countries from *Baldacio*, or Babylon.

BALDMONIE, an old Engliſh name for gentian, the root of which is uſed in medicine; ſome alſo have called the *meum*, or ſpignel, by this name.

BALDNESS, CALVITES, in *Medicine*, a falling of the hair, eſpecially of that of the ſinciput, without being able to grow again; the moiſture of the head, which ſhould feed it, being dried up by ſome diſeaſe, old age, or the immoderate uſe of powder, &c.

It differs from *alopecia*, *area*, *ophiaſis*, and *tinea*, as theſe all ariſe from ſome vice in the nutritious humour; *baldneſs*, from the defect of it. But the diſtinction is not always obſerved by modern phyſicians.

When the eye-lids ſhed their hair, it is called a *ptiloſis*.

Among the cauſes of *baldneſs*, immoderate venery is reputed one of the chief: old age uſually brings it on of courſe. Some will have the proximate cauſe of *baldneſs* to be the dryneſs of the brain, and its ſhrinking from the *cranium*; it having been obſerved, that in *bald* perſons there is always a vacuity or empty ſpace between the ſkull and the brain.

Calvus, *bald-pate*, was a frequent term of reproach among the Romans; among whom this defect was in great diſcredit. Hence divers arts to conceal it, as falſe hair, a *galericulus* contrived on purpoſe.

The later Romans, however, ſeem to have been reconciled to *baldneſs*; for we find among them a kind of officers, or ſervants, called *glabratores*, or *glabrarii*, whoſe buſineſs was to take off the hair from all parts, even from the head. In an ancient inſcription, there is mention of one Diophantus, TI. CÆSARIS. ORNATOR. GLABR. that is, *ornator glabrarius*. See ALOPECIA.

BALDWIN'S *phoſphorus*. See PHOSPHORUS.

BALE, in *Commerce*, a term denoting a quantity of merchandiſe wrapped or packed up in cloth, and corded round very tight, after having been well ſecured with hay or ſtraw, to keep it from breaking, or to preſerve it from the weather. Moſt of the merchandiſe, capable of this kind of package, that are ſent to fairs, or intended for exportation, ought to be in *bales*; and too much care cannot be taken in packing them, to ſecure them from damage.

To ſell goods in the *bale* is to ſell them in the lump, on ſhewing a ſpecimen, without unpacking, or taking off the cordage. Thus it is the Eaſt India company ſell their *bale*-goods.

BALE-*goods*, in the Eaſt India *Trade*, the bulky goods, as ſalt-petre, pepper, red-earth, tea, &c.

The *bale*-goods ſtand oppoſed to piece-goods.

BALES *of camelet*, at Smyrna, are called *tables*, on account of their flat ſquare figure.

A *bale* of cotton-yarn is from three to four hundred weight: of raw-ſilk, it is from one to four hundred; of lockram or dowlas, either three, three and a half, or four pieces, &c.

BALE *of paper* denotes a certain number of reams packed together in a bundle.

There are *bales* of more and fewer reams. Thoſe ſent from Marſeilles to Conſtantinople uſually contain twelve reams.

A *bale* or ballon of crown paper, manufactured in ſome parts of Provence, conſiſts of fourteen reams, and is ſold in the Levant for Venice paper.

BALE *of dice*, denotes a little packet, or paper, containing ſome dozens of dice for playing with.

BALENGER, BALENGARIA, in *Middle Age Writers*, a kind of veſſel of war, but what in particular ſeems not well known. Blount ſays, that by the ſtat. 28 Hen. VI. cap. 5. *balenger* ſeems to have been a kind of barge.

BALESTRA, in *Zoology*, a name by which Salvian and ſome other authors have called the fiſh more uſually known by the name of CAPRISCUS.

BALISTA. See BALLISTA.

BALISTES, in *Zoology*, a genus of the ſwimming amphibia, comprehending eight ſpecies.

BALIVIS, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to the common duck of that part of the world; this is ſomewhat ſmaller than our wild-duck, and much more beautifully coloured.

BALIVO *amovendo*, a writ to remove a bailiff from his office, for want of ſufficient land in the bailiwick.

BALKS, in *Agriculture*, are ridges or banks between two furrows, or pieces of arable land: the word is ſometimes alſo uſed for the poles or rafters over out-houſes or barns; and among bricklayers for great beams, ſuch as are uſed in making ſcaffolds.

BALKS, among *Builders*, large pieces of timber, brought from abroad in floats.

BALKS are a ſort of beams imported, from five to twelve inches ſquare.

The greater *balks* are accounted timber, if above eight inches ſquare.

In ſome parts of England, *balk*, or *bawk*, denotes the ſummer-beam of a building.

Balks, or *bawks*, alſo denote poles laid over a ſtable, or other building, for the roof.

BALKERS, in the *Fiſhery*, perſons placed on rocks, and eminences at ſea, to ſpy the herring droves, and give notice to the fiſhermen by waving boughs, what way they go, and where they may be found. 1 Stat. Jac. I. cap. 23.

BALL gives the denomination to a ſpecies of game or ſport frequent among the ancients.

The Romans had four kinds of *pilæ*, or *balls*; the firſt called *trigon*, or *trigonalis*, becauſe the three gameſters at it were placed in a triangle: theſe caught and toſſed the *ball*, taking great care not to let it fall to the ground.

The ſecond called *follis*, made of leather, blown up like our foot-balls: the largeſt ſort of theſe were ſtruck with the arm, the ſmaller with the fiſt: the former ſeem to have been diſtinguiſhed by the appellation *paganica*, as being much uſed in country villages: the fourth was the *harpaſt*, a kind of ſmall *ball*, ſo called, becauſe the gameſters endeavoured to ſnatch it from each other.

Galen has an entire treatiſe on the exerciſe of the *leſſer ball*.

Ball, *pila*, is alſo the denomination of a form of medicines. We meet with *balls* for the tooth ach; ſpitting *balls*, uſed to promote a diſcharge of ſaliva, &c.

Ball is alſo uſed in Cornwall, &c. for a tin-mine.

In this ſenſe, Godolphin's *ball* is ſaid to be the moſt famous of all the *balls* or mines in Cornwall, for quantity of metal. Phil. Tranſ. Nº 138, p. 951.

Ball is alſo uſed, in a well-known ſenſe, for an aſſembly of both ſexes, who dance to the ſound of inſtruments.

Balls, in *Architecture*, are repreſented at C, *fig*. 40. (*Tab. Archit.*) and are uſed for ſupporting attic pedeſtals.

Balls, *billiard*, are ivory-*balls* uſed in the game of billiards. Moxon deſcribes the method of turning hollow ivory *balls*, one within another. Mechan. Exerc. p. 219.

Balls, in *Brewing*. They are either *brown* or *pale*, and uſed to fine, feed, preſerve, and colour MALT-*drinks*, wines, and cyders. See the compoſition of them deſcribed under BREWING.

Balls, *chewing*, are theſe which the horſe is to keep champing or maſticating in his mouth, a conſiderable time, without ſwallowing. Theſe are chiefly uſed for loſt appetite; a thing very incidental to horſes.

They are uſually made of *aſſa-fœtida*, liver of antimony, juniper, bay-wood, and pellitory of Spain, beaten and incorporated into a maſs with verjuice. The method of adminiſtration is to wrap one of the *balls* in a linen cloth, and having a ſtring faſtened to it, make the horſe chew it two or three hours at a time.

Balls, *cryſtalline*. There are two ſorts of foſſile bodies mentioned in authors by this name, and diſtinguiſhed into the echinated, and concave.

The firſt are roundiſh nodules of ſtrong matter, covered over with points of cryſtal; and the other, flints and other ſtones, having cavities in their middles, which are lined, or cruſted over with theſe cryſtals.

Ball *of the foot of a dog*, is the prominent part of the middle of the foot, called by Latin writers of the middle age, *pelota*, which is to be taken away in EXPEDITATION. Du-Cange Gloſſ. Lat.

Balls, in *Electricity*. Mr. Canton's *balls* are two pieces of cork, or pith of elder, nicely turned in a lathe, to the ſize of a ſmall pea, and ſuſpended by fine linen threads; intended as ELECTROMETERS, and of excellent uſe to diſcover ſmall degrees of *electricity*, to obſerve the changes of it from *poſitive* to *negative*, and *vice verſa*; and to eſtimate the force of a ſhock before the diſcharge, ſo that the operator ſhall always be able to tell very nearly before the diſcharge, by knowing how high he has charged his jars, what the exploſion will be. Dr. Prieſtley's Hiſt. of Elect. 3d edit. 8vo. vol. ii. p. 101.

Balls, *fire*, are bags of canvas filled with gunpowder, ſulphur, ſalt-petre, pitch, &c. to be thrown by the ſoldiers, or out of mortars, in order to fire houſes, incommode trenches, advanced poſts, or the like.

The Greeks had divers kinds of *fire-balls*, made of wood, ſometimes a foot, or even a cubit long; their heads being armed with ſpikes of iron, beneath which were hemp, pitch, and other combuſtibles, which being ſet on fire, were caſt among the enemy.

The preparations of *fire-balls*, among the moderns, conſiſts of ſeveral operations, viz. making the bag, preparing the compoſition, tying, and laſtly dipping the *ball*.

The bags for this purpoſe are either oval or round.

The compoſition wherewith *fire-balls* are filled, is various. To ten pounds of meal gun-powder, add two of ſaltpetre, one of ſulphur, and one of colophony: or, to ſix pounds of gunpowder, add four of ſaltpetre, four of ſulphur, one of powdered glaſs, half a pound of antimony, as much camphor, an ounce of ſal ammoniac, and four of common ſalt, all pulverized. Sometimes they even fill *fire-balls* with hand granados.

For tying the *fire-balls*, they prepare two iron rings, one fitted around the aperture, where the *ball* is to be lighted, the other near its baſe. A cord is tied to theſe rings, in ſuch manner as that the ſeveral turns repreſent ſemicircles, or meridians of the ſphere, cutting the globe through the poles: over the cords, extended according to the length of the *ball*, others are tied, cutting the former at right angles, and parallel to each other, making a knot at each interſection. Laſtly, putting in a leaden bullet, the reſt of the ſpace is filled with tow or paper. Thus completed, the *fire-ball* remains to be dipped in a compoſition of melted pitch, colophony, and linſeed-oil, or oil of turpentine; after dipping, they cover it round with tow, and dip again, till it be brought to the juſt diameter required.

Balls *of fire* in the air, are meteors ſometimes ſeen paſſing over countries, and computed by philoſophers to be often, at leaſt, thirty miles high. They ſometimes burſt at that height; and though the air muſt be exceeding rare there, yet the exploſion is heard at that diſtance, and for ſeventy miles round on the ſurface of the earth, &c. Does not this look as if a rare atmoſphere, almoſt a *vacuum*, was no bad conductor of ſound? Dr. Franklin's Works, p. 437.

Balls, *glaſs*. See GLASS-*balls*.

Balls. *Zoologiſts* ſpeak of a ſort of *balls* of hair covered over with a ſmooth, ſhining coat, or ſhell, found in the ſtomachs of oxen, cows, calves, horſes, ſheep, and goats, particularly the chamois, or *rupicapra*. See ÆGAGROPILUS.

Some alſo have been found in the *uterus*, and ovaries of females. Sir Hans Sloan gives the hiſtory of a *ball* found in the inteſtines of a man, much afflicted with the colic, ſix inches in circumference, of a ſpungy ſubſtance, and which when viewed with a microſcope, appeared made up of ſmall tranſparent hairs or fibres, wrought together like the *tophus bovinus*: in the middle was a common plum-ſtone, which made, as it were, the core or *nucleus*, around which the fibrous matter had gathered *ſtratum ſuper ſtratum*. Phil. Tranſ. Nº 309. p. 2387. Sloan, in Phil. Tranſ. Nº 282. p. 1283, ſeq. See HAIR.

Others have been found with plum-ſtones, and cherry-ſtones, in the centers. Bezoars have uſually ſome ſeed for a *nucleus*. The origin and formation of theſe *balls* is conteſted. Bartholin, and after him Dr. Plott, and others, attribute them to the creatures licking themſelves, and ſwallowing the hair, which being elaborated in the *reticulum*, become compacted together much after the manner that the wool of a hat is by the hand of the workman; and lying long in the ſtomach, have a thick tough coat, ſuperinduced by the plenty of ſlime it there meets with. Plott, l. c. § 71.

The Royal Academy of Sciences at Paris ſubſtitute another origin. In diſſecting a chamois, a *ball* was found in the third ventricle, which did not ſeem compoſed of hair, but of woody fibres, as appeared from their inequality, which were neither uniform in figure nor ſize, as hairs are. Add, that the like *balls* are found in horſes, which are not animals that lick themſelves, and where of conſequence they muſt be formed of ſomething elſe than hair. Hence the generality of naturaliſts, particularly Geſner and Camerarius, take theſe *balls* to be formed of the reſidue of the plants, which the animals have eaten, the harder fibres whereof remain undigeſted. Thoſe of the *rupicapra*, in particular, are ſuppoſed to be the fibres of the plant *doronicum*, reputed by ſome a ſpecies of ACONITE. Phil. Tranſ. Nº 189, p. 373.

Balls, or **Ballets**, in *Heraldry*, make a frequent bearing in coats of arms, though never ſo called; but having according to their ſeveral colours ſeveral names; as *beſants*, when the colour is *or*; *plates* when *argent*; *hurts* when *azure*; *torteaux* when *gules*; *pomeis* when *vert*; *pellets* or *agreſſes* when *ſable*; *golpes* when *purple*; *orenges* when *tanne*; and *guzes* when *ſanguine*.

Ball, *Hero's*, *pila Heronis*, is a kind of artificial fountain, wherein the water is made to ſpout out of a hollow *ball*, or globe.

It takes the denomination from the inventor Hero of Alexandria, who has left the deſcription of it in his Spiritalia. See FOUNTAIN.

Balls, *horſe*, among *Farriers*, a kind of cordial medicines, adminiſtered in form of *balls*, ſuppoſed of great virtue for feeding and ſtrengthening ſound, as well as healing and raiſing unſound horſes.

Balls, *Markham's horſe*, are a preparation of aniſe-ſeeds, carthamus, elecampane, and other ingredients, wrought into a ſtiff paſte, and thence formed into *balls*. They are cleanſing and emollient, efficacious in colds, ſurfeits, and hard labour, and eſpecially uſeful where any of the chief *viſcera* are decayed: nothing raiſes a lean jade ſo ſoon, being partly food, partly phyſic.

BALANCERS, in *Natural Hiſtory*, are two ſmall oblong bodies, placed under the wings of the two-winged flies, and, in ſome meaſure, ſupplying the office of the two other wings, which thoſe of the four-winged claſs are poſſeſſed of.

BALANCIER, a machine uſed in the ſtriking of coins, medals, counters, and the like. See Coinage.

BALANI, in *Natural Hiſtory*, the name of a genus of ſhell-fiſh, belonging to the claſs of multivalves, approaching to the ſhape of an acorn (βαλανος), and uſually growing to the ſhells of the larger ſort of ſea ſhell-fiſh: they are commonly called in Engliſh, centre ſhells. See the figure in *Table of Shells*, N° 26.

It is a very common error to miſtake the names of the multivalve ſhells, ſo far, as to confound the *balani* and *conchæ anatiferæ*, as they are called, together; though they be extremely different.

The *balani* are found affixed in cluſters to a thouſand different ſubmarine things; ſuch as the harder ſea-plants, all ſorts of teſtaceous, and cruſtaceous ſea-animals, rocks, and timber. They may be arranged under the two ſubdiſtinctions of wide and narrow-mouthed, including ſeveral ſpecies. The ſmall fiſh which nature has covered with this ſhell, is of a very admirable ſtructure. Lewenhoek acknowledges, that he never met with any animal, in which ſo many objects of wonder lay open to the naked eye as in this. It has twelve legs or arms which are crooked, and garniſhed with a great number of hairs: theſe twelve they elevate on all occaſions; and, beſide theſe, they have eight others, which are much ſmaller, and ſtand lower. Their body is, in all reſpects, like that of the *concha anatifera*. It is cartilaginous, and mucous, and of an ill taſte. The ſhell ſhapes itſelf, at the baſe, to the figure of the ſurface of whatever it grows to, and ſticks very firmly to it.

The *balanus*, in the Linnæan ſyſtem, is a ſpecies of the LEPAS.

BALANITES, in *Natural Hiſtory*, a name given by the ancients to a ſtone, ſeeming to have been one of the ſemipellucid gems. They deſcribe two ſpecies of it; the one of which was yellow, and the other green, but each having veins of a flame colour. Their deſcriptions are too ſhort for us to be able to aſcertain, what ſtones, among thoſe known at this time, they meant.

Some think the *balanites* to have been the *lapis Judaicus*, on account of its acorn-like figure and ſize. Plin. Nat. Hiſt. lib. xxxvii. cap. 10. Ed. Hardouin.

BALANUS, βαλανος, or Glans, is ſometimes uſed by anatomiſts for the nut of the yard. Sometimes alſo the clitoris is ſo called.

Balanus is alſo ſometimes uſed for a SUPPOSITORY.

Balanus Myrepsica, in the *Materia Medica*, the oily acorn. The whole nut is of a purging quality; and the dry preſſing or powder after the oil is taken out, is of a cleanſing and drying nature.

BALASS, or Ballas, a precious ſtone, of the ruby kind; whence it is alſo denominated *ballas-ruby*.

BALATITI, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to a ſpecies of bird, by the flight of which they divine the event of things.

BALAUSTINES, Balaustia, from βαλαυϛειον, in *Pharmacy*, the flowers of the wild pomegranate, or *malus punica ſylveſtris*, which are very rough to the tongue and palate, and very aſtringent; and on that account are frequently uſed in diarrhœas, and other fluxes, hernias, &c.

BALBUSARDUS, in *Zoology*, the name uſed by authors for the bird called in Engliſh the *bald-buzzard*. It is of the long-winged and hawk kind, and has been deſcribed by Aldrovandus, and ſome other authors, under the name of the *haliætus* and *morphnus*, two kinds of the eagle.

It frequents the ſhores of ponds and rivers, and ſometimes of the ſea, where it preys on fiſh. It builds on the ground among reeds, and lays three or four large white eggs, little leſs than hens eggs.

BALCONY, from the French *balcon*, in *Architecture*. *Balconies* are a kind of open galleries without the walls of buildings, contrived chiefly for the convenience of looking around, ſeeing proceſſions, cavalcades, and the like.

Where there is but one, it is uſually in the middle of the front of the edifice, and level with the firſt floor: ſometimes they are made of wood, ſometimes of caſt iron; the former ſurrounded with a rail, or balluſtrade, the latter wrought in various figures in *demi-relievo*. Some are alſo made of bar iron, faſhioned in crail-work, or flouriſhes of divers fancies.

Balcony, in a ſhip, denotes a gallery either covered or open, made abaft, either for ornament, or convenience of the captain's cabin.

BALDACANIFER, corruptly alſo written *balcanifer*, denotes a ſtandard-bearer; chiefly in the ancient order of knights templars.

BALDACHIN, or Baldaquin, a piece of architecture in form of a canopy, ſupported with columns, and ſerving as a crown or covering to an altar.

The word comes from the Italian *baldacchino*, which ſignifies the ſame.

Baldachin, or Baldakin, or Baldekin, popularly Baudekin, in *Middle Age Writers*, denotes a rich kind of cloth, made of gold warp and ſilk woof, variouſly figured. It took the denomination from its being formerly brought into theſe countries from *Baldacio*, or Babylon.

BALDMONIE, an old Engliſh name for gentian, the root of which is uſed in medicine; ſome alſo have called the *meum*, or ſpignel, by this name.

BALDNESS, Calvites, in *Medicine*, a falling of the hair, eſpecially of that of the ſinciput, without being able to grow again; the moiſture of the head, which ſhould feed it, being dried up by ſome diſeaſe, old age, or the immoderate uſe of powder, &c.

It differs from *alopecia*, *area*, *ophiaſis*, and *tinea*, as theſe all ariſe from ſome vice in the nutritious humour; *baldneſs*, from the defect of it. But the diſtinction is not always obſerved by modern phyſicians.

When the eye-lids ſhed their hair, it is called a *ptiloſis*.

Among the cauſes of *baldneſs*, immoderate venery is reputed one of the chief: old age uſually brings it on of courſe. Some will have the proximate cauſe of *baldneſs* to be the dryneſs of the brain, and its ſhrinking from the *cranium*; it having been obſerved, that in *bald* perſons there is always a vacuity or empty ſpace between the ſkull and the brain.

Calvus, *bald-pate*, was a frequent term of reproach among the Romans; among whom this defect was in great diſcredit. Hence divers arts to conceal it, as falſe hair, a *galericulus* contrived on purpoſe.

The later Romans, however, ſeem to have been reconciled to *baldneſs*; for we find among them a kind of officers, or ſervants, called *glabratores*, or *glabrarii*, whoſe buſineſs was to take off the hair from all parts, even from the head. In an ancient inſcription, there is mention of one Diophantus, TI. CÆSARIS. ORNATOR. GLABR. that is, *ornator glabrarius*. See Alopecia.

BALDWIN'S *phoſphorus*. See Phosphorus.

BALE, in *Commerce*, a term denoting a quantity of merchandiſe wrapped or packed up in cloth, and corded round very tight, after having been well ſecured with hay or ſtraw, to keep it from breaking, or to preſerve it from the weather. Moſt of the merchandiſe, capable of this kind of package, that are ſent to fairs, or intended for exportation, ought to be in *bales*; and too much care cannot be taken in packing them, to ſecure them from damage.

To ſell goods in the *bale* is to ſell them in the lump, on ſhewing a ſpecimen, without unpacking, or taking off the cordage. Thus it is the Eaſt India company ſell their *bale*-goods.

Bale-*goods*, in the Eaſt India *Trade*, the bulky goods, as ſaltpetre, pepper, red-earth, tea, &c.

The *bale*-goods ſtand oppoſed to piece-goods.

Bales *of camelet*, at Smyrna, are called *tables*, on account of their flat ſquare figure.

A *bale* of cotton-yarn is from three to four hundred weight: of raw-ſilk, it is from one to four hundred; of lockram or dowlas, either three, three and a half, or four pieces, &c.

Bale *of paper* denotes a certain number of reams packed together in a bundle.

There are *bales* of more and fewer reams. Thoſe ſent from Marſeilles to Conſtantinople uſually contain twelve reams.

A *bale* or ballon of crown paper, manufactured in ſome parts of Provence, conſiſts of fourteen reams, and is ſold in the Levant for Venice paper.

Bale *of dice*, denotes a little packet, or paper, containing ſome dozens of dice for playing with.

BALENGER, Balengaria, in *Middle Age Writers*, a kind of veſſel of war, but what in particular ſeems not well known. Blount ſays, that by the ſtat. 28 Hen. VI. cap. 5. *balenger* ſeems to have been a kind of barge.

BALESTRA, in *Zoology*, a name by which Salvian and ſome other authors have called the fiſh more uſually known by the name of CAPRISCUS.

BALISTA. See Ballista.

BALISTES, in *Zoology*, a genus of the ſwimming amphibia, comprehending eight ſpecies.

BALIVIS, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands to the common duck of that part of the world; this is ſomewhat ſmaller than our wild-duck, and much more beautifully coloured.

BALIVO *amovendo*, a writ to remove a bailiff from his office, for want of ſufficient land in the bailiwick.

BALKS, in *Agriculture*, are ridges or banks between two furrows, or pieces of arable land: the word is ſometimes alſo uſed for the poles or rafters over out-houſes or barns; and among bricklayers for great beams, ſuch as are uſed in making ſcaffolds.

Balks, among *Builders*, large pieces of timber, brought from abroad in floats.

Balks are a ſort of beams imported, from five to twelve inches ſquare.

The greater *balks* are accounted timber, if above eight inches ſquare.

In ſome parts of England, *balk*, or *bawk*, denotes the ſummer-beam of a building.

BALKS, or *bawks*, alſo denote poles laid over a ſtable, or other building, for the roof.

BALKERS, in the *Fiſhery*, perſons placed on rocks, and eminences at ſea, to ſpy the herring droves, and give notice to the fiſhermen by waving boughs, what way they go, and where they may be found. 1 Stat. Jac. I. cap. 23.

BALL gives the denomination to a ſpecies of game or ſport frequent among the ancients.

The Romans had four kinds of *pilæ*, or *balls*; the firſt called *trigon*, or *trigonalis*, becauſe the three gameſters at it were placed in a triangle: theſe caught and toſſed the *ball*, taking great care not to let it fall to the ground.

The ſecond called *follis*, made of leather, blown up like our foot-balls: the largeſt ſort of theſe were ſtruck with the arm, the ſmaller with the fiſt: the former ſeem to have been diſtinguiſhed by the appellation *paganica*, as being much uſed in country villages: the fourth was the *harpaſt*, a kind of ſmall *ball*, ſo called, becauſe the gameſters endeavoured to ſnatch it from each other.

Galen has an entire treatiſe on the exerciſe of the *leſſer ball.*

BALL, *pila*, is alſo the denomination of a form of medicines. We meet with *balls* for the tooth ach; ſpitting *balls*, uſed to promote a diſcharge of ſaliva, &c.

BALL is alſo uſed in Cornwall, &c. for a tin-mine.

In this ſenſe, Godolphin's *ball* is ſaid to be the moſt famous of all the *balls* or mines in Cornwall, for quantity of metal. Phil. Tranſ. Nº 138, p. 951.

BALL is alſo uſed, in a well-known ſenſe, for an aſſembly of both ſexes, who dance to the ſound of inſtruments.

BALLS, in *Architecture*, are repreſented at C, *fig.* 40. (*Tab. Archit.*) and are uſed for ſupporting attic pedeſtals.

BALLS, *billiard*, are ivory-*balls* uſed in the game of billiards. Moxon deſcribes the method of turning hollow ivory *balls*, one within another. Mechan. Exerc. p. 219.

BALLS, in *Brewing*. They are either *brown* or *pale*, and uſed to fine, feed, preſerve, and colour MALT-*drinks*, wines, and cyders. See the compoſition of them deſcribed under BREWING.

BALLS, *chewing*, are theſe which the horſe is to keep champing or maſticating in his mouth, a conſiderable time, without ſwallowing. Theſe are chiefly uſed for loſt appetite; a thing very incidental to horſes.

They are uſually made of *aſſa-fœtida*, liver of antimony, juniper, bay-wood, and pellitory of Spain, beaten and incorporated into a maſs with verjuice. The method of adminiſtration is to wrap one of the *balls* in a linen cloth, and having a ſtring faſtened to it, make the horſe chew it two or three hours at a time.

BALLS, *cryſtalline*. There are two ſorts of foſſile bodies mentioned in authors by this name, and diſtinguiſhed into the echinated, and concave.

The firſt are roundiſh nodules of ſtrong matter, covered over with points of cryſtal; and the other, flints and other ſtones, having cavities in their middles, which are lined, or cruſted over with theſe cryſtals.

BALL *of the foot of a dog*, is the prominent part of the middle of the foot, called by Latin writers of the middle age, *pelota*, which is to be taken away in EXPEDITATION. Du-Cange Gloſſ. Lat.

BALLS, in *Electricity*. Mr. Canton's *balls* are two pieces of cork, or pith of elder, nicely turned in a lathe, to the ſize of a ſmall pea, and ſuſpended by fine linen threads; intended as ELECTROMETERS, and of excellent uſe to diſcover ſmall degrees of *electricity*, to obſerve the changes of it from *poſitive* to *negative*, and *vice verſa*; and to eſtimate the force of a ſhock before the diſcharge, ſo that the operator ſhall always be able to tell very nearly before the diſcharge, by knowing how high he has charged his jars, what the exploſion will be. Dr. Prieſtley's Hiſt. of Elect. 3d edit. 8vo. vol. ii. p. 101.

BALLS, *fire*, are bags of canvas filled with gunpowder, ſulphur, ſalt-petre, pitch, &c. to be thrown by the ſoldiers, or out of mortars, in order to fire houſes, incommode trenches, advanced poſts, or the like.

The Greeks had divers kinds of *fire-balls*, made of wood, ſometimes a foot, or even a cubit long; their heads being armed with ſpikes of iron, beneath which were hemp, pitch, and other combuſtibles, which being ſet on fire, were caſt among the enemy.

The preparations of *fire-balls*, among the moderns, conſiſts of ſeveral operations, viz. making the bag, preparing the compoſition, tying, and laſtly dipping the *ball*.

The bags for this purpoſe are either oval or round.

The compoſition wherewith *fire-balls* are filled, is various. To ten pounds of meal gun-powder, add two of ſaltpetre, one of ſulphur, and one of colophony: or, to ſix pounds of gunpowder, add four of ſaltpetre, four of ſulphur, one of powdered glaſs, half a pound of antimony, as much camphor, an ounce of ſal ammoniac, and four of common ſalt, all pulverized. Sometimes they even fill *fire-balls* with hand granados.

For tying the *fire-balls*, they prepare two iron rings, one fitted around the aperture, where the *ball* is to be lighted, the other near its baſe. A cord is tied to theſe rings, in ſuch manner as that the ſeveral turns repreſent ſemicircles, or meridians of the ſphere, cutting the globe through the poles: over the cords, extended according to the length of the *ball*, others are tied, cutting the former at right angles, and parallel to each other, making a knot at each interſection. Laſtly, putting in a leaden bullet, the reſt of the ſpace is filled with tow or paper. Thus completed, the *fire-ball* remains to be dipped in a compoſition of melted pitch, colophony, and linſeed-oil, or oil of turpentine; after dipping, they cover it round with tow, and dip again, till it be brought to the juſt diameter required.

BALLS *of fire* in the air, are meteors ſometimes ſeen paſſing over countries, and computed by philoſophers to be often, at leaſt, thirty miles high. They ſometimes burſt at that height; and though the air muſt be exceeding rare there, yet the exploſion is heard at that diſtance, and for ſeventy miles round on the ſurface of the earth, &c. Does not this look as if a rare atmoſphere, almoſt a *vacuum*, was no bad conductor of ſound? Dr. Franklin's Works, p. 437.

BALLS, *glaſs*. See GLASS-*balls*.

BALLS. *Zoologiſts* ſpeak of a ſort of *balls* of hair covered over with a ſmooth, ſhining coat, or ſhell, found in the ſtomachs of oxen, cows, calves, horſes, ſheep, and goats, particularly the chamois, or *rupicapra*. See ÆGAGROPILUS.

Some alſo have been found in the *uterus*, and ovaries of females. Sir Hans Sloan gives the hiſtory of a *ball* found in the inteſtines of a man, much afflicted with the colic, ſix inches in circumference, of a ſpungy ſubſtance, and which when viewed with a microſcope, appeared made up of ſmall tranſparent hairs or fibres, wrought together like the *tophus bovinus:* in the middle was a common plum-ſtone, which made, as it were, the core or *nucleus*, around which the fibrous matter had gathered *ſtratum ſuper ſtratum*. Phil. Tranſ. Nº 309. p. 2387. Sloan, in Phil. Tranſ. Nº 282. p. 1283, ſeq. See HAIR.

Others have been found with plum-ſtones, and cherry-ſtones, in the centers. Bezoars have uſually ſome ſeed for a *nucleus*. The origin and formation of theſe *balls* is conteſted. Bartholin, and after him Dr. Plott, and others, attribute them to the creatures licking themſelves, and ſwallowing the hair, which being elaborated in the *reticulum*, become compacted together much after the manner that the wool of a hat is by the hand of the workman; and lying long in the ſtomach, have a thick tough coat, ſuperinduced by the plenty of ſlime it there meets with. Plott, l. c. § 71.

The Royal Academy of Sciences at Paris ſubſtitute another origin. In diſſecting a chamois, a *ball* was found in the third ventricle, which did not ſeem compoſed of hair, but of woody fibres, as appeared from their inequality, which were neither uniform in figure nor ſize, as hairs are. Add, that the like *balls* are found in horſes, which are not animals that lick themſelves, and where of conſequence they muſt be formed of ſomething elſe than hair. Hence the generality of naturaliſts, particularly Geſner and Camerarius, take theſe *balls* to be formed of the reſidue of the plants, which the animals have eaten, the harder fibres whereof remain undigeſted. Thoſe of the *rupicapra*, in particular, are ſuppoſed to be the fibres of the plant *doronicum*, reputed by ſome a ſpecies of ACONITE. Phil. Tranſ. Nº 189, p. 373.

BALLS, or BALLETS, in *Heraldry*, make a frequent bearing in coats of arms, though never ſo called; but having according to their ſeveral colours ſeveral names; as *beſants*, when the colour is *or*; *plates* when *argent*; *hurts* when *azure*; *torteaux* when *gules*; *pomeis* when *vert*; *pellets* or *agreſſes* when *ſable*; *golpes* when *purple*; *orenges* when *tanne*; and *guzes* when *ſanguine*.

BALL, *Hero's*, *pila Heronis*, is a kind of artificial fountain, wherein the water is made to ſpout out of a hollow *ball*, or globe.

It takes the denomination from the inventor Hero of Alexandria, who has left the deſcription of it in his Spiritalia. See FOUNTAIN.

BALLS, *horſe*, among *Farriers*, a kind of cordial medicines, adminiſtered in form of *balls*, ſuppoſed of great virtue for feeding and ſtrengthening ſound, as well as healing and raiſing unſound horſes.

BALLS, *Markham's horſe*, are a preparation of aniſe-ſeeds, carthamus, elecampane, and other ingredients, wrought into a ſtiff paſte, and thence formed into *balls*. They are cleanſing and emollient, efficacious in colds, ſurfeits, and hard labour, and eſpecially uſeful where any of the chief *viſcera* are decayed: nothing raiſes a lean jade ſo ſoon, being partly food, partly phyſic.

Balls, *land*, thoſe which being thrown out of a mortar, fall to the ground, burn and burſt there. The ingredients are much the ſame as in the water *balls*, only the ſpecific gravity is not attended to.

Balls, *light*, are ſuch as diffuſe an intenſe light around; or they are *balls* which being caſt out of a mortar, or the hand, burn for ſome time and illuminate the adjacent parts.

Thoſe for the hand are made of ground powder, ſalt-petre, brimſtone, camphor, and borax, all ſprinkled with oil, and mouldered into a maſs with ſuet, common and Greek pitch, to the ſize of an ordinary granado: this is wrapped up in tow, with a ſheet of ſtrong paper over it. To fire it, a hole is made into it with a bodkin, into which is put ſome priming, that will burn ſlow. Its uſe is to be caſt into any works that are to be diſcovered in the night time.

For the *larger light balls*, or thoſe to be thrown to a greater diſtance, they are prepared by melting equal quantities of ſulphur, turpentine, and pitch; and by dipping in this compoſition an earthen, or ſtone *ball*, of a diameter much leſs than that of the mortar out of which the fire-*ball* is to be caſt: then rolling it in gun-powder, and covering it round with gauſe, the dipping is repeated till it comes to fit the cavity of the mortar: laſtly, it is ſprinkled around with gun-powder. This being once kindled, will ſtrongly illuminate all round the place where it is thrown, and give opportunity for examining the ſtate and condition thereof.

Balls, *martial*, in *Chemiſtry*, a mixture of filings of iron, and cream of tartar, formed into a ſolid conſiſtence, and the form of a ball, uſed to impregnate water, or other liquids, with iron, diſſolved by the tartareous acid.

They are of the ſame nature as the TINCTURE *of Mars tartariſed*; and therefore theſe preparations may be ſubſtituted for each other.

To make *martial balls*, take one part of filings of iron, and two parts of powdered cream of tartar; mix them well together, and put them into an earthen or iron veſſel with ſome water; ſtir the mixture from time to time, till it becomes almoſt dry; add more water, and ſtir it as before, till it acquires, when nearly dry, ſomewhat of the conſiſtence and tenacity of ſoftened roſin; then it is rolled into the form of a *ball*, generally kept tied up in a rag, and when it is uſed, infuſed into water, till it gives ſome colour to that liquid. Mac. Chem. Dict. Eng. Ed.

Balls, *mercurial*, in *Chemiſtry*, an amalgam of mercury and tin, ſufficiently ſolid to be moulded, and to preſerve a given form.

To make *mercurial balls*, add mercury to melted tin, and pour the fluid maſs into a round and hollow mould.

Theſe *balls* are uſed to purify water in which they are boiled; for which purpoſe travellers often carry ſome along with them. Macquer.

Ball, in the *Military* and *Pyrotechnical Arts*, is a compoſition of divers ingredients, generally of the combuſtible kinds, ſerving to burn and deſtroy, give light, ſmoak, ſtench, or the like.

In this ſenſe, we read of fire-*balls*, light-*balls*, ſmoak-*balls*, ſtink-*balls*, ſky-*balls*, water-*balls*, land-*balls*, &c.

Balls are likewiſe uſed for all ſorts of fire-arms; thoſe for cannon are made of iron, and thoſe for muſquets, &c. of lead.

Ball *of a pendulum*, the weight at the bottom. In ſhorter pendulums, this is called the *bob*.

Ball, among *Printers*, a kind of wooden tunnel ſtuffed with wool, contained in a cover of ſheep's ſkin, which is nailed to the wood; with which the ink is applied on the forms, to be wrought off.

The preſſman holding one of theſe balls in either hand, firſt daubs them on the ink-block, then working them on each other, he applies them afterwards on the forms, which retain the ink neceſſary to make an impreſſion.

Ball, *puff*. See Lycoperdon.

Balls *of ſilk-worms and ſpiders* are little caſes or cones woven of ſilk, wherein thoſe inſects depoſit their eggs. See Silk. Spiders are extremely tender of their *balls*, which they carry about with them, adhering to the papillæ about their *anus*. Grew ſpeaks of *balls* or bags of a ſpecies of ſilk-worms in Virginia, as big as hens eggs, and containing each four *aureliæ*. Phil. Tranſ. N° 362, p. 1037.

Balls, *ſky*, thoſe caſt on high out of mortars, and which, when arrived at their height, burſt like rockets, and afford a ſpectacle of decoration. *Sky-balls* are made of a wooden ſhell, filled with various compoſitions, particularly that of the ſtars of rockets.

Theſe are ſometimes intermixed with crackers, and other combuſtibles, making rains of fire, &c.

Balls, *ſmoak*, or *dark*, thoſe which fill the air with ſmoak, and thus darken a place, to prevent diſcoveries. To prepare a darkening *ball*, make an oval, or ſpherical bag; melt roſin over the coals, and add an equal part of ſaltpetre not purified, alſo of ſulphur, and a fifth part of charcoal. The whole being well incorporated, put in tow firſt ſhred, and fill the bag with this compoſition, and dip it after the ſame manner as a fire-*ball*.

Ball-*ſoap*. See Soap.

Ball *and ſocket*, a machine contrived to give an inſtrument full play, and motion every way.

It conſiſts of a *ball* or ſphere of braſs, fitted within a concave ſemi-globe, ſo as to be moveable every way, both horizontally, vertically, and obliquely. It is carried by an endleſs ſcrew, and is principally uſed for the managing of ſurveying inſtruments; to which it is a very neceſſary appendage.

The ancient *balls* and *ſockets* had two concaves, or channels, the one for the horizontal, the other for the vertical direction.

Balls, *ſtink*, thoſe which yield a great ſtench where fired, to annoy the enemy.

Their preparation is thus: melt ten pounds of pitch, ſix of roſin, twenty of ſaltpetre, eight of gun-powder, and four of colophony; to theſe add two of charcoal, ſix of horſe-hoofs cut ſmall, three of *aſſa fœtida*, one of ſtinking ſaracen, and any other offenſive ingredients. Then proceed as in making *ſmoak* and *fire-balls*.

Ball, *tennis*, is a little globe, made and covered with cloth, or leather, uſed in playing at the game of tennis.

Balls, *treacle*, ſometimes alſo called in a more eſpecial manner, *cordial balls*, are made of juniper-berries, beaten, boiled, preſſed, and ſtrained; then the liquor boiled up a ſecond time to the conſiſtence of broth, and mixed with the cordial powder known among farriers, made of aniſe, fennel, liquorice, &c. adding to the whole ſome of the grains of kermes powdered. The maſs being made into *balls*, is commended againſt diſorders of the ſtomach, breaſt, wind, &c. and is by ſome called the treacle of the Germans.

Balls, *vegetable*, in *Natural Hiſtory* and *Botany*, a very particular kind of plant of a deep green colour, of an irregularly ſpherical ſhape, hollow within, and of different ſizes, from an inch and a half to three inches in diameter. It probably belongs to the CONFERVA genus, in the claſs of moſſes; though Mr. Ray has ranged a ſimilar plant under the genus of ALCYONIUM. See Coral. Phil. Tranſ. vol. xlvii. art. 83, an. 1752.

Ball-*vein*, in *Mineralogy*, a name given by the miners in Suſſex to a ſort of iron ore, common there, and wrought to conſiderable advantage. It yields not any great quantity of metal, but what it has runs freely in the fire; it is uſually found in looſe maſſes, not in form of ſtrata, and is often covered with one or more cruſts. It generally contains ſome ſparkling particles, and is uſually of a circular form, in the perfect maſſes; thickeſt in the middle, and gradually thinner as it approaches the ſides. The ores of Suſſex in general are poor, but they require very little trouble in the working; ſo that a conſiderable profit is annually made from them.

Balls, *water*, thoſe which ſwim, and burn a conſiderable time in the water, and at length burſt therein.

Theſe are made in a wooden ſhell, the cavity of which is filled with a compoſition of refined ſaltpetre, ſulphur, ſawduſt boiled in water of ſaltpetre, and dried; to which ſometimes other ingredients are added, as iron filings, Greek pitch, amber duſt, glaſs powdered, and camphor. The ingredients are to be ground and mixed up, and moiſtened with linſeed-oil, nut-oil, olive-oil, hempſeed-oil, or petrol. At the bottom is placed an iron coffin, filled with whole gun-powder, that the *ball* may at laſt burſt with a great noiſe; and laſtly, the *ball* is, by the addition of lead, or otherwiſe, made of the ſame ſpecific gravity with water.

Balls, *wool*. See Wool.

BALLAD, or **Ballet**, a popular ſong, containing the recital of ſome action, adventure, or intrigue.

The French confine their *ballads* to ſtricter terms. A *ballad*, according to Richelet, is a ſong conſiſting of three ſtrophes, or ſtanzas, of eight verſes each, beſides a half ſtrophe; the whole in rhime, of two, three, or four verſes, with a burthen repeated at the end of each ſtrophe, as well as of the half ſtrophe.

In the old Engliſh verſion of the Bible, the book of Canticles is entitled the *ballet* of *ballets*; which has given ſcandal to ſome Romiſh writers, as countenancing the opinion of thoſe who hold that book a *ballet* of love, or a recital of the amours between Solomon and his concubine, as Caſtalio and ſome others have conceived it to be.

Some have ſuggeſted, that a collection of *ballads* is neceſſary to a miniſter, in order to learn the temper and inclinations of a people, which are here frequently uttered with great ſimplicity. The great Cecil, chief miniſter to queen Elizabeth, is ſaid to have made a moſt ample collection of *ballads*, on this account.

A very ingenious political writer, Mr. Fletcher of Saltoun, ſays, that if he could but make the *ballads* of a nation, he would care very little who made the *religion* of it. There is a very curious Collection of old Engliſh and Scottiſh Ballads, publiſhed in 3 vols. 8vo. by Dr. Percy; in which, and in a diſſertation prefixed to Aikin's Collection of Songs, &c. the curious in this way may find abundance of entertainment and information concerning old *ballads*, and ballad-makers.

BALLAST, in *Navigation*, any heavy matter uſed to ſink a veſſel to its proper depth in water, or to give it a juſt weight and counterpoiſe, and enable it to bear ſail upright, without overturning.

The word comes from the Flemiſh *belaſt*, formed of *be*, and *laſt* or *leſt*. The French call it ſimply *leſt*. In the Mediterranean, *quartelage*. In Latin writers of the lower age it is denominated *laſtagium*.

The ordinary *ballaſt* is ſand or ſtones, ſtowed in the bottom, or hold, next the falſe keel of a veſſel: ſometimes, lead, corn, or other heavy goods, ſerve for *ballaſt*.—The *ballaſt* is ſometimes one half, ſometimes a third, and ſometimes a fourth part of the burden of the veſſel. Flat veſſels require the moſt *ballaſt*.—Ships are ſaid to be in *ballaſt*, when they have no other loading.

Maſters of veſſels are obliged to declare the quantity of *ballaſt* they bear, and to unload it at certain places. They are prohibited unloading their *ballaſt* in havens, roads, &c. the neglect of which has ruined many excellent ports. See 19 Geo. II. cap. 22.

That *ballaſt* is beſt which is heavieſt, lies cloſeſt and faſteſt, and drieſt, both for the ſhip, bearing a ſail, ſtowing of goods, health of the company, and ſaving of caſks and other goods. If a ſhip have too much *ballaſt*, ſhe will draw too much water; if too little, ſhe will bear no ſail.

Ballast, *to trench the*, denotes, to divide the *ballaſt* into two ſeveral parts, or more, in the ſhip's hold, commonly done to find a leak in the bottom of the ſhip, or to undock her.

Ballast, *the*, *ſhoots*, that is, runs over from the one ſide to the other. Hence it is that corn, and all kinds of grain, is dangerous lading, for that is apt to *ſhoot*. To prevent which, they make *poucles*, that is, bulk-heads of boards, to keep it up faſt, that it may not run from ſide to ſide, as the ſhip heels upon a tack.

BALLASTAGE. See Lastage.

BALLATOONS, large, heavy luggage-boats, carrying goods by the river from Aſtracan and the Caſpian ſea to Moſcow. Theſe will carry from a hundred to two hundred tun; and have from a hundred to a hundred and ten, or twenty men employed to row, and tow them along.

BALLERUS, in *Ichthyology*, a name given by ſome authors to a ſpecies of freſh water fiſh of the leather-mouthed kind, which appears to be the ſame with the carcassius, or, as authors call it, the *carcaſſii tertium genus*.

Ballerus is alſo a name given by Ariſtotle to that ſpecies of *cyprinus* called *blicca* and *pleyſta*, and *pallerus*, by the modern writers.

BALLET, or Balet, Baletto, a kind of dramatic poem, repreſenting ſome fabulous action or ſubject, divided into ſeveral entries; wherein ſeveral perſons appear, and recite things under the name of ſome deity, or other illuſtrious character.

Ballet, from *βαλλειν*, *to caſt*, is more particularly uſed for a kind of comic dance, conſiſting of a ſeries of ſeveral airs of different kinds of movements, which together repreſent ſome ſubject or action.

F. Meneſtrier has a treatiſe expreſs on ancient and modern *ballets*, according to the rules of the ſtage; wherein he explains the nature of dancing according to Ariſtotle and the ancients.

Ballet, in Engliſh *Poetry*, &c. See Ballad.

BALLIAGE, a ſmall duty paid to the city of London, by aliens, and even denizens, for certain commodities exported by them; which they claim by their charter, dated the 5th of September, in the ſixteenth of Charles II. confirmed by the twentieth rule of the Book of Rates; and by 2 W. and M. cap. 8.

BALLISTA, a military engine in uſe among the ancients, ſomewhat like our croſs-bow, though much larger, and more forcible; it was uſed in the beſieging of cities, to throw in ſtones, or ſometimes darts and javelins.

The word is alſo frequently written, leſs conſiſtently with its etymon, *baliſta*, ſometimes *baliſtra*. It is formed from the Greek *βαλλειν*, *jacere*, being chiefly uſed in caſting of darts and arrows, in which it differed from the catapulta, which was uſed only for caſting ſtones; in other reſpects they were alike, and were each bent in the ſame manner.

Marcellinus deſcribes the *balliſta* thus; a round iron cylinder is faſtened between two planks, from which reaches a hollow ſquare beam placed croſs-wiſe, faſtened with cords, to which are added ſcrews; at one end of this ſtands the engineer, who puts a wooden ſhaft with a big head, into the cavity of the beam; this done, two men bend the engine, by drawing ſome wheels: when the top of the head is drawn to the utmoſt end of the cords, the ſhaft is driven out of the *balliſta*, &c.

The generality of authors confound the *balliſta* with the *catapulta*, attributing to the one what belongs to the other. According to Vitruvius, the *balliſta* was made after divers manners, though all uſed to the ſame purpoſe: one ſort was framed with levers and bars; another with pullies; another with a crane; and others with a toothed wheel.

The *balliſta* is ranked by the ancients in the ſling kind, and its ſtructure and effect reduced to the principles of the ſling; whence it is called by Hero, and others, *funda* and *fundibulus*. Guntherus calls it *Balearica machina*, as a ſling peculiar to the Balearic iſlands.

Perrault, in his notes on Vitruvius, gives a new contrivance of a like engine for throwing bombs without gunpowder.

Ballista, in *Practical Geometry*, the geometrical croſs, called alſo *Jacob's ſtaff*. See Cross-*ſtaff*.

Ballista, or *Os* Ballistæ, is a denomination given by ſome anatomiſts to the firſt bone of the *tarſus*, otherwiſe called *talus* and *aſtragalus*.

BALLISTARII, or Ballistrarii, in *Antiquity*, ſlingers in the ancient armies, or ſoldiers who fought with the *balliſtæ*.

There were two kinds of *balliſtarii milites*; the former caſt ſtones, and other miſſive weapons, with the hand, called *manuballiſtarii*; ſometimes ſimply, *manuballiſtæ*. The latter called *carroballiſtarii*; ſometimes only *carroballiſtæ*, made uſe of a machine. Some ſpeak of a third kind, called *arcuballiſtarii*; but theſe are better reduced to the ſecond.

The *balliſtarii* were ſcarce heard of before the age of Conſtantine.

Ballistarius is alſo uſed, in *Middle Age Writers*, for a croſs-bowman, or *arbaletier*.

BALLISTES, in *Ichthyology*. See Balistes.

BALLISTEUM, or Ballistæa, in *Antiquity*, a military ſong or dance uſed on occaſions of victory.

The *balliſtea* were a kind of popular ballads, compoſed by poets of the lower claſs, without much regard to the laws of metre.

BALLISTICA, Ballistics, is uſed for the art of throwing heavy bodies. F. Merſennus has publiſhed a treatiſe on the projection of bodies, under this title.

BALLOON, or Ballon, in *Chemiſtry*, denotes a large round ſhort-necked matraſs, or veſſel, uſed in chemiſtry, to receive what is diſtilled or drawn off by means of fire. They are generally round like hollow ſpheres, or like foot-balls, called in French *balons*, whence they derive their name. When chemiſts have occaſion to drill holes in their *balloons*, or glaſs veſſels, the operation is beſt performed by a copper drill and emery; a ſteel inſtrument makes vibrations which are apt to break the glaſs.

Balloon is alſo uſed, in *Architecture*, for a round ball, or globe, placed on the top of a pillar, or the like, by way of acroter, or crowning. That on the top of St. Peter's at Rome is of braſs ſuſtained by an iron arming within; and, being at the height of ſixty-ſeven fathoms, is above eight feet in diameter.

Balloon alſo denotes a kind of game ſomething reſembling tennis.

The *balloon* is played in the open field, with a great round ball of double leather blown up with wind, and thus driven to and fro with the ſtrength of a man's arm, fortified with a brace of wood.

Balloon, or Baloen, is more particularly uſed among *Voyagers*, for the ſtate barges of Siam.

The *balloons* are a kind of brigantine, managed with oars, of very odd figures, as ſerpents, ſea-horſes, &c. but by their ſharpneſs and number of oars, of incredible ſwiftneſs. The *balloons* are ſaid to be made of a ſingle piece of timber, of uncommon length; they are raiſed high, and much decorated with carving at head and ſtern: ſome are gilt over, and carry an hundred and twenty, or even an hundred and fifty rowers on each ſide. The oars are either plated over with ſilver, or gilt, or radiated with gold; and the dome or canopy in the middle, where the company is placed, is ornamented with ſome rich ſtuff, and furniſhed with a baluſtrade of ivory, or other coſtly matter, enriched with gilding. The edges of the *balloon* juſt touch the water, but the extremities riſe with a ſweep to a great height. Some are adorned with a variety of figures, made of pieces of mother of pearl inlaid: the richer ſort, inſtead of a dome, carry a kind of ſteeple in the middle; ſo that conſidering the ſlenderneſs of the veſſel, which is uſually an hundred, or an hundred and twenty feet long, and ſcarce ſix broad, the height of the two ends, and of the ſteeple, with the load of decorations, it is a wonder they are not overſet.

BALLOTADES, in the *Manege*, the leaps of a horſe between the pillars, or upon a ſtreight line; ſo that when his forefeet are in the air, he only ſhews his hind ſhoes, without yerking out.

A horſe naturally takes to *ballotades*, after putting him on caprioles; when the fire and mettle of the caprioles is over, he falls of courſe to *ballotades*, and then to CROUPADES, unleſs a poinſon in a hard hand make him yerk out, and continue the air of CAPRIOLES.

BALLOTE, in *Botany*. See *Black* HOREHOUND.

BALLOTING, a method of voting at elections, &c. by means of little balls, which are uſually of different colours, by the French called *ballotes*; which are put into a box privately.

BALLUSTER, or BALLISTER, a ſmall kind of column or pillar, whereof BALLUSTRADES are formed.

The word is French, *baluſtre*, which ſignifies the ſame; formed from the Latin *baluſtrum* or *baluſtrium*, a place among the ancients where the baths were railed in.

Balluſters are of divers forms, as well as matters, according to different occaſions, and different orders of architecture.

BALLUSTER of the Ionic capital, denotes the lateral part of the volute, anſwering to what Vitruvius calls *pulvinata*, on account of its reſemblance to a pillow.

BALLUSTRADE, in *Architecture*, an aſſemblage of one or more rows of balluſters, high enough to reſt the elbow on, fixed upon a terrace, or the top of a building, by way of ſecurity; ſometimes alſo to make a ſeparation between one part and another, as thoſe around altars, fonts, &c. See *Tab. Archit. fig.* 40 (G).

BALM, or BALSAM. See BALSAM.

BALM. See BAUM.

BALM *of ſulphur*. See SULPHUR.

BALMING. See EMBALMING.

BALNEARII *ſervi*, in *Antiquity*, ſervants or attendants belonging to the baths.

Some were appointed to heat them, called *fornicatores*; others were denominated *capſarii*, who kept the cloaths of thoſe that went into them; others *aliptæ*, whoſe care it was to pull off the hair; others *unctuarii*, who anointed and perfumed the body.

BALNEARIUS *fur*, in *Antiquity*, a kind of thief who practiſed ſtealing the cloaths of perſons in the baths; ſometimes alſo called *fur balnearum*.

The crime of thoſe thieves was a kind of ſacrilege; for the hot baths were ſacred: hence they were more ſeverely puniſhed than common thieves, who ſtole out of private houſes. The latter were acquitted with paying double the value of the thing ſtolen; whereas the former were puniſhed with death.

BALNEUM, is a word much uſed by chemiſts, generally ſignifying a veſſel filled with ſome matter, as ſand, water, or the like, in which another is placed that requires a more gentle heat than the naked fire.

BALNEUM *fœni*, a hay bath, is when a body is laid to digeſt in moiſt hay, whoſe heat is likewiſe directed by the application of water.

BALNEUM *Mariæ* is by ſome ſo called, as being ſuppoſed to have been firſt invented by the bleſſed Virgin; but by others, with more propriety, it is called *balneum maris*, or ſea-bath, in regard the veſſel here floats as it were in a ſea. Here the cucurbit is placed in hot water, which warms the matter contained, and diſpoſes it for riſing, or exhalation. A ſand-heat is ſometimes alſo called *balneum ſiccum*, or *arenoſum*. See BATH.

BALNEUM *minerale*, or mineral bath, is uſed by ſome chemiſts for *aqua regia*.

BALNEUM *roris*, or *roritum*, is a furnace where the cucurbit, or diſtilling veſſel, is only ſuſpended over the vapour of water, and not in contact with the water itſelf.

This is alſo denominated *balneum vaporarium*, or a *vapor-bath*.

BALNEUM *ventris equini*, or a horſe-dung bath, is when a body is laid to digeſt in horſe-dung, the heat whereof is managed by the affuſion of hot water.

BALONICH, in the *Materia Medica* of the ancients, a name given by Avicenna, Averrhoes, and others, to a kind of camphor, which they deſcribe as coarſe, brown, and of leſs value than the other ſorts. This is probably the ſame with our rough camphor, as brought over to us from the Eaſt Indies.

BALSAM, BALSAMUM, properly denotes an oily, reſinous, and odorous ſubſtance, ouſing from inciſions in certain plants; of ſovereign virtue in the cure of wounds, and divers other diſorders. They are liquid, but ſomewhat thick, and flow ſpontaneouſly from certain trees. If pure *balſam* be dropped on a woollen cloth, it may be waſhed off without leaving the leaſt ſtain, but adulterated *balſam* ſticks to the place. Pure *balſam* coagulates with milk, but adulterated *balſam* will not. True *balſam* dropped into water diſcovers its genuineneſs by ſpreading on the ſurface, imparting its taſte and ſmell; it is ſo thick, that the groſs parts at the top may be taken off with a needle. Theſe are called natural *balſams*, to diſtinguiſh them from compoſitions of the ſame name.

Balſams are only RESINS in their liquid ſtat which, when combined with any conſiderable proportion of gum, are called *gummy* RESINS. They are ſoluble in vinous ſpirits and oils, not acted upon by water, not volatile in the heat of boiling water, fuſible in a ſmall degree of heat, and readily inflammable on the contact of any flaming or ignited body.

Balſams by yolk of eggs are rendered ſoluble in water; more elegantly ſtill by ſugar; and moſt elegantly, as eſſential oils alſo are by the intervention of gums and mucilages; the ſolutions thus procured are moſt permanent. Gum is the medium employed by nature herſelf to unite the reſinous and balſamic with the watery juices of vegetables.

Of themſelves they have no ſmell; but they often retain, or have preſerved in them induſtriouſly, a part of the odorous principle, and are nevertheleſs looked upon as pure RESINS.

They derive both their liquidity and ſmell from a greater or leſs quantity of eſſential oil, which they contain, and which may be extracted by diſtillation.

Balſams may even be conſidered as true *eſſential* OILS, which have loſt ſome of their odoriferous principle, and of their fineſt and moſt volatile part. When they are deprived of their remaining part of volatile oil, their *reſidua* exactly reſemble thoſe which remain after the rectification of *eſſential* OILS. Theſe *reſidua* are true RESINS, from the analyſis of which the ſame principles are obtained, as from *natural reſins*, which are themſelves nothing elſe but *balſams* exhauſted by time, or by the action of the air, and of the ſun, of all their odoriferous and volatile parts. Neumann. Lewis. Macquer.

Balſamic medicines are of a nature ſomewhat hot and acrid. Under this denomination come what we commonly call cephalic, nervous, apoplectic, and antiparalytic medicines; as alſo ſpirituous cordials, and other ſubſtances of ſimilar natures and properties. But of all the medicines belonging to the *balſamic* claſs, the moſt noted and efficacious are aloes wood, together with its reſin and eſſence; yellow ſanders with its eſſence, reduced to a liquid *balſam*; ambergris; liquid amber; balm of Gilead; amber; benzoin; ſtorax, with its reſin; the ladaniferous ſhrub, with its reſin; the *balſams* of Peru, and Tolu; *balſam* of Caſour; and that called the red American *balſam*; the true Peruvian bark; the bitter *coſtus*; Indian bark; cinnamon; cloves; cardamoms; cubebs; mace; nutmegs; ſavory; thyme; rue; mother of thyme; lavender; our *origanum*, and that of Crete; marjoram; our own, and Turkiſh baum; Roman chamomile; Syrian herb maſtich; baſil; ſouthernwood; ſpikenard; camel's hay; bay, and myrtle leaves; together with the genuine fragrant and unadulterated oils diſtilled from them. The compound *balſamics* are, the apoplectic *balſam* of Crollius; the *balſamum cellenſe*; that of Scherzerus, and the liquid *balſam* of life; ſpirit of Peruvian *balſam*; ſpirit of amber and maſtich; the apoplectic water of Sennertus; the *aqua Anhaltina*; true eſſence of amber, and volatile oily ſpirits, impregnated with oil of cinnamon, mace, and cedar.

Balſams are of great ſervice in medicine and ſurgery. To uſe them, they are uſually liquified with ſpirit of wine, or oil, and ſometimes mixed up with the yolk of an egg. They are to be uſed cautiouſly and in moderate doſes by young people, and patients of choleric and delicate conſtitutions, as alſo in caſes where the body abounds with blood and humours.

Balſamics labour under this defect, that they muſt make a vaſt progreſs in moſt inſtances, before they can arrive at the intended ſcene of action; by which means they not only come ſlowly, and in ſmall quantities, but much altered, and variouſly modified, by the action of the blood-veſſels, and the intermixture of its humours.

In the intentions where *balſamics* are chiefly given, the ſeat of the diſorder is generally in the *viſcera*; where a medicine can only arrive by the common conveyance of the blood; and how long, from its being taken into the ſtomach, muſt ſuch a medicine be, and how many alterations muſt it undergo in the divers parts of the body it paſſes through, before it comes to the place deſired? Though the lungs are, by their ſituation, ſo near the ſtomach, a medicine cannot arrive there, till it has taken its courſe through the lacteals, paſſed all the meanders of the meſentery, gone up with the chyle into the ſubclavian vein, and there entered the blood: and, after all, it has only the chance of coming to the part in ſuch a quantity, as, with regard to the whole medicine which entered the blood, bears the ſame proportion, as the blood in the pulmonary artery bears to all the blood in the other arteries.

Hence nothing is to be expected from *balſamics*, in a ſhort time, or a few days: they muſt be repeated, and followed, till the animal juices are ſufficiently charged therewith, to afford a continual ſupply.

Add, that *balſamics* generally load and clog the ſtomach; and hence, have often bad effects. This conſideration led the biſhop of Cloyne to prefer tar-water to all other *balſamics*.

Balsam, or *balm of Gilead*, is in the greateſt eſteem, though there are ſome who hold that of Peru equal to it in virtue. It is drawn by inciſion from a tree of the ſame name growing in Egypt and Judea, but chiefly in Arabia Felix, and which is held ſo precious, that it makes part of the ſpecial revenue of the grand ſignior, without whoſe permiſſion none are allowed to be planted or cultivated. See Dr. Lewis's Mater. Medic. p. 422.

Its ſmell is agreeable, and very briſk: its taſte bitter, ſharp, and aſtringent; it eaſily diſſolves in the mouth, and leaves no ſtain on woollen cloth.

At preſent there are three ways of obtaining it, and according to theſe there are three kinds of the *balſam*. The firſt kind is that obtained from the natural cracks, or wounds, made in the bark, as by the ancients, which is the beſt and moſt precious kind. But there is ſo little procured this way, that it ſcarcely ſupplies the ſeraglio, and the great officers; and hardly a drop of it is ever ſent out of the country. The ſecond kind is called by ſome the Conſtantinople balſam; this alſo rarely comes to us, unleſs in ſmall quantities preſented by the great men of the Porte, and is prepared by boiling. They fill large veſſels with the young twigs and leaves of the *balſam* ſhrub; and adding a large quantity of water they boil them gently. During the boiling there riſes to the ſurface of the liquor an oily and balſamic matter, which they ſkim off, and preſerve for uſe. After all this fine matter is raiſed, they increaſe the fire, and a large quantity of ſomewhat thicker balſam riſes more like turpentine; this they alſo ſeparate, and preſerve by itſelf; and this is principally what is brought into Europe.

It is unqueſtionably a very noble detergent and balſamic; is of the ſame uſe with *capivi* in gonorrhœas, and is excellent in ulcers of the kidnies and bladder. It is by ſome eſteemed a cure for conſumptions; and though it does not abſolutely deſerve that title, yet with proper management it may do great ſervice in them. Externally it has been always deſervedly famous for curing wounds of all kinds; where the wound is indeed a ſimple ſolution of continuity, and there is no bruiſe with it, the cures with *balſams* of this kind are very ſudden.

For internal uſe it may be either given in boluſſes, or dropped on ſugar; or finally diſſolved, by means of the yolk of an egg, into emulſions.

There is likewiſe a *balſam* of Mecca, which is a dry, white gum, reſembling white copperas, eſpecially when old. It is brought from Mecca, by the returns of the caravans of pilgrims and Mahometan merchants, who travel thither out of devotion to the birth-place of their prophet. It has all the virtues of the *balm* of Gilead, or Judea; and is probably the ſame, only hardened, and its colour altered.

Balsam, *Luccatellus's*, is compoſed of oil, two parts, and turpentine and wax, each one part; the red ſanders only contributing to its colour and ſmell.

Balsam *of Peru* is of three kinds; or rather, it is one and the ſame *balſam*, having three ſeveral names, viz. *balſam of inciſion*, which is a white glutinous reſin, ouſing at an inciſion in the tree, and afterwards thickened and hardened. This is excellent for green wounds, and much reſembles the opobalſamum, excepting in ſmell, which diſtinguiſhes it.—*Dry balſam*, which is diſtilled from the tips of branches cut off, to which are faſtened little veſſels to receive the liquor, which at firſt is like milk, but reddens by being expoſed to the ſun. Its chief uſe is in the compoſition of the lac virginale, which is made much better with this, than with ſtyrax or benzoin.—Laſtly, the *balſam of lotion*, which is blackiſh, and is drawn from the bark, roots, and leaves of the tree, minced and boiled together. This is uſed in wounds like the white *balſam*; and, on account of its excellent ſmell, by the perfumers.

The virtues of this *balſam* as a cordial, pectoral, and diuretic, are very great. It is given with ſucceſs from four to eight drops for a doſe in conſumptions, aſthmas, nephritic complaints, obſtructions of the *viſcera*, and ſuppreſſions of the *menſes*. It has alſo externally all the virtues of the balm of Gilead, and conſolidates wounds in the ſame remarkable manner. It is beſt taken dropped on ſugar; the yolk of an egg will indeed diſſolve it, and it may that way be made into an emulſion, but it is more acrid in that form than when taken ſingly. It is often made an ingredient in boluſſes and electaries; and is in ſome of the officinal compoſitions.

Balsam *of Copabu*, or *Copaiba*, vulgarly *Capivi*, comes from Braſil, in earthen bottles. There are two ſorts, the one bright and thin, the other thick; the firſt white of a reſinous ſmell; the other a little more on the yellow: both are admirable for wounds; the Jews uſe this *balſam* after circumciſion to ſtop the blood.

Many of the Americans call all odoriferous reſins, and ſweet-ſcented gums, *copal*; and the word *iba*, or *iva*, is the name for a tree; by which the etymology of *copaiva* eaſily appears.

It is a great cleanſer of the urinary paſſages; on which account it obtains much in gonorrhœas, and all obſtructions and ulcerations in thoſe parts. It is efficacious in the *fluor albus*, and in gleets. It is alſo reputed a powerful balſamic, and, as ſuch, uſed in many diſtempers of the breaſt.

But its heat and acrimony render it hurtful in inflammatory caſes, *phthiſes*, diſorders of the kidneys, &c.

The *balſam of Copaiba* is frequently adulterated with oil of ſweet almonds, and oil of turpentine; the near reſemblance it bears to this laſt, has occaſioned them to be ſometimes confounded. They may be diſtinguiſhed by the conſiſtence as well as by colour; turpentine being thicker, and of a vitreous caſt, but the *balſam* whiter, and more inclining to a yellow: add, that it is more odorous, as well as ſharper and bitterer to the taſte.

Beſide the common uſes of this *balſam*, the art of the modern chemiſts has found a new and very profitable one, that is, the debaſing and adulterating the dearer eſſential oils with it, as the ſmell in its oil is much ſweeter than that of turpentine or deal-wood.

This *balſam* yields a very large proportion of eſſential oil, by diſtillation with water, even to the quantity of five or ſix ounces from a pound; and the chemiſts who know this, adulterate their oils, either by mixing them with the oil of *Copaiba*, or more artfully, by putting a proper quantity of this *balſam* with the ingredients into the ſtill, and ſo drawing off the oil of both mixed intimately together. There ſeems no eaſy way of detecting this fraud; the nice uſe of a hydroſtatical balance indeed would do it; and it is worth obſerving whether the oils thus adulterated will not, on long keeping, diſcharge the ink of their written label, as the eſſential oils, adulterated with the oil of turpentine, are known to do, on account of the acid vapour which continually exhales from that oil. See Copaiba.

Balsam *of Tolu* is at firſt a liquid reſin, which, as it grows old, becomes of the colour and conſiſtence of Flanders glue. It comes by inciſion from ſome trees growing in New Spain; where the inhabitants receive it in little veſſels of black wax: in taſte and ſmell it reſembles balm of Gilead; as it grows old, it takes the conſiſtence of a dry *balſam*. It is an excellent balſamic and reſtorative; and good in all decays, eſpecially of the lungs. It ſoftens and thickens the blood, and cures catarrhs, and coughs, from tickling defluxions, &c. Its healing virtues extend even to the ſeminal parts, where it is good in old gleets, &c. There is a ſyrup of it in the ſhops; but the beſt form of adminiſtering it is in pills, or in a ſolution in ſome ſpirituous *menſtruum*.

It takes its denomination from a place called Tolu, ſituated between Carthagena and Nombre de Dios.

Balsam, *Hungarian*, *balſamum*, is a ſpecies of oil, or liquid reſin, oozing from a coniferous tree growing on the Carpathian mountains, to which the Hungarians attribute many virtues. Vid. Ephem. Acad. N. C. Cent. 7. Obſ. 2. p. 4.

The virtues of this *balſam*, internally taken, or externally applied, are ſaid to be very great, and not inferior to thoſe of the *oriental balſam*. But whether either deſerve the commendation beſtowed on them, and how far they excel the common turpentine, is a queſtion which muſt be left to impartial practitioners.

Balsam *of liquid amber*, is a clear reddiſh reſin, produced by a tree in New Spain, called by the natives *oſoſol*; in ſome degree reſembling ambergris in ſmell, whence its name. This *balſam* is liquid; in which ſtate it is called *oil of liquid amber*, and when old, *balſam of liquid amber*; it comes from both the Spains, in barrels, but the genuine is very rare among us.

Balsam, *new*, reſembles *balſam* of Tolu in ſmell and colour, and is procured in the manner of oil of bays, from a red fruit in the iſland of St. Domingo. It is found excellent for wounds and ulcers; eſpecially for fiſtulas *in ano*.

Balsam is alſo applied to a mineral ſubſtance, of a fragrant, healing quality; extracted from a kind of ſtones diſcovered in a mine near Bergamo in Italy. Vid. Phil. Tranſ. N° 79. p. 3059; or Abridg. vol. ii. p. 460.

This is more peculiarly called, by way of diſtinction, the *mineral balſam*.

The diſcoverer was Sig. Caſtagna. Its chief uſe is in diſorders of the *uterus*; on which account it is in great eſteem among the Genoeſe, to reſtore women after labour. Some have alſo found it of great benefit in the phthiſis.—Phil. Tranſ. N° 127. p. 674.

Balsam is alſo applied to certain factitious ſubſtances, made by chemiſts and apothecaries, chiefly of balſamic and healing ingredients, in imitation of the native *balſams*.

Theſe are called, by way of diſtinction, *factitious*, or *artificial balſams*.

We have two different compoſitions of *balſams*, in imitation of the true, or Egyptian *balſam*; one by Matthiolus, the other by Euricus Cordus. Pomet has alſo given a method of imitating many of the native *balſams*.

Balsams, *artificial*, are, by ſome, divided into ſimple and compound; to the claſs of *ſimple* belong the rectified oils of wax, turpentine, linſeed, *hypericum*, roſes, *ſolanum*, and *triſoliatum odoratum*; to which Boerhaave adds freſh butter.

Balsams, *compound*, are numerous; the diſpenſatory writers furniſh a great number of forms, as magiſterial, chalybeat, paralytic, nephritic, and polychreſt *balſams*; red, green, Spaniſh, and Samaritan *balſams*; *balſams* of *arceus*, of amber, of pitch, &c.

Beſides theſe, chemiſts and alchemiſts ſpeak of *balſams of antimony*, *of life*, &c. See ſome remarks on the uſe of *balſams* in the cure of *conſumptions*. Lond. Med. Obſerv. &c. vol. iv. p. 231. by Dr Fothergill, who is of opinion that all medicines poſſeſſed of heating, ſtimilating qualities, are in general improper in the treatment of this diſorder.

Balsam *of antimony*, a famous medicine deſcribed by Baſil Valentine in his *Currus antimonii triumphalis*. This author has related many incredible things in its praiſe; but Kirkring, in his commentaries on that work, declares, that all he has ſaid of it, is ſhort of its real praiſe; and that, in particular, cancers were to be cured by it; himſelf having, as he informs us, performed a perfect cure on a breaſt condemned to be cut off, by anointing it with this *balſam*, and giving the common internals.

Balsam *of life*. The firſt medicine known by this pompous name, was the preparation of antimony, ſo highly extolled by Baſil Valentine, and, after him, by Kerkring. Theſe gentlemen are very cautious of giving the proceſſes for this and the like medicines, in intelligible terms; but they acknowledge, that it contains all the virtues of antimony, and all that can be done by the ſpagyric art.

The famous Frederick Hoffman ſpeaks of a *balſam of life*, of his own invention, to which he aſcribes great virtues; but we know not if he ever publiſhed the proceſs for making it. That given in the Straſburg and Ratiſbon Diſpenſatories, under the name of *Balſamum vitæ Hoffmanni*, is taken from the notes on Poterius, and is not the ſame with that *balſam*, which the late learned Fred. Hoffman prepared in his own houſe.

Balsam is alſo applied to certain preparations of ſpirit of wine, with balſamic and aromatic ſpices, fragrant reſins, and the like. Theſe are otherwiſe called elixirs. Among theſe, the *elixir balſamicum Hoffmani*, otherwiſe called his *balſamum vitæ*, is famous; but its preparation ſeems not known.

Balsams, *odoriferous*, are a fragrant kind of unguents, generally of a thick conſiſtence, compoſed of ſome fatty, denſe juice, joined with ſome diſtilled oils of divers kinds. Theſe are alſo called *ſweet-ſcented*, or *apoplectic balſams*.

Theſe *balſams* are prepared as rich perfumes, to raiſe the languid ſpirits; and the nobleſt and richeſt of the eſſential oils ſhould therefore be uſed in them. The oils principally directed by Boerhaave to this purpoſe, are thoſe of balm, *calamus aromaticus*, cinnamon, cedar, citron, cloves, jaſmin, lavender, white lilies, marjoram, mace, nutmeg, *origanum*, oranges, both thoſe of China and Seville, roſes, *rhodium*, and yellow ſanders; to which may be added, the natural balſams of Peru and Gilead; theſe two being ſpontaneouſly fragrant without diſtillation.

Balsams, *diſtilled*, are only etherial oils diſſolved in ſpirit of wine.

Balsams, *unguentareous*, are, properly, unguents compoſed of divers reſins, gums, and oils, fuſed into one maſs with ſpirit of wine, oil of turpentine, or the like; intended to cleanſe, preſerve from putrefaction, heal, mitigate, reſolve, &c.

Balsam is alſo uſed, in *Pharmacy*, as the name of one of the forms of medicines; of a conſiſtence ſomewhat greater than that of oil, but leſs than that of an unguent.

Balsamum *ſamech*, of Paracelſus, is a ſalt of tartar dulcified, by diſtilling ſpirit of wine from it, till the ſalt be ſufficiently ſaturated with its ſulphur, and till it ſuffer the liquor to be drawn off, as ſtrong as when it was poured on.

Balsam *of ſulphur* is a ſolution of the flowers of ſulphur in ſome oil: it is made by boiling the two together over a ſoft fire the ſpace of an hour, or till the ſulphur be totally incorporated with the oil into a red balſam.

The *balſams* of *ſulphur* are named from the particular oils which enter into their compoſition. Thus if it be made with the eſſential oil of turpentine, it is called *terebinthinated* balſam of ſulphur; if made with the eſſential oil of aniſeed, it is called the balſam of ſulphur with oil of aniſeed; theſe are the two moſt in uſe. When it is made with the oil of nuts, it is called *Rulland's balſam* of *ſulphur*. It is recommended both for external and internal uſes, as being warm and mollifying in caſes of wounds, ſanious ulcers, fiſtulas, &c. and curative even of ulcers of the lungs.

Helmont, its inventor, extols it for all diſeaſes of the breaſt; yet Boerhaave rejects all internal uſe of it, as too hot, and acrimonious. Bartholin alſo obſerves, that it ſometimes cauſes a cardialgy.

Balsam *of Saturn* is a ſalt, or ſugar of lead, diſſolved in oil or ſpirit of turpentine, juniper, or the like, digeſted, till the matter hath acquired a red tincture. This is found to reſiſt the putrefaction of humours, and is good to cleanſe and cicatrize ulcers.

Balsam, or **Balm**, among *Alchemiſts*, ſometimes denotes the ſpirit of common ſalt extracted in a particular manner. The preparation is thus: they diſſolve the ſalt, and place its diſſolution, well clarified, in horſe dung, to putrefy, for the ſpace of two or three months, and then diſtil it ſtrongly with a ſand heat; upon which there ariſes a precious unctuoſity, wherein things the moſt corruptible being ſteeped, are ſaid to remain entire, eternally.

It is ſaid, that it was by this means ſome of the ancients preſerved dead bodies entire, without reducing them to mummy; and particularly that of the woman mentioned by Volaterranus to be found in a *mauſoleum* near Albano, in the time of pope Alexander VI. which was by his order thrown ſecretly into the Tiber, to prevent idolatry; ſhe being found as freſh as when alive, though ſhe had been dead 1300 years.

We read of a *balſam* of this kind, called

Balsam, *dead*, a liquor prepared of myrrh and aloes, diſſolved in ſpirit of wine, chiefly uſed for drying and abſorbing the humours of dead bodies.

Balsam *of the philoſophers*, *balſamum philoſophorum*, is one of thoſe ænigmatical terms, whereby they expreſs *aurum potabile*.

Balsam is alſo ſometimes uſed, in *Eccleſiaſtical Writers*, for the ſacred chryſm.

This is otherwiſe denominated *balſamelæum*.

Balsamum *traumaticum*, *vulnerary balſam*, a form of medicine preſcribed in the London Diſpenſatory, intended to ſupply the place of the tincture, commonly called the Friar's *balſam*, ſo famous for curing freſh wounds. It is made thus: take of benjamin three ounces, ſtrained borax two ounces, balſam of Tolu one ounce, ſuccotorine aloes half an ounce, rectified ſpirit of wine a quart; digeſt them together, till as much as may be of the gums are diſſolved, and then ſtrain off the ſpirit.

Balsam *apple*, *male*, *momordica*, in *Botany*, a genus of the *monoecia ſyngeneſia* claſs. Its characters are theſe: it hath male and female flowers upon the ſame plant; and the male flowers have an open concave empalement of one leaf. It has three ſhort awl-ſhaped ſtamina, which are compreſſed in a body, and have a reflexed line containing the *farina*. The female flowers have the ſame empalement and petal as the male, but ſit upon the germen; theſe have three ſhort filaments, without ſummits. The germen ſupports one taper trifid, crowned by three oblong, gibbous ſtigmas, and afterwards turns to an oblong fruit, opening with an elaſticity, having three membranaceous cells filled with compreſſed ſeeds. There are four ſpecies, one of which is known by the name of the wild, or ſpurting cucumber, from its caſting out its ſeeds, together with the viſcid juice in which they are lodged, with a violent force, if touched when ripe; and from hence it has ſometimes obtained the name of *noli me tangere*, or *touch me not*.

This plant grows naturally in ſome of the warm parts of Europe; but in England it is cultivated in gardens for the fruit, which is uſed in medicine, or rather the *fæcula* of the juice of the fruit, which is the *elaterium* of the ſhops.

Balsam-*tree*. See Turpentine-*tree*.

BALSAMATION, **Balsamatio**, is uſed by ſome writers, for the art or act of embalming dead bodies.

Dr. Hook ſpeaks of an univerſal *balſamation*, or method of preſerving all kinds of bodies from corruption, invented by Dr. Elſhot. See Preservation.

BALSAMELÆON, in the *Materia Medica*, a name given by ſome authors to the balm of Gilead, or true *balſamum Judaicum*.

BALSAMIC, a term in phyſic, ſignifying that property in a medicine, whereby it is rendered ſoft, gently attenuating, and ſomewhat agglutinant; and is often applied to things healing or vulnerary.

In this ſenſe, phyſicians ſpeak of the *balſamic* virtues of iron: hence alſo the denomination, *balſamic ſtyptic*, given to Dr. Eaton's liquor. Mem. Acad. Scienc. 1713. p. 247. Phil. Tranſ. N° 283. p. 110.

Balsamics are medicines endowed with a balſamic, that is, a reſtoring, healing, and cleanſing power.

The chief remedies in the claſs of *balſamics*, are the native balſams, which give the denomination to all the reſt.

Balsamics are divided into emollients, reſtoratives, vulneraries, and detergents.

Balsamics, again, are either internal or external; hot and acrid, or mild and temperate. The acrimonious kind are dangerous internally, and not to be given without the greateſt caution, where there is any diſpoſition to inflammation or fever; as in *phthiſes*, vomicas, gonorrhœas, urinous diſorders, ſtone, *cephalæa*, &c.

BALSAMINA *ſcandens*, a name given to the large-fruited white briony of Ceylon.

BALSAMINE, *female*, BALSAMINA, or *balſam*, in *Botany*, the name given by Tournefort to a genus of plants, called by Linnæus *impatiens*, and belonging to the claſs of *ſyngeneſia monogamia*; the characters of which are theſe: the flower has a two-leaved ſmall empalement; it hath five petals, which are unequal, and ſhaped like a lip-flower. It hath a *nectarium* at the bottom of the flower, ſhaped like a hood or cowl, which is oblique to the mouth, riſing on the outſide, whoſe baſe ends in a tail or ſpur, and five ſhort ſtamina, which are incurved. In the bottom is ſituated an oval, ſharp-pointed germen, which afterward becomes a *capſula* with one cell, opening with an elaſticity in five valves, which twiſt ſpirally, and contain ſeveral roundiſh ſeeds fixed to a column. There are three *ſpecies*.

The varieties of this plant, kept in the gardens, are all raiſed from ſeeds ſown on hot-beds in the ſpring, and afterwards planted out into pots and borders; though there are two or three of the hardier kinds, as the common white, red, and purple kinds, which will come up in common ground, without any artificial heat, and will be ſtronger, and flower better ſo, than if raiſed on hot-beds. But the fine double large kind, or immortal eagle-flower, as it is called, requires to be ſet on a freſh hot-bed, after it has been raiſed on one, in order to bring it forward; elſe it does not get into flower till late in the year, and will not ripen its ſeeds. There are two kinds of this beautiful ſpecies; one brought from the Weſt Indies, known by the name of the *cock's ſpur*: this produces large and ſtrong plants, but flowers very late. The other is from China, and is what is moſt commonly called the *immortal eagle-flower*, and is one of the fineſt annual plants we have, producing very large double flowers, and continuing a long time in flower, if ſheltered from violent winds and rain. This produces ſeeds very well with us; but theſe are apt to degenerate, after a few years, into ſingle flowers.

When the young plants are raiſed in a hot-bed, and are to be planted out into pots, ſuch are always to be preferred as have ſtalks finely ſpotted with red; for theſe always produce red and double flowers. Miller.

BALSAMITA, a name given by ſome to a ſpecies of TANZY.

BALTAGI, among the Turks, porters, and hewers of wood, in the court of the grand ſignior; who alſo mount on horſeback, when the emperor rides out. Part of them alſo, who, for that purpoſe, muſt be caſtrated, keep watch at the gates of the firſt and ſecond courts of the ſeraglio. Theſe laſt are called *capigi*, and their commander *capigi paſcha*.

BALTHEUS *Orionis*, *belt of Orion*, in *Aſtronomy*, a part of the conſtellation of ORION, conſiſting of three bright ſtars of the ſecond magnitude, placed nearly in a right line in Orion's girdle.

BAMBELE, in *Zoology*. See RUTILUS.

BAMBO, in *Commerce*, an Eaſt Indian meaſure, containing five Engliſh pints.

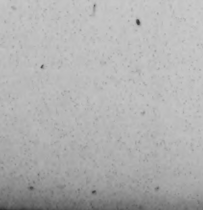
BAMBOE, in *Natural Hiſtory*. See ARUNDO.

The Indian *bamboe* is the largeſt kind of cane that is known. It is of an extraordinary height and bigneſs, when it bears no bloſſom: each cane is often, toward the bottom, of the ſize of a man's thigh, decreaſing gradually to the top, where it bears a bloſſom or flower like our reeds in their proper ſeaſon. The *bamboe* grows in all the maritime countries in the Eaſt Indies.

With theſe canes of *bamboe* the Indians build their houſes, and make all ſorts of furniture in a very ingenious manner. The wood of theſe canes is ſo hard and ſtrong, that they ſerve very well to make piles for ſupporting their little houſes built over rivers, which have a gentle courſe. They alſo make with this wood all ſorts of utenſils for their kitchens and tables. They ſerve to make the ſticks, or poles, with which the ſlaves carry thoſe ſorts of litters called *palanquins*, which are ſo common in all the Eaſt. They likewiſe make of them a kind of pails, in which the water keeps extremely cool. The ſmall ſhoots of them ſerve to make walking canes.

A decoction is made of the leaves, of uſe for diſperſing coagulated blood; and of the pithy part in the middle they alſo make a medicine againſt the ſtrangury.

BAMBOO *habit*, a Chineſe invention, by which a perſon, who cannot ſwim, may eaſily keep himſelf above water. Four *bamboos*, two before, and two behind their bodies, are placed horizontally, and project about twenty-eight inches. They are croſſed on each ſide by two others, and the whole properly ſecured, leaving a ſpace for their body, it is put over their heads, and tied ſecure in two minutes. Its ſhape as here repreſented.



BAN, a ſort of ſmooth fine muſlin, which the Engliſh import from the Eaſt Indies. The piece is a yard broad, and runs about twenty yards and a half.

BAN and **BANS**. See BANN and BANNS.

BAN, *Arriere*. See ARRIERE.

BANANA, a name uſed by many authors for the MUSA, or plantain tree, of the common kind; but more frequently, with us, underſtood to mean another ſpecies of the ſame genus, which the Portugueſe call *pacoeira*, and we, particularly, the *banana* tree.

The difference between the two is this; the *muſa* has a green ſtalk, and a long, crooked, angular fruit, reſembling a crooked cucumber; the *banana*, a ſpotted ſtalk, and a round fruit.

The fruit of this tree is ſaid to be nouriſhing, to excite urine, and to be a provocative to venery.

The abbé Poyart deſcribes two trees under the name of *bananas*, which he met with in Africa. The one, which is rather a plant than a tree, riſes to the height of between twelve and fifteen feet, on a ſtalk or trunk of eight or ten inches in diameter. The fruit ſhoots forth from the trunk in a cluſter, containing between one and two hundred *bananas*, each an inch thick, and eight or nine inches in length. As ſoon as one cluſter is produced the plant dies, and ſeveral new plants ſpring up in the room of the old one. The trunk of the tree is encompaſſed with ſeveral ſprigs, of the rind of which the negroes make cords. The leaves of this plant are ſeven or eight feet long, and twenty inches broad; as ſtrong as parchment, and are uſed for umbrellas, and other purpoſes. The other tree is the fig-*bananas*, or fig-tree of Adam, and differs from the former only in the nature and qualities of its fruit. The produce of the former is a kind of bread, which is dry and mealy; that of the latter a delicious fruit, which is ſoft and moiſt. Hiſtoire de Loango, &c. vol. i. 1776. Paris.

BANC, BANCUS, or BANK, in *Law*, denotes a ſeat, or bench of judgment. See COURT.

BANCI, *jus*, or the privilege of having a bench, was anciently only allowed to the king's judges, *qui ſummam adminiſtrant juſtitiam*. Inferior courts, as courts-baron, hundred courts, &c. were not allowed that prerogative; and even at this day the hundred-court at Freibridge in Norfolk, is held under an oak at Gey-wood; and that of Woolfry, in Herefordſhire, under an oak, near Aſhton in that county, called Hundred-oak.

BAND, in a general ſenſe, ſome ſmall, narrow ligament, wherewith a thing is tied, or faſtened.

We ſay, a *ſtay-band*, a *brow-band*, a *hat-band*, &c.

BAND, in *Architecture*, denotes any flat, low member, or moulding.

This amounts to the ſame with what is otherwiſe called *face*, from the Latin *faſcia*, which Vitruvius uſes for the ſame thing, and ſometimes *fillet*, *plinth*, &c.

BANDS *of columns*, properly denote a kind of emboſſments ſurrounding the ſhafts of ruſtic columns, at certain diſtances, by way of decoration.

Theſe are ſometimes plain, ſometimes picked or vermiculated, and ſometimes carved with decorations of low relievo, which are different in every different *band*.

Columns enriched with theſe *bands*, are ſometimes called *banded columns*.

BAND, in *Surgery*, denotes a fillet, ſwath, or piece of linen cloth, wherewith either to cover or ſurround certain parts, that ſtand in need of aſſiſtance.

Bands are the ſame with what are otherwiſe called *rollers*.

A *band*, or *roller*, when applied, becomes a BANDAGE.

BAND, *bandum*, is uſed, in *Middle Age Writers*, for a flag or banner.

BAND alſo gives the denomination to a military order in Spain, inſtituted by Alphonſus XI. king of Caſtile, in the year 1332.

It takes its name from the *banda*, *band*, or red ribband, which comes acroſs over the right ſhoulder, and under the left arm, of the knight.

This order is for none but the younger ſons of nobles; the eldeſt ſons of grandees are excluded; and, before admittance, it is requiſite to have ſerved at leaſt ten years, either in the army, or at court. They are bound to take up arms for the catholic faith againſt the infidels.

The king himſelf is grand maſter of the order.

BAND *of ſoldiers*, ſo many as fight under the ſame flag, or enſign.

Thus Romulus called thoſe who fought under the ſame manipule (a handful of hay being then uſed for a flag) *manipulus militum*.

Formerly *bands* eſpecially denoted bodies of foot; and the French ſtill call their infantry *bandes Françoiſes*.

BAND *of penſioners*, is ſtill retained, to denote a company of gentlemen, who receive a yearly allowance of 100*l.* for attending the king on ſolemn occaſions.

BANDS, *trained*. See TRAINED-*bands*.

BAND, in matters of artillery, denotes a hoop of iron uſed about the carriage of a gun.

Such are the nave *bands*, which are iron hoops binding the nave at both ends.

Bands *of a ſaddle*, denote two flat narrow pieces of iron, nailed on each ſide the bows of the ſaddle, to retain thoſe bows in the ſituation which makes the fo m of a ſaddle.

Band, *to put a bow in the*, is to nail down the two ends of each *band* to each ſide of the bow.

Beſides the two great *bands*, the fore-bow has a ſmall one, called the *wither-band*, and the hinder-bow another to ſtrengthen it.

BANDAGE, in *Surgery*, the application of a band, ſwath, roller, or fillet, to a part of the body; or the act of rolling, or tying a ſwath or band, round a part affected, and the parts adjacent, with compreſſes, plaſters, and the like.

Of *bandages* there are two ſorts; whereof one ſort are remedies of themſelves.—The other, being intended only to keep the medicaments on the part, are called more particularly *contentive bandages.*

Bandages are a very neceſſary part of the *apparatus* in dreſſing and binding up of wounds. They are not only of greater ſervice than compreſſes and plaſters, in ſecuring the other dreſſings, but are alſo of excellent uſe in reſtraining dangerous hæmorrhages, and in joining fractured or diſlocated bones.

Almoſt all *bandages*, uſed in dreſſing of wounds, ulcers, or fractured or diſlocated bones, ſhould be made of clean linen cloth, ſoftened by wearing, but ſtrong.

They are to be made of a proper length and breadth for the occaſion; and, that they may be ſtrong, examine the courſe of the threads, and tear the cloth lengthways. Darns, ſeams, and large hems in the cloth, are, as much as poſſible, to be avoided, that no inconvenience may be brought on by the roughneſs and irregularity of the roller.

There are different ſorts of *bandages*, for different uſes. Some are common; others are proper. Theſe laſt are only to be applied to particular parts; the others may be applied to any.

Bandages may be diſtinguiſhed alſo into *ſimple* and *compound*; the *ſimple* are thoſe which are formed of one entire piece of linen; the *compound*, of ſeveral pieces, ſewed together in different manners.

The moſt ſimple of all *bandages*, is that uſually not rolled up, but left looſe, and uſed in phlebotomy.

The next to this, is that called the *ſingle-headed bandage*, which is rolled up at one end only. Next to that, the *double-headed bandage*, or that rolled up at both ends.

After theſe come thoſe *bandages*, which are made out of one piece of linen, but are divided at both ends, almoſt as far as the middle; theſe are uſually called, by the ſurgeons, *four-headed bandages*.

Another ſort is ſomewhat ſhorter, and narrower, than the laſt deſcribed, and is divided at one end, and perforated at the other. It is uſually employed in dreſſings to the *penis*, or to one of the fingers.

Another kind is, from its uſe, called the *uniting bandage*; it is a double-headed *bandage*, divided about the middle, and ſerves to unite wounds that are made lengthways, without calling for the future.

There is alſo another *bandage*, provided with an opening in the middle, through which the head may eaſily paſs; the extreme parts of the *bandage* hanging, one over the breaſt, the other over the back. The chief uſe of this *bandage* conſiſts in this, that, in dreſſing wounds of the *thorax* or *abdomen*, it is capable of ſupporting another *bandage*, ſomething wider, made of a cloth four or ſix times doubled, and bound round the breaſt or belly.

There remains ſtill to be conſidered, a compound *bandage*, made of two pieces of cloth, almoſt in form of the letter T. The upper part of this is to be brought round the belly, and faſtened by a knot; but the lower part paſſes under the body, between the thighs, and, being brought up again, is faſtened to the upper part upon the back. This *bandage* plainly appears to be deſigned for the ſecurity of ſuch dreſſings, as ſhall be thought proper to be applied to the *anus*, or parts of generation. Some, from the inventor, call this *Heliodorus's bandage*. Others, from its ſhape, denominate it the T *bandage*; and, from the diviſion that is frequently made in the lower part of it, it is ſometimes called the double T.

As to *bandages* for the head, notwithſtanding that ſurgeons have formerly invented different kinds of them, for every wound that could be inflicted on that part, yet there is but one form that ſeems neceſſary: and this alone will anſwer all the ends that can be propoſed from this kind of application. It is made in the following manner: take a handkerchief, napkin, or any ſquare piece of linen; double it up in a triangular form, and apply it as we frequently do in hot weather, when we lay aſide the uſual coverings of the head.

But there is another method of *bandage* in uſe, called *creeping bandages*, and, in the French ſchools, *rampants*. Theſe creeping, or, as we ſometimes call them, *ſerpentine bandages*, are uſed to ſecure cataplaſms, or compreſſes, upon a diſeaſed part.

The place of beginning and ending theſe *bandages* is alſo to be determined. When the arm is to be dreſſed, the beginning is formed by two or three circular windings on the wriſt, aſcending, by looſe ſpires, up to the cubit, or ſhoulder, as the nature of the caſe ſhall require. But when the beginning is to be on the foot, it is to be formed by three or four circular windings of the *bandage* round the *tarſus*, and *metatarſus*; then proceeding, in a ſerpentine courſe, up to the knee; or, if the caſe requires it, up to the head of the thigh, and then, as it ſometimes happens, deſcending again.

We ſhould not omit to mention, that the beginning of the *bandage* is ſometimes applied to the diſeaſed part, as in ſeveral kinds of fractures; ſometimes near it, above it, or below it; and ſometimes at a great diſtance from it, according to the diſpoſition of the wound. On the contrary, the extremity of the *bandage* is ſcarce ever faſtened on the diſeaſed part, but rather on a ſound one, to avoid giving pain.

Beſides the double and four-headed *bandages*, ſurgeons ſometimes make uſe of the *eighteen-headed bandage*. Its figure may be learnt from Heiſter's Surgery, Tab. IX. *fig.* 4.

Bandage, *knotted*, a *bandage* for the head, called *knotted*, from its many croſſings on the temples; and *ſtellar*, or *ſolar*, from its direction in radii. It is a very uſeful *bandage*, when the temporal artery is divided, either in *arteriotomy*, or by an accidental wound, and hardly ever failing of ſucceſs in ſuppreſſing the hæmorrhage. For the application, vid. Heiſt. Surg. p. 3. c. 2. § 7.

Bandage, *incarnative*, is the ſame as the *uniting bandage*. Vid. Heiſter's Surgery. p. 3. c. 2.

Bandage-*depart*, the ſame as DISCRIMEN.

Bandages, *expulſive*, or ſuch as are uſed to reduce, and prevent the enlargement of tumours. They are frequently applied with this intention, to ſwelled legs, and alſo to diſcharge the offenſive matter in *fiſtulæ* and ſinuous ulcers. Vid. Heiſter's Surgery.

Bandage, *retentive*, is proper for the neck, as it ſerves to keep on the dreſſings, and topical remedies, applied to the neck after bleeding, &c. This *bandage* is generally compoſed of two ſimple bands, one of which is about a Paris ell, and the other an ell and a half in length; the firſt being of a thumb's breadth, and the laſt of three fingers. As to the application, vid. Heiſter's Surgery.

Bandage *for Tracheotomy.* Vid. Heiſter's Surgery, p. 3. c. 3.

Bandage, *Arnaud's*, is a *bandage* contrived by Mr. Arnaud of Paris, for *fiſtulæ* and abſceſſes of the *anus*, and is, by Garengeot, highly commended. But Heiſter thinks, that the common T *bandage* has the ſame advantages, provided the ſcapulary be made ſtrong.

Few of the common *bandages* are capable of reſtraining a profuſe hæmorrhage, after cutting for the *fiſtula* of the *anus*, or for the ſtone. What Heiſter has contrived for this purpoſe, may be ſeen in his Surgery, p. 3. c. 5.

Beſides Heiſter, there are many other writers on *bandages*. That author, in his introduction, § 28. mentions Galen, tranſlated by Vido Vidius, with figures; Verduc on *bandages*, in French; and Solingen: but he thinks the beſt writers of all, are Le Clerc, in his *Appareil commode*, and Baſſius, in High Dutch. For other *bandages*, as the *ſpica*, *ſcapulary*, &c. ſee them in their alphabetical places.

There is a diſſertation on the manner of ſtopping blood in hæmorrhages, with the deſcription of a machine, or bandage, for conſolidating veſſels after amputations, by compreſſion only, by M. Petit, in the Mem. of the A. D. S. an. 1751. p. 85. See alſo obſervations on a new *bandage*, by Helvetius, and on a compreſſive *bandage* for the cure of the lachrymal tumour. Ibid. an. 1742. Hiſt. 153, and an. 1745, p. 152.

BANDALEER, or **Bandeleer**, a large leathern belt, thrown over the right ſhoulder, and hanging down under the left arm; worn by the ancient muſqueteers both for the ſuſtaining of their fire-arms, and for the carriage of their muſquet-charges; which being put up in little wooden caſes, coated with leather, were hung, to the number of twelve, to each *bandaleer*.

The word is originally French, *bandoüillre*, formed apparently from *bandoalier*, a kind of banditti particularly infeſting the Pyreneans; who were formerly diſtinguiſhed by this piece of furniture; and were themſelves ſo denominated, *quaſi ban de voliers*, a *knot of robbers*.

The French ſoldiery ſtill retain the *bandaleer*; their horſe, their muſqueteers, and common guards, wearing it indifferently; excepting for ſome difference in its garniture.

BANDELET, or **Bandlet**, in *Architecture*, any little band, or flat moulding, encompaſſing a column, like a ring; as that which crowns the Doric architrave. See *Tab. Archit. fig.* 25. N° I *and* II.

It is alſo called *tænia*, which Vitruvius uſes for the ſame thing; ſometimes *fillet diadema*, &c.

It is ſometimes uſed for the three parts which compoſe the architrave, called, by Vitruvius, *faſciæ*; and which are ſometimes alſo denominated *bands*, or *plat-bands*.

BANDERET, the name appropriated to the commanders of the militia of the canton of Bern.

BANDEROLL, a little flag in form of a guidon, extended more in length than breadth, uſed to be hung out on the maſts of veſſels, &c.

BANDITTI, from the Italian *bandito*, perſons proſcribed, or, as we call it, outlawed; ſometimes denominated *banniti*, or *foris-banniti*.

BANDITTI, or BANDITI, is alſo a denomination given to highwaymen, or robbers, who infeſt the roads in troops, eſpecially in Italy and France.

The term is alſo applied to a ſort of freebooters, who pillage in the iſlands of the Archipelago.

BANDOLEERS, from the French *bandouliers*, in the *Military Art*, denote ſmall wooden caſes covered with leather; each of which contains a ſufficient charge of powder for a muſket.

BANDORE, the name of a muſical inſtrument with ſtrings, reſembling a lute, and ſaid to be invented in the fourth year of queen Elizabeth, by John Roſe, a citizen of London. See a figure of it in Hawkins's Hiſtory of Muſic, vol. iii. p. 345.

BANDY-*legs*, from the French *bander*, *to bend*, a diſtortion of the legs, when they turn either inward or outward, on either ſide; ariſing from ſome defect in the birth, or imprudence in the nurſe, endeavouring to make a child ſtand or walk before his legs were ſtrong enough to ſuſtain the weight of his body.

Beſide the uſe of emollients, it is proper to apply a kind of ſtrong boots proportioned to the limbs.

BANE-*berry*. See HERB *Chriſtopher*.

BANGLE-*ears*, an imperfection in a horſe's ears, remedied in the following manner: Place his ears in ſuch a ſituation as they are wanted to ſtand; bind them with two ſmall boards, ſo faſt as not to ſtir; and then clip away the empty wrinkled ſkin cloſe by the head.

BANGUE, a ſpecies of opiate, in great uſe throughout the Eaſt, for drowning cares, and inſpiring joy.

This, by the Perſians, is called *beng*; by the Arabs, *eſrar*, corruptly *aſſeral*, and *aſſarth*; by the Turks, *bengitic*, and vulgarly *maſtack*; by the European naturaliſts, *bangue*, or *bange*. The Indians, ſays Acoſta, eat the ſeed and leaves to increaſe their vigour, and to excite an appetite to their food. The nobles, and chief military officers, when they are diſpoſed to forget their toil, and to ſleep in perfect eaſe and ſecurity, take of the powder of the ſeed and leaves, as much as they think ſufficient; and thereto add an *arcea*, or green Indian hazel-nut; with as much opium as they think fit, and eat them all together with ſugar. If they deſire to be entertained with variety of ſcenes, and images of things in their ſleep, they add ſome of the choiceſt camphor, cloves, nutmegs, and mace. If they have a mind to be merry, witty, and to indulge their amours, they add ambergris and muſk, and make them all into an electary with ſugar. It is by many affirmed, that the ſeed and leaves promote luſt; whence, ſays J. Bauhine, it appears, that this herb has no affinity with hemp, though it be very much like it; ſince hemp, according to Dioſcorides, is of a hot and dry nature, and extinguiſhes amorous deſires.

Ray, from whom this account is taken, ſays, he learned from Sir Hans Sloane that it is a different plant from hemp. It grows in Indoſtan, and other parts of the Eaſt Indies, where it is principally in uſe.

Bangue, in reality, is a *ſuccedaneum* to wine, and obtains in thoſe countries where Mahometaniſm is eſtabliſhed; which prohibiting the uſe of that liquor abſolutely, the poor muſſulmen are forced to have recourſe to *ſuccedanea*, to rouſe their ſpirits. The principal are *opium*, and this *bangue*.

BANIAN-*days*, in *Marine Language*, is a cant term among ſailors, to ſignify thoſe days on which they have no fleſh meat. It ſeems to be derived from the practice of the people mentioned in the following article.

BANIANS, a religious ſect in the country of the Moguls, who believe a *metempſychoſis*, and will therefore eat no living creature, nor even kill noxious animals, but endeavour to releaſe them, if they ſee them in the hands of others.

The *Banians* are ſaid to be ſo fearful of having communication with other nations, that they break their cups, if one of a different religion hath drank out of them, or even touched them; and empty the water out of a pond where he has waſhed himſelf. It is added, that if they happen to touch one another, they muſt waſh and purify themſelves before they eat, or enter their own houſes. They carry, hanging at their necks, a ſtone called *tamberan*, as big as an egg, and perforated in the middle, through which run three ſtrings: this ſtone, they ſay, repreſents their great god, and upon this account they have great reſpect ſhewn them by all the Indians.

The proper *Banians* are called, in the SHASTER, or book of their law, by the name of *ſhuddery*, under which are comprehended all who live after the manner of merchants, or that deal and tranſact for others, as brokers; excluſive of the mechanics, or artificers, who make another caſt, called *wyſe*. Theſe *Banians* have no peculiar ſect or religion, unleſs it be, that two of the eight general precepts given by the legiſlator, Bremaw, to the Indian nation, are, on account of the profeſſion of the *Banians*, ſuppoſed more immediately to relate to them, viz. thoſe which enjoin veracity in their words and dealings, and avoiding all practices of circumvention in buying and ſelling.

The *Banians* and the Chineſe are the greateſt traders in the Indies, to whom muſt alſo be added the Jews and Armenians, who are greatly diſperſed over thoſe parts. But the moſt conſiderable trade is carried on by the *Banians*, in the whole peninſula on this ſide the Ganges. They are extremely ſkilful and cunning in commerce. Moſt of them follow brokerage, and moſt of the brokers of the Engliſh, Dutch, and French companies, are of that nation. For the reſt, they are very honeſt, and have almoſt conſtantly in their hands the ſtock and caſh of thoſe companies.

They are likewiſe bankers; and there are few places in the Eaſt Indies, for which they cannot furniſh bills of exchange. They have alſo a ſort of ſtanding caſh or bank, where perſons may depoſit their money, and take it out again whenever they pleaſe.

Their form of contract in buying and ſelling, is remarkable; being done in the profoundeſt ſilence, only by touching each other's fingers: the buyer looſening his *pamerin*, or girdle, ſpreads it on his knee; and both he and the ſeller having their hands underneath, by the intercourſe of the fingers, mark the price of pounds, ſhillings, &c. demanded, offered, and at length agreed on. When the ſeller takes the buyer's whole hand, it denotes a thouſand, and, as many times as he ſqueezes it, as many thouſand pagods, or roupees, according to the ſpecies in queſtion, are demanded: when he only takes the five fingers, it denotes five hundred, and when only one, one hundred: taking only half a finger, to the ſecond joint, denotes fifty: the ſmall end of the finger, to the firſt joint, ſtands for ten. See CEURAWATH.

BANILLIA, in the *Materia Medica*, a name uſed by ſome for the *vanillia*, or vanilloes, uſed in making the ſcented chocolate.

BANISHMENT, EXILE, among us, is of two kinds: the one voluntary, and upon oath; the other by compulſion, for ſome offence or crime.

The former, properly called *abjuration*, is now ceaſed; the latter is chiefly enjoined by judgment of parliament. Yet outlawing and tranſportation may alſo be conſidered as ſpecies of exile.

By Magna Charta, none ſhall be outlawed or baniſhed his country, but by lawful judgment of his peers, or according to the law of the land. 9 Hen. III. cap. 29. And by the common law no perſon ſhall be baniſhed, but by authority of parliament; or in caſe of ABJURATION for felony, &c. But this is taken away by ſtatute, 3 Inſt. 115. Stat. 21 Jac. I. cap. 28.

BANISTERIA, in *Botany*, a genus of plants belonging to the *decandria trigynia* claſs of Linnæus; the characters of which are theſe. The flower hath five petals, which are ſhaped like thoſe of the papilionaceous tribe, but ſpread open; having in ſome ſpecies one, in others two, and in ſome ſeveral nectarious glands, with ten ſhort ſtamina. There are in ſome ſpecies three, and in others but one germen, which afterward become ſo many winged fruit, like thoſe of the maple; each containing a ſingle ſeed. There are only ſix known ſpecies of this genus.

Theſe plants are all of them natives of warm countries, and therefore cannot be preſerved in England, unleſs in a bark ſtove.

BANK, in *Commerce*, is a denomination given to certain ſocieties, or communities, who take on them the charge of the money of private perſons, to improve it, or to keep it ſecure.

The word *bank*, in this ſenſe, comes from the Italian *banca*, formed of the Spaniſh *banco*, a bench whereon the ancient money-changers ſat in the public markets; or, as others think, a table whereon they told their money: for the Spaniſh *banco* ſignifies a table, as well as a bench; as among the Greeks the word τραπεζα ſignified a *bench*, as well as a *table*; whence the word τραπεζιτης for a *bencher*.

It cannot be doubted but that the beginning of traffic was by exchanging one commodity for another, as men could beſt ſuit each other's occaſions. But the neceſſities of men being ſo various and different, in reſpect of the quantity and quality of requiſites, money was inſtituted as the moſt convenient medium for commerce; whereby people might procure whatſoever they ſtood in need of, in quantities according to their exigencies.

This changed the term of bartering into that of buying and ſelling; yet all trading at length reſults into a general barter. For he who ſells any thing to receive money for it, purchaſes what he requires with the ſame money. Money then becoming the principal engine for circulating the bulk of commerce, its application to trade is proper to be conſidered.

Money is uſed in the minuter kinds of dealings, as retailing, &c. when it is commuted for all kinds of labour, and to furniſh the neceſſary proviſions for daily uſe. This requires its being divided into the ſmalleſt denominations of the pieces, as into ſhillings and pence: ſo that this way of dealing is not capable of being tranſacted by bills and aſſignments.

Money is alſo employed in the more extenſive and wholeſale way of trade, wherein large ſums are negociated; and this occaſions frequent payments from one tradeſman to another. In which payments, although ſtrictly ſpeaking ready caſh be required, as often as contracts are made, yet as commerce in general conſiſts in the mutual dealings and tranſactions of many traders, it may often ſo fall out, by means of interchangeable debts and credits, that divers traders may ſatiſfy each other's occaſions, without making any payments in ſpecie, by transferring their debts to each other.

But when ſuch mutual conveniences do not occur, traders uſually receive their money in ſpecie, and ſo pay it from one to the other. Yet this way of payment is attended with many inconveniences; as, the trouble in counting the money, hazard in ſecuring it from the attempts of robbers, and loſs from truſting it with unfaithful ſervants: for the prevention of all which, cities of large commerce have very naturally introduced the uſe of *banks*.

A *bank* then may be properly defined a common repoſitory, where many perſons agree to keep their caſh, to be always ready at their call, or direction.

There are ſeveral of theſe *banks* eſtabliſhed in the ſeveral principal trading cities in Europe; as in Venice, Genoa, London, Amſterdam, Hamburg, Paris, &c. But of all others, that of Venice is the moſt conſiderable, as being the moſt ancient, and that whereon the others are modelled.

Bank is alſo applied, in a more particular manner, to ſocieties inſtituted for lending money on pledges. Of theſe there are ſeveral in Holland, particularly at Amſterdam, where it is called the *bank van leening*, or *bank of loan*. Private perſons are here furniſhed with money, on the depoſit of effects as a ſecurity, and on payment of a certain intereſt regulated by the burgo-maſters. This *bank* is otherwiſe called the *Lombard-huis*, or *Lombard-houſe*, or, ſimply, *Lombard*; which is the name it is moſt commonly known by, in moſt of the towns in Holland.

Bank, or Banco, *of Venice*, commonly called *banco del guiro*, was eſtabliſhed in the middle of the twelfth century, and is properly a board of public credit and intereſt; or a general and perpetual purſe for all merchants and traders; eſtabliſhed by a ſolemn edict of the commonwealth, which enacts, that all payments of wholeſale merchandize, and letters of exchange, ſhall be in *banco*, or *bank* notes; and that all debtors and creditors ſhall be obliged, the one to carry their money to the *bank*, the other to receive their payments at *banco*; ſo that payments are performed by a ſimple transfer from the one to the other: he who was before creditor on the *bank* books, becoming debtor as ſoon as he has reſigned his right to another, who is entered down as creditor in his place; ſo that the parties only change name, without any effective payment being made. Indeed there are ſometimes actual payments made, eſpecially in matters of retail, and when foreigners are diſpoſed to have ready money to carry off in ſpecie; or when particular traders chooſe to have a ſtock by them to negociate in bills of exchange, &c. The neceſſity of theſe effective payments has given occaſion to the opening a fund of ready money; which is found ſo far from diminiſhing the ſtock, that this liberty of withdrawing money at pleaſure rather augments it. By means of this *bank*, the republic, without incroaching on the freedom of commerce, or without paying any intereſt, is miſtreſs of 5,000,000 ducats, to which the capital of the *bank* is limited, to be in readineſs on any preſſing occaſion; the republic being ſecurity for the capital.

Bank *of England* was firſt eſtabliſhed in the year 1694, partly for the convenience of commerce, and partly alſo for the emolument of the proprietors. The ſcheme was projected by Mr. W. Paterſon, a merchant, and debated for a long while in the privy-council, till at length, by an act of 5 and 6 William and Mary, cap. 20. it was enacted, that their majeſties might grant a commiſſion to take particular ſubſcriptions for 1,200,000*l.* of any perſons, natives or foreigners, whom their majeſties were hereby empowered to incorporate, with a yearly allowance of 100,000*l.* viz. 96,000*l.* or 8 *per cent.* for intereſt till redeemed, and 4000*l.* to be allowed the intended *bank* for management. The corporation was to have the name of the governor and company of the *bank* of England; their ſaid fund to be redeemable upon a year's notice, after the firſt of Auguſt, 1705, and payment of the principal, and then the corporation to ceaſe. The company was enabled by this act to purchaſe lands, &c. unlimitedly, and to enjoy the other uſual powers of corporations; their ſtock was to be transferrable. They were reſtricted from borrowing more than 1,200,000*l.* except on parliament funds, and from trading in any merchandiſe, except in bills of exchange, and in bullion, and in the ſale of ſuch goods as were the produce of lands purchaſed by the corporation: and all bills obligatory under the ſeal of the ſaid corporation, were made aſſignable by indorſement. The charter of incorporation was executed July 27, 1694; which directs, that there be a governor, deputy-governor, and twenty-four directors; and ſpecifies the qualifications of voters and of directors, together with other regulations, which have been farther amended and enlarged by ſubſequent ſtatutes.

The buſineſs of the *bank* is, for the moſt part, that of dealing in bullion of gold and ſilver, diſcounting bills, advancing money to the public on the credit of acts of parliament, circulating their own notes, &c. and exchequer bills for the government; beſide the management of thoſe funds which are immediately under its care, and which conſtitute a principal part of the *national* Debt.

Bank, *agents of*. See Agent.

Bank *bills*. See Bill.

Bank, *days in*. See Day.

Bank *of France* was firſt projected by Mr. Law, a native of Scotland, with a view of paying off the public debts of France, by drawing its creditors into the newly projected Miſſiſſippi and India companies, and erected in the year 1716. It was taken into the king's hands in 1718, and denominated the *Royal Bank*; and by its union with both the companies above mentioned, formed a bubble, which occaſioned great confuſion and diſtreſs in the year 1720.

Bank, *million*, derives its name from king William's *million* lottery in the year 1695; the proprietors agreed in partnerſhip to purchaſe tickets in this lottery. They afterwards purchaſed many reverſions of the 14 *per cent.* annuities, and admitted many proprietors of annuities to purchaſe their joint ſtock, which amounted, and ſtill amounts, to 500,000*l.* They are a partnerſhip by deed enrolled in chancery, in the year 1721. They divided 5 *per cent.* till Lady-day, 1728, when they reduced their annual dividend to 4 *per cent.* and it was again raiſed to 5 *per cent.* which is ſtill continued.

Bank *of Scotland* was erected by act of parliament in 1695. Its capital ſtock is 101,000*l.* ſterling.

Bank, *royal, of Scotland*, was incorporated by charter of king George I. in the year 1727. Its capital is 151,000*l.* ſterling; and the public revenues of Scotland are paid into this *bank*.

Bank, or Bench, in *Law*. See Banc.

Bank, *foot*. See Banquette, and Footbank.

Bank, in *Natural Hiſtory*, denotes an elevation of the ground, or bottom of the ſea, ſo as ſometimes to ſurmount the ſurface of the water, or, at leaſt, to leave the water ſo ſhallow, as uſually not to allow a veſſel to remain afloat over it.

In this ſenſe, *bank* amounts to much the ſame with flat, ſhoal, &c.

There are *banks* of ſand, and others of ſtone, called alſo ſhelves, or rocks. In the north ſea, they alſo ſpeak of *banks* of ice, which are large pieces of that matter floating. Vapours at ſea occaſion ſometimes ſuch a *deceptio viſûs*, that mariners imagine they ſee land, with trees, &c. They call ſuch deceptions fog-banks. See a remarkable deception of this kind related in Dr. Hawkeſworth's Account of the Voyages to the Southern Hemiſphere, vol. i. p. 10.

A long narrow *bank* is ſometimes called a *rib*.

The *bank* abſolutely ſo called, or the *main bank*, or *great bank*, denotes that of Newfoundland, the ſcene of the cod-fiſhery.

It is called the *great bank*, not only by reaſon of its vaſt extent, being, according to the Engliſh computation, two hundred miles long, and, according to the French, one hundred leagues, or three hundred miles; but alſo on account of ſeveral leſſer *banks* near it, where cod are alſo caught. Theſe laſt the French call *banquezeaux*.

This is one of thoſe *banks* which have water enough to float a ſhip, and which, on this account, are not dangerous.

Banks are uſually diſtinguiſhed by a buoy, poſt, or the like. On charts, ſand-*banks* are uſually marked by little dots, and *banks* of ſtone by croſſes. The colours of the buoys are alſo varied accordingly; ſand-*banks* being denoted by light-coloured buoys, and rocks by black ones.

In large rivers, as the Elbe, &c. ſand-*banks*, by high tides and inundations, are liable to change places; care is therefore taken to ſhift the buoys from time to time, to ſhew the true channel of the river.

An exact knowledge of the *banks*, their extent, and the depth of water on them, makes the moſt eſſential part of the ſcience of a pilot, and a maſter of a ſhip: if the veſſel be large, and draw much water, great attention will be neceſſary to keep clear of the *banks*: on the contrary, if it be ſmall, the ſame *banks* afford a ſure *aſylum*, where it may brave the largeſt and ſtouteſt veſſels, which dare not follow it here. By means of this barrier, many a ſmall craft has eſcaped its enemy.

BANK, in veſſels which go with oars, is uſed for the bench where the rowers are ſeated; popularly called, by our ſeamen, the *thaught*.

In this ſenſe, we read of *banks* of gallies, of galeaſſes, of galliotes, of brigantines, and the like.

The Venetian gondolas have no *banks*; for the watermen row ſtanding.

The common gallies have twenty-five *banks*, that is, twenty-five on each ſide, in all fifty *banks*, with one oar to each *bank*, and four or five men to each oar. The galeaſſes have thirty-two *banks* on a ſide, and ſix or ſeven rowers to a *bank*.

BANK alſo denotes an elevation of earth, ſtones, ſtakes, or other materials, in form of a wall, or cauſeway, to ſtop the waters, and prevent inundations.

Theſe, on other occaſions, are denominated *dams*, and *ſea-walls*, &c. and by the ancients, *aggeres*: thoſe on the coaſts of Holland are more particularly denominated *dykes*. The beſt *bank* in the opinion of Dr. Hales is that contrived by Dr. Wark of Scotland. A quantity of furze is fixed to the bottom of the channel of ſuch a breadth as is proportioned to the force which it is to reſiſt. The ſand, or ſlime, will ſoon ſettle in the furze; and when this is covered, another bed of furze is to be laid on as before, and ſo on, till the *bank* is raiſed to a ſufficient height.

BANK is alſo uſed, in ſeveral games, for the ſtock or fund of him who undertakes the game.

BANK *at baſſet*, a ſum of money laid down by the *tailleur*, before the gameſters, to anſwer all the winning cards that ſhall turn up in his courſe of dealing. Yet it is to be obſerved, that what the *bankers* gain *per cent.* of all the money adventured at pharo, is greater than at baſſet; it being two pounds nineteen ſhillings and ten pence *per cent.* in the firſt, and but fifteen ſhillings and three pence in the ſecond. Vid. De Moiv. Doctr. Chanc. p. 93.

BANKER, in *Commerce*. The hiſtory of private *banks* is as follows. The royal mint in the tower of London had for ſome years before the year 1640, been made uſe of as a kind of *bank*, or depoſit, for merchants to lodge their caſh in. But king Charles the firſt having in that year made free with their money, the mint loſt its credit. After this, the merchants and traders of London generally truſted their caſh with their ſervants, until the breaking out of the civil war, when it was very cuſtomary for their apprentices and clerks to leave their maſters, and go into the army. Whereupon in ſuch unſettled times, merchants not daring longer to confide in their apprentices, began firſt, about the year 1645, to lodge their neceſſary caſh in goldſmith's hands, both to receive and pay for them; until which time the whole and proper buſineſs of London goldſmiths was, to buy and ſell plate, and foreign coins of gold and ſilver, to melt and cull them, to coin ſome at the mint, and with the reſt to ſupply the refiners, plate-makers, and merchants, as they found the price to vary. This account of the matter we have from a ſcarce and moſt curious ſmall pamphlet, publiſhed in 1676, intitled, the Myſtery of the new-faſhioned Goldſmiths, or Bankers diſcovered, in only eight quarto pages.

Bankers on their firſt eſtabliſhment allowed to thoſe who entruſted their money in their hands a moderate intereſt for the ſame, and hereby their buſineſs was very conſiderably increaſed, and roſe to great reputation in the year 1667, when the Dutch burnt our ſhips at Chatham; but this event cauſed a *run* on the *bankers*, which hurt their credit; and in the year 1672 king Charles II. ſhut up the exchequer, and ſeized the money which the *bankers* had lent him at 8 *per cent.* intereſt, the whole ſum amounting to 1,328,526*l.* The king was afterwards neceſſitated to pay 6 *per cent.* intereſt for this debt out of his hereditary exciſe, but the principal was never paid. However, the parliament of 12 William, cap. 12. provided for a large arrear of intereſt, and ſettled an intereſt of 3 *per cent.* for the future. The debt was hereby made redeemable, on paying one moiety of the principal ſum, viz. 664,263*l.* farther confirmed by an act of 2 and 3 Anne, cap. 15. which moiety now became the proper debt of the public; and being reduced from 6 to 5 *per cent.* in 1717, was finally ſubſcribed into the South-ſea capital ſtock in the year 1720.

Bankers now allow no intereſt; and by inveſting a certain proportion of it in the funds, or laying it out on other ſufficient ſecurity, and trafficking with it in the ſtocks, in diſcounts, &c. reap very conſiderable advantage from it; and by negociating bills, &c. on the part of their creditors, greatly contribute to the convenience and diſpatch of buſineſs.

In Italy the employment of a *banker*, eſpecially in republics, does not derogate from nobility; and hence it is, that moſt of the cadets, or younger ſons of perſons of condition, undertake it for the ſupport of their family.

The ancient *bankers* were called *argentarii*, and *nummularii*. Their chief buſineſs was to put out the money of private perſons to intereſt: they had their boards and benches for this purpoſe, in all the markets and public places, where they took in the money from ſome, to lend it to others.

The Romans had two kinds of *bankers*, though their office was much more extenſive than that of the *bankers* among us; theirs being that of public officers, in whom were united the functions of a broker, agent, *banker*, and notary; managing the exchange, taking in money, aſſiſting in buying and ſelling, and drawing the writing, neceſſary on all theſe occaſions.

BANKERS *in the court of Rome*, are perſons authorized, excluſive of all others, to ſolicit and procure, by their correſpondents at Rome, all bulls, diſpenſations, and other acts diſpatched at the papal datary, or in the legateſhip of Avignon: they are diſperſed in all the cities of France, where there is a parliament, or a preſidial; and were erected into a regular, and hereditary office, by an edict in 1673.

They owe their origin to the Guelphs, who took ſhelter at Avignon, and in other cities within the obedience of the pope, in the time of the civil wars of Italy. The favour they were in with the pontiffs, for having eſpouſed the papal cauſe, occaſioned their being employed in procuring expeditions of the court of Rome. But the heavy extortions they practiſed towards their clients, ſoon rendered them odious, and occaſioned ſeveral denominations of reproach, as, *coarcini*, *caturcini*, *caurſini*, *corſini*, &c. from the city Cahors, the native place of pope John XXII. in whoſe pontificate they were in their higheſt power.

BANKER, in *Bricklaying*, a piece of timber whereon they cut the bricks.

The *banker* is ſix feet long, or more, according to the number of men to work at it, and nine or ten inches ſquare: it is to be laid on two peers of timber, three feet high from the floor they ſtand on.

BANKER, in *Sea Language*, ſignifies a veſſel employed in the cod-fiſhery, on the banks of Newfoundland.

BANKING, the making of *banks* to oppoſe the force of the ſea, rivers, or the like, and ſecure the land from being overflowed thereby.

With reſpect to the water which is to be kept out, this is called *banking*; with reſpect to the land, which is hereby to be defended, *imbanking*.

BANKING, in a ſalt-work, the raiſing a fence againſt the ſea, whereby its waters may be kept out, excepting ſo much as is neceſſary for the preparation of the ſalt.

BANKRUPT, a dealer, who having gotten other mens goods, or money, in his hands, abſconds to defraud his creditors; or being ſo reduced and involved, that he can conduct his buſineſs no longer, is deſirous of being legally diſcharged from farther demands and trouble.

The word is formed of the ancient Latin *bancus*, a *bench*, or *table*, and *ruptus*, *broken*.

Bank, we have elſewhere obſerved, originally ſignified a *bench*, which the firſt bankers had in the public places, in markets, fairs, &c. on which they told their money, wrote their bills of exchange, &c. Hence, when a banker failed, they broke his bank, to advertiſe the public, that the perſon to whom the bank belonged, was no longer in a condition to continue his buſineſs. As this practice was very frequent in Italy, it is ſaid, the term *bankrupt* is derived from the Italian *banco rotto*, *broken bench*.

Cowel rather chuſes to deduce the word from the French *banque*, *table*, and *route*, *veſtigium*, *trace*, by a metaphor from the ſign left in the ground, of a table once faſtened to it, and now gone. On this principle he traces the origin of *bankrupts* from the ancient Roman *menſarii*, or *argentarii*, who had their *tabernæ* or *menſæ* in certain public places; and who, when they fled, or made off with the money, that had been truſted to them, left only the ſign or ſhadow of their former ſtation behind them.

And it is obſervable, that the title of the firſt Engliſh ſtatute concerning this offence, 34 Hen. VIII. cap. 4. "againſt ſuch perſons as do make *bankrupt*," is a literal tranſlation of the French idiom, *qui ſont banque route*.

By ſtat. 1 Jac. I. cap. 15. a *bankrupt* is thus deſcribed. All and every perſon who ſhall uſe the trade of merchandiſe by way of bargaining, exchange, bartering, or otherwiſe in groſs, or by ſeeking his or her living by buying and ſelling, who ſhall depart his houſe, or abſent himſelf, or ſuffer himſelf to be arreſted for any debt, or other thing, not grown due for money delivered, wares ſold, or other good conſideration; or ſhall ſuffer himſelf to be outlawed, or go to priſon, or fraudulently procure himſelf to be arreſted, or his money or goods attached; or make any fraudulent conveyance of his lands, goods, or chattels, whereby his creditors may be defeated in the recovery of their juſt debts; or being arreſted for debt, ſhall lie in priſon ſix months or more, upon ſuch arreſt or detention, ſhall be adjudged a *bankrupt*.

There are ſeveral ſubſequent ſtatutes relating to *bankrupts*, viz. 21 Jac. I. cap. 19.—4 Anne, cap. 17.—5 Anne, cap. 22.—7 Geo. I. cap. 31.—5 Geo. II. cap. 30.

In ſome places *bankrupts* are condemned to wear a green cap; at Lucca, an orange cap.

BANKRUPTCY, the failure, abſconding, and relinquiſhing of traffick in a merchant, a banker, or any other trader.

The French make this difference between a *bankruptcy* and a *failure*; that the firſt is ſuppoſed voluntary and fradulent, and the latter conſtrained and neceſſary, by means of accidents, &c.

A failing, breaking, or ſtopping of payment, diminiſhes the merchant's credit; but does not note him with infamy, as *bankruptcy* often does.

When a merchant, &c. fails to appear at the exchange, &c. without apparent reaſon, it is called *a failing of preſence*; the *bankruptcy* becomes open from the day he abſconds, or when the ſeal is affixed to his effects.

BANKRUPTCY, *commiſſion of*. See COMMISSION.

BANLEUGA, or BANNILEUGA, or BANLIEUE, in *Middle Age Writers*, the territory within which the juriſdiction of municipal magiſtrates, or ordinary judges of a city, town, or the like, are confined.

It is thus called, becauſe within this tract, they may make their proclamations, prohibitions, and other acts of juſtice and policy, compriſed under the name of BAN, or BANNUM.

BANN, or BAN, BANNUM, or BANNUS, in the *Feudal Law*, a ſolemn proclamation, or publication of any thing.

The origin of the word is uncertain: ſome deduce it from the Britiſh *ban*, *clamour*, *noiſe*; others from the Saxon *pan*, a thing ſpread; whence *ban*, and *band*, uſed for a flag.

Bracton mentions *bannus regis*, for a proclamation of ſilence anciently made by the court, before the encounter of the champions in a combat.

BANN is alſo uſed for a ſolemn convocation of the nobility of a province, to attend the king in his army, conformably to their ſeveral tenures.

Bann, in this ſenſe, differs from *rear-bann*; as the former reſpects thoſe who hold mediately of him. But the words are now confounded; and *bann*, and *rear-bann*, denote a ſummons to all the feudal tenants, mediate and immediate, to go to war in the king's ſervice.

BANN alſo denotes the aſſembly, or body of nobility and gentry thus convocated.

In this ſenſe, they ſay, the *bann* and *rear-bann* is long in getting into the field; the *bann* and *rear-bann* was aſſembled, &c.

The French nobility appear to have ſerved the king, in the way of *bann* and *rear-bann*, from the beginning of the monarchy; though the uſage was not regularly ſettled, till the time of the inveſtiture of feuds.

BANN is more particularly uſed to denote a proſcription or baniſhment, for a crime proved; becauſe anciently publiſhed by ſound of trumpet; or, as Voſſius thinks, becauſe thoſe who did not appear at the abovementioned ſummons, were puniſhed by proſcription.

Hence, *to put a prince under the* bann *of the empire*, is to declare him diveſted of all his dignities.

The ſentence only denotes an interdict of all intercourſe, and offices of humanity, with the offender; the form of which ſeems taken from that of the Romans, who baniſhed perſons, by forbidding them the uſe of fire and water.

Sometimes alſo cities are put under the imperial *bann*; that is, ſtripped of their rights and privileges.

BANN alſo denotes a pecuniary mulct, or penalty, laid on a delinquent for offending againſt a *bann*.

BANNS *of marriage*, are certain ſolemn notices of matrimonial contracts made in the pariſh-church, before the marriage; that if there be any objections to either party as to prior engagements, &c. there may be an opportunity of making them. The publication of *banns* (popularly called *aſking in the church*) was intended as an expedient to prevent clandeſtine marriages: but a licence or diſpenſation is now eaſily procured, ſo that their uſe is defeated.—By the laws of the church, *banns* are to be publiſhed thrice, on three diſtant days, in the places where the parties live, on pain of nullity of marriage; and excommunications are threatened againſt thoſe, who knowing impediments conceal them. But ſee 26 Geo. II. cap. 33.

The uſe of matrimonial *banns* is ſaid to have been firſt introduced in the Gallican church, though ſomething like it obtained even in the primitive times; and it is this Tertullian is ſuppoſed to mean by *trinundina promulgatio*.

BANN is alſo uſed for a ſolemn *anathema*, or excommunication, attended with curſes, &c.

In this ſenſe, we read of *papal banns*, &c.

BANN *of God*, *bannus Dei*, or the judgment of God. Spelman takes it for excommunication.

BANN is alſo uſed for a prohibition.

In which ſenſe, the *bann* of harveſt, of vintage, &c. in the French cuſtoms, imports a prohibition to reap, or gather the grapes, without leave of the lord.

The former is now taken away, and the peaſant may reap his corn when he pleaſes; but the latter ſtill remains, perſons not being allowed to open the vintage, till publication is made by the officers of the place for that purpoſe.

BANN-*vin*, in the French *Cuſtoms*, a privilege enjoyed by lords, of ſelling the wine of their own growth, during a certain time, excluſive of all other perſons within the compaſs of their fees or lordſhips.

The ſame right, in ſome places, extends alſo to other liquors; and even to hogs, cows, and other animals.

BANNALIS *mola*, or *bannal-mill*, a kind of feudal ſervice, whereby the tenants of a certain diſtrict are obliged to carry their corn to be ground at a certain mill, and to be baked at a certain oven, for the benefit of the lord.

BANNER properly denotes a ſquare flag, faſtened like a cornet to a lance.

Menage derives the word from the Latin *bandum*, a *band*, or *flag*; and ſuppoſes *banniere* to have been firſt written for *bandiere*; which is confirmed by this, that we meet with the word *banderia*, uſed, in the ſame ſenſe, by Latin writers of the barbarous age.

A *banner* differed from a *penon*, or *guidon*, which had a long tail, or train; the cutting off which, in the ceremony of creating a BANNERET, converted it into a *banner*.

Moſt of the ancient lords are repreſented, on their ſeals, with *banners* in their hand; in which guiſe they entered the liſts in tournaments.

Arms **BANNER**-*wiſe*, or *en banniere*, are thoſe borne ſquare; ſtill uſed in Bretagne, to denote families deſcended from BANNERETS. Favyn ſuppoſes the uſage to have been brought thither from England.

It was reputed more honourable for a perſon to bear his arms in a *banner*, than in an *eſcutcheon*.

BANNER is alſo uſed to denote the flag under which all the tenants of the ſame fief were to muſter themſelves, when their ſervice was required in the army.

BANNER is alſo uſed for the chief flag, or ſtandard of a prince, lord, baron, or the like.

BANNER, *the*, *of France*, was the largeſt and richeſt of all the flags borne by the ancient kings, in their great military expeditions. St. Martin's cap was in uſe ſix hundred years, as the *banner* of France: it was made of taffety, painted with the image of that ſaint, and laid one or two days on his tomb, to prepare it for uſe. This was ſucceeded by the famous AURIFLAMMA, or ORIFLAMME. Though ſome make a difference between the *banner* of France and the *oriflamme*; making it the diſtinguiſhing character of the former, to be hung out at the window, wherever the king was; whereas the latter was only uſed in extraordinary wars.

About the year 1100 was introduced a more pompous *apparatus*; the mode of which was borrowed from Italy; the *banner* royal was faſtened to the top of a maſt, or ſome tall tree planted on a ſcaffold, borne on a chariot drawn by oxen, covered with velvet houſings, decorated with devices, or cyphers, of the reigning prince. At the foot of the tree was a prieſt, who ſaid maſs early every morning. Ten knights mounted guard on the ſcaffold, night and day, and as many trumpets, at the foot of the tree, never ceaſed flouriſhing, to animate the troops. This cumberſome machine, the mode of which was brought from Italy, continued in uſe about an hundred and thirty years. Its poſt was in the center of the army. And here it was the chief feats were performed, to carry off and defend the royal *banner*: for there was no victory without it; nor was an army reputed vanquiſhed, till they had loſt this *banner*.

BANNER is alſo uſed, in *Middle Age Writers*, for any flag or enſign.

But the word is out of uſe in this ſenſe, except in ſpeaking of former times, or foreign nations. In the Levant they ſtill ſay, the Engliſh *banner*, the Venetian *banner*, &c. The French alſo retain the denomination *banner*, in ſpeaking of eccleſiaſtical proceſſions; where the people, bearing each a croſs, march under a *banner*, repreſenting the church militant; to denote themſelves ſoldiers of the church.

BANNERS *of the Romans*. See SIGNA.

BANNERETS, an ancient order of knights, or feudal lords, who, poſſeſſing ſeveral large fees, led their vaſſals to battle, under their own flag, or banner, when ſummoned thereto by the king.

The word ſeems formed from *banner*, a ſquare flag, or from *band*, which anciently alſo denoted a flag.—*Bannerets* are alſo called in ancient writers, *milites vexilliferi*, and *vexillarii*, *bannerarii*, *bannarii*, *banderiſii*, &c.

Anciently there were two kinds of knights, *great* and *little*; the firſt whereof were called BANNERETS, the ſecond BACHELORS; the firſt compoſed the upper; the ſecond, the middle nobility.

The *banneret* was a dignitary allowed to march under his own flag, whereas the *bachelarius eques* followed that of another.

To be qualified for a *banneret*, one muſt be a gentleman of family, and muſt have a power to raiſe a certain number of armed men; with eſtate enough to ſubſiſt at leaſt twenty-eight or thirty men. This muſt have been very conſiderable in thoſe days, becauſe each man, beſides his ſervant, had two horſemen to wait on him, armed, the one with a croſs-bow, the other with a bow and hatchet.

As he was not allowed to be a baron who had not above thirteen knights-fees, ſo he was not admitted to be a *banneret*, if he had leſs than ten.

Banneret, according to Spelman, was a middle order between a baron, and a ſimple knight; called ſometimes alſo *vexillarius minor*, to diſtinguiſh him from the greater, that is, from the baron, to whom alone properly belonged the *jus vexilli*, or privilege of the ſquare flag.

Hence the *banneret* was alſo called *bannerettus*, *quaſi baro minor*, a word frequently uſed by Engliſh writers in the ſame ſenſe, as *banneret* was by the French; though neither of them occur before the time of Edward II.

Some will have *bannerets* to have originally been perſons who had ſome portion of a barony aſſigned them; and enjoyed it under the title of *baro proximus*, and that with the ſame prerogatives as the baron himſelf.

Some again find the origin of *bannerets* in France; others in Brittany; others in England. Theſe laſt attribute the inſtitution of *bannerets* to Conan, lieutenant of Maximus, who commanded the Roman legions in England under the empire of Gratian, in 383. This general, ſay they, revolting, divided England into forty cantons, and in theſe cantons diſtributed forty knights, to whom he gave a power of aſſembling on occaſion, under their ſeveral banners, as many of the effective men as were found in their reſpective diſtricts: whence they are called *bannerets*.

However this be, it appears from Froiſſart, &c. that anciently ſuch of the military men as were rich enough to raiſe and ſubſiſt a company of armed men, and had a right to do ſo, were called *bannerets*. Not, however, that theſe qualifications rendered them knights, but only *bannerets*; the appellation of knight being only added thereto, becauſe they were ſimple knights before.

Bannerets were ſecond to none, but knights of the garter; they were reputed the next degree below the nobility; and were allowed to bear arms with ſupporters, which none elſe may, under the degree of a baron. In France, it is ſaid, the dignity was hereditary; but in England it died with the perſon that gained it. The order dwindled on the inſtitution of *baronets* by king James I. and at length became extinct. The laſt perſon created *banneret* was Sir John Smith, made ſo after Edghill-fight, for reſcuing the ſtandard of king Charles I.

The form of the *banneret's* creation was this: on a day of battle, the candidate preſented his flag to the king or general, who, cutting off the train, or ſkirt thereof, and making it a ſquare, returned it again, the proper banner of *bannerets*; who are hence ſometimes called *knights of the ſquare flag*.

There ſeems to have been *bannerets* created, either in a different manner, or by others than the ſovereign; ſince king James, in the patent of baronets, gives them precedence to all knights *bannerets*, except ſuch as are created by the king himſelf in the field; which implies, either that there are ſome of this order created out of the field, or by inferior perſons.

BANNERET is alſo the name of an officer, or magiſtrate of Rome, towards the cloſe of the fourteenth century.

The people of that city, and throughout the territory of the church, during the diſputes of the antipopes, had formed a kind of republican government; where the whole power was lodged in the hands of a magiſtrate, called ſenator, and twelve heads of quarters, called *bannerets*, by reaſon of the banners which each raiſed in his diſtrict.

BANNIMUS, q. d. *we baniſh*, from the obſolete *bannio*, the form of expulſion of any member from the univerſity of Oxford, by affixing the ſentence up in ſome public place, as a denunciation or promulgation of it.

BANNOCK, in *Food*, is an oat-cake kneaded only with water, and baked in the embers. Theſe are common in Lancaſhire, and ſome other counties.

BANNUS, or BANUS, a title anciently given to the governor or viceroy of Croatia, Dalmatia, and Sclavonia.

BANNUS *epiſcopalis*, was a mulct paid to the biſhop by thoſe guilty of ſacrilege, and other crimes.

BANNUM *capitis*, was a mulct paid in cattle.

BANOY, the name given, by the people of the Philippine iſlands, to a kind of hawk, ſomewhat larger than our ſparrow-hawk, and of a yellowiſh colour on the back and wings, and white under the belly. It is the moſt common of all the kinds of hawk in that part of the world, and is a very voracious animal.

BANQUET, in the *Manege*, denotes that ſmall part of the branch of a bridle under the eye; which, being rounded like a ſmall rod, gathers and joins the extremities of the bit to the branch, in ſuch a manner, that the *banquet* is not ſeen, but covered by the cap, or that part of the bit next the branch.

BANQUET-*line*, is an imaginary line drawn by the bit-makers along the *banquet*, in forging a bit, and prolonged upwards and downwards, to adjuſt the deſigned force or weakneſs of the branch, in order to make it ſtiff, or eaſy. For the branch will be hard and ſtrong, if the ſevil-hole be on the outſide of the *banquet*, with reſpect to the neck; and it will be weak, and eaſy, if the ſevil-hole be on the inſide of the line, taking the center from the neck.

BANQUETING-*room*, or *houſe*. See XENIA, SALOON, &c.

The ancient Romans ſupped in the *atrium*, or veſtibule, of their houſes; but, in after-times, magnificent ſaloons, or *banqueting-rooms*, were built, for the more commodious and ſplendid entertainment of their gueſts. Lucullus had ſeveral of theſe, each diſtinguiſhed by the name of ſome god; and there was a particular rate of expence appropriated to each. Plutarch relates with what magnificence he entertained Cicero and Pompey, who went with deſign to ſurprize him, by telling only a ſlave who waited, that the cloth ſhould be laid in the Apollo. The emperor Claudius, among others, had a ſplendid *banqueting-room*, named Mercury. But every thing of this kind was outdone by the luſtre of that celebrated *banqueting-houſe* of Nero, called *domus aurea*; which, by the circular motion of its partitions, and cielings, imitated the revolution of the heavens, and repreſented the different ſeaſons of the year, which changed at every ſervice, and ſhowered down flowers, eſſences, and perfumes, on the gueſts. Heliogabulus, neverthelefs, is ſaid to have improved as much upon Nero, as the latter had done on Lucullus. Senec. Ep. 90.

BANQUETTE, in *Fortification*, is a little foot-bank, or an elevation of earth forming a path which runs along the inſide of a parapet; by which the muſqueteers get up, to diſcover the counterſcarp, or to fire on the enemies in the moat, or in the covert-way.

The *banquette* is generally between two and three feet high, and three feet broad, and four feet and a half lower than the parapet, having two or three ſteps to mount it by.—Where the parapet is very high, they make a double *banquette* one over the other.

BANSTICKLE, in *Ichthyology*, a name given by us to the GASTEROSTEUS.

The *banſtickle* is otherwiſe called *prickle-bag*, or *prickle-back*.

BANTAM-*work*, a kind of Indian painting, and carving on wood, reſembling Japan work, only more gay, and decorated with a great variety of gaudy colours.

Bantam-work is of leſs value among connoiſſeurs, though ſometimes preferred, by the unſkilful, to the true Japan work. Formerly it was in greater uſe, and eſteem, than at preſent; and the imitation of it much practiſed by our japanners.

There are two ſorts of *Bantam*, as well as of Japan work; as, in the latter, ſome are flat, lying even with the black, and others high, or emboſſed; ſo, in *Bantam-work*, ſome is flat, and others in-cut, or carved into the wood, as we find in many large ſcreens; with this difference, that the Japan artiſts work chiefly in gold and other metals, and the *Bantam* generally in colours, with a ſmall ſprinkling of gold here and there.

For the flat *Bantam-work*, it is done in colours, mixed with gum-water, proper for the thing deſigned to be imitated. For the carved, or in-cut kind, the method of performing it is thus deſcribed by an ingenious artiſt. 1. The wood is to be primed with whiting and ſize, ſo often till the primer lie near a quarter of an inch thick; then it is to be water-plained, i. e. rubbed with a fine wet cloth, and, ſome time after, bruſhed very ſmooth, the blacks laid on, varniſhed up with a good body, and poliſhed well, though with a gentle hand. This done, the deſign is to be traced out with vermilion, and gum-water, exactly in the manner wherein it is intended to be cut; the figures, trees, buildings, &c. in their due proportions. Then the graver is applied, with other tools of proper ſhapes, differing according to the workman's fancy. With theſe he cuts deep or ſhallow, as is found convenient, but never deeper than the whiting lies; the wood being never to feel the edge of the inſtrument. Lines, or parts of the black, are ſtill to be left, for the draperies and other out-lines, and for the diſtinction of one thing from another; the rule being to cut where the white is, and leave the black untouched. The carving being finiſhed, they then uſe the pencil, with which the colours are laid into the cut-work. After this, the gold is to be laid in thoſe places which the deſign requires; for which purpoſe, a ſtrong, thick gum-arabic water is taken, and laid with a pencil on the work; and, while this remains wet, leaf-gold is cut with a ſharp ſmooth-edged knife, in little pieces, ſhaped to the bigneſs and figure of the places where they are to be laid. Theſe being taken up with a little cotton, they dab them with the ſame cloſe to the gum-water, which affords a rich luſtre. The work thus finiſhed, they clear up the black with oil, taking care not to touch the colours. The European workmen, in lieu of leaf-gold, ordinarily uſe braſs-duſt, which is leſs bright and beautiful. Park. Treat. of Japan.

BAOBAB, in *Natural Hiſtory*, the name of an African fruit deſcribed by Proſper Alpinus. It is of the ſize of a lemon, but it reſembles a gourd, and contains ſeveral black ſeeds, whoſe extremities are a little crooked. Its ſubſtance alſo much reſembles that of the gourd; and, when firſt pulled off, is moiſt, red, and of a grateful acid taſte. The people of Æthiopia, where it is plentiful, are very fond of it, in the ſcorching heats of ſummer; and the richer ſort add ſugar to it, to correct its acidity. It is a great cooler, and very agreeably quenches thirſt; and has alſo ſome medicinal uſe, as it is good in contagious and peſtilential fevers. The people of Cairo, where the freſh fruit is not to be had, uſe its pulp dried and powdered; and it is ſo uſed at Senegal in peſtilential fevers, the dyſentery, and bloody flux. The doſe is a drachm, taken either in common water, or in an infuſion of the plantain.

The *baobab* tree has been lately very minutely and accurately deſcribed by Mr. Adanſon, in the Memoirs of the Academy of Sciences at Paris. It is found at Senegal in Africa; and its bulk is ſo enormous, that it has more the appearance of a foreſt than of a ſingle tree. Its trunk, which ſeldom exceeds twelve feet in height, meaſures between ſeventy and eighty feet in circumference, and is crowned with a number of branches, remarkable for their thickneſs and their length, which is from fifty to ſixty feet. They moſtly ſhoot out in an horizontal direction, and give to the trunk the appearance of an hemiſphere from ſixty to ſeventy feet high, and about a hundred and forty feet in diameter. The bark is an inch thick, of an aſh-coloured grey, greaſy to the touch, bright and very ſmooth; the outſide is covered with a varniſh, and the inſide is green, ſpeckled with red; the wood is white and ſoft; the leaves are oval, pointed at the end, and about five inches long, and two and a half broad: ſeven of theſe are generally attached to one pedicle. The tree produces flowers much larger than any hitherto known; the calyx of the flower conſiſts only of one piece, the lower part of which forms a ſhort tube, which ſpreads into the ſhape of a ſaucer, having its edge divided into five equal parts of a triangular figure. The petals are five in number, of the ſame length with the calyx. From the ſame center, and within the petal, riſes a cone, which ſpreads into about ſeven hundred filaments, each having a ſmall ſubſtance in form of a kidney at the end of it, the convex part of which opens into two cells, which ſhed a duſt, conſiſting of ſmall white tranſparent particles. The piſtil riſes from the center of the calyx, and conſiſts of an ovary, a ſtylus, and ſeveral ſtigmata, in number from ten to fourteen. The ovary becomes a very conſiderable fruit. The tree flowers in July, and the fruit ripens in October and November. The bark and leaves are dried, and powdered by the negroes of Senegal, and uſed like pepper and ſalt. M. Adanſon uſed it as a preſervative from the epidemic fever of the country, and found it of great benefit in promoting perſpiration, and attempering the exceſſive heat of the blood. The woody bark of the fruit, and the fruit itſelf, ſupply the negroes with an excellent ſoap, which they prepare by drawing a lye from the aſhes, and boiling it with palm-oil that begins to be rancid. The decaying trunks are hollowed out into burying places for perſons moſt eſteemed by the negroes; ſuch as poets, muſicians, and buffoons; and their bodies ſhut up in theſe trunks become perfectly dry, without rotting, and form a kind of mummies, without the help of embalment. The African *baobab* has been ſometimes confounded with the American CALABASH.

BAPHE, in the *Writings of the Ancients*, a word uſed to expreſs that fine red colour, with which they uſed to illuminate the capital letters in manuſcripts, at the beginning of chapters. It is alſo called, by ſome, *encauſtum ſacrum*, and, by others, *coccus* and *cinnabaris*. It was a very elegant colour, and is ſaid to have been prepared of the purple colour taken from the *murex*, and ſome other ingredients. It was called *encauſtum*, from its reſembling very much the fine bright red uſed in enamels.

BAPTÆ, in *Antiquity*, an effeminate, voluptuous kind of prieſts at Athens, belonging to the goddeſs Cotyttus; thus called, from their ſtated dippings and waſhings, by way of purification. It ſeems, they were to be made very clean and pure, that they might wallow, and defile themſelves, with the leſs reſerve; for their rites were performed in the night, and conſiſted chiefly of laſcivious dances.

Eupolis having compoſed a comedy to expoſe them, entitled Βαπτος, they threw him into the ſea, to be revenged; and the ſame fate is alſo ſaid to have befallen Cratinus, another Athenian poet, who had written a comedy againſt the *baptæ*, under the ſame title.

Others deduce the denomination *baptæ*, from the practice of dying and painting their bodies, eſpecially their eyebrows, and officiating at the ſervice of their deity, with the parade and demureneſs of women. Juvenal deſcribes them in this light. Sat. ii. ver. 91.

BAPTES, in *Natural Hiſtory*, a name given by the ancients to a foſſile ſubſtance uſed in medicine; they have left us but very ſhort deſcriptions of it. Pliny only tells us, that it was ſoft, and of an agreeable ſmell. Hence Agricola judges, that it was probably one of the bitumens.

BAPTISECULA, in *Botany*, a name given by ſome authors to the blue corn-flower, called the CYANUS, or blue-bottle.

BAPTISM, in *Theology*; formed from the Greek βαπτιζω, of βαπτω, *I dip* or *plunge*, a rite or ceremony by which perſons are initiated into the profeſſion of the Chriſtian religion.

The Jews practiſed a ceremony, which they called *baptiſm*, after circumciſion, on their proſelytes, long before the coming of Jeſus Chriſt.—In the primitive times this ceremony was performed by immerſion, as it is to this day in the oriental churches, according to the original ſignification of the word. The practice of the weſtern churches is, to ſprinkle the water on the head or face of the perſon to be baptized, except in the church of Milan, in whoſe ritual it is ordered, that the head of the infant be plunged three times into the water; the miniſter at the ſame time pronouncing the words "*I baptize thee in the name of the Father, the Son, and the Holy Ghoſt*;" importing that by this ceremony the perſon baptized is received among the profeſſors of that religion, which God, the Father of all, revealed to mankind by the miniſtry of his Son, and confirmed by the miracles of his Spirit.—A triple immerſion was firſt uſed, and continued for a long time: this was to ſignify either the three days that our Saviour lay in the grave, or the three perſons in the Trinity. But it was afterwards laid aſide, becauſe the Arians uſed it: it was then thought proper to plunge but once.—Some are of opinion, that ſprinkling in *baptiſm* was begun in cold countries. It was introduced into England about the beginning of the ninth century. At the council of Celchyth, in 816, it was ordered, that the prieſt ſhould not only ſprinkle the holy water upon the head of the infant, but likewiſe plunge it in the baſon.—There are abundance of ceremonies delivered by eccleſiaſtical writers, as uſed in *baptiſm*, which are now diſuſed; as the giving milk and honey to the baptized, in the Eaſt; wine and milk in the Weſt, &c.

The quakers diſallow the perpetuity of *baptiſm* in the Chriſtian church. See QUAKERS.

It was alſo wholly rejected by the Valentinians, Manichees, Paulicians, and many other ſects.

Several of the Socinians have maintained, that *baptiſm* was only to be uſed by thoſe who are converted to Chriſtianity from a different profeſſion; and that though the children of ſuch proſelytes were to be baptized with their parents, all who deſcended from them were to be conſidered as baptized in them; and they urge the practice of proſelyte *baptiſm* among the Jews in ſupport of this opinion.

Theological authors diſtinguiſh three kinds of *baptiſm*; 1. *Water baptiſm*, which is that above mentioned. 2. *Baptiſm of fire*, which is the perfect love of God, joined with an earneſt deſire to be baptiſed; called alſo the *baptiſm of the Holy Ghoſt*: on occaſion this may ſupply the place of *water baptiſm*. 3. *Baptiſm of blood*; which is the martyrdom of a catechumen.

Baptiſm, in the primitive times, was only adminiſtered at Eaſter and Whitſuntide, except in caſes of neceſſity. The catechumens were not forward in coming to *baptiſm*: St. Ambroſe was not baptiſed before he was elected biſhop of Milan; and ſome of the fathers not till the time of their death. Some deferred it out of a tender conſcience; and others out of too much attachment to the world; it being the prevailing opinion of the primitive times, that *baptiſm*, whenever conferred, waſhed away all antecedent ſtains and ſins. Divers of the fathers rallied this ſuperſtitious delicacy to ſuch a degree, that they introduced a different extreme; the ridiculous zeal of ſome people carrying them to baptize even the dead, by proxy.

The opinion of the neceſſity of *baptiſm* in order to ſalvation, is grounded on thoſe two ſayings of our Saviour: *He that believeth, and is baptiſed, ſhall be ſaved*; and, *Except a man be born of water, and of the ſpirit, he cannot enter into the kingdom of God*.

Mr. Dodwell maintains, that the ordinance of *baptiſm*, if adminiſtered by perſons duly ordained, conveys an immortaliſing ſpirit; whereas perſons dying unbaptiſed are not immortal. See PÆDO-BAPTIST.

BAPTISM *of the dead*, a cuſtom which anciently prevailed among ſome people in Africa, of giving *baptiſm to the dead*. The third council of Carthage ſpeaks of it, as a thing that ignorant Chriſtians were fond of. Gregory Nazianzen alſo takes notice of the ſame ſuperſtitious opinion prevailing among ſome who delayed to be baptiſed. In his addreſs to this kind of men, he aſks, whether they ſtaid to be baptiſed after death? Philaſtrius alſo notes it as the general error of the Montaniſts or Cataphrygians, that they baptiſed men after death.

The practice ſeems to be grounded on a vain opinion, that when men had neglected to receive *baptiſm* in their life-time, ſome compenſation might be made for this default, by receiving it after death.

Baptism *of the dead*, was alſo a ſort of vicarious *baptiſm*, formerly in uſe, where a perſon dying without *baptiſm*, another was baptiſed in his ſtead; a practice founded on 1 Cor. xv. 29. concerning the ſenſe of which paſſage critics have been much divided. Several catholics underſtand it of the baptiſm of tears, penance, and prayers, which the living undergo for the dead, and allege it as the proof of the belief of purgatory in the apoſtle's days. See Heinſius's Exerc. ad Nov. Teſt. lib. vii. cap. 13.

Baptism, *Lay*, ſeems to have been allowed in the rubric of the Engliſh liturgy, till the time of king James I. though there were great diſputes among the biſhops at the Hampton-court conference, whether the words of the liturgy imported ſuch allowance or not. The biſhop of Worceſter allowed them to be doubtful; but that the contrary practice of the church, which cenſured women for conferring *baptiſm*, ſhewed, that the compilers of the book did not intend them as a permiſſion: they had indeed propounded them ambiguouſly, becauſe otherwiſe, perhaps, the book would not have paſſed the parliament. The archbiſhop of Canterbury inſiſted, that the adminiſtration of private *baptiſm* by women and laymen, was not allowed in the practice of the church, but, on the contrary, cenſured by the biſhops in their viſitations. He even added, that the words of the liturgy do not infer any ſuch meaning. To which king James excepted; urging and preſſing the words of the book, that they could not but intend a permiſſion of women, and private perſons to baptize.

At preſent, the Engliſh divines condemn it as invalid; and Burnet, biſhop of Sarum, was ſeverely handled by ſome of them, for aſſerting, that faith in the Trinity gives every man a right to baptize. Collins's Diſc. on Free-Think. p. 73.

Baptism, *Clinic*. See **Clinic**.

Baptism is alſo applied, abuſively, to certain ceremonies uſed in giving names to many inanimate things.

Baptism, in *Sea-Language*, is a ceremony in long voyages aboard merchant-ſhips; practiſed both on perſons and veſſels which paſs the tropic, or line, for the firſt time.

That of veſſels is ſimple, and conſiſts only in the waſhing them throughout with ſea-water: that of paſſengers is ludicrous: but neither the one nor the other is done without making the crew drunk; the ſeamen, on chriſtening the ſhip, pretending to a right of cutting off the beak-head, unleſs redeemed by the maſter or captain.

Baptism *of bells*; ſee **Bell**.

BAPTISMAL *font*; ſee **Baptistery**.

Baptismal *preſents* are in uſe in Germany, made by the ſponſors to the infant, conſiſting of money, plate, or even ſometimes fiefs of lands; which, by the laws of the country, are to be kept for the child till of age, the parents having only the truſt, not the right of diſpoſing of them.

An anonymous author has publiſhed a diſcourſe expreſs on this occaſion, entitled, De Pecunia Luſtrica.

Baptismal *vow*, or *covenant*, a profeſſion of obedience to the laws of Chriſt, which perſons, in the ancient church, made before baptiſm.

It was made by turning to the Eaſt, but for what myſtical reaſons it is not well agreed.

BAPTISTERY, in *Eccleſiaſtical Writers*, a place or edifice where water is preſerved for perſons to be baptiſed in.

Anciently, in the churches which baptiſed by immerſion, the *baptiſtery* was a kind of pond where the catechumens were plunged; though in many places the next river ſerved for a *baptiſtery*, which was the caſe in the time of Juſtin Martyr, and of Tertullian. And the *baptiſteries* continued ſeparate from the church till the ſixth century.

In after-times, the *baptiſtery* was a little building adjoining to the church, purpoſely appointed for the adminiſtration of this ceremony.

There were ſeveral fonts and altars in each *baptiſtery*, becauſe then they baptiſed a number at once, all of whom received the euchariſt immediately after.

At firſt, theſe *baptiſteries* were only in the great cities, where biſhops reſided, who alone had the right of baptiſing; but they afterwards allowed pariſhes to have fonts, for the more commodious adminiſtration of baptiſm. This right was confined to pariſhes alone; and if any monaſteries were found with baptiſmal fonts, it was becauſe they had baptiſmal churches in another place: though the biſhops ſometimes granted them to monks, upon condition that they would have a ſecular prieſt along with them to take care of the people; but they afterwards found means to throw off the prieſt, and make themſelves maſters of the church, and attach it, with its baptiſmal fonts, to their own monaſtery.

Baptistery is alſo uſed for a baptiſmal or parochial church.

Baptistery is alſo uſed, by the *Armenians*, for the feaſt of Epiphany, when the anniverſary of Chriſt's baptiſm is celebrated.

Baptistery is alſo uſed for a church-book, wherein the prayers and ceremonies of baptiſm were particularly deſcribed. Some take the *baptiſterium* to have contained the order of all the ſacraments, except the euchariſt.

BAPTISTS, in *Eccleſiaſtical Hiſtory*, from βαπτιζω, *I baptize*; a denomination of Chriſtians, diſtinguiſhed from other Chriſtians by their particular opinions reſpecting the mode and the ſubjects of baptiſm.

Inſtead of adminiſtering the ordinance by ſprinkling or pouring water, they maintain that it ought to be adminiſtered only by immerſion. Such, they inſiſt, is the meaning of the word βαπτιζω; ſo that a command to baptize is a command to immerſe. Thus it was underſtood by thoſe who firſt adminiſtered it. John the Baptiſt, and the apoſtles of Chriſt, adminiſtered it in Jordan and other rivers, and places where there was much water. Both the adminiſtrators and the ſubjects are deſcribed as going down into, and coming up again out of the water. And the baptiſed are ſaid to be buried in baptiſm, and to be raiſed again: which language could not, they ſay, be properly adopted on ſuppoſition of the ordinance's being adminiſtered in any other manner than by immerſion. Thus alſo, they affirm, it was in general adminiſtered in the primitive church. Thus it is now adminiſtered in the Ruſſian and Greek church: and thus it is, at this day, directed to be adminiſtered in the church of England, to all who are thought capable of ſubmitting to it in this manner.

With regard to the ſubjects of baptiſm, the *baptiſts* ſay, that this ordinance ought not to be adminiſtered to children or infants at all, nor to grown up perſons in general; but to adults only of a certain character and deſcription. Our Saviour's commiſſion to his apoſtles, by which Chriſtian baptiſm was inſtituted, is to go and teach all nations, baptiſing them: that is, ſay they, not to baptize all they meet with; but firſt to inſtruct them—to teach all nations, or to preach the goſpel to every creature—and whoever receives it, him to baptize in the name of the Father, and of the Son, and of the Holy Ghoſt. To ſuch perſons, and to ſuch only, baptiſm appears to have been adminiſtered by the apoſtles, and the immediate diſciples of Chriſt. They are deſcribed as repenting of their ſins, as believing in Chriſt, and as having gladly received the word. Without theſe qualifications, Peter acquaints thoſe who were converted by his ſermon, that he could not have admitted them to baptiſm. Philip holds the ſame language in his diſcourſe with the eunuch. And Paul treats Lydia, the jailor, and others, in the ſame manner. Without theſe qualifications, Chriſtians in general think it wrong to admit perſons to the Lord's ſupper; and, for the ſame reaſons, without theſe qualifications, at leaſt a profeſſion of them, the *baptiſts* think it wrong to admit any to baptiſm. Wherefore they withhold it, not only from the impenitently vicious and profane, and from infidels who have no faith, but alſo from infants and children, who have no knowledge, and are incapable of every action civil and religious. They further inſiſt, that all poſitive inſtitutions depend entirely upon the will and declaration of the inſtitutor; and that therefore reaſoning by analogy from previous abrogated rites is to be rejected, and the expreſs commands of Chriſt reſpecting the mode and ſubjects of baptiſm, ought to be our only rule.

The *baptiſts* in England form one of the three denominations of Proteſtant Diſſenters. They ſeparate from the eſtabliſhment for the ſame reaſons as their brethren of the other denominations do, with whom they are united; and from additional motives derived from their particular tenets reſpecting baptiſm. The conſtitution of their churches, and their modes of worſhip, are congregational or independent: in the exerciſes of which they are protected, in common with other diſſenters, by the act of toleration. Before this act, they were liable to pains and penalties as nonconformiſts, and often for their peculiar ſentiments as *baptiſts*. A proclamation was iſſued out againſt them, and ſome of them were burnt in Smithfield in 1538. They bore a conſiderable ſhare in the perſecutions of the laſt, and of the preceding centuries; and, as it ſhould ſeem, in thoſe of ſome centuries before; for there were ſeveral among the Lollards and the followers of Wickliff, who diſapproved of infant-baptiſm. There were many of this perſuaſion among the proteſtants and reformers abroad. In Holland, Germany, and the North, they went by the names of **Anabaptists** and **Mennonites**; and, in Piedmont and the South, they were found among the **Albigenses** and **Waldenses**. See the Hiſtories of the Reformation, and the above articles in this Dictionary.

The *baptiſts* ſubſiſt under two denominations, viz. the *Particular* or Calviniſtical, and the *General* or Arminian. The former is by far the moſt numerous. Some of both denominations allow of mixed communion, others diſallow it: and ſome of them obſerve the ſeventh day of the week as the ſabbath, apprehending the law that enjoined it, not to have been repealed by Chriſt or his apoſtles. But a difference of opinion reſpecting theſe and other matters, is not peculiar to the *baptiſts*: it is common to all Chriſtians, and to all bodies of men who think and judge for themſelves. See PÆDOBAPTISTS, under which article an account will be given of the principal arguments in favour of infant baptiſm.

BAR, in *Architecture*, a long ſlender piece of wood or iron, uſed to keep things cloſe and faſt together.

In this ſenſe, we ſpeak of *bars* of windows, of doors, and the like.

BARS *of iron* are made of the metal of the ſows and pigs, as they come from the furnaces.

Theſe paſs through two forges, called the *finery* and the *chaufery*; where, undergoing five ſeveral heats, they are formed into bars. Phil. Tranſ. N° 138. p. 954. See IRON and FORGE.

BAR, in a court of juſtice, denotes an incloſure made with a ſtrong partition of timber, three or four feet high, where the counſel are placed to plead cauſes.

This the French call *barre d' audience*, and in ſome places *auditoire*. It anſwers to what, among the Romans, was denominated *cauſidica*.

It is called *bar*, becauſe incloſed with a barrier, called alſo in Latin writers *cancelli* and *caulæ*, by a metaphor taken from ſheep-folds.

The denomination BAR is alſo given to the benches, where the lawyers or advocates are ſeated.—The appellation aroſe hence, that anciently there was a *bar*, or barrier, to ſeparate the counſellors and pleaders from the attorneys and others.

Hence our lawyers who are called to the *bar*, or licenſed to plead, in other countries called *licentiati*, are termed *barriſters*.

BAR, or BARRE, BARRA, in *Common Law*, denotes a peremptory exception againſt a demand or plaint.

The author of the Terms of the Law defines *bar*, a plea brought by the defendant in an action, whereby the action of the plaintiff is deſtroyed for ever.—But the modern writers extend the uſe of the word farther, dividing *bars* into *perpetual* and *temporary*.

BAR, *perpetual*, is that which overthrows the action for ever.

BAR, *temporary*, or *bar pro tempore*, is that which is allowed good for the preſent, but may fail, or be ſet aſide hereafter.

BAR, in *Geography*, is uſed for a heap of ſand or mud, or a chain of rocks, which block up the mouth of a river, or port, ſo that there is no entrance except at high water.

The *bar* of Siam is a remarkable bank of mud, gathered in the mouth of the river, which allows not above thirteen feet of water, when the tide is higheſt.

BAR *of a port*, in *Marine Fortification*; ſee BOOM.

BARS, in the *Manege*, denote the ridges or upper part of the gums, between the tuſhes and grinders of a horſe; the under and outward ſides retaining the name *gums*.

The *bars* ſhould be ſharp-ridged and lean; for ſince all the ſubjection a horſe ſuffers, proceeds from thoſe parts, if they have not thoſe qualities, they will be very little, or not at all ſenſible; ſo that the horſe can never have a good mouth; for if the *bars* be flat, round, and inſenſible, the bit will not have its effect; and conſequently, ſuch a horſe can be no more governed by his bridle, than if one took hold of his tail.

To BAR or *ſtrike a vein*, among *Farriers*, an operation performed on the veins of a horſe's legs, or other parts of his body, in order to ſtop the courſe, and leſſen the quantity of malignant humours prevailing there.

It is thus performed: the farrier opens the ſkin, after diſengaging the vein, ties it above and below, and then ſtrikes between the two ligatures.

BARS, in *Muſic*, denote ſtrokes drawn perpendicularly acroſs the lines of a piece of muſic, including between each two, a certain quantity or meaſure of time, which is various as the time is triple or common.

The uſe of *bars* in muſic is a modern invention. They cannot be traced higher than the year 1574, and ſeem not to have been in general uſe till the year 1653; ſo that probably this improvement is owing to Mr. Henry Lawes, who publiſhed his Airs and Dialogues in that year.

In common time, between each two *bars*, is included the meaſure of four crotchets; in triple time, three crotchets. Their principal uſe is, to regulate the beating, or meaſure of the muſical time in a concert. See TIME.

BAR, BARR, or BARRE, in *Heraldry*, denotes an ordinary nearly reſembling the FESS; from which it only differs by its narrowneſs, and by this, that the *bar* may be placed in any part of the field, whereas the *feſs* is confined to a ſingle place.

The *bar* itſelf has its diminutives, which are the *cloſet* and *barrulet*.

The *bar* of legitimate cadets proceeds from right to left; that of baſtards from left to right.

BAR-*gemel*, denotes a double *bar*, or where the *bars* are placed in couples, at a ſmall diſtance, and more than two in the field, in even number.

BAR, among *Printers*, denotes a piece of iron with a wooden handle, whereby the ſcrew of the preſs is turned in printing.

BAR-*maſter*, in *Mining*, he who keeps the gage, or diſh, to meaſure all miners ore; he, or his ſervant, being always to be preſent when it is meaſured.

BAR-*ſhot*; ſee SHOT.

BARACK, or BARRACK, BARAQUE, a hut, or little lodge for ſoldiers in a camp.

The word comes from the Spaniſh *barracas*, little cabins, which fiſhermen make on the ſea-ſhore.

Thoſe for the horſe were formerly called *baracks*, and thoſe for the foot *huts*; but *barack* is now uſed indifferently for both.

Baracks are generally made by fixing four forked poles in the ground, and laying four others acroſs them; afterwards they build up the walls with ſods, wattles, or what the place affords; and the top is planked, thatched, or covered with turf, as they have convenience.

When the army is in winter quarters, the ſoldiers uſually build *baracks*; in the ſummer they are content with their tents.

BARACKS is alſo more generally applied to buildings to lodge ſoldiers in fortified towns, or others. Thus we ſay the *baracks* of the Savoy, of Dublin, &c.

Baracks, when damp, are greatly prejudicial to the health of the ſoldiers lodged in them; occaſioning dyſenteries, intermitting fevers, coughs, rheumatic pains, &c. For which reaſon quarter-maſters ought to be careful in examining every *barack*, offered by the magiſtrates of a place; rejecting all ground-floors in houſes that have either been uninhabited, or have any ſigns of moiſture.

BARALIPTON, a term in *Logic*, denoting the firſt indirect MODE of the firſt FIGURE of ſyllogiſms.

A ſyllogiſm in *baralipton* is, when the two firſt propoſitions thereof are univerſal affirmatives, and the third a particular affirmative; the middle term being the ſubject of the firſt, and the attribute of the ſecond.—For example:

BA *Every evil ought to be feared:*
RA *Every violent paſſion is an evil:*
LIP *Therefore ſomething that ought to be feared is a violent paſſion.*

See letters A and I, and SYLLOGISM.

BARALLOTS, BARALOTTI, the name of a ſect at Bologna in Italy, who had all things in common, even their wives and children.—They gave, it is ſaid, into all manner of debauchery, and were alſo termed *compliers*.

BARANGI, officers among the Greeks of the lower empire, whoſe buſineſs it was to keep the keys of the city-gates where the emperor reſided.

Codinus ſays, *barangi* were thoſe who ſtood guard at the door of the emperor's bed-chamber and dining-room.

Condinus and Curopalata obſerve, that the name is Engliſh, formed from *bar*, *to ſhut*; and that the *barangi* were Engliſhmen, by country; Anglo-Danes, who, being driven out of England, were received into the ſervice of the emperor of Conſtantinople, and made guards or protectors of his perſon. Whence they are called in Latin, by Cujaccius, *protectores*; by others, *ſecurigeri*, as being armed with a battle-ax, *ſecuris*. Codinus adds, that they ſtill ſpoke the Engliſh tongue. Anna Comnena ſays, the *barangi* came from the iſland Thule; by which is, doubtleſs, meant our iſland. Yet Nicetas makes them Germans; a miſtake eaſy to be made at that diſtance, conſidering the relation the Anglo-Saxons bore to Germany.

There were *barangi* as early as the emperor Michael Paphlagonius, in the year 1035, as appears from Cedrenus; but they were then only common ſoldiers, not a life-guard.

Their commander was called ακολουθος, as importing a perſon who always followed the emperor.

BARA-*picklet*, bread made of fine flour kneaded with barm, which makes it very light and ſpongy: *bara* being the Welch for bread.

BARATHRUM, from βαραθρον, ſignifying the ſame, among the *Ancient Athenians*, a deep pit into which condemned criminals were caſt headlong.

The *barathrum* was a dark noiſome hole, having ſharp ſpikes at the top, to prevent any eſcape, and others at the bottom, to pierce and lacerate the offender.

From its depth and capaciouſneſs, the name came to be uſed proverbially for a miſer, or a glutton, always craving.

In which ſenſe, the word *barathro* is uſed among the Latin poets.

BARATHRUM is alſo uſed, in *Phyſiology*, to denote certain baleful caverns, inacceſſible on account of their fetid, or poiſonous fumes.

Theſe amount to the ſame with what others call *foſſæ charoniæ*.

BARATRY, or BARETRY, in *Law*, ſignifies the moving and maintaining ſuits in diſturbance of the peace; and the taking and detaining houſes, lands, &c. by falſe inventions. The word *baratterre* in French ſignifies *miſdemeanor, fraud, deceit*: it is derived from the old word *barat*,

barat, which ſignifies any impoſition; whence alſo they ſaid *baratter, to impoſe on any one.* 8 Rep. 31.

Baratry, in a *Marine Senſe*, is the maſter of a ſhip, or the mariners cheating the owners or inſurers, whether it be done by running away with the ſhip, ſinking her, deſerting her, or embezzling the cargo.

Baratry of mariners is ſo epidemical on ſhip-board, that it it is rare if the maſter, be his induſtry ever ſo great, can prevent it, by reaſon of the encouragement one knaviſh ſailor gives another; yet the law, in ſuch caſes, imputes the offences of the mariners to the negligence of the maſter, and from him the merchant is to ſeek for remedy for all goods or merchandize loſt, embezzled, or otherwiſe damnified.

By the French ordonnances, inſurers are not obliged to make good the loſs or damage accruing to a veſſel, or its lading, by the fault of the maſter or crew, unleſs, by the forms of the policy, they be made accountable for the *baratry* of the patron. A maſter who, without neceſſity, takes up money on the body, proviſion, or tackling of a ſhip, or ſells the effects on board, or, in his account of average, ſets down fictitious expences, ſhall pay the value, be declared unworthy of being maſter, and baniſhed the port where he ordinarily reſided. In ſome caſes, he is alſo ſubject to corporal puniſhment, and even to death, where it appears he willingly threw away the ſhip.

Baratry is alſo uſed for bribery or corruption in a judge, giving a falſe ſentence for money.

Baratry is alſo uſed, in *Middle Age Writers*, for fraud or deceit in making of contracts, ſales, or the like.

BARB is uſed for the *Barbary pigeon*, called alſo by Moore the *columba Numidica*.

This is but a ſmall pigeon, and has a very ſhort beak like a bulfinch, with a ſmall water, and a naked circle of tuberoſe red fleſh round the eyes; the *iris* of the eye is of a pearl-colour, and the broader and redder this circle round them is, the more the pigeon is valued; but this is always narrow while they are young, and does not arrive at its full breadth till they are four years old. Some of this ſpecies have a tuft of feathers behind their head, and others not. The red circle round their eyes grows pale and whitiſh, if they become ſick; but always recovers its redneſs as they grow well: their proper colour is black, or dun. There are likewiſe pyed ones; but they are of a mixed breed, and not ſo valuable.

BARBA *Aron*, in *Botany*, a name given by ſome authors to the common great houſe-leek.

Barba *Capræ*, in *Botany*; ſee Spiræa.

Of this genus Mr. Tournefort allows only one ſpecies, the common *barba capræ*, or, as it is called by ſome, *drymopogon*.

Barba *Jovis*, in *Botany*, the name of a ſpecies of *anthyllis*. See Lady's *finger*.

BARBACAN, or Barbican, properly denotes an outer defence, or fortification to a city, or caſtle; uſed eſpecially as a fence to the gates, or walls.

In which ſenſe, *barbacan* amounts to the ſame with what is otherwiſe called, *antemurale, promurale, murus exterior*, or *outer wall*.

Barbacan is alſo uſed for a fort at the entrance of a bridge, or in the outlet of a city, having a double wall with towers. Such is that at one end of the wooden bridge at Rouen, which is ſtill called by ſome *Barbacana*.

Barbacan is alſo uſed for an aperture in the walls of a city, through which to fire with muſquets on the enemy. See Embrasure.

Barbacan, in *Architecture*, denotes a long narrow canal, or opening, left in the walls for water to come in and go out at, when edifices are raiſed in places liable to be overflowed; or to drain off the water from a terrace, or the like.

BARBADOES *cherry*; ſee Cherry.

Barbadoes *flower-fence, poinciana*, in *Botany*, a genus of the *decandria monogynia* claſs. Its characters are theſe: the empalement of the flower is compoſed of five oblong concave leaves, which fall off. The flower has five unequal petals, four of them nearly equal and roundiſh, but the fifth larger, deformed and indented. It hath ten long, briſtly, riſing ſtigmas, terminated by oblong ſummits; and an awl-ſhaped declining *germen*, which ſits upon the ſtyle, and is crowned by an acute ſtigma. The *germen* afterward becomes an oblong compreſſed pod, with ſeveral tranſverſe partitions, in each of which is lodged a ſingle flattiſh ſeed.

This plant grows naturally in both Indies. It is planted in hedges, to divide the lands in Barbadoes, from whence it had the title of *flower-fence*; it is alſo called Spaniſh *carnation* by ſome of the inhabitants of the Britiſh iſlands.

Theſe plants muſt conſtantly remain in the bark-ſtove, where in warm weather they ſhould have a large ſhare of air; but they muſt not be expoſed to cold; if damp ſeizes their top, it very often kills the plants, or at leaſt occaſions the loſs of their heads. With proper management, they will grow much taller here than they uſually do in Barbadoes, but their ſtems will not be larger than a man's finger, which is occaſioned by their being drawn up by the glaſſes of the ſtove.

Barbadoes *tar, Petroleum Barbadenſe*, is a bitumen of a reddiſh black colour, and thick conſiſtence, approaching to that of common tar. It is found in ſeveral of the American iſlands, and particularly in *Barbadoes*; where it is greatly eſteemed as a ſudorific, in diſorders of the breaſt, and as an external diſcutient and anti-paralytic. It is leſs inflammable than the other petrolea, and leaves on being burnt a conſiderable quantity of aſhes. The oil obtained from it in diſtillation, and a balſam prepared by boiling it with one fourth its weight of flowers of ſulphur, are directed by the London college to be kept in the ſhops. Lewis's Mat. Med.

BARBARA, in *Logic*, the firſt mode of the firſt figure of ſyllogiſms.

A ſyllogiſm in *barbara*, is that whereof all the propoſitions are univerſal and affirmative; the middle term being the ſubject in the firſt propoſition, and attribute or predicate in the ſecond.—For example:

BAR *Whoever ſuffers a man to ſtarve, whom he ought to ſuſtain, is a murderer:*
BA *Whoever is rich, and refuſes to give alms, ſuffers thoſe to ſtarve, whom he ought to ſuſtain:*
RA *Therefore, whoever is rich, and refuſes to give alms, is a murderer.*

BARBARIAN, a name given by the ancient Greeks to all thoſe who were not of their own country, or who did not ſpeak the Greek language.—In which ſenſe the word ſignified with them, no more than *foreigner*, and did not carry that odium with it as it does now.

Strabo derives the word βαρϐαρος from βαρϐαριζειν, *balbutire*, becauſe foreigners coming to Athens uſed to ſtammer, or ſpeak coarſely: others derive it from βαρϐαρ, a word that foreigners frequently ſtumbled on, which yet had no meaning.

BARBARICARII, in *Antiquity*, a kind of artiſts, who, with threads of divers colours, expreſſed the figures of men, animals, and other things; or, as others deſcribe them, thoſe whoſe buſineſs was to gild, and decorate ſhields and helmets with gold and ſilver.

The *barbaricarii* were ſo called, becauſe they learned this kind of painting from the Phrygians, who were particularly denominated *barbarians*, in regard of their oppoſition to the Greeks; though the name is ſometimes alſo written *branbaricarri*.

Barbaricarii ſeem alſo to have been uſed for ſoldiers or officers, who wore maſks and vizards, thus adorned with gold and ſilver.

BARBARICUM, in *Ancient Writers*, is uſed for a military ſhout, raiſed by the ſoldiers on point of engagement.

This is called *barbaricum* from the barbarians, in whoſe armies this method of ſhouting much obtained.

The ſame appellation was given to a war, or expedition, undertaken againſt the barbarians.—*Quouſque ad ipſum tempus quo barbaricum extortum eſt inter nos & vos.*

Barbaricum was alſo uſed for an armoury, or magazine, wherein the Greek emperors kept the ſpoils, and donaries, taken from the barbarians in the time of war or peace.

Barbaricum is alſo an appellation given by the modern Greeks to rhubarb.

It is thus called from the *Sinus Barbaricus*, by the way of which this root was firſt brought to them.

BARBARISM, in *Grammar*, denotes an offence againſt the purity of ſtyle or language.

A *barbariſm* differs, according to Iſidore, from a *barbarous term*, as the former, for inſtance, is Latin, though corrupt or miſuſed; whereas the latter, which this writer calls *barbarologia*, is a word merely foreign, intruded into Latin ſpeech.

In general, under *barbariſms* are comprehended things written, ſpoken, declined, or conjugated wrong; or uſed in a wrong quantity, or in an unuſual ſenſe; as when a word is uſed which is foreign to the language, and not received by the better and purer ſort of writers therein. Such are *liper* for *liber*, *ſyllăba* for *ſyllāba*, *patri* for *patris*, *lexi* for *legi*, *bannus* for *proſcriptio*, &c.

Barbariſm is often charged, with great juſtice, on modern writers in the learned languages. The Latin books of late ages are full of Angliciſms, Galliciſms, Germaniciſms, &c. according to the country of the author. But what ſhall we ſay to Caſp. Scioppius, who accuſes Cicero himſelf of *barbariſms* in his own language?

There are great diſputes among critics concerning *barbariſms* in the New Teſtament.

Divers pious perſons are ſtartled at the apprehenſion of any thing like a *barbariſm* in the inſpired books, as ſuppoſing it an objection to the inſpiration of them; yet this does not hinder but many of the Jews, after Abarbanel and others, ſtill maintain *barbariſms* in the Old Teſtament; in which they are ſeconded by M. Simon, Le Clerc, and others. Divers of the prophets are ſaid to have been unacquainted with the language they wrote in, particularly Jeremiah.

BARBARISM, *barbaries*, is alſo uſed for that rudeneſs of mind, wherein the underſtanding is neither furniſhed with uſeful principles, nor the will with good inclinations.

BARBAROUS, in a general ſenſe, ſomething that partakes of the quality of BARBARISM.

In this ſenſe we ſay a *barbarous* nation, age, writer, word, or the like.

Barbarous Latin words are innumerable; the ſchoolmen are full of them: the chemiſts, phyſicians, lawyers, can ſcarce write intelligibly without them. Du-Cange has given two large volumes in folio of *barbarous* Latin words, and as many of *barbarous* Greek words.

The modern or vulgar Greek is ſometimes called *barbarous* Greek, *barbaro-Greca*, or *Greco-barbara-lingua*. Langius has publiſhed Philologia Barbaro-Greca, Gramatica Barbaro-Greca, or Gloſſarium Barbaro-Grecum.

BARBATED *leaf*, in *Botany*, is a leaf terminated by a bunch of ſtrong hairs.

BARBATINA, or SEMEN *contra*, a ſeed which is efficacious in extirpating worms from the human body, to which children are chiefly liable: it comes from Perſia, and from the borders of Muſcovy.

This ſeed, to be good, ought to be plump, of an agreeable ſcent, and very green: ſpecial care muſt be taken that it be not dyed green, and that the ſeed of ſouthern-wood be not ſold inſtead of it.

BARBATULA, in *Ichthyology*, a ſpecies of the COBITIS.

BARBATUS *Piſcis*, in *Ichthyology*, a name given by Salvian, and ſome others, to the SILURUS, called in Engliſh, the *ſheat-fiſh*; the *glanus* of Pliny, and the ancients. This Artedi deſcribes under the name of the *ſilurus* with four *cirri*, or beards, at the mouth. By this it is diſtinguiſhed from the fiſh called the *lake*, or *alkuſſa*, which, though a genuine ſpecies of *ſilurus*, has only one beard.

BARBE, or BARB, in *Commerce*, a kind of horſe brought from Barbary, much eſteemed for its beauty, vigour, and ſwiftneſs.

Barbs are uſually of a ſlender make, and their legs far apart. It is a maxim, that *barbs* grow ripe, but never old; becauſe they retain their vigour to the laſt, which makes them prized for ſtallions: their mettle, according to the duke of Newcaſtle, never ceaſes but with their lives. It is ſaid, they were anciently wild, and ran at large in the deſarts of Arabia; and that it was in the time of the Cheq Iſhmael, that they firſt began to tame them. It is ſaid, there are *barbs* in Africa, that will outrun oſtriches: ſuch are ordinarily ſold, according to Dapper, for 1000 ducats, or 100 camels. They are fed very ſparingly, Dapper ſays with camel's milk. It is added, that in Barbary they preſerve the genealogy of their *barbs*, with as much care as the Europeans do thoſe of their noble families; and that to ſell them, they always produce their titles of nobility.

The race of horſes is much degenerated in Numidia; the Arabs having been diſcouraged from keeping it up, by the Turkiſh officers, who were ſure to be maſters of them. At preſent, the Tingitanians, and Egyptians, have the reputation of preſerving the beſt breed, both for ſize and beauty.

The ſmalleſt of theſe laſt are uſually ſixteen hands high, and all of them ſhaped, according to their phraſe, like the antelope.

The *good* qualities of a Barbary horſe (beſides the ſuppoſed one of never lying down, and of ſtanding ſtill when the rider drops his bridle) are to have a long walk, and to ſtop ſhort, if required, in a full career.

The *barb* is very lazy and negligent in all his motions; he will ſtumble in walking upon the ſmootheſt ground; his trot is like that of a cow, and his gallop very low, and very eaſy to himſelf: this ſort of horſe is, however, for the moſt part, ſinewy, nervous, and excellently winded; he is therefore good for a courſe, if not over-weighted.

The *mountain barbs* are accounted the beſt, becauſe they are the largeſt and ſtrongeſt: they belong to the Allarbes, who value themſelves much upon them, and are as fond of them as other nations are; for which reaſon it is not eaſy to get at any of them. The common *barbs* are not uncommon among our people of faſhion. They may uſually be bought in Provence and Languedoc in France, at a moderate price, and many of the Engliſh have them from thence.

Barbs, among us, fall ſhort of that ſwiftneſs attributed to them in their native country. This may be accounted for, partly from the ſmallneſs and lightneſs of their riders, and partly from their not being loaded with heavy ſaddles and bridles, as in Europe, nor even with ſhoes. An Arab ſaddle is only a cloth girt round, with a pair of light ſtirrups, and a ſort of pummel to ſuſtain them.

Baſtard-BARBS, thoſe deſcending from the Engliſh mares, covered by *barb*-ſtallions, are, by experience, conſtantly found both better ſhaped and fitter for the ſaddle, and ſtronger for ſervice than their ſires. Phil. Tranſ. Nº 105.

BARBE, or BARBET, in the *Military Art*.—*To fire en* BARBE, is to fire the cannon over the parapet, inſtead of through the embraſures; in which caſe the parapet muſt not be more than three feet and a half high.

BARBE, or BARDE, is alſo an old term for the armour of the horſes of the ancient knights, and ſoldiers, who were accoutred at all points.

Della Cruſca ſays, the *barde* is an armour of iron or leather, wherewith the neck, breaſt, and ſhoulders of the horſe are covered.

BARBED, in *Heraldry*, is underſtood of a cock, when his comb and wattles are of a different colour from the reſt of the body. In which caſe, he is ſaid to be *barbed and creſted*.

A Croſs BARBED, *croix barbée*, is that whoſe extremities are faſhioned like the barb of an iron ſpear, or inſtruments uſed for ſtriking fiſh, &c.

BARBEL, in *Ichthyology*; ſee BARBUS.

BARBELICOTÆ, an ancient ſect of Gnoſtics, ſpoke of by Theodoret. The doctrine of the *Barbelicotæ* was, that one of the Æons, poſſeſſed of immortality, had commerce with a virgin ſpirit named *Barbeloth*, who demanded of him, firſt preſcience, then incorruptibility, and laſtly eternal life; all which were granted to her: that being one day in a gayer humour than ordinary, ſhe conceived, and afterwards brought forth light, which being perfected by the unction of the ſpirit, was called *Chriſt*: the child Chriſt deſired to have underſtanding, νȣν, and obtained it: after which, underſtanding, reaſon, incorruptibility, and Chriſt, united together; and from their union aroſe autogenes, αυτογενης. To theſe fables they add divers others. They were alſo denominated *Barbarians*.

BARBERRY-*tree*, *berberis*, or the *pipperidge-buſh*, in *Botany*, a genus of plants, belonging to the claſs of *hexandria monogynia*, the characters of which are theſe: the flower hath a coloured empalement, compoſed of ſix concave leaves; the flower is of ſix leaves, which are roundiſh and concave. It hath two coloured nectariums, faſtened to the baſe of each petal; and ſix *ſtamina*, with two ſummits faſtened on each ſide their *apex*. The *germen* is cylindrical, and afterward becomes an obtuſe cylindrical umbilicated berry, having a puncture and one cell, incloſing two cylindrical ſeeds. There are three ſpecies; the common *barberry*; the Canada *barberry*, with very broad leaves; and the *barberry* with a ſingle flower on each foot-ſtalk.

The common *barberry*-buſh grows naturally in the hedges in many parts of England, but is alſo cultivated in gardens for its fruit, which is pickled and uſed for garniſhing diſhes. The flowers come out from the wings of the leaves, in ſmall ramoſe bunches, like thoſe of the currant-buſh, which are yellow; theſe are ſucceeded by oval fruit, which are firſt green, but when ripe turn to a fine red colour. The flowers appear in May, and the fruit ripens in September.

The box-leaved ſort is at preſent very rare in England, and while young the plants are ſomewhat tender, ſo have frequently been killed by ſevere froſt. This never riſes higher than four or five feet in England.

The *barberry* is a ſhrub, whoſe berries, as well as bark, are of medicinal uſe; known alſo by the name of *oxyacantha Galeni*.

Its berry is red, and oblong, of an agreeable, cooling, aſtringent taſte, chiefly uſed in the way of conſerve; under which form it quenches thirſt, ſtrengthens the ſtomach, and is good againſt diarrhœas and dyſenteries. We alſo read of ſyrup, eſſential ſalt, and lozenges, made of the juice of the *barberry*.

The bark, on the contrary, is opening and deterſive; and, though rarely found in diſpenſatory compoſitions, is much uſed in common preſcriptions, as well as in medicated ales, againſt the jaundice, and other diſtempers from obſtructions and foulneſſes of the *viſcera*.

The only officinal preparation from this tree, is the conſerve of the fruit.

BARBET, in *Natural Hiſtory*, a name given by M. Reaumur, and other of the French writers, to a peculiar ſpecies of the worms which feed on the *pucerons*.

This worm is more particularly called *barbet blanc*, as alſo *heriſſon blanc*, or *white hedgehog*, from its being covered with oblong white tufts of filaments, which ſtand in the manner of the quills of a hedgehog or porcupine.

This creature is of the ſize of a ſmall fly without its wings; but this tufted covering ſo much increaſes the bigneſs, that it appears of the ſize of a fly of the largeſt kind.

The *barbet* lives about a fortnight in that form, and then becomes a chryſalis; from which, after a month, there comes out a ſmall beetle, of the ſize of our cow-lady, but of a flatter figure, and, in general, of a duſky brown colour.

BARBICAN; ſee BARBACAN.

BARBICANAGE, *barbicanagium*, in our *Old Writers*, money given for the maintenance of a *barbican*, or watch-tower; or a tribute towards repairing or building a bulwark.

BARBILLONS, in the *Natural Hiſtory of Inſects*, are certain bodies, uſually two in number, placed under the creature's head, and moveable at pleaſure, ſomewhat reſembling hands or fingers placed on a ſhort or broken arm.

The word is a diminutive of the French *barbe*, *beard*.

BARBING is ſometimes uſed in *Ancient Statutes* for ſheering. Cloth is not to be exported till it be *barbed*, rowed, and ſhorn. 3 Hen. VII. c. 11.

BARBITOS, or BARBITON, an ancient inſtrument of muſic, mounted with three, others ſay ſeven ſtrings, much uſed by Sappho and Alcæus; whence it is alſo denominated *Leſboum*.

The *barbitos* is ſaid to have differed from the lyre and *cithara*; but wherein the preciſe difference lay, does not appear. Strabo makes it the ſame with the *ſambuca*. It is repreſented as yielding a grave, deep ſound, and, on that account, peculiarly fitted for Doric compoſitions. Anacreon is ſaid to be the inventor of the *barbiton*.

BARBLE, or BARBEL, in *Ichthyology*; ſee BARBUS.

BARBLES, in the *Manege*, knots of ſuperfluous fleſh growing in the channels of a horſe's mouth; that is, in the intervals, which ſeparate the bars, and obſtruct his eating.

Theſe are alſo called *barbes*; and obtain in black cattle as well as horſes.

For the cure, they caſt the beaſt, take out his tongue, and clip off the *barbles* with a pair of ſciſſars, or cut them with a ſharp knife; others chooſe to burn them off with a hot iron.

BARBONI, in *Zoology*, a name given by many to the MULLUS BARBATUS, a fiſh greatly eſteemed at table, and caught in the Mediterranean, and ſome other ſeas.

BARBOTINE, a ſeed, otherwiſe called *ſemen ſantonicum*, and *ſemen contra vermes*, in Engliſh, WORMSEED.

BARBULÆ, in *Botany*, a name given by Pliny to the SEMI-FLOSCULI.

BARBUS, in *Ichthyology*, the fiſh called in Engliſh the *barbel*, and by ſome writers in natural hiſtory, *muſtus fluviatilis*, a ſpecies of the CYPRINUS.

The *barbel* is a fiſh commonly known, and ſo called, on account of the barb or beard under its noſe, or chaps. It is of the leather-mouthed kind.

This is but a moderately well-taſted fiſh. The male is eſteemed better than the female; but neither of them is very much valued. The worſt ſeaſon for them is April. They uſually ſwim together in great ſhoals, and love to be among weeds, where there is a hard, gravelly bottom. In ſummer they frequent the ſtrongeſt and ſwifteſt currents of the water; as deep bridges, weirs, and the like places, and are apt to get in among the piles, weeds, and other ſhelter; but in winter, they retire into the deepeſt and ſtilleſt waters.

The time for taking this fiſh is very early in the morning, or late in the evening: the place ſhould be baited with chopped worms ſome time before; and no bait is ſo good for the hook as the ſpawn of the ſalmon, or ſome other fiſh: in defect of theſe, lob-worms will do; but they muſt be very clean and nice, and the hook carefully covered, otherwiſe he will not touch them. Old cheeſe ſteeped in honey is alſo a very fine bait. The beſt ſeaſon for angling for this fiſh is from May to Auguſt.

BARBYLA, in *Botany*, a name by which Theocritus, and other of the early writers, have called the common damaſk prune.

BARCALAO, a Spaniſh word, which the French pronounce *baccala*, or *baccaliau*. By this laſt name the Baſques moſt commonly call the fiſh which we ſtyle cod; and thoſe people call alſo the iſland which we call Newfoundland, the iſle of *Baccaliau* (*Cod iſland*), becauſe of the great plenty of cod catched there. There is, however, a league to the weſt of that large iſland, another ſmall one, which is more particularly called *Baccaliau*.

BARCALON, an appellation given to the chief miniſter of the emperor of Siam, to whom belongs the care of trade both within the kingdom and out of it, the ſuperintendency of the royal magazines, the receipt of the revenues, and the management of foreign affairs.

BARCA-LONGA, a large Spaniſh fiſhing-boat, navigated with lug-ſails, and having two or three maſts. Theſe are very common in the Mediterranean.

BARCES, or BERCHES, were formerly a kind of ſhip-guns, not unlike ſakers, only ſhorter, thicker in metal, and wider bored.

BARCONE, a ſhort broad veſſel, of a middle ſize, uſed in the Mediterranean ſea for the carriage of corn, wood, ſalt, and other proviſions, from one place to another.

BARD is uſed, in the *Culinary Art*, for a broad ſlice of bacon uſed to cover fowls before they are roaſted, baked, or otherwiſe dreſſed.

BARDANA, in *Botany*; ſee BURDOCK.

BARDARIOTÆ, in *Antiquity*, were a kind of ancient guard attending the Greek emperors, armed with rods, wherewith they kept off the people from crouding too near the prince, when on horſeback.

Their captain, or commander, was denominated *primivergius*.

The word was probably formed from the *bardæ* or houſings on their horſes.

BARDED, in *Heraldry*, is uſed in ſpeaking of a horſe that is capariſoned.

He bears ſable, a *cavalier d'or*, the horſe *barded*, argent.

BARDELLE, in the *Manege*, denotes a ſaddle made in form of a great ſaddle, but only of cloth ſtuffed with ſtraw, and tied tight down with packthread, without either leather, wood, or iron. *Bardelles* are not uſed in France; but in Italy they trot their colts with ſuch ſaddles; and thoſe who ride them are called *cavalcadours*, or *ſcozone*.

BARDE; ſee BARBE.

BARDESANISTS, a ſect thus denominated from their leader, Bardeſanes, a Syrian of Edeſſa, in Meſopotamia, in the ſecond century.

He adopted the oriental philoſophy concerning the two principles; maintaining, that the ſupreme God is free from all evil and imperfection, and that he created the world and its inhabitants pure and incorrupt: that in proceſs of time the prince of darkneſs, who is the fountain of all evil and miſery, enticed men to ſin; in conſequence of which, the ſupreme God permitted them to be diveſted of thoſe ethereal bodies with which he had endued them, and to fall into ſluggliſh and groſs bodies formed by the evil principle: and that Jeſus deſcended from heaven, cloathed not with a real but aerial body, in order to recover mankind from that body of corruption which they now carry about them; and that he will raiſe the obedient to manſions of felicity, cloathed with aerial vehicles, or celeſtial bodies.

Strunzius has given the hiſtory of the *Bardeſaniſts*.

BARDS, BARDI, ancient poets among the Gauls and Britons, who deſcribed and ſung in verſe, the brave actions of the great men of their nation; with deſign to inculcate and recommend virtue, and even ſometimes to put an end to the difference between armies at the point of engagement.

Bochart derives the word from *parat*, *to ſing*. Camden agrees with Feſtus, that *bardus* originally ſignifies *a ſinger*: and adds, that the word is pure Britiſh. Others derive the word from *Bardus*, a druid, the ſon of Dryis, and the fifth king of the Celtæ.

The *bards* differed from the *druids*, in that the latter were prieſts and teachers of the nation, but the former only poets and writers.

Larrey, Bodin, and Paſquier, indeed will have the *bards* to have been prieſts, as well as philoſophers: and Cluverius, orators too: but without much foundation in antiquity.—Strabo divides the ſects of philoſophers among the Gauls and Britons into three, viz. the druids, *bards*, and evates. The *bards*, adds he, are the ſingers and poets; the evates, the prieſts and natural philoſophers; and the druids, to natural philoſophy add alſo the moral. Hornius however reduces them to two ſects, viz. *bards*, and druids; others to one, and make a druid a general name, comprehending all the others. Cluverius will have it, that there were *bards* alſo among the ancient Germans; becauſe Tacitus makes mention of their ſongs and poems, which contained their hiſtory.

Almoſt all hiſtory, Celtic and Chaldæan, as well as Greek and Roman, had its foundation in poetry. Whether we ſhall find the rules of their proſody to agree with thoſe laid down by captain Middleton in his Hardometh, or Art of Welch Poetry, we know not: but how methodically they ordered their *tybwyths* or tribes, Sylas, Taylor, and Rowland have at large informed us.

It was cuſtomary to ſing theſe compoſitions in the preſence of their nobles, and at their chief feſtivals and ſolemnities.

Among the ancient Britiſh *bards*, the moſt celebrated is the great Merlyn, whoſe true name, according to Lhuyd, is *Merdhyn*. The genealogical ſonnets of the Iriſh *bards* are ſtill the chief foundations of the ancient hiſtory of Ireland. In the Highlands of Scotland there are conſiderable remains of many of the compoſitions of their old *bards* ſtill preſerved. But the moſt genuine entire and valuable remains of the works of the ancient *bards*, and perhaps the nobleſt ſpecimen of uncultivated genius, are the poems of Oſſian the ſon of Fingal, a king of the Highlands of Scotland, who flouriſhed in the ſecond or third century; lately collected by Mr. Macpherſon, and by him tranſlated from the Erſe or Galic language into Engliſh.

BARE, in a general ſenſe, ſignifies not covered. Hence we ſay *bare*-headed, *bare*-footed, &c.

The Roman women, in times of public diſtreſs and mourning, went *bare*-headed, with their hair looſe.

Among both Greeks, Romans, and Barbarians, we find a feaſt called *nudipedalia*, at which perſons were to attend *bare*-footed.

The Abyſſinians never enter their churches but *bare*-footed; not on account of Moſes, who was commanded to put off his ſhoes on mount Sinai, but in reverence of the place; as is alſo done by them in entering the palaces of kings and great men.

Sagittarius has a diſſertation expreſs on thoſe who went *bare*-footed among the ancients, De Nudipedalibus Veterum; wherein he treats of ſuch as went *bare*-footed in journies or otherwiſe, either out of choice, or neceſſity: alſo of *bare*-footed religious, of mourners and penitents, who went *bare*-footed; and, laſtly, of the *leviri*.

Bare, in reſpect of *Manufacture*. A cloth is ſaid to be *bare* or naked, when the nap is too ſhort, as having been ſhorn too near, or not being ſufficiently covered with wool by the teazel.

Bare is alſo uſed for a ſort of bowling-ground, not covered with green ſwarth.

Bare-*foot* **Carmelites**, and *Auguſtines*, are religious of the order of St. Carmel and St. Auguſtin, who go without ſhoes, like the capuchins.

There are alſo *bare*-foot fathers of mercy. Formerly there were *bare*-foot Dominicans, and *bare*-foot nuns of the order of St. Auguſtin.

Bare-*footed Trinitarians*; ſee TRINITARIAN.

Bare-*pump*; ſee PUMP.

BAR-FEE, a fee of 20 pence, which every perſon acquitted of felony pays the gaoler.

BARGAIN, a CONTRACT either for the ſale, purchaſe, or exchange of a thing.

The word is formed from the French *barguigner*, *to barter*, or *haggle*.

He that ſells is the *bargainor*, and he that buys the *bargainee*.

Bargain *and Sale*, in *Law*, is properly a CONTRACT made of manors, lands, and other things, transferring the property thereof from the *bargainor* to the *bargainee*, for a conſideration in money.

It is a good contract for land, and the fee paſſes, though it be not ſaid in the deed, to have and to hold to him and his heirs, and though there be no livery and ſeſin given by the *vendor*, ſo it be by deed indented, ſealed, and inrolled, either in the county where the land lies, or in one of the king's courts of record at Weſtminſter, within ſix months after the date of the deed.

This manner of conveying lands was created and eſtabliſhed by the 27 Hen. VIII. cap. 10. which executes all uſes raiſed; and as this introduced a more ſecret way of conveying than was known to the policy of the common law, therefore the inrolment of the deed of *bargain and ſale* was made neceſſary by the 16th chapter of that ſtatute.

Bargains, in *Commerce*, are of divers kinds: *verbal*, thoſe made only by word of mouth, and giving earneſt; *written*, thoſe where the terms are entered in form on paper, &c.

At Amſterdam they diſtinguiſh three kinds of *bargains*.

Bargains, *conditional*, for goods which the ſeller has not yet in his poſſeſſion; but which he knows have been bought for him by his correſpondents abroad, and which he obliges himſelf to deliver to the buyer, on their arrival, at the price and the conditions agreed on.

Bargain, *firm*, that wherein the ſeller obliges himſelf to deliver to the buyer a certain quantity of goods, at the price and in the time agreed on.

Bargains, *optional*, thoſe wherein a dealer obliges himſelf, in conſideration of a *premium* received in hand, either to deliver or take a certain quantity of goods at a fixed price, and within a time limited; but with a liberty, nevertheleſs, of not delivering, or not receiving them, if they think proper, upon forfeiture of their *premium*.

Bargains, *forehand*, are thoſe wherein goods are bought or ſold in order, to be delivered at a certain time afterwards, ſome part of the price being advanced.

BARGE, a kind of ſtate, or pleaſure-boat, or large luggage-boat, uſed chiefly in the navigation of rivers, which lead to great cities.

Barges are of various kinds, and acquire various names, according to the variety of their uſes and ſtructures: as,

A company's barge,	*A Severn trow*,
A row barge,	*A Ware barge*,
A royal barge,	*A light horſeman*,
A ſand barge,	*A Weſt-country barge*.

A *barge* differs from a bark, as being ſmaller, and uſed only on rivers; whereas the latter goes out to ſea.

There are alſo *barges* belonging to men of war, ſerving to carry generals, admirals, and chief commanders.

Barge-*courſe* is uſed by workmen, to ſignify a part of the tiling, which projects over the gable of a building, and is made up with mortar.

Barge, in *Zoology*, a name uſed by ſome authors for the *godwit*, or, as it is called in ſome places, the *ſtone-plover*, the ÆGOCEPHALUS.

BARGH, is uſed in ſome places of England for a ſteep horſe-way up a hill.

It ſeems to come from the German *bargh*, *a hill*.

Bargh-*maſter*, **Barmer**, or **Bar**-*maſter*, in the *Royal Mines*, the ſteward or judge of the BARGHMOTE.

The word is formed of the German *berg-meiſter*, q. d. *maſter of the mines*.

The *bar-maſter* is to keep two great courts of barmote yearly, and every week a ſmall one, as occaſion requires.

BARGHMOTE, or **Barmote**, a court which takes cognizance of cauſes and diſputes between miners.

Some ſuppoſe it thus called from a *bar*, at which the ſuitors appear; others, with more probability, derive the word from the German *berg*, *a mine*.

By the cuſtom of the mines, no perſon is to ſue any miner for ore-debt, or for ore, or for any ground in variance, but only in the court of *barmote*, on penalty of forfeiting the debt, and paying the charges at law.

BARILLARIUS, an ancient officer in monaſteries and great houſeholds, who had the care of the caſks and veſſels of wine, &c. in the cellars.

BARILLIA, or **Bariglia**, in the *Glaſs Trade*, a ſort of pot-aſhes imported from Spain, inferior in goodneſs to that of the Levant, called *polverine* when looſe, ſmall, and in powder, and *rochetta* when in hard, rocky lumps.

The frit made of theſe makes fine and clear cryſtal glaſs, eſpecially that from the *rochetta*, or the *polverine* in lumps; but the *barillia* of Spain, though it be uſually fatter, yet makes not a glaſs ſo white, but uſually inclining a little to a bluiſh colour.

BARING *of trees*, in *Agriculture*; ſee ABLAQUEATION.

BARITONO, in *Muſic*, denotes a voice of low pitch, between a tenor and baſs.

BARK, the exterior part of trees, ſerving them for a ſkin, or covering.

In *Writers of the Laſt Age*, this is ſometimes alſo called *baſt*. Vid. 15 Car. II. c. 2.

The *bark* of trees in general is of a ſpongy texture; and, by many little fibres which paſs through the capillary tubes, whereof the wood conſiſts, it communicates with the pith; ſo that the proper nutriment of the tree, being imbibed by the roots, and carried up through the fine arterial veſſels of the tree by the warmth of the ſoil, &c. to the top of the plant, is uſually ſuppoſed to be there condenſed by the cold air, and in that form returns by its own gravity down the veſſels, which do the office of veins, lying between the wood and inner *bark*; leaving as it paſſes by, ſuch parts of its juice as the texture of the *bark* will receive, and requires for its ſupport. See CIRCULATION *of ſap*.

That ſoft whitiſh rind or ſubſtance between the inner *bark* and the WOOD, which Mr. Bradley thinks to do the office of veins, ſome account a third *bark*, only differing from the others in that its fibres are cloſer; it is this contains the liquid ſap, gums, &c. found in plants in the ſpring and ſummer months. It hardens by little and little, by means of the ſap it tranſmits, and is converted imperceptibly into the woody part of the tree. There are few trees without it; yet it is ſtill found in leſs quantity as the tree is more expoſed to the ſun: that of the oak is ordinarily about an inch thick. It is here that the corruption of trees generally begins: whence thoſe who fell and cut out trees, ought always to take care to leave as little of it on as poſſible.

The *bark* of roots is ſometimes yellow, as in dock; ſometimes red, as in biſtort; but ofteneſt white. It is derived from the ſeed itſelf, being only the extenſion of the *parenchyma* of the radicle. It is variouſly ſized, being ſometimes very thin, as in the Jeruſalem artichoak, and in moſt trees. Sometimes it is thicker, and makes the greater part of the ſubſtance of the root, as in aſparagus and dandelion. In beet-root, the *bark* ſcarce exceeds a good thick ſkin; whereas in a carrot, it is half the ſemi-diameter of the root, being in ſome places above an inch over. This too is found common to the generality of roots, that their *barks* are proportionably thicker at bottom than at top.

The inner part of the *bark*, we have obſerved, annually lignifies, or turns to wood: the *bark* of a tree is found each year to divide and diſtribute itſelf two contrary ways: the outer part gives towards the ſkin, till it becomes ſkin itſelf, and at length falls off, like the ſcales or dandriff of our body, or the *exuviæ* of ſerpents; while the inmoſt portion is yearly diſtributed and added to the wood.

The *bark* is found truly continuous to the body of a tree, as the ſkin of our body is to the fleſh; contrary to the common opinion, which imports, that the *bark* only ſurrounds the tree, as a ſcabbard does a ſword, or a glove the hand; which ſeems confirmed by the eaſy ſlipping of the *bark* of willow, and moſt other trees, when full of ſap, from the wood. Their continuity is effected by means of the *parenchyma*, which is one entire body, running from the *bark* into the wood, and thus uniting both together. The reaſon why the *bark* ſlips ſo eaſily from the wood is, that moſt of the parenchymous parts are young veſſels, formed every year ſucceſſively between the wood and the *bark*, and are much in the condition of the tender veſſels or fibres of the embryos in a womb, or egg; a thouſand of which are broke with the ſmalleſt force.

That trees only live by the aſcent of the ſap in or between the *bark* and the wood, and that if a circle be drawn round any tree (except, perhaps, aſh) by inciſion to the timber, how thin ſoever the knife be, provided no part of the thickneſs of the *bark* remain uncut, the tree will die from that part upwards, has been the ſtanding doctrine of naturaliſts of all ages, and is delivered for fact by Pliny, and others. Dr. Plott aſſerts this to be a popular error, from the inſtance of a large old elm in Magdalen-college grove, quite diſbarked around, at moſt places two feet, at ſome four feet, from the ground, which yet grew and flouriſhed many years, as well as any tree in the grove. Beſides, it was entirely without pith, being hollow within as a drum: and the ſame is confirmed from the hiſtory of the elm in the Thuilleries, related by M. Parent, which lived, and put out leaves, though entirely ſtripped of *bark* from top to bottom. Add, that the plane and cork trees diveſt themſelves yearly of all their old *bark*, and acquire a new one, as ſnakes do their ſkins: and in the change from one to the other, it is evidently not by the *bark* that they are nouriſhed. Some infer from hence, that the *bark* never feeds the WOOD. Dr. Plott is more reſerved in his concluſion, arguing only, that hence it ſeems to follow, that there muſt be other veſſels, beſides the ſap-veſſels of the *bark*, capable of the office of conveying ſap. It is probable, when the ordinary conveyance fails, ſome of the woody part, which had all once been ſap-veſſels, reſumes its ancient office; or, as the author laſt mentioned conjectures, they ſtill ſo far retain their office of conveying ſap, as to keep a tree alive, though not to augment it; which may, perhaps, be one different uſe of thoſe ſap-veſſels in the wood from thoſe in the *bark*, the former being ſufficient for the continuation of a tree, and the latter ſerving only for its augmentation. Plin. Hiſt. Nat. lib. xvii. c. 24. Phil. Tranſ. N° 43. Hiſt. Acad. Scien. 1709, and 1711. Plott's Nat. Hiſt. Oxf. c. vi. § 65.

Mr. Brotherton has given ſome new experiments, which ſeem to decide the controverſy, and ſhew, that the *bark* is not the vehicle of vegetation: he hacked a crab-tree round with a hatchet, ſo as, beſides cutting off the *bark*, to cut pretty deep into the wood, for the breadth of about four inches; yet the ſame year it was obſerved to increaſe very conſiderably in thickneſs above the ſaid hacking, and to ſhoot in length of wood about one foot: the next year it alſo grew conſiderably, and ſhot in length five inches: the third year it died to the very root. The like was found in another tree, part of whoſe *bark* was eat off by the canker: the lower part ſtood without increaſe, and by degrees the wood rotted: the upper part increaſed to the third year, and then died alſo.

The ſame author found, that, in the branches of Scotch fir, the joints above the rings *barked*, would grow much bigger in three years, than in five if the rings were not cut off. A ring of *bark* three inches broad being cut off a Scotch fir, near the bottom of the ſtem, below the uppermoſt knot or joint, was found to grow and ſhoot out at its top half a yard, and all the parts above the ring to increaſe in thickneſs the ſame year, much more than they would have done, had not the ſection been made; but all the part of the ſtem between the ring and the next knot below it, grew not at all: the part below the ring next under that, increaſed ſomewhat, though leſs than it would have done, if the *bark* had not been cut off. The ſecond year the increaſe was alſo conſiderable; but the third it died. Phil. Tranſ. N° 187.

M. Magnol mentions an olive-tree, from which a circular ring of *bark* being cut away, the tree that year bore, above the place of inciſion, double the quantity of flowers and fruit which it uſed to bear. Mr. Reneaume relates a fact near a-kin to this. In the country about Aix and Marſeilles, when an olive-tree grows old, and almoſt ready for felling, they have a method of making it firſt yield all the fruit which it is capable of producing, by cutting a circular ring of *bark*, an inch broad, from one of its young branches, and in its place putting an equal ring of *bark* taken from the branch of a young bearing olive-tree; the effect of this engraftment is, that the branches of the old tree bear plentifully the enſuing year, and thoſe of the young one die away. Hiſt. Acad. Sc. 1711.

From the whole, Mr. Brotherton concludes, that the ſap, moſt of it, if not all, aſcends in the veſſels of the woody part, and not by the *bark*, nor between the *bark* and the wood. Phil. Tranſ. N° 187. p. 312.

Mr. Lewenhoeck, on the other hand, has given ſeveral experiments and obſervations with the microſcope to ſhew, that the *bark* of trees is produced from the wood, and not the wood from the *bark*. Philoſ. Tranſact. N° 202.

It is very remarkable, that trees ſtripped in the time of the ſap, and ſuffered to die, afford timber heavier, more uniformly denſe, ſtronger, and fitter for ſervice, than if the tree had been cut down in its healthy ſtate. Something of a like nature has been obſerved by Vitruvius and Evelyn. Mem. Acad. Scienc. 1738.

As animals are furniſhed with a *panniculus adipoſus*, uſually replete with fat, which inveſts and covers all the fleſhy parts, and ſcreens them from external cold, plants are encompaſſed with a *bark* replete with fatty juices, by means whereof the cold is kept out, and, in winter-time, the *ſpiculæ* of ice prevented from fixing and freezing the juices in the veſſels: whence it is, that ſome ſort of trees remain ever-green the year round; becauſe their *barks* contain more oil than can be ſpent and exhaled by the ſun, &c. Ray's Wiſd. of God, &c. part i. p. 103.

Boerhaave mentions eight different ſpecies of juices lodged in the *bark*, viz. the watery ſap or chyle, an oil, balm, pitch, reſin, colophony, gum, and gummous reſin.

The *bark* has its peculiar diſeaſes, and is infected with inſects peculiar to it. Moſs is a diſeaſe of the *bark*. Wounds of the *bark* often prove mortal. See CANKER.

Of the *bark* of willows and linden-trees is ordinarily made a kind of ropes. The Siameſe make their cordage of the *bark* of the cocoa-tree, which is alſo the caſe in moſt of the Aſiatic and African nations. In reality, flax and hemp, with all their toughneſs, are only the ſap-veſſels, or ligneous fibres of the *bark* of thoſe plants.

There are a great many kinds of *barks* in uſe in the ſeveral arts: ſome in *Medicine*, as the QUINQUINA, or JESUIT'*s* *bark*, *macer*, *chacarilla*, &c. others in *Dying*, as the *bark* of the alder; others in *Spicery*, as CINNAMON, *caſſia lignea*, &c. the *bark* of oak in *Tanning*; others on other occaſions, as *cork*; that of a kind of birch is uſed by the Indians for canoes capable of holding twenty-four perſons.

The ancients wrote their books on *barks*, eſpecially thoſe of the aſh, and *tilia* or lime-tree; not on the exterior or outer *bark*, but on the inner and finer, called *philyra*; which is of ſo durable a texture, that there are manuſcripts on it, ſtill extant, a thouſand years old.

In the Eaſt Indies they manufacture the *bark* of a certain tree into a kind of ſtuff or cloth. It is ſpun and dreſſed much after the manner of hemp. The long filaments ſeparated from it, upon beating and ſteeping it in water, compoſe a thread, of a middle kind between ſilk and common thread; neither ſo ſoft nor bright as ſilk, nor ſo hard or flat as hemp. See Neumann's Works, p. 428, note.

Some of theſe ſtuffs are pure *bark*, and are called pinaſſes, biambonnes, &c. In others they mix ſilk with the *bark*, and call them ginghams and nillas: the fountalungees too are part ſilk, part *bark*, and are only diſtinguiſhed by being ſtriped.

Bark alſo makes a good manure, eſpecially that of oak, which is rich in ſalt; but the better ſort is reſerved for tanning.

BARK, *Indian*, *Thuris cortex*, a medicinal *bark*, brought from the Eaſt, rolled up like cinnamon, of a ruſty colour, a warm aromatic, bitter taſte, and pleaſant ſmell; ſometimes uſed in fumigation againſt fits of the mother.

BARK-*mills*; ſee MILL.

BARK, *grafting in*; ſee ENGRAFTING.

BARK, in *Navigation*, denotes a little veſſel for the ſea, uſually with pointed or triangular ſails, in number two, or three at the moſt.

The word is derived by ſome from the Latin *barca*; Fournier, from *Barce*, a city in Africa; and Toletanus, from *Barcelona*.

Some authors uſe the word *bark* for any veſſel that has no maſts.—Of *barks*, there are various kinds: as,

A bilander,
A ſaik,
A ſettee,
A ſkuit,
A ſnaul,
A ſnouke.

BARK, *armed*, a kind of fire-ſhip filled with ſoldiers, uſed both for making ſallies, and to attack galleries, and bar the paſſage over them.

BARK, *long*, is a ſmall veſſel without deck, longer and lower than the common *barks*, being ſharp afore, and commonly going both with ſails and oars. It is built after the manner of a ſloop, and in many places is called a *double ſloop*.

Barks, *water*, are little veſſels uſed in Holland for the carriage of freſh-water to places where it is wanting, as well as for the fetching ſea-water to make ſalt of. They have a deck, and are filled with water up to the deck.

Bark-*binding*, a diſtemper incident to trees, cured by ſlitting the *bark*, or cutting it along the grain, viz. in apple-trees by cutting ſtrait down.

Bark-*galling*, is when trees are galled by thorns, or by being bound to ſtakes, &c. It is cured by clay laid on the galled place, and bound on with hay.

BARKARY denotes a tan-houſe, or place to keep *bark* in, eſpecially for tanners.

It is otherwiſe called a *heath-houſe* in old writers.

BARKING *of trees*, is the peeling off or ſtripping the bark from the wood.

The month of May is the ſeaſon for *barking of trees*, becauſe then the ſap looſens the bark from the wood; which it is very hard to effect in any other time, unleſs the ſeaſon be very wet; heat and dryneſs being always oppoſite thereto.

Maliciouſly *barking* of apple-trees, or other fruit-trees, is made felony by 37 Hen. VIII. c. 6.

By the French laws, all dealers are forbid to *bark* their wood while growing, on the penalty of 500 livres.

This law was the reſult of ignorance; it being now found, that *barking* of trees, and letting them die, increaſes the force of timber.

Barking is alſo a name given to the cry of dogs and foxes.

The term is alſo applied to certain quaint noiſes made by ſick perſons in ſome diſeaſes.

In cynic ſpaſms, and epileptic fits, the patient ſometimes ſnarls, howls, and *barks*, with all the notes of a dog. But it is in the *hydrophobia*, that *barking* has been ofteneſt obſerved: perſons ſeized with this, are apt to rave, bite, ſnarl, and make a harſh noiſe in their throats, which is called *barking*.—Vid. Phil. Tranſ. N° 280. N° 323. N° 207. and N° 242.

BARLAAMITES, in *Church Hiſtory*, the followers of a Calabrian monk, afterwards biſhop of Emont, the great opponent of Greg. Palama and the Heſychaſtæ. Fabr. Bib. Græc.

The *Barlaamites* are the ſame with thoſe otherwiſe denominated *Acindynites*.

BARLERIA, in *Botany*, a genus of plants, of the *didynamia angioſpermia* claſs; called by the inhabitants of Jamaica, *ſnap-dragon*. The characters are, that the flower is nearly of the lip-kind, of one leaf, funnel-ſhaped, and divided into five parts at the top: that it hath four ſlender *ſtamina*, two ſhort, and two longer: that an oval *germen* is placed in the centre, which afterward becomes an oblong membranaceous veſſel, with two cells, which is very elaſtic, containing two roundiſh compreſſed ſeeds. There are four ſpecies.

BARLEY, in *Botany*, a gramineous, frumentaceous herb, whoſe ſeeds are of the larger ſort, being covered with a huſk, growing in a ſpike, and the grains bearded.

Barley, through neglect and poverty, is ſaid to degenerate into oats and darnel. Dr. Plott ſpeaks of *barley* and rye growing in the ſame ear alternately.

The principal uſe of *barley* among us is for making beer, in order to which it is firſt malted.

Barley has alſo its medicinal virtues, in which it reſembles oats: the wort of malt is an excellent antiſcorbutic.

All the ſorts of *barley* are ſown in the ſpring of the year, in dry weather; in ſome very dry light land, it is ſown early in March, but in ſtrong clayey ſoils, it is not ſown till April, and ſometimes not until the beginning of May; but when it is ſown ſo late, if the ſeaſon doth not prove favourable, it is very late in autumn before it is fit to mow; unleſs it be the rath ripe ſort, which is often ripe in nine weeks from the time of ſowing. Some have ſteeped the ſeed, before it is ſown.

Some people ſow *barley* upon land where wheat grew the former year; but where this is practiſed, the ground ſhould be plowed the beginning of October in a dry time, laying it in ſmall ridges, that the froſt may mellow it the better; which will improve the land greatly: and if it can be ploughed again in January, or the beginning of February, it will break and prepare the ground better. In March it ſhould be ploughed again deeper, and be laid even where it is not very wet: but in ſtrong wet land the ground ſhould be laid in round lands, and the furrows be made deep to receive the wet. When this is finiſhed, the common method is to ſow the *barley*-ſeed with a broad caſt at two ſowings, the firſt being harrowed in once, the ſecond is harrowed until the ſeed be buried. The common allowance of ſeed, is four buſhels to an acre.

After the *barley* is ſown and harrowed in, the ground ſhould be rolled after the firſt ſhower of rain, to break the clods and lay the earth ſmooth; which will render it better to mow the *barley*, and alſo cauſe the earth to lie cloſer to the roots of the corn, which will be of great ſervice to it in dry weather.

Where *barley* is ſown upon new broken up land, the uſual method is to plough up the land in March, and let it lie fallow until June, at which time it is ploughed again, and ſown with turneps, which are eaten by ſheep in winter, by whoſe dung the land is greatly improved; and then in March following the ground is ploughed again, and ſown with *barley* as before.

There are many people who ſow clover with their *barley*; and ſome have ſown lucern with it; but neither of theſe methods is to be commended: for where there is a good crop of *barley*, the clover or lucern will be ſo weak as not to pay for ſtanding. The better way is to ſow the *barley* alone, and then the land will be at liberty for any other crop when the *barley* is taken off the ground. The clover has been ſometimes ſown a month after the *barley*, and found to anſwer very well.

When the *barley* has been up three weeks or a month, it will be a very good method to roll it with a heavy roller, which will preſs the earth cloſe to the roots, and keep the ſun from penetrating the ground in dry ſeaſons: and this rolling it before it ſtalks, will cauſe it to ſend out a greater number of ſtalks; ſo that if the plants ſhould be thin, this will cauſe them to ſpread ſo as to fill the ground, and likewiſe ſtrengthen the ſtalks.

The time for cutting of *barley*, is when the red colour of the ears is off, when the ſtraw turns yellow, and when the ears begin to hang down. In the north of England they always reap their *barley*, and make it up into ſheaves, as is practiſed here for wheat; by which method they do not loſe near ſo much corn, and it is alſo more convenient for ſtacking; but this method cannot be ſo well practiſed where there are many weeds among the corn, which is too frequently the caſe in the rich lands near London, eſpecially in moiſt ſeaſons. Therefore when this is the caſe, the *barley* muſt lie on the ſwarth until the weeds are dead: but as it is apt to ſprout in wet weather, it muſt be ſhook up and turned every fair day after rain to prevent it. When it is carried it ſhould be thoroughly dry, for if it be ſtacked wet, it will turn muſty; and if too green, it is ſubject to burn in the mow.

The common produce of *barley* is two and a half, or three quarters, on an acre; but a much greater produce is ſometimes found.

Pearl **Barley**, and *French* **Barley**; theſe are *barley* freed of the huſk by a mill; the diſtinction between the two being, that the *pearl barley* is reduced to the ſize of ſmall ſhot, all but the very heart of the grain being ground away.

Barley-*water* is a decoction of either of theſe, reputed ſoft and lubricating, of frequent uſe in phyſic.

This well-known decoction is a very uſeful drink in many diſorders; and is recommended, with nitre, by ſome authors of reputation, in ſlow fevers.

There is a diſſertation of Hoffman's *De cura avenacea*.

Barley-*corn* is uſed to denote a long meaſure, containing in length the third part of an inch, and in breadth the eighth.

The French carpenters alſo uſe *barley-corn*, *grain d'orge*, as equivalent to the line, or the twelfth part of an inch.

Barley-*corn*, *grain d'orge*, is alſo uſed, in *Building*, for a little cavity between the mouldings of joiners work, ſerving to ſeparate or keep them aſunder; thus called becauſe made with a kind of plane of the ſame name.

Barley-*ſugar*; ſee Sugar.

BARM, otherwiſe called Yeast; the head or workings produced by the fermentation of ale or beer. It is the froth that forms on the ſurface of beer or wine of grains during their fermentation; which, mixed with dough, raiſes it more quickly and better than LEAVEN, and makes the lighteſt bread.

BARMINE denotes ſuch mine or ore, as is adjudged at a court of BARGHMOTE.

BARN, in *Huſbandry*, a covered place or houſe, with air-holes in the ſides, for laying up any ſort of grain, hay, or ſtraw.

BARNABITES, an order of religious, thus called from the church of St. Barnabas at Milan, where they were firſt eſtabliſhed; and not, as ſome have imagined, becauſe St. Barnabas was their patron: in reality, St. Paul is the patron of the *Barnabites*.

The *Barnabites* are regular prieſts of the congregation of St. Paul. Their habit is black, and the ſame with what they wore when firſt eſtabliſhed, in 1533, by the expreſs bulls of pope Clement VII. and afterwards confirmed by Paul III. Their office is to inſtruct, catechize, and ſerve in miſſions.

BARNACLE, in *Natural Hiſtory*, a bird of the gooſe kind, frequent in the Weſtern iſles of Scotland; concerning whoſe origin and ſpecies many fables have been advanced.

The word is alſo written *bernacle*, agreeably to its ſuppoſed etymon, from the Saxon *bearn, a child.*

Several authors have repreſented the *barnacle* as the produce of a marine animal, or ſhell-fiſh: but the latter naturaliſts, on better grounds, refer it to the natural manner of generation of the feathered kind; making it a real gooſe, produced like others *ab ovo.* See a deſcription and draught of it in Sir Rob. Sibbald's Nat. Hiſt. Scot.

The *barnacle* is the ſame with what is otherwiſe called the *Soland gooſe*, in Latin *anſer Scoticus*; ſome will have it the ſame with the French *macreuſe*, or *macrout*; and others with the *diable de mer*, but erroneouſly: Dr. Robinſon aſſigns the difference, making the *barnacle* to be of the gooſe, the *macreuſe* of the duck, and the *diable de mer* of the moor-hen kind.—The ſame author ſhews, that the *macreuſe* is no other than the *ſcoter*, or *anas niger minor*, deſcribed by Mr. Ray and Mr. Willoughby; contrary to the opinion of M. Cattier, who took it for the greater *coot* of Bellonius; and alſo of others, who miſtook it for the *puffin* of the Scillies, and iſle of Man; and of others, with whom it paſſed for a ſort of *columbus* or *doucker*. See Ray Syn. Meth. Avium, p. 141.

BARNACLE is alſo a name given to a kind of ſhell-fiſh, which is found cleaving to the bottoms and ſides of ſhips in certain ſeas; ſometimes alſo to the fins and tails of whales, and the like.

In this ſenſe, *barnacle* is the ſame with what is called by ſailors *clam*; by naturaliſts, *concha anatifera.*

There are divers ſpecies of ſhell-fiſhes included under the denomination *barnacles*: ſome reduce them to two, viz. the *balanus* and *pinna marina.*

See an account of ſeveral rare ſpecies of *barnacles*, by John Ellis, Eſq. Phil. Tranſ. vol. l. part ii. N° 113.

BARNACLES, in *Farriery*, alſo denote an inſtrument which farriers apply to horſes noſes, when they will not ſtand quietly to be ſhod, blooded, dreſſed, or the like. They are alſo called *horſe-twitchers*, or *brakes.*

Barnacles differ from pinchers, as the latter have handles whereby to hold them; whereas the former are faſtened to the noſe with a lace or cord.

There is another meaner ſort of *barnacles*, uſed in defect of the former, called *roller barnacles*, or *wood-twitchers*, which are only two rollers of wood bound together, with the horſe's noſe between them.

BARNFIARD, in *Zoology*, the name of a bird uſually ſeen at ſea, and looked on as a foreteller of bad weather. It is about the ſize of a ſparrow, its neck and back are black, and its breaſt and belly grey; its feet are red, and its bill black, and ſomewhat broad. It ſkims very nimbly along the ſurface of the water.

BAROCO, in *Logic*, denotes the fourth mode of the ſecond figure of ſyllogiſms.

A ſyllogiſm in *baroco* has the firſt propoſition univerſal and affirmative, but the ſecond and third particular and negative; and the middle term, the attribute in the two firſt.—For example:

BA	*Every virtue is attended with diſcretion:*
RO	*Some kinds of zeal are not attended with diſcretion:*
CO	*Therefore ſome kinds of zeal are not virtues.*
BAR	*Nullus homo non eſt bipes:*
OC	*Non omne animal eſt bipes:*
O	*Non omne animal eſt homo.*

BAROMETER, a machine for meaſuring the weight of the atmoſphere, and the variations therein, in order chiefly to determine the changes of weather, and the heights of mountains, &c. to which uſe it was firſt applied by M. Paſcal, in leſs than four years after the invention of it.

The word is compounded of βαρος, *weight*, and μετρον, *meaſure.*

The *barometer* is frequently confounded with the *baroſcope*, though ſomewhat improperly; the latter, in ſtrictneſs, being a machine that barely ſhews an alteration in the weight of the atmoſphere: but it is one thing to know that the air is heavier at one time than another, and another to meaſure how much that difference is; which is the buſineſs of the *barometer.*

The *barometer* is founded on the Torricellian experiment, as it is called from its inventor Torricelli, in 1643: which is no more than a glaſs tube filled with mercury, hermetically ſealed at one end; the other open, and immerged in a baſon of ſtagnant mercury. Now, as the weight of the atmoſphere diminiſhes, the mercury in the tube will here deſcend; on the contrary, as it increaſes, the mercury will again aſcend: the column of mercury ſuſpended in the tube being always equal to the weight of the incumbent atmoſphere.

BAROMETER, *common, the conſtruction of it.*—A glaſs tube AB (*Tab. Pneumatics, fig.* 1.) hermetically ſealed in A, having its diameter about one tenth of an inch, and its length, at leaſt, thirty-one inches, is filled with mercury ſo juſtly, as not to have any air over it, nor any bubbles adhering to the ſides of the tube; which is beſt done by means of a glaſs funnel, with a capillary tube. If a ſmall bubble of air be moved backwards and forwards in the tube, it will help to clear the mercury, which will appear, when pure, like a poliſhed rod of ſteel. The orifice of the tube, filled after this manner, ſo as to overflow, is then cloſely preſſed by the finger, ſo as to exclude any air between it and the mercury, and thus immerged in a veſſel, of a convenient diameter, ſo, however, as not to touch the bottom: at the diſtance of twenty-eight inches from the ſurface of the mercury, are fixed two plates, CE, and DF, divided into three inches, and theſe again ſubdivided into any number of ſmaller parts. Laſtly, the tube is incloſed in a wooden frame, to prevent its being broken; the baſon, though open to the air, ſecured from duſt; and the *barometer* is complete.

As the common *barometer* is the beſt, and moſt to be depended upon in accurate obſervations, it may be proper to add ſome directions for preparing it; they are collected from the publications of Muſchenbroek, Deſaguliers, and De Luc on this ſubject. It appears from many experiments, that the mercury ſtands higher in tubes of a larger, than in thoſe of a narrower bore; and therefore when obſervations are made with different *barometers*, ſome regard ſhould be paid to the difference of their diameters; and it would be deſirable to have them conſtructed of tubes of the ſame diameter. The bore of the tube ſhould be large, in order to prevent the effects of the attraction of coheſion; not leſs than one fourth of an inch; but if they are one third of an inch diameter, they are better. If a ciſtern be uſed as a reſervoir for the ſtagnant mercury, it ſhould be large in proportion to the diameter of the tube, at leaſt ten times greater. The tube ſhould be preſerved free from duſt till it is uſed; and for this purpoſe it may be hermetically ſealed at both ends, and one end may be opened with a file, when it is filled. If this precaution has not been obſerved, the inſide ſhould be well cleaned, by waſhing it with alcohol highly rectified, and rubbing it with a little piſton of ſhammy leather faſtened to a wire. The mercury ſhould be pure; and may be purged of its air, by previouſly boiling it in a glazed earthen pipkin covered cloſe; and when the tube has been uniformly heated and rendered electrical by rubbing it, the hot mercury ſhould be poured into it in a regular current, through a glaſs funnel with a long capillary tube, ſo that the air may not have room to paſs between the parts of the quickſilver. M. De Luc directs, as Mr. Orme had practiſed many years ago in the conſtruction of his improved *diagonal barometers*, that the mercury ſhould be boiled in the tube, as the moſt effectual method of purging it of its air and moiſture. The proceſs is briefly this: he chuſes a tube of $2\frac{1}{2}$ lines or 3 lines bore, and not exceeding half a line in thickneſs; he fills it with mercury within two inches of the top, and holds it with the ſealed end loweſt in an inclined poſition over a chafing-diſh of burning charcoal, preſenting firſt the ſealed end to the fire, and moving it obliquely over the chafing-diſh. As the mercury is heated, the air-bubbles appear like ſo many ſtuds on the inner ſurface of the tube, and gradually running into one another, aſcend towards the higher part of the tube, and at length eſcape. The mercury is hereby freed from all the heterogeneous particles contained in it, together with their ſurrounding atmoſpheres, and the air which lines the inſide of the tube, which cannot be eaſily expelled in any other way, is diſcharged; when this laſt mentioned ſtratum of air is thus expelled, the tube may be afterwards emptied, and filled even with cold mercury, and will be found nearly as free from air as before. The mercury in the tubes thus prepared by a determinate quantity of heat, will riſe higher than in thoſe of the common ſort, and the *barometers* will more nearly correſpond with each other; whereas there will be a difference of ſix or eight lines in the aſcent of the mercury in common *barometers.*

Barometers of this kind roſe uniformly in a heated room; whilſt the mercury in thoſe that had been prepared in the common way deſcended, and in different proportions. When the room cooled, the former deſcended uniformly, and correſponded with each other; the latter roſe with the ſame irregularity with which they had before deſcended, nor were they found, at the cloſe of the experiment, to ſtand at the ſame relative heights as they did at the beginning of it. The reaſon of which is obvious, from the effects of heat on the air remaining in unequal quantities in the tubes in the one caſe, and on the purer mercury in the other.

M. De Luc has alſo contrived to eſtimate the effects of heat on the quickſilver in the *barometer*, when it is uſed for accurate obſervations, by means of a thermometer; the ſcale of which is divided in ſuch a manner as to indicate, with little labour of calculation, the correction to be made on account of heat. As an increaſe of heat that is ſufficient to raiſe the mercury in the thermometer from the freezing to the boiling point, will lengthen the column of mercury in the *barometer* ſix lines, he divides each line in the ſcale of the *barometer* into four parts, each of which may be eaſily ſubdivided into four leſſer parts, or ſixteenths of a line. The ſcale of the thermometer marking the interval between the freezing and boiling points, and anſwering to the ſix lines of the *barometer*, is divided into ninety-ſix equal parts; each of which will correſpond to the ſixteenth of a line in the motion of the mercury in the *barometer* dilated by heat. M. De Luc prepared two *barometers* with their reſpective thermometers graduated in the manner above explained; he placed one pair in the cellar of one houſe, and the other pair in the upper room of another houſe in a lower ſituation, ſo as to be exactly on a level with the cellar; he found that the thermometer in the room roſe nine degrees, and the barometer $\frac{9}{16}$ of a line higher than thoſe in the cellar; whence he ſhews, that, without allowing for the effect of heat, the difference in the heights of theſe two *barometers* would have indicated a difference of about 45 feet in the heights of theſe two places, though they were exactly on the ſame level. See ATMOSPHERE.

M. Prins, an artiſt in Holland, has made an improvement in the reſervoir of the ſimple *barometer*, by means of which, the mercury contained in it is conſtantly kept at the ſame level; but the conſtruction is difficult, and therefore it has not been generally adopted. De Luc's Recherches, &c. vol. i. p. 35.

The *barometer* has been rendered more convenient for carriage, and leſs expenſive, by bending the lower end of the tube in form of a ſyphon, and leaving the mercury in the recurved part open to the preſſure of the atmoſphere: and *barometers* of this conſtruction are preferred by M. De Luc, as being the moſt favourable for indicating the real weight of the atmoſphere, and correſponding invariably with each other. But he acknowledges, that this is not ſo convenient for a ſtationary *barometer*, and for the common purpoſes of a weather-glaſs. The ſcale is hereby diminiſhed one half, and therefore this part was afterwards made conſiderably larger in diameter than the tube, ſo that the variations in the tube might be attended with no ſenſible variations in this part.

Many attempts have been made to render the changes in the *barometer* more ſenſible, and ſo to meaſure the atmoſphere more accurately; which has given riſe to a great number of *barometers* of different ſtructures.—Hence the *wheel barometer*, *diagonal barometer*, *horizontal barometer*, *pendant barometer*, &c.

Des Cartes ſuggeſted the firſt method of increaſing the ſenſibility of the *barometer*, though he did not live to execute it. He propoſed a tube AB (*fig.* 2.) about twenty-ſeven inches long, terminating in a cylindric veſſel CD; one half of which veſſel, connected above with a long tube of a very ſmall bore, ſealed at top, and exhauſted of its air, was to be filled with water extending up into the ſmall tube; the other part of the veſſel, and the lower part of the tube, were to be filled with mercury. Whenever the mercury roſe in the cylinder, it would force up a proportional quantity of water into the narrow tube, where it would have a conſiderably larger range than that of the mercury in the cylinder: neglecting the weight or preſſure of the water, the motion of the water and of the mercury would be in the inverſe ratio of the ſquares of the diameters of the veſſels containing them. But the water preſſes on the mercury according to its height; and therefore if the whole range of the mercury in the cylinder, or in a common *barometer*, were ſuppoſed to be two inches, the ſpecific gravity of water to that of mercury as 1 to 14, and the difference between the diameters of the cylinder and tube a *maximum* or infinite, then the entire ſcale of variation in this inſtrument would be twenty-eight inches; or the extent of this ſcale would be to that of the common *barometer* in the inverſe ratio of the ſpecific gravity of water to that of mercury. It is evident that, in practice, it would be ſomewhat leſs than twenty-eight inches. Huygens conſtructed a *barometer* of this kind. But here, though the column ſuſpended was larger, and conſequently the variation greater, yet the air impriſoned in the water getting looſe by degrees, filled the void ſpace in the top, and ſo ruined the machine.

Huygens then bethought himſelf of placing the mercury at top, and the water at bottom, in the manner following: ADG (*fig.* 3.) is a bent tube hermetically ſealed in A, and open in G; the cylindric veſſels BC and FE are equal, and about twenty-nine inches apart; the diameter of the tube is about a line, that of each veſſel fifteen lines, and the depth of the veſſels is about ten; the tube is filled with mercury (the common *barometer* ſtanding about twenty-nine inches) which will be ſuſpended between the middle of the veſſel FE, and that of the veſſel BC; the remaining ſpace to A, being void both of mercury and air; laſtly, common water, tinged with a ſixth part of *aqua regis* to prevent its freezing, is poured into the tube FG, till it riſes a foot above the mercury in DF.

When the mercury riſing above the level of that contained in FE, through the tube AD, becomes a balance to the weight of the atmoſphere; as the atmoſphere increaſes, the column of mercury will increaſe, conſequently the water will deſcend; as the atmoſphere again grows lighter, the column of mercury will deſcend, and the water aſcend. This *barometer* therefore, which is nearly the ſame with that of Dr. Hook, will diſcover much minuter alterations in the air than the common one: for, inſtead of two inches, the fluid will here vary two feet; and by enlarging the diameters of the cylinders, that variation may be ſtill increaſed: but it has this inconvenience, that the water will evaporate, and ſo render the alterations precarious; though the evaporation be, in ſome meaſure, prevented by a drop of oil of ſweet almonds ſwimming at top: the column of water will likewiſe be ſenſibly affected by heat and cold.—On account of theſe and ſuch defects, others have had recourſe to a

BAROMETER, *horizontal*, or *rectangular*, ABCD (*fig.* 4.), the tube whereof is bent in form of a ſquare BCD; at top of its perpendicular leg it is joined to a veſſel or ciſtern AB; and its variations accounted on the horizontal leg CD.

Now here the interval, or ſpace of variation, may be made of any extent at pleaſure, and ſo the minuteſt change in the air become ſenſible. For the diameter of the tube CD being given, it is eaſy to find the diameter of the veſſel AB, ſo as that the ſcale of deſcent in the tube DC ſhall have any given proportion to the ſcale of aſcent in the veſſel AB; the rule being, that the diameter of the veſſel is to that of the tube in a ſubduplicate reciprocal ratio of their ſcales.

The diameters then of CD and AB being given, together with the ſcale of aſcent of the mercury in the veſſel, the ſcale of mercury in the tube is found thus: as the ſquare of the diameter of the tube is to the ſquare of the diameter of the veſſel, ſo, reciprocally, is the ſcale of mercury in the veſſel, to the ſcale of mercury in the tube.

Caſſini was the firſt inventor of this kind of *barometer*, though the ſame conſtruction had been thought of, and firſt publiſhed by M. J. Bernouilli, in the year 1710.

This and the preceding contrivance of Huygens are founded on a theorem in hydroſtatics; viz. that fluids, having the ſame baſe, gravitate according to their perpendicular altitude, not according to the quantity of their matter; whence the ſame weight of the atmoſphere ſupports the quickſilver that fills the tube ACD, and the ciſtern B, as would ſupport the mercury in the tube alone.

This laſt, however, with its excellencies, has great defects: for, by reaſon of the attraction between the parts of the glaſs and of the mercury (which Dr. Jurin has ſhewn to be conſiderable), with the length of the ſcale (conſequently the quantity of motion), and the attrition againſt its ſides, eſpecially in ſudden riſes and deſcents, the mercury breaks, ſome parts of it are left behind, and the equability of its riſe and fall ruined.—Some therefore prefer the

BAROMETER, *diagonal*, of Sir Samuel Moreland, where the ſpace of variation is conſiderably larger than in the common one, and yet the riſe and fall more regular than in the others.—Its foundation is this; that in a Torricellian tube BC (*fig.* 5.) inclined at any angle to the horizon, the cylinder of mercury equivalent to the weight of the atmoſphere, is to a cylinder of mercury equivalent to the ſame in a vertical tube, as the length of the tube BC to the perpendicular height DC.

Hence, if the height DC be ſubtriple, ſubquadruple, &c. of the length of the tube, the changes in the diagonal *barometer* will be triple or quadruple, &c. of the changes in the common *barometer*. This *barometer* will ſcarce allow its tube to be inclined to the horizon at a leſs angle than 45°, without undergoing the inconveniency of the horizontal one.

Mr. Orme, in order to obviate ſome of the objections to which the *diagonal* conſtruction of the *barometer* is liable, purified the quickſilver from its droſs and earthy particles by diſtillation; and when the tube was filled with a certain quantity of mercury, diſcharged the remaining air by an intenſe heat ſufficient to make the mercury boil; and he continued this operation for four hours. In the proceſs, an innumerable quantity of ſmall particles were emitted, and when no more bubbles roſe in the tube, the mercury appeared extremely bright, but ſunk lower in the tube than when it was firſt put in, by two inches. Phil. Tranſ. abr. vol. viii. p. 455.

Barometer, *wheel*. This was a contrivance of Dr. Hook, in 1668, to make the alterations in the air more ſenſible; the foundation of this is the *common vertical barometer*, with the addition of a couple of weights A and B (*fig.* 5.) hanging in a pulley, the one of them playing at liberty in the air, the other reſting on the ſurface of the mercury in the tube, and riſing and falling with it.

Thus is the motion of the mercury communicated, by means of the pulley, to an index which turns round a graduated circle; and thus the three inches of vertical aſcent are here improved to five, or ſix, or more, at pleaſure.

But the friction of the parts, in the pulley and index, is ſo conſiderable, that unleſs the machine be made with a great deal of accuracy, it does not anſwer.

An inſtrument of this kind, with conſiderable improvements, has been conſtructed by Mr. Fitzgerald, F. R. S. It is furniſhed with two pulleys that move on friction-wheels; each of which turns an index on the centre of a graduated circle. The ſmaller circle is four inches in diameter, and divided into three equal parts, each of which is again ſubdivided decimally; and the changes correſponding to the riſe or fall of the mercury from 28 to 31 inches, are marked on the margin of it, as they are on the ſcales of common *barometers*. The larger circle is divided into 300 equal parts; and being about 30 inches in circumference, the index belonging to it will mark diſtinctly the 600th part of an inch in the riſe or fall of the mercury. On the centre of this circle two regiſters are fixed, which are placed along the index when the inſtrument is adjuſted; one of them is carried round with the index, and left behind on its return; ſo that their diſtance will determine the limits of the variation from one obſervation to another. Phil. Tranſ. vol. lii. part i. N° 29. Ibid. vol. lx. N° 10.

Barometer, *pendant*, invented by M. Amontons, in 1695, is a machine rather pretty and curious, than uſeful. It conſiſts of a conical tube, placed vertically, its upper and ſmaller extreme hermetically ſealed; it has no veſſel or ciſtern, its conical figure ſupplying that defect: for when filled, like the reſt, there will be as much mercury ſuſtained as is equivalent to the weight of the atmoſphere; and as that varies, the ſame mercury takes up a different part of the tube, and ſo becomes of a different weight.

Thus, when the weight of the atmoſphere is increaſed, the mercury is driven up into a narrower part of the tube; by which means its column is lengthened, and, for the reaſon juſt given, its weight increaſed. Again, the atmoſphere decreaſing, the mercury ſinks into a wider part of the tube; by which means its column is again ſhortened, and its preſſure accordingly weakened. Thus, the ſame mercury is ſtill a balance to the atmoſphere under all its variations.

The inconvenience in this *barometer* is, that to prevent the mercury and air from changing places, the bore of the tube muſt be very ſmall; which ſmallneſs of the bore renders the friction ſo ſenſible, as to impede its playing.

Barometer, *marine*, is likewiſe a contrivance of Dr. Hook, in 1700, to be uſed at ſea, where the motion of the waves renders the others impracticable. It is nothing more than a double thermometer, or a couple of tubes half filled with ſpirit of wine; the one hermetically ſealed at both ends, with a quantity of common air incloſed; the other ſealed at one end, and open at the other.

Now the air, we know, is able to act on the ſpirit of wine, and raiſe it, two ways; the one by its gravity, as in the Torricellian tube; the other by its heat, as in the thermometer. If then the two tubes be graduated, ſo as to agree with each other at the time when the air is incloſed, it will eaſily follow, that, wherever the two agree afterwards, the preſſure of the atmoſphere is the ſame, as at the time when the air was incloſed. If in the thermometer open to the air the liquor ſtand higher, conſidering withal how much the other is riſen or fallen from the other cauſe of heat or cold, the air is heavier; on the contrary, when it is lower, compared with the other, the air is lighter than at the time when the inſtrument was graduated.

Here the ſpaces anſwering to an inch of mercury will be greater or leſs, according to the quantity of the air incloſed, and the ſmallneſs of the tubes; and they may be increaſed, almoſt, in any proportion.

But it muſt be remembered, that the denſity and rarity of the air, on which this machine is founded, do not only depend on the weight of the atmoſphere, but alſo on the action of heat and cold.—This, therefore, can never be a juſt *barometer*; but may properly enough be called a *manoſcope*, or inſtrument to ſhew the denſity of the air. See Manometer.

Nevertheleſs, the inſtrument is ſaid to be of good uſe in giving notice of all bad weather at ſea, as alſo of veerable winds, and of the neighbourhood of ice. Phil. Tranſ. N° 429. p. 133.

Mr. Nairne, an ingenious artiſt in London, conſtructed a *marine barometer* for Capt. Phipps, in his voyage to the north pole; the upper part of which was a glaſs tube about three tenths of an inch in diameter, and four inches long, to which another glaſs tube was joined with a bore about ^{1} th of an inch in diameter. Theſe two glaſs tubes formed the tube of this *barometer*, which was filled with mercury, and inverted into a ciſtern of the ſame. The inſtrument was fixed in gimmals, and kept in a perpendicular poſition by a weight faſtened to the bottom of it, and was not liable to the inconvenience attending the common *barometer* at ſea. Voyage to the North Pole, p. 123.

M. Paſſement, another ingenious artiſt at Paris, accommodates the *barometer* to nautical uſes, by twiſting the middle part of the common *barometer* into a ſpiral conſiſting of two revolutions; by this contrivance, the impulſes which the mercury receives from the motions of the ſhip, are deſtroyed by being tranſmitted in contrary directions. De Luc's Recherches, &c. vol. i. p. 34.

Barometer, *ſtatical*, or **Baroscope**, uſed by Mr. Boyle, Otto de Gueric, &c. is fallacious, and liable to be acted on by a double cauſe: it conſiſts of a large glaſs bubble, balanced by a braſs weight, in a nice pair of ſcales: for theſe two bodies being of equal gravity, but unequal bulk, if the medium in which they equiponderate be changed, there will follow a change of their weight; ſo that if the air grows heavier, the greater body, being lighter in ſpecie, will loſe more of its weight than the leſſer and more compact; but if the medium grow lighter, then the bigger body will outweigh the leſs. See Collect. Acad. P. Etr. tom. ii. p. 41.

The moſt accurate *barometer* yet invented, ſeems to be that of Mr. Caſwell; the ſtructure whereof he deſcribes as follows: Suppoſe ABCD (*fig.* 6.) a bucket of water, wherein is the *barometer xrezyosm*, conſiſting of a body *xrsm*, and a tube *ezyo*. The body and tube are both concave cylinders, communicating with each other, made of tin, or rather glaſs. The bottom of the tube, *z*, *y*, has a lead weight to ſink it, ſo that the top of the body may juſt ſwim even with the ſurface of the water, by the addition of ſome grain weights at the top. The water, when the inſtrument is forced with its mouth downwards, gets up into the tube to the height *yo*. There is added on the top a ſmall concave cylinder, which we call the *pipe*, to diſtinguiſh it from the other at bottom, which we call the *tube*: this pipe is to ſuſtain the inſtrument from ſinking to the bottom, *md* is a wire, *m*S and *de* two threads oblique to the ſurface of the water, performing the office of diagonals. Now, while the inſtrument ſinks more or leſs, by the alteration of the gravity of the air; there, where the ſurface of the water cuts the thread, is formed a ſmall bubble, which aſcends up the thread, as the mercury of the common *barometer* aſcends, and *vice verſa*.

This inſtrument, as appears from a calculation which the author gives, ſhews the alterations in the air more accurately than the common *barometer*, by no leſs than 1200 times. He obſerves, that the bubble is ſeldom known to ſtand ſtill a minute; that a ſmall blaſt of wind, that cannot be heard in a chamber, will make it ſink ſenſibly; and that a cloud always makes it deſcend, &c.

Mr. Rowning has contrived a compound *barometer*, in which the ſcale of variation ſhall bear any proportion to that of the common one. ABC (*Tab.* II. *Pneumatics*, *fig.* 1.) is a compound tube hermetically ſealed at A, and open at C; empty from A to D, filled with mercury from thence to B, and from thence to E with water. It appears from the nature of a ſyphon, that if H, B, G be in the ſame horizontal line, the column of mercury DH will be in equilibrio with the column of water GE, and a column of air of the ſame baſe, and will therefore vary with the ſum of the variations of theſe. He has ſubjoined a calculation, whence it appears, that if the tubes AF and FC are of an equal bore, the variation in this is leſs than that of the common *barometer* in the proportion of 7 to 13; but if the diameter of AF be that of FC as 5 to 1, the variations will be to thoſe in the common *barometer* as 175 to 1; but if the proportion of the diameters be greater, the variations will be infinite in reſpect to thoſe of the common *barometer*. Rowning's Nat. Phil. part ii. diſſ. 4.

Whilſt ſome have endeavoured to enlarge the variations of the *barometer*, others have endeavoured to make it more convenient, by reducing the length of the tube. M. Amontons, in 1688, firſt propoſed this alteration in the ſtructure of *barometers*, by joining ſeveral tubes to one another, alternately filled with mercury and with air, or ſome other fluid; and the number of theſe tubes may be increaſed at pleaſure: but the contrivance is more ingenious than uſeful.

M. Mairan's reduced *barometer*, which is only three inches long, ſerves the purpoſe of a *manometer* in diſcovering the dilatations of the air in the receiver of an air-pump; and inſtruments of this kind are now generally applied to this uſe. See Air-*pump*.

Barometer, *portable*, is ſo contrived, that it may be carried from one place to another without being diſordered. The tube is tied up in a leathern bag not quite full of mercury; which being preſſed by the air, forces the mercury into the tube, and keeps it ſuſpended at its proper height. This bag is commonly incloſed in a box, through the bottom of which paſſes a ſcrew: by means of this ſcrew, the mercury may be forced up to the top of the tube, and prevented from breaking the tube by daſhing againſt the top of it when the inſtrument is removed from one ſtation to another. A contrivance of this ſort we are indebted for to Mr. Patrick. But the *portable barometer* has received various improvements ſince: however, the moſt complete of this kind is deſcribed, together with the apparatus belonging to it, the method of conſtruction and uſe, and the advantages attending it, by M. De Luc, and illuſtrated by drawings, in his Recherches, &c. vol. ii. p. 5, &c.

Barometer, *phænomena of.*—The *phænomena* of the *barometer* are various; the cauſes aſſigned for them, by ſeveral authors, are widely different; nor is its uſe, in predicting the weather, yet perfectly aſcertained.

On the top of Snowdon-hill, 1240 yards high, Dr. Halley found the mercury to be lower, by three inches eight tenths, than at the foot thereof; whence it appears, that at every 30 yards the mercury ſinks one tenth of an inch. Mr. Derham, from ſome experiments he made at the top and bottom of the Monument, allows 32 yards perpendicular aſcent to a fall of the mercury of one tenth of an inch: whence we have not only a foundation for determining the height of the atmoſphere; which, on this foundation (were it equally denſe every where), would not be found more than 5 miles and one tenth; but alſo a very accurate method of meaſuring the height of mountains. Thus, if on the ſurface of the earth the mercury be at 30 inches, at 1000 feet high it would be at 28.91 inches; at 2000 feet, 27.86; at 3000, 26.85; at 4000, 25.87; at 5000, 24.93; at 1 mile, 24.67; at 2 miles, 20.29; at 5 miles, 11.28; at 10 miles, 4.24; at 15 miles, 1.60; at 20 miles, 0.95; at 30 miles, 0.08; at 40 miles, 0.012: though, it muſt be obſerved, this is on a ſuppoſition that the Atmosphere is equally heavy every where.

Dr. Nettleton made ſeveral experiments in the neighbourhood of Halifax, in order to aſcertain the elevations anſwering to given heights of the *barometer*. The following table ſhews the reſult:

	Height.	Altitude of ☿. Bottom.	Top.	Difference for $\frac{1}{10}$ of an inch.	
Tower of Halifax,	102 -	29.78 -	29.66 -	0.12 -	85
Coal mine,	140 -	29.48 -	29.32 -	0.16 -	87
Another ditto,	236 -	29.50 -	29.23 -	0.27 -	87
A ſmall hill,	312 -	29.81 -	29.45 -	0.36 -	86
Halifax hill,	507 -	30.00 -	29.45 -	0.55 -	91

Whence by the theorem, demonſtrated under the article Atmosphere, viz. that the elevations are as the logarithms of the height of the mercury reciprocally; ſuppoſing 30 inches the ſtandard altitude, and 85 feet the elevation, correſponding to one tenth of an inch, he made the following proportion: as the logarithm of $\frac{1}{29.9}$ is to 85, ſo is the logarithm of $\frac{1}{29.5}$ to the elevation which will make the mercury to fall half an inch; and ſo for any other. In this way he computed the following tables:

A TABLE ſhewing the Number of Feet aſcending, required to make the Mercury fall to any given Height in the Tube from 30 to 26 Inches. As alſo the Number of Feet deſcending, required to make the Mercury riſe from 30 to 31 Inches.

Inches. Dec.	Feet. Dec.	Inches. Dec.	Feet. Dec.

M. De Luc has given an hiſtorical and critical detail of the various attempts that have been made at different times for applying the motion of the mercury in the *barometer* to the meaſurement of acceſſible heights, beginning with the firſt trials propoſed by Paſcal and Des Cartes, and concluding with the more accurate experiments of M. Bouguer, and the other French academicians in Peru. He has added a table, exhibiting, in French meaſure, the heights of the atmoſphere correſponding to thoſe of the mercury in the *barometer*, calculated on the principles and rules of Mariotte, Halley, Maraldi, Scheuchzer, J. Caſſini, D. Bernouilli, Horrebow, and Bouguer, from 28 inches, the height obſerved by the French academicians on the ſea-ſhore of Peru, to 15 inches 10 lines, the height of the mercury obſerved by M. De la Condamine on the top of Coraçon, one of the Cordeliere mountains. The height of this hill above the level of the ſea was found, by geometrical meaſure, to be 14820 feet. The *barometrical* height, deduced from the principles of Mariotte, is 12087 feet 2 inches; from a rule afterwards propoſed by him, 13167 feet 4 inches; from Halley's rule, 14486 feet 1 inch; from Maraldi's, 19491 feet; from the principles of J. Scheuchzer, 12386 feet 5 inches; from the rule of J. Caſſini, 16090 feet; from the hypotheſis of D. Bernouilli, 16905 feet 3 inches; from Horrebow's rule, 14334 feet 4 inches; and from Bouguer's, 14359 feet 11 inches. De Luc's Recherches, &c. vol. i. p. 184.

The greateſt height the mercury has been known to ſtand at in the *barometer*, at London, is 30 inches three eighths, its leaſt 28 inches; its greateſt height, at the obſervatory of Paris, has been found 28 inches four tenths, and its leaſt 26 inches four tenths of the Paris foot, which exceeds the London foot by $\frac{8}{144}$: with theſe obſervations agree others, made at Hall, in Saxony, by Wolfius. At Algiers it riſes to 30 inches two tenths or three tenths, with a northerly wind, though attended with the greateſt rains and tempeſts. Shaw's Trav. p. 218.

It is true, there is an experiment wherein the height of the mercury is found ſurpriſingly to exceed theſe numbers; mercury perfectly purged being ſuſpended in a tube, in the Torricellian way, at the height of 75 feet; though by the leaſt ſhake it falls down to the ordinary height. See an account of this *phænomenon* under the word Torricellian.

The *phænomena* of the *barometer*, Mr. Boyle obſerves, are ſo very precarious, that it is exceedingly difficult to form any general, certain rules about the riſe and fall thereof. Even that which ſeems to hold moſt univerſally, viz. that, when high winds blow, the mercury is the lower, ſometimes fails.

Dr. Halley gives us the following obſervations: that in calm weather, when the air is inclined to rain, the mercury is commonly low; in ſerene good ſettled weather, high.

That on great winds, though unaccompanied with rain, the mercury is the loweſt of all, with regard to the point of the compaſs the wind blows on. That, *cæteris paribus*, the greateſt heights of the mercury are on eaſterly and north-eaſterly winds. That after great ſtorms of wind, when the mercury has been low, it riſes again very faſt.

That in calm froſty weather it ſtands high.

That the more northerly places find greater alterations than the more ſouthern: and that within the tropics, and near them, there is little or no variation of the height of the mercury at all.

For inſtance, at Naples it hardly ever exceeds an inch; whereas, at Upminſter it is 2.5 inches, at Peterſburgh 3.31. Phil. Tranſ. N° 434. p. 407.

Dr. Beal, who adopted the opinion of M. Paſcal, obſerves, that, *cæteris paribus*, the mercury is higher in cold weather than in warm; and, uſually, in the morning and evening higher than at mid-day.

That, in ſettled and fair weather, the mercury is higher than either a little before or after, or in the rain; and that it generally deſcends lower after rain than it was before it. And he aſcribes theſe effects to the vapours with which the air is charged in the former caſe, and which are diſperſed by the falling rain in the latter. If it chance to riſe higher after rain, it is generally followed by a ſettled ſerenity.

That there are frequently great changes in the air, without any perceptible alteration in the *barometer*.

For the uſe of BAROMETERS, an ingenious author obſerves, that, by their means, we may regain the knowledge which ſtill reſides in brutes, and which we forfeited by not continuing in the open air, as they generally do; and, by our intemperance, corrupting the *craſis* of our organs of ſenſe.

The following are Mr. Patrick's obſervations on the riſing and falling of the mercury: they are very juſt, and are to be accounted for on the ſame principles with thoſe of Dr. Halley.

1. The riſing of the mercury preſages in general, fair weather; and its falling, foul weather; as rain, ſnow, high winds, and ſtorms.
2. In very hot weather, the falling of the mercury indicates thunder.
3. In winter, the riſing preſages froſt; and in froſty weather, if the mercury falls three or four diviſions, there will certainly follow a thaw: but in a continued froſt, if the mercury riſes, it will certainly ſnow.
4. When foul weather happens ſoon after the falling of the mercury, expect but little of it: and on the contrary, expect but little fair weather, when it proves fair ſhortly after the mercury has riſen.
5. In foul weather, when the mercury riſes much and high, and ſo continues for two or three days before the foul weather is quite over, then expect a continuance of fair weather to follow.
6. In fair weather, when the mercury falls much and low, and thus continues for two or three days before the rain comes; then expect a great deal of wet, and probably high winds.
7. The unſettled motion of the mercury, denotes uncertain and changeable weather.
8. You are not ſo ſtrictly to obſerve the words engraved on the plates (though for the moſt part it will agree with them), as the mercury's riſing and falling; for if it ſtands at much rain, and then riſes up to changeable, it preſages fair weather, although not to continue ſo long as it would have done, if the mercury were higher: and ſo on the contrary, if the mercury ſtood at fair, and falls to changeable, it preſages foul weather, though not ſo much of it, as if it had ſunk down lower.

From theſe obſervations it appears, that it is not ſo much the height of the mercury in the tube, that indicates the weather, as the motion of it up and down: wherefore, in order to paſs a right judgment of what weather is to be expected, we ought to know whether the mercury is exactly riſing or falling, to which end the following rules are of uſe:

1. If the ſurface of the mercury is convex, ſtanding higher in the middle of the tube than at the ſides, it is generally a ſign that the mercury is then riſing.
2. If the ſurface of the mercury is concave, or hollow in the middle, it is ſinking. And,
3. If it is plain or level, or rather if it is a little convex, the mercury is ſtationary; for mercury being put into a glaſs tube, eſpecially a ſmall one, will naturally have its ſurface a little convex; becauſe the particles of mercury attract each other more forcibly than they are attracted by glaſs. Farther,
4. If the glaſs be ſmall, ſhake the tube; and if the air be grown heavier, the mercury will riſe about half the tenth of an inch higher than it ſtood before; if it is grown lighter, it will ſink ſo much. This proceeds from the mercury ſticking to the ſides of the tube, which prevents the free motion of it, until it is diſengaged by the ſhock. Therefore, when an obſervation is to be made by ſuch a tube, it ought always to be ſhaken firſt; for ſometimes the mercury will not vary of its own accord, until the weather it ought to have indicated be preſent.

Cauſe of the phænomena of the BAROMETER.—Thoſe, which have been enumerated, are the chief *phænomena* of the *barometer*; to account for which, the *hypotheſes* that have been framed are almoſt infinite. Indeed, as the weight of the atmoſphere is generally allowed to be the foundation of the *barometer*, ſo is it generally granted, that the alterations in the weight of the air are the occaſions of thoſe in the *barometer*; and yet even this does not obtain univerſally. Dr. Liſter, for inſtance, accounts for the changes of the *barometer* from the alterations of heat and cold. This, he ſays, he has often obſerved, that in ſtorms, &c. when the mercury is at the loweſt, it breaks, and emits ſmall particles, which he calls a kind of *fretting*; and argues, that in all times of its deſcent, it is more or leſs on the fret. In this diſorder, he thinks, its parts are contracted, and brought cloſer together; and, for that reaſon, deſcend: beſides, in the fretting they let go little particles of air, before incloſed in them; and theſe riſing into the top of the tube, the mercury muſt ſink, both from the column's being ſhortened by their eſcape, and by their lying upon it. Mercury, therefore, he adds, riſes either in very hot or very cold weather, between the tropics, &c. as being then in its natural ſtate; and, again, in the intermediate degrees of heat and cold it falls, as being contracted, and, as it were, convulſed, and drawn together. Phil. Tranſ. N° 165.—But his account, however ingenious, yet comes far ſhort of accounting for the *phænomena*; nay, in ſome reſpects, it contradicts them.

The changes in the weight of the atmoſphere, therefore, muſt be laid down as the cauſe of thoſe in the *barometer*; but then, for the cauſe of that cauſe, or whence thoſe alterations ariſe in the atmoſphere, will be no eaſy matter to determine; there being, perhaps, no one principle in nature that will account for ſuch a variety of appearances, and thoſe too ſo irregular. It is probable, the winds, as driven this or that way, have a great ſhare in them; ſome ſhare too, vapours and exhalations, riſing from the earth, may have; ſome, the changes in the air of the neighbouring regions; and ſome, the flux and reflux occaſioned in the air by the moon, though this is too inconſiderable to be regarded, as it is not perceptible by the niceſt *barometer*.

Dr. Halley thinks the winds and exhalations ſufficient; and on this ground, gives us a very probable *rationale* of the *barometer*. The ſubſtance of what may be ſaid on that head, is as follows:

1ſt, then, The winds muſt neceſſarily alter the weight of the air in any particular country; and that, either by bringing together and accumulating a greater quantity of air, and ſo loading the atmoſphere of any place; which will be the caſe, as often as two winds blow at the ſame time, from oppoſite points towards the ſame point: or by ſweeping away a part of the air, and removing ſome of the load, and thus giving room for the atmoſphere to expand itſelf; which will be the caſe, when two winds blow at the ſame time, and from the ſame point, oppoſite ways: or, laſtly, by cutting off the perpendicular preſſure of the atmoſphere; which happens, as often as any ſingle wind blows briſkly any way; it being found, by experiment, that a ſtrong blaſt of wind, even made by art, will render the atmoſphere lighter; and accordingly, the mercury, in a tube under which it paſſes, as well as in another at a diſtance from it, will ſubſide conſiderably. See Phil. Tranſ. N° 292.

2dly, The cold nitrous particles, and even air itſelf condenſed in the northern parts, and driven elſewhere, muſt load the atmoſphere, and increaſe its preſſure.

3dly, Heavy dry exhalations from the earth, muſt increaſe the weight of the atmoſphere, and heighten its elaſtic force, as we find the ſpecific gravity of menſtruums increaſed by diſſolved ſalts, and metals.

4thly, The air being rendered heavier from theſe and the like cauſes, is thereby the more able to ſupport the vapours; which being likewiſe intimately mixed with it, and ſwimming every where equably through it, make the weather ſerene and fair: again, the air being made lighter, from the contrary cauſes, it becomes unable to ſupport the vapours wherewith it is replete; theſe, therefore, precipitating, are gathered into clouds; and thoſe, in their progreſs, coaleſce into drops of rain.

Theſe things obſerved, it appears pretty evident, that the ſame cauſes which increaſe the weight of the air, and make it more able to ſupport the mercury in the *barometer*, do likewiſe occaſion a ſerene ſky, and a dry ſeaſon; and the ſame cauſes which render the air lighter, and leſs able to ſupport the mercury, do likewiſe generate clouds and rain.

Hence, 1ſt. When the air is lighteſt, and the mercury in the *barometer* is loweſt, the clouds are very low, and move ſwiftly; and when, after rain, the clouds break, and a calm ſky again ſhines forth, being purged of the vapours, it appears exceedingly bright and tranſparent, and affords an eaſy proſpect of remote objects.

2dly, When the air is heavier, and the mercury ſtands higher in the tube, the weather is calm, though ſomewhat leſs clear, by reaſon the vapours are diſperſed every where equally; if any clouds now appear, they are very high, and move ſlowly; and when the air is heavieſt of all, the earth is frequently found enveloped in pretty thick clouds, which appear to be formed out of the groſſer exhalations, and which the air is then able to ſuſtain, though a lighter atmoſphere could not.

3dly, Hence it is, that with us the mercury ſtands higheſt in the coldeſt ſeaſons, and when the wind blows from the north or north-eaſt corner: for, in that caſe, there are two winds blowing towards us at the ſame time, and from oppoſite corners; there being a conſtant weſt wind found in the Atlantic ocean, at the latitude correſponding to ours. To which we may add, that in a north wind, the cold condenſed air of the northern parts is brought hither.

4thly, Hence, in the northern regions, the variation of the mercury is more ſenſible than in the ſouthern ones; the winds being found both more ſtrong, more frequent, more various, and more oppoſite to each other in the former, than the latter.

Laſtly, Hence it is, that between the tropics, the variation of the mercury is ſcarce ſenſible; the winds there being extremely gentle, and uſually blowing the ſame way.

But this account, however well adapted to many of the particular caſes of the *barometer*, ſeems to come ſhort of ſome of the principal and moſt obvious ones; and is, beſides, liable to ſeveral objections.

For, 1ſt. If the wind were the ſole agent in effecting theſe alterations, we ſhould have no alterations without a ſenſible wind, nor any wind without ſome alteration of the mercury; both which are contrary to experience.

2dly, If two winds be ſuppoſed blowing from the ſame place, viz. London, oppoſite ways, viz. N. E. and S. W. there will be two others, blowing from oppoſite points, viz. N. W. and S. E. to the ſame place; which two laſt will balance the firſt, and bring as much air towards the point, as the others ſwept from it. Or thus, in proportion as the air is carried off N. E. and S. W. the adjacent air will croud in from the other points, and form a couple of new currents in the direction N. W. and S. E. to fill up the vacancy, and reſtore the equilibrium. This is a neceſſary conſequence from the laws of fluids.

3dly, If the wind were the ſole agent, the alterations in the height of the mercury would only be relative, or topical; there would be ſtill the ſame quantity ſupported at ſeveral places taken collectively: thus, what a tube at London loſt, another at Paris, or at Piſa, or at Zurich, &c. would at the ſame time gain. But we find the very contrary true in fact; for, from all the obſervations hitherto made, the *barometers* in ſeveral parts of the globe riſe and fall together; ſo that it muſt be ſome alteration in the abſolute weight of the atmoſphere, that accounts for the riſe and fall of the mercury.

Laſtly, ſetting aſide all objections, theſe popular phænomena, the mercury's fall before, and riſe after rain, ſeem to be inexplicable on the ground of this hypotheſis: for, ſuppoſe two contrary winds ſweeping the air from over London, we know that few, if any, of the winds reach above a mile high; all, therefore, they can do, will be to cut off a certain part of the column of air over London: if the conſequence of this be the fall of the mercury, yet there is no apparent reaſon for the rain's following it. The vapours indeed may be let lower, but it will only be till they come into an air of the ſame ſpecific gravity with themſelves; and there they will ſtick as before.

M. Leibnitz endeavours to ſupply the defects of this hypotheſis with a new one of his own. He aſſerts, that a body immerſed in a fluid only weighs with that fluid while it is ſuſtained thereby; ſo that when it ceaſes to be ſuſtained, i. e. when let fall, its weight ceaſes to make a part of that of the fluid, which by this means become lighter. Thus, adds he, the watery vapours, while ſuſtained in the air, increaſe its weight; but, when let fall, they ceaſe to weigh along with it. Thus the weight of the air is diminiſhed; and thus the mercury falls, and rain enſues.

But M. Leibnitz's principle, notwithſtanding the experiment he brings to confirm it, is falſe, as has been evidently made appear by a counter experiment of D. Deſaguliers. For a body, whether ſpecifically equal, or lighter, or heavier, than a fluid, while it is immerged in it, whether it be at reſt, or in motion, adds to the fluid a weight equivalent to that of an equal bulk of the fluid; as follows from that law in hydroſtatics, that fluids gravitate according to their perpendicular altitudes.—However, were M. Leibnitz's principle true, yet it is defective; and that in the ſame reſpect with Dr. Halley's; nor would it account for the phænomena more than the other. For, ſuppoſing the vapours by being condenſed, to be put in a motion downwards, and ſo ceaſing to gravitate with the atmoſphere; they will therefore fall, till they reach a part of the atmoſphere of the ſame ſpecific gravity with themſelves; and there they will hang as before. If the mercury fall, it will only be during the time of that deſcent; for theſe once fixed, the former gravity is retrieved; or, were it not retrieved, yet no rain would ſucceed the fall of the mercury.

If it might be allowed to add any thing after ſuch great men, it ſhould be as follows.—Suppoſe any number of watery veſicles floating in any part of the atmoſphere, over any determinate portion of the globe; for inſtance, over AB, *fig.* 21. if the upper veſicles be condenſed by the cold of the ſuperior regions, their ſpecific gravity will be increaſed, and they will deſcend; the horizontal claſs 1, v. gr. to 2, 2 to 3, &c. where meeting with other veſicles, not yet precipitated, they will coaleſce, or run into larger veſicles, by the known laws of attraction. Or, if we rather chooſe to have the wind act, let it drive either horizontally, or obliquely: in the former caſe, the veſicles, claſs 8. will be driven againſt 9; thoſe againſt 10, &c. or the oblique claſs A 7, driven againſt 5, 8 againſt 4, &c. by which means, likewiſe, will the particles coaleſce, and form new and larger veſicles, as before; ſo that their number, which before was, ſuppoſe a million, will now be reduced, v. gr. to an hundred thouſand.

But by the ſame coalition whereby their number is diminiſhed, their ſpecific gravity, if we may ſo call it, is increaſed, i. e. they come to have more matter in the ſame ſpace, or under an equal ſurface; as may be eaſily proved from principles of geometry: for in augmenting the maſs of any homogeneous body, the increaſe of ſurface does not keep pace with that of the ſolidity; but that of the former is as the ſquare of the diameter, and that of the latter as the cube of the ſame.

But ſince the ſame quantity of matter is now in a leſs ſpace, or under leſs dimenſions, it will loſe leſs of its weight by the reſiſtance of the medium. This is evident: for a body immerſed in a fluid loſes nothing of its weight but by the friction of its parts againſt thoſe of the fluid; but the friction is evidently as the ſurface; therefore, when the ſurface is leſſened, the reſiſtance muſt be ſo too. Conſequently, the veſicles, whoſe gravity before the coalition was equal to the reſiſtance of the medium, now that reſiſtance is diminiſhed, will deſcend; and that with a velocity in the ratio of the increaſe of the maſs to the increaſe of the ſurface.

In their deſcent, as they arrive at denſer parts of the atmoſphere, v. gr. at 4, 5, &c. their maſs and ſurface again will be increaſed by new coalitions; and thus, by conſtant freſh acceſſions, more than equal to the conſtant reſiſtances, they will be enabled to purſue their journey through all the ſtages of the air, till they reach the earth; their maſſes exceedingly magnified, and in the form of rain.

Now that the vapours are got down, let us conſider how the *barometer* muſt have been affected during their paſſage. Before any of the veſicles began to ſubſide, either from the action of the cold, or of the wind, they all floated in the portion of the atmoſphere ABCD, and all gravitated towards the centre E. Here now, each reſpectively reſiding in a part of the medium of the ſame ſpecific gravity with itſelf, will loſe as much of its weight, as is equal to that of a part of the medium of the ſame bulk with itſelf, i. e. each will loſe all its weight. But, then, whatever weight each loſes, it communicates to the medium, which now preſſes on the ſurface of the earth AB, with its own weight, and that of the veſicles, conjointly. Suppoſe, then, this united preſſure keeps up the mercury in the *barometer* at thirty inches: by the coalition of the veſicles from the cauſes aforeſaid, their ſurfaces, and conſequently their friction, are leſſened; therefore they will communicate leſs of their weight to the air, i. e. leſs than the whole; and conſequently they will deſcend with the exceſs, i. e. with a velocity equal to the remainder, as before obſerved. Now, as the veſicles can act no otherwiſe on the ſurface of the earth AB, but by the mediation of the interjacent air, in proportion as their action on the medium is leſs, their action on the earth will be leſs It is alſo evident, that the ſurface of the earth AB muſt be now leſs preſſed than before; and that in proportion as the veſicles reſerve more of their weight uncommunicated to the medium, to promote their own deſcent, i. e. in proportion to the velocity of the falling veſicles; which is, again, in proportion to their bulks. Thus, as the veſicles deſcend, the bulks continually increaſing, the friction, and therefore the preſſure on the earth, and, laſtly, the height of the mercury, will continually decreaſe, during the whole time of the fall.—Hence we ſee, both why the veſicles, when once beginning to fall, perſevere; why the mercury begins to fall at the ſame time; and why it continues and ceaſes to fall together with them; which were the great *deſiderata* in the philoſophy of the *barometer*.

There is one objection that evidently lies againſt this theory, viz. that the veſicles being put in motion, and ſtriking againſt the particles of the *medium* and one another with ſome moment, will meet with a conſiderable reſiſtance from the *vis inertiæ* thereof; by which means their deſcent will be retarded, and the preſſure of the atmoſphere retrieved; the impetus of the moving veſicles being ſuppoſed to compenſate for their loſs of ſurface. Thus a heavy body ſuſtained in a fluid by a hair, and moved up and down therein, preſſes more on the bottom, than when held at reſt; which additional preſſure will be the greater, as the velocity of the falling veſicles is greater; a greater impulſe being required to break through the *vis inertiæ* of the contiguous particles in a leſs time than in a larger.

But we have both reaſon and experiment againſt this objection; for the velocity of the veſicles, in theſe circumſtances, muſt neceſſarily be very ſmall, and their impulſe inconſiderable; beſides, the *vis inertiæ* of the air muſt be exceedingly weak, by reaſon of its extreme ſubtilty; and it muſt be a very improper vehicle to convey an impulſe to a diſtance, by reaſon of its elaſticity; we alſo find, that a piece of lead, which is a ponderous body, falling with great moment, gravitates conſiderably leſs, in its deſcent through water, which is a groſs unelaſtic medium, than when ſuſtained at reſt therein: in which the ſeveral experiments of Reaumur, Ramazzini, and Deſaguliers, all agree.

M. de Luc ſuppoſes, that the changes obſerved in the weight of the atmoſphere are principally produced by the preſence or abſence of vapours floating in it. Others have attributed the effect to vapours, but have given a different explication of it. It is his opinion, that vapours diminiſh the ſpecific gravity, and conſequently the abſolute weight of thoſe columns of the atmoſphere into which they are received, which, notwithſtanding this admixture, remain of an equal height with the adjoining columns that conſiſt of pure or dry air. He afterwards more largely explains and vindicates this theory, and applies it to the ſolution of the principal phænomena of the *barometer*, connected with, or produced by the varying denſity and weight of the atmoſphere.

See a ſummary of the numerous hypotheſes that have been framed for explaining the variations of the *barometer*, by Paſcal, Beal, Wallis, Garcin, Garden, Liſter, Halley, Garſten, de la Hire, Mariotte, Le Cat, Woodward, Leibnitz, de Mairan, Hamberger, D. Bernouilli, and Muſchenbroek, in M. de Luc's Recherches ſur les Modifications de l'Atmoſphere, vol. i. chap. 3. See on the ſubject of this article, both volumes of that excellent work, *paſſim*.

BAROMETRICAL *obſervations*, make a branch or ſpecies of thoſe called meteorological obſervations.

Modern philoſophers ſpeak much of the importance of *barometrical* obſervations. Dr. Wallis, Dr. Beal, Cruquius, de la Hire, and others, have publiſhed collections of *barometrical* obſervations, made at Oxford, Leyden, Delft, Paris, Zurich, in China, &c. Phil. Tranſ. Nº 55. Nº 249. Nº 256. Nº 381, &c.

Dr. Jurin has publiſhed an invitatory paper, for making *barometrical* obſervations by joint conſent. Phil. Tranſ. Nº 379, p. 423.

Barometrical *phoſphorus*. See Phosphorus.

BARON, a perſon who holds a barony.

Baron is a term whoſe origin and primary import is much conteſted. Some will have it originally denote a *man*, *ανηϱ*; ſome a *hero*, or *valiant man*; ſome a *libertinus*, or *freeman*; ſome a *great* or *rich man*; ſome a *vaſſal* or *liegeman*.—Menage derives it from the Latin *baro*, which we find uſed in the pure age of that language for *vir*, a *ſtout* or *valiant man*; whence, according to this author, it was, that thoſe placed next the king in battles were called *barones*, as being the braveſt men in the army; and as princes frequently rewarded the bravery and fidelity of thoſe about them with fees, the word came to be uſed for any noble perſon who holds a fee immediately of the king.—Iſidore, and after him Camden, take the word, in its original ſenſe, to ſignify a *mercenary ſoldier*. Meſſieurs of the Port Royal derive it from βαϱος, *weight*, or *authority*. Cicero uſes the word *baro* for a ſtupid, brutal man; and the old Germans make mention of *buffetting a baron*, i. e. a *villain*; as the Italians ſtill uſe the word *barone*, to ſignify a *beggar*.—M. De Marca derives *baron* from the German *bar*, *man*, or *freeman*; others derive it from the old Gauliſh, Celtic, and Hebrew languages: but the moſt probable opinion is, that it comes from the Spaniſh *varo*, a *ſtout*, *noble perſon*; whence wives come to call their huſbands, and princes their tenants, *barons*. In the Salic law, as well as the laws of the Lombards, the word *baron* ſignifies a *man* in the general; and the old gloſſary of Philomenes tranſlates *baron* by *ανηϱ*, *man*.

Baron is more particularly uſed, among us, for a lord, or peer of the loweſt claſs; or a degree of nobility next below that of a viſcount, and above that of a knight, or a baronet.

Barons are lords of parliament, and peers of the realm, and enjoy all the privileges of ſuch.—They are not girt with a ſword at their creation, nor had they any Coronets till the reign of king Charles II. who gave them a circle of gold with ſix pearls ſet cloſe to the rim.

In ancient records, the word *barons* included all the nobility of England, becauſe regularly all noblemen were *barons*, though they had alſo a higher dignity.—And therefore the charter of king Edward I. which is an expoſition of what relates to *barons* in *Magna Charta*, concludes, *teſtibus archiepiſcopis, epiſcopis, baronibus*, &c. And the great council of the nobility, when they conſiſted, beſides earls and *barons*, of dukes, marquiſes, &c. were comprehended under the name *de la councel de baronage*.

Barons *by ancient tenure* were thoſe who held by certain territories of the king, who ſtill reſerved the tenure in chief to himſelf. We alſo read of *barons by temporal tenure*; who are ſuch as hold honours, caſtles, manors, as heads of their *barony*, that is, by grand ſergeanty; by which tenure they were anciently ſummoned to parliament. But at preſent a *baron* by tenure is no lord of parliament, till he be called thither by writ.

The *barons* by tenure, after the Conqueſt, were divided into *majores* and *minores*, and were ſummoned accordingly to parliament; the *majores*, or greater *barons*, by immediate writ from the king; the *minores*, or leſſer *barons*, by general writ from the high ſheriff, at the king's command.

The ancients diſtinguiſhed the greater *barons* from the leſs, by attributing high, and even ſovereign juriſdiction, to the former, and only inferior juriſdiction over ſmaller matters to the latter.

Barons *of the exchequer* are judges, four in number, one of whom is called the chief *baron*, and the other three puiſne *barons*, to whom the adminiſtration of juſtice is committed in cauſes between the king and his ſubjects, touching matters belonging to the exchequer, and the king's revenue. They are called *barons*, becauſe *barons* of the realm were uſed to be employed in that office.

Their office is alſo to look to the accompts of the king; to which end they have auditors under them; as well as to decide cauſes relating to the revenue, brought by any means into the exchequer: ſo that, of late, they have been conſtantly perſons learned in the law; whereas formerly they were *majores & diſcretiores in regno, ſive de clero eſſent, ſive de curia*. See Court *of Exchequer*.

Barons *of the cinque ports*, are members of the houſe of commons elected by the five ports, two for each port. See Cinq *Ports*.

Thoſe who have been mayors of Corfe-caſtle in Dorſetſhire, are alſo denominated *barons*.—As were formerly, likewiſe, the chief citizens of London.

Baron is alſo uſed for the huſband, in relation to the wife; which two, in law, are called *baron* and *feme*. See Husband and Wife.

Baron *and feme*, in *Heraldry*, is when the coats of arms of a man and his wife are borne *per pale* in the ſame eſcutcheon; the man's being always on the *dexter* ſide, and the woman's on the *ſiniſter*.—But here the wife is ſuppoſed not an heireſs; for then her coat muſt be borne by the huſband on an in-eſcutcheon, or eſcutcheon of pretence.

Baron, *court*. See Court.

Baron, *prender de*. See Prender.

BARONET, among *Modern Writers*, denotes a dignity, or degree of honour, next beneath a baron, and above a knight; having precedency of all knights, excepting thoſe of the *garter*.

The dignity of *baronet* is given by patent, and is the loweſt degree of honour that is hereditary. The order was founded by king James I. at the ſuggeſtion of Sir Robert Cotton, in 1611, when two hundred *baronets* were created at once; to which number, by the patent, they were always to be reſtrained. Though, it is ſaid, there are now four times that number.

They had ſeveral conſiderable privileges given them, with an *habendum* to them and their heirs male. They were allowed to charge their coat with the arms of Ulſter, which are, in a field argent, a hand gules; and that upon condition of their defending the province of Ulſter, in Ireland, againſt the rebels, who then harraſſed it extremely: to which end, they were each to raiſe and keep up thirty ſoldiers, at their own expence, for three years together; or to pay into the exchequer a ſum ſufficient to do it; which, at 8*d.* *per* day *per* head, was 1095*l.*

Baronets take place according to the dates of their patents; by the terms of which no honour is to be erected between *barons* and *baronets*.

The title *Sir* is granted them by a peculiar clauſe in their patents, though they be not dubbed knights.—But both a *baronet*, and his eldeſt ſon, being of full age, may claim knighthood.

BARONIÆ *caput*. See Caput.

BARONY, **Baronia**, or **Baronagium**, the lordſhip, or fee of a baron, either temporal or ſpiritual.

In which ſenſe *barony* amounts to the ſame with what is otherwiſe called *honour*.

A *barony* may be conſidered as a lordſhip held by ſome ſervice in chief of the king, coinciding with what is otherwiſe called *grand ſergeanty*.

Baronies, in their firſt creation, moved from the king himſelf, the chief lord of the whole realm, and could be holden immediately of no other lord. For example: the king enfeoffed a man of a great ſeigneurie in land; to hold to the perſon enfeoffed and his heirs, of the king and his heirs, by baronial ſervice, to wit by the ſervice of twenty, forty, ſixty knights, or of ſuch other number of knights, either more or fewer, as the king by his enfeoffment limited or appointed.—In the ages next after the Conqueſt, when a great lord was enſeoffed by the king of a large ſeigneurie, ſuch ſeigneurie was called a *barony*; but, more commonly, an *honour*: as, the *honour* of Glouceſter, the *honour* of Walingford, the *honour* of Lancaſter, the *honour* of Richmond, and the like. There were in England certain *honours*, which were often called by Norman or other foreign names; that is to ſay, ſometimes by the Engliſh, and ſometimes by the foreign name. This happened when the ſame perſon was lord of an *honour* in Normandy, or ſome other foreign country, and alſo of an *honour* in England. For example: William de Forz, de Force, or de Fortibus, was lord of the *honour* of Albemarle in Normandy: he was alſo lord of two *honours* in England, to wit, the *honour* of Holderneſs, and the *honour* of Skipton in Cravene. Theſe *honours* in England were ſometimes called by the Norman name, the *honour* of Albemarle, or the honour of the earl of Albemarle. In like manner, the earl of Britannie was lord of the *honour* of Britannie in France, and alſo of the *honour* of Richmond in England: the *honour* of Richmond was ſometimes called by the foreign name, the *honour* of Britannie, or the *honour* of the earl of Britannie. This ſerveth to explain the terms, *honour* of Albemarle in England, *honor Albemarliæ*, or *comitis Albemarliæ in Anglia*; *honor Britanniæ*, or *comitis Britanniæ in Anglia*, the *honour* of Britannie, or the earl of Britannie in England. Not that Albemarle or Britannie were in England, but that the ſame perſon reſpectively was lord of each of the ſaid *honours* abroad, and of each of the ſaid *honours* in England.

The *baronies* belonging to biſhops are by ſome called *regalia*, as being held ſolely on the king's liberality. Theſe do not conſiſt in one *barony* alone, but in many; for, *tot erant baroniæ, quot majora prædia*.

A *barony*, according to Bracton, is a right indiviſible: wherefore, if an inheritance be to be divided among co-parceners, though ſome capital meſſuages may be divided, yet, if the capital meſſuage be the head of a county, or *barony*, it may not be parcelled; and the reaſon is, leſt by this diviſion, many of the rights of counties and *baronies*, by degrees, come to nothing, to the prejudice of the realm; which is ſaid to be compoſed of counties and *baronies*.

BAROPTIS, or **Baroptinus Lapis**, a name given by the ancient naturaliſts to a ſpecies of ſtone, ſuppoſed to have wonderful virtues againſt venomous bites, externally applied. Pliny has left us but a very ſhort deſcription of it: he ſays, it was black in colour, but variegated with large ſpots of red and white.

BAROSCOPE, a machine contrived to ſhew the alterations in the weight of the atmoſphere. See Barometer.

The word is derived from βαρος, *onus*, and σκοπεω, *video*.

BARQUETTE, or **Barchetta**, in the Mediterranean, denotes a leſſer ſort of barks, uſed for the ſervice of gallies, much as boats and ſhallops are for other ſhips, as to fetch proviſions, water, carry perſons aſhore, and the like.

BARR. See Bar.

Barr, **Barra**, or **Barro**, in *Commerce*, denotes a Portugueſe long meaſure, uſed in the menſuration of cloths, ſtuffs, and the like; ſix whereof are equivalent to ten *cavidos* or *cabidos*; each *cavido* equal to $\frac{4}{7}$ of a Paris ell.

Barra, *the Spaniſh*, is the ſame with the yard of Seville.

Barr *of Valentia* is equal to $\frac{10}{13}$ of the Paris ell.

Barr *of Caſtile* is equal to $\frac{5}{7}$ of the Paris ell.

Barr *of Arragon* is equal to $\frac{2}{3}$ of the Paris ell. Savar. Dict. Com. p. 273.

Barr is alſo uſed by the Portugueſe in the Eaſt Indies for a weight, more frequently called bahar.

Barr-*dice*, a ſpecies of falſe dice, ſo formed, as that they will not eaſily lie on certain ſides, or turn up certain points. *Barr-dice* ſtand oppoſed to flat dice, which come up on certain points oftener than they ſhould do.

BARRACKS. See Baracks.

BARRACOL, in *Ichthyology*, a name given by Artedi, from the Venetians, to expreſs the ſpecies of ray-fiſh, called by Bellonius and Geſner *miraletus*, and by others *raya oculata lævis*.

The ſpecific name of Artedi carries in it a much better character of the fiſh; he calls it the ray, with a ſmooth back and belly, and with the eyes ſurrounded with a ſeries of ſpines, and three other rows of them on the tail.

BARRAGAN, or **Barracan**, in *Commerce*, a kind of ſtuff belonging to the claſs of camblets, only of a grain much coarſer than the reſt, manufactured in divers parts of France and Flanders, chiefly at Abbeville, Amiens, Rouen, and Liſle, and now in England.

The word is barbarous Latin, formed, as ſome ſuppoſe, from *barra*, q. d. *barrarum formam referens*. Du-Cange.

The chief uſe of *barragans*, called alſo by the French *bouracans*, is for ſurtouts, or upper garments againſt the rain, being, when good, of ſo cloſe a grain, that the water will not ſoke through, but only run upon them.

For the woof, its thread is ſingle, twiſted, and fine ſpun; that of the warp is double or triple, i. e. compoſed of two or three threads well twiſted together. The uſual matter it is made of, is wool; though there are ſome made at Rouen, where the warp is hemp, and the woof wool. Some *barragans*, again, are made of wool, dyed before it comes to the loom; others are woven white, and dyed afterwards, red, black, blue, brown, &c. They are not fulled, but only boiled two or three times in fair water, when they come from the loom; then calendered to make them ſmooth and even; and laſtly made into rolls, called pieces of *barragan*.

BARRATI, *barred*, an appellation given to the Carmelites, after they were obliged to lay aſide the white cap, and wear cowls ſtriped black and white.

BARRATRY is uſed for bribery or corruption in a judge, giving a falſe ſentence for money.

Barratry is alſo uſed, in *Middle Age Writers*, for fraud or deceit in making of contracts, ſales, or the like. See Baratry.

BARRE. See Bar.

BARREL, an oblong veſſel, of a ſpheroidal, or rather a cylindroidal figure, uſed for the holding divers ſorts of goods, both liquid and dry.

Barrels are of divers uſes in artillery, as for powder, ſmall-ſhot, flint, ſulphur, ſalt-petre, roſin, pitch, quick-match, and many other things.

Barrels filled with earth, ſerve to make a parapet to cover the men, like gabions and canvaſs bags.

Barrels, *fire*, are caſks of divers capacities, filled with bombs, grenados, fire-pots, mixed with great quantities of tow ſoaked in petrol, turpentine, pitch, &c. uſed by the beſieged to defend breaches. Theſe are ſometimes alſo called *thundering barrels*, being to be rolled down on the enemy on their entering the breach.

Barrel is alſo uſed for a certain quantity, or weight of ſeveral merchandizes; which is various as the commodities vary.

The Engliſh *barrel*, wine meaſure, contains the eighth part of a tun, the fourth part of a pipe, and the moiety of a hogſhead, that is, thirty-one gallons and a half; of beer it contains thirty-ſix gallons; and of ale thirty-two gallons.

The *barrel* of beer, vinegar, or liquor preparing for vinegar, is to contain 34 gallons, according to the ſtandard of the ale quart. 10 and 11 W. III. cap. 21.

The *barrel* of herrings is to contain 32 gallons, wine meaſure; being about 28 gallons, old ſtandard: uſually amounting to about 1000 full herrings, 13 Eliz. cap. 11.

The *barrel* of ſalmon is to contain 42 gallons, 5 G. cap. 18.—And the *barrel* of eels, the ſame, 22 Ed. IV. cap. 2.

The *barrel* of ſoap is to contain 256 pounds, 10 A. cap. 19.

The *barrel* or *barrille* of Florence is a liquid meaſure containing 20 fiaſques, flaſks, or one third of a ſtar or ſtaio.

The *barrel*, *barique* of Paris, contains 210 pints, or 26 ſeptiers and an half; four bariques make three muids, or one tun.

Barrel, in *Anatomy*, denotes a pretty large cavity ſituated behind the drum of the ear, lined with a membrane, in which there are ſeveral veins and arteries. It is ſaid to be full of a purulent matter in children; and, in its cavity, there are four ſmall bones, viz. the *malleolus*, the *incus*, the *ſtapes*, and the *os orbiculare*.

Barrel *of a clock* is a cylindrical part, about which the ſtring is wound, anſwering to what in watches is properly called the *fuſee*.

Barrel *of a jack* is the cylindrical part whereon the line is wound.

Barrel *of a pump* is the wooden tube, which makes the body of the engine, and wherein the piſton moves.

BARRELLING, the art of putting up certain commodities in caſks or barrels.

Gun-powder for the land-ſervice is often *barrelled* double, the barrel it is put in being incloſed in another barrel, partly to prevent the powder catching moiſture in the ſubterraneous places it is kept in, and partly to enable it the better to bear the motion and jolting of carriages, when it is to be conveyed to another place.

Barrelling *of herrings* imports the cutting off their heads, as they are thrown into the buſs, and afterwards pulling out the guts, ſalting them, and putting them up in barrels.

There are two ſorts of *barrelled herrings*; one wherein they are laid orderly, layer over layer, called by ſome *packed herrings*; the other wherein they are thrown at random, called *herring in wrack*.

The difference ariſes thus: as faſt as the fiſhermen catch the herrings, they throw them on the deck of the veſſel; where having gutted and ſalted them, they throw them at random into the barrel, to be carried home: this is the herring *in wrack*.

When arrived aſhore, they take the fiſh out of theſe barrels, caſt them into a tub, and ſalting them anew, range them handſomely in their barrels again, laying ſalt over them, to preſerve them: this is the *packed herrings*. And in this ſtate it is they are uſually ſold.

BARREN *ground*, that which being ſowed, produces no crop, or, at moſt, ſo ſlender a crop, that it will not defray the charge of its tillage.

BARREN *money* is uſed, in the *Civil Law*, for that which is not put out to intereſt.

BARREN *corn*, the name given to a diſtemper in corn by M. Aimen, who firſt obſerved it. It is moſt common in wheat and rye; the ears of which are long, lean, and white; in ſome the ſtamina are dry, tranſparent, and horned; the female organs are ſmall, whiter, and leſs velvetty than in healthy ears; in others the filaments are ſmaller, the apices are void of farina, and the ſtigmata badly unfolded.

It is owing either to the too ſudden growth of the corn; to froſt, or to hot gleams of ſun-ſhine after hard ſhowers; and ſometimes, though very rarely, to inſects. Count Ginnani imputes this diſeaſe of corn to the faultineſs of the ſoil; and he recommends particular attention to the amendment of it, by ſuch means as are beſt ſuitable to its nature; and he alſo directs to change the ſeed every year.

BARREN *ſprings*, a name given by huſbandmen to thoſe whoſe waters are injurious to land. Such are moſt of thoſe that flow from coal-mines, or through beds of ſulphureous minerals.

BARRENNESS. See STERILITY.

BARRENWORT, EPIMEDIUM, in *Botany*, a genus of the *tetandria monogynia* claſs. Its characters are theſe. The flower hath a three-leaved empalement, which falls off; it hath four obtuſe petals, and four nectariums, which are cup-ſhaped, and as large as the petals; with four ſtamina, and an oblong germen, which afterward becomes an oblong pod, with one cell, incloſing many oblong ſeeds.

The root and leaves are the parts uſed in medicine. The leaves triturated, and made into a cataplaſm with oil, and ſo applied to the breaſts, prevent their farther growth; the root cauſes barrenneſs. The leaves triturated, and drank to the quantity of five drams, in urine, for five days together, after the menſtrual purgation, Dioſcorides ſays, effectually prevents conception.

BARRICADE, or BARRICADO, a military term for a fence, or retrenchment, haſtily made with veſſels, or baſkets of earth, carts, trees, paliſades, or the like, to preſerve an army from the enemy's ſhot, or aſſault.

The moſt uſual matter of *barricades* is pales, or ſtakes, which are croſſed with battoons, and ſhod with iron at the feet: uſually ſet up in paſſages, or breaches, to keep back as well the horſe as foot.

BARRICADE, in the *Marine*, is a ſtrong wooden rail, ſupported by pillars, and extending, as a fence, acroſs the foremoſt part of the quarter-deck. In ſhips of war, the intervals between the pillars are commonly filled with cork, junks of old cable, or plaited cordage. About a foot above the rail, there extends a double rope-netting, ſupported by cranes of iron; and between the two parts of the netting are ſtuffed hammocks, filled with the ſeamen's bedding, to intercept ſmall ſhot fired by ſwivel guns and muſkets, in time of battle.

BARRIER, a kind of fence made at a paſſage, retrenchment, gate, &c. to ſtop up the entry thereof. See DEFENCE.

It is uſually made of great ſtakes, about four or five feet high, placed at the diſtance of eight or ten feet from one another, with overthwart rafters; ſerving to ſtop either horſe or foot that would ruſh in.—In the middle is a moveable bar of wood, which opens and ſhuts at pleaſure.

BARRIERS has been likewiſe uſed to ſignify a martial exerciſe of men, armed, and fighting together with ſhort ſwords, within certain rails, or bars, whereby they were incloſed from the ſpectators.

BARRIERS, or BARRIERES. Thus they call in the chief cities of France, and particularly at Paris, the places where the cuſtom-houſes are eſtabliſhed; and where the officers receive the duties of importation, according to the tariff ſettled by the king's council. They are called *barriers*, becauſe the paſſages through which the carriages and merchandiſes liable to pay duties are to paſs, are ſhut up with a wooden bar, which turns upon a hinge, and is opened and ſhut at the will of the cuſtom-houſe officers.

There are at Paris ſixty of thoſe *barriers*, all placed at the entrance of the ſuburbs.

BARRING *a vein*, an operation performed by farriers on the veins of horſes legs, and of other parts, in order to ſtop the courſe, and leſſen the quantity, of the malignant humours which prevail there.

It is done by opening the ſkin above the part, and, after diſengaging it, and tying it both above and below, ſtriking between the two ligatures.

When horſes have got traverſe mules, or kibed heels, and rat-tails, or arreſts in the hinder legs, it is common to BARR *a vein*.

BARRISTER, a perſon qualified and impowered to plead, and defend the cauſes of clients in the courts of juſtice.

The word is formed from *bar*, *barra*, a name given the place where they ſtand to plead.

Barriſters, in the Engliſh law, amount to the ſame with *licentiates*, and *advocates*, in other countries and courts, where the civil, &c. laws obtain.

Anciently they were denominated among us, *apprentices of the law*, *apprenticii juris*; now uſually *counſellors at law*.

They ſeem to have been firſt appointed by an ordinance of king Edward I. in parliament, in the twentieth year of his reign.

To paſs *barriſters* they were formerly obliged to ſtudy eight years, now only ſeven, and ſometimes fewer. The exerciſe required was twelve grand moots, performed in the inns of chancery in time of the grand readings, and twenty-four petty moots at the inns of chancery in term-time, before the readers of the reſpective inns of chancery.

Barriſters, according to Forteſcue, might be called to the ſtate and degree of *ſerjeants*, when they were of ſixteen years ſtanding.

Utter barriſters, according to ſome, are pleaders without the bar; they are thus called to diſtinguiſh them from benchers, or thoſe who have been readers, who are admitted to plead within the bar; hence called *inner barriſters*, 5 El. cap. 1.

BARRITUS, in *Antiquity*, a military ſhout, raiſed by the Roman ſoldiers at the firſt charge on the enemy.

BARROW, in the Engliſh *Topography*, denotes a large hillock or mount of earth raiſed or caſt up by art; ſuppoſed to have been one of the Roman *tumuli*, or ſepulchres.

Dr. Plott takes notice of two ſorts of *barrows* in Oxfordſhire; one placed on the military ways, the other in the fields, meadows, woods, &c.

The former were doubtleſs of Roman erection; the latter more probably erected by the Britons or Danes.

Some of theſe *barrows* appear rude and erected only of earth; others are more regular, trenched round; ſome with two or three circumvallations, and ſurmounted with monumental ſtones. Plott's Nat. Hiſt. Oxford. chap. 10. § 48.

They are to be met with in ſeveral parts of England: thoſe in Wiltſhire are well known. We have an examination of the *barrows* in Cornwall by Dr. Williams, in the Phil. Tranſ. N° 458. from whoſe obſervations we find, that theſe *barrows* are compoſed of foreign or adventitious earth, that is, ſuch as does not riſe on the place, but is fetched from ſome diſtance.

It has been thought, that theſe *barrows* were erected for ſepulchres; and this conjecture ſeems well confirmed by the urn found in one of them. This urn is made of burnt or calcined earth, very hard, and very black in the inſide: it has four ſmall handles, and in it were found ſeven quarts of burnt bones and aſhes.

That it was the ancient practice to burn the dead, is well known; and from theſe *barrows* it appears, how the nations, that practiſed this way of burial, expreſſed their regard for the dead. It was by erecting over their aſhes theſe *barrows*, or *tumuli*, compoſed of earth and ſtone brought from diſtant places; and the *barrow* was generally in proportion to the greatneſs, rank, and power of the deceaſed perſon. Each ſoldier or friend might bring ſome of the earth or ſtones from diſtant places where they lived, and thus compoſe the *tumulus*. Many paſſages might be quoted from ancient authors to this purpoſe. Phil. Tranſ. loc. cit.

See an account of the numerous *tumuli*, or *barrows*, diſcovered in the ſouthern part of Siberia, in the Archæologia, vol. ii.

BARROWS, in the *Salt Works*, are caſes made with flat cleft wickers, in the ſhape almoſt of a ſugar-loaf, with the bottom uppermoſt, wherein the ſalt is put, as it corns, and ſet to drain. Phil. Tranſ. N° 53. p. 1065. Hought. Collect. N° 211. p. 81.

BARROWISTS, in *Eccleſiaſtical Hiſtory*. See BROWNISTS.

BARRULET, in *Heraldry*, is the half of the cloſet, or the quarter of the bar.

BARRY, in *Heraldry*.—When an eſcutcheon is divided barways into an even number of partitions, and conſiſts of two or more tinctures, interchangeably diſpoſed, it is expreſſed in blazon, by the word *barry*, and the number of pieces is to be ſpecified.—E. gr. *barry* of ſo many pieces.

If the diviſions be odd, the field muſt be firſt named, and the number of bars expreſſed.

BARRY-BENDY is when an eſcutcheon is divided evenly both bar and bend-ways, by lines drawn tranſverſe and diagonal, interchangeably varying the tinctures of which it conſiſts.—Thus, he bears *barry-bendy, or* and *ſable*.—See *Tab. Herald. fig.* 4.

BARRY-PILY is when a coat is divided, as repreſented in *Tab. Herald. fig.* 5. which is blazoned, *barry-pily* of eight pieces.

BARRY, *counter*. See COUNTER.

BARSANIANI, in *Church Hiſtory*, a ſect who held all the errors of the Severians and Theodoſians.

BARSE, in *Ichthyology*, an Engliſh name for the common *pearch*, PERCA, a well known freſh-water fiſh. It is alſo the name now in uſe for the ſame fiſh in the Saxon language, and is one of the many Saxon words we have yet retained.

BARTERING, the act of trucking or EXCHANGING one commodity for another of like value.

The word comes from the Spaniſh *baratar, to deceive*, or *circumvent* in bargaining; perhaps becauſe thoſe who deal this way uſually endeavour to over-reach one another.

This is alſo called *bartry*, 13 Eliz. cap. 7.

In order to ſolve all queſtions that occur under this article, find the value of that commodity, the quantity of which is given, and then find how much of the other commodity will amount to that ſum at the rate propoſed.

BARTHOLOMEW's *Hoſpital*. See HOSPITAL.

BARTON, in Devonſhire, and the weſt of England, is uſed for the demeſne-lands of a manor. Alſo for the manor-houſe.—And, in ſome places, for out-houſes, fold-yards, &c.

BARTRAMIA, in *Botany*, a genus of the *decandria monogynia* claſs of plants; the calyx of which is a perianthium, cut into five parts; the corolla conſiſts of five wedge-ſhaped petals; the fruit is globular, and the ſeeds are four in number, convex on one ſide, and angular on the other.

BARTSIA, in *Botany*, the name of a genus of plants of the *didynamia angioſpermia* claſs, which ſeems of a middle nature between the *euphraſia*, *pedicularis*, and *rhinanthus*. The characters are theſe: the perianthium conſiſts of one leaf, and is tubular and permanent: it is bifid at the extremity, and the ſegments are emarginated, and are coloured at the points. The flower conſiſts of one petal, and is of the ringent kind: the upper lip is erect, narrow, undivided, and longer than the cup: the ſtamina are four ſetaceous filaments of the length of the upper lip of the flower; but two of them are ſhorter than the others: the antheræ are oblong, and ſtand cloſe together, under the top of the upper lip of the flower: the germen of the piſtil is oval; the ſtyle is capillary, and longer than the ſtamina; and the ſtigma is obtuſe and nutant: the fruit is an oval capſule, of a compreſſed ſhape, and pointed; is compoſed of two valves, and divided by a membrane into two cells within; the ſeeds are numerous, and ſmall.

BARULES, in *Church Hiſtory*, a ſect which maintained that the Son of God had only a phantom of a body; that ſouls were created before the world, and that they lived all at one time.

BARUTH, an Indian meaſure, containing ſeventeen gantans; it ought to weigh about three pounds and a half, avoirdupois.

BARYPYCNI, βαρυπυκνοι, in the *Ancient Muſic*, was a name given to ſuch chords as formed the graveſt notes of the ſeveral SPISSA. There were five *barypycni* in the ſcale. See PYCNI.

BARYTONUM, from βαρυς, *grave*, and τονος, *accent*, in the Greek *Grammar*, denotes a verb, which having no accent marked on the laſt ſyllable, a grave accent is to be underſtood.

In the Italian muſic, *barytono* anſwers to our common pitch of baſs.

BAS-*relief*. See BASSO-*relievo*.

BASAAL, in *Botany*, the name of an Indian tree growing about Cochin. Ray's Hiſt.

BASALT, *artificial*, or *black porcelain*, a compoſition, having nearly the ſame properties with the natural *baſalt*, invented by Meſſrs. Wedgwood and Bentley, and applied to various purpoſes in their manufactures.

BASALTES, a kind of ſtone, deſcribed by the ancient naturaliſts, as of the hardneſs and colour of iron.

Pliny, and others after him, write the word *baſaltes*. Salmaſius corrects it, *baſalites*. Its ſpecific gravity is to that of water, as 3000 or upwards to 1000.

The largeſt block of this ſtone that ever was ſeen, Pliny ſays, was placed by Veſpaſian in the temple of Peace: in it was repreſented the figure of Nilus, with ſixteen children playing about it, denoting ſo many cubits of its riſe: he adds, that the ſtatue of Memnon, in the temple of Serapis, at Thebes, which reſounded at the riſing of the ſun, was alſo made of this ſtone. How this miraculous kind of reſonance was cauſed ſeems indicated by Juvenal, Sat. xv. ver. 5.

> —*Dimidio magicæ reſonant ubi Memnone chordæ*—

Moſt of the antique Egyptian figures remaining, are alſo apparently of the ſame ſtone.

Some of the ancients call it *lapis Lydius*, from Lydia, the place where it was found in moſt abundance; and among the moderns it is denominated the TOUCH-STONE, as being uſed for the trial of gold and ſilver.

It is hard, heavy, cloſe, black, and reſiſts the file; and had its name from *baſal, iron*; or βασαλιζω, *diligenter examino*.—Dalechampius ſays, there are ſtones of the ſame kind near Gallon in Normandy; others are brought from Ethiopia and Germany.—The Giants Cauſeway in Ireland is compoſed of the *baſaltes*.

The deſcriptions the ancients have agreed to give of the *baſaltes*, as carefully collected by De Boet, give us a very juſt and accurate deſcription of the Giants Cauſeway, though that author has never ſeen or heard of it, the appearance of this marble in all parts of the world being the ſame, and theſe accounts plainly evincing, that the immenſe pile of the *baſaltes* in Ireland is no miracle, nor work of art, but, perhaps, the nobleſt collection of that body which the world has to ſhew.

The origin and formation of this marble has much puzzled the world; but we may conſider, that many of the known foſſile bodies have a property, like ſalts, of arranging themſelves into different figures at the time of their firſt coaleſcence into a maſs. This is from the ſame laws in nature with that of ſalts; and we are well aſſured by daily experience, that cryſtal and ſpar, according to this natural determination, ever form regularly angular figures, when all the proper accidents have concurred to their concretion. The moſt common figures of cryſtals are the hexangular columns; and thoſe of ſpar, either trigonal columns, or parallelopipeds. The combinations and mixtures of theſe, in different degrees, may naturally produce mixt figures, according to theſe degrees; and a third ſubſtance, though in itſelf not diſpoſed by nature to aſſume or arrange itſelf into any particular figure, if mixed with theſe, may be able to ſpread, extend, and inlarge the figures they concrete into, or otherwiſe alter them.

This ſubſtance has been referred by d'Acoſta, and others, in imitation of the ancients, to the genus of marbles; though differing from them in many eſſential qualities. The *baſaltes* is vitreous, analogous in ſubſtance to the horny ſtones. It reſiſts aqua fortis, and the chiſſel, and only yields to a violent fire, and the engraver's wheel. When wrought in this manner it acquires the poliſh of the ancient *baſaltes*; named by the Italians *marmo paragone*. M. Deſmauſt, having accurately examined the *baſaltes*, which are found in great quantities at Auvergne, attributes their origin to the matter of volcanoes refrigerated from fuſion; and he was naturally led to this hypotheſis, by diſcovering that they were placed on beds of *lavas*, and *ſcoriæ*, cloſe to the opening of an extinguiſhed volcano. M. Raſpe has adopted this hypotheſis, and confirmed it by his own obſervations on the *baſalt* hills, in the neighbourhood of Caſſel, and in other places; this ſubſtance being generally found near the lavas of volcanoes; and the whole iſland of Sicily, chiefly on the ſide of mount Ætna, abounding with it. This opinion is farther ſupported by the vitreous ſubſtance of theſe ſtones; the want of marine bodies, and from the circumſtance attending ſome melted metals, which, when hardened, appear in cryſtallizations, not unlike thoſe of watery congelations. Hiſt. de l'Acad. Roy. des Sciences, at Paris, for 1771. Phil. Tranſ. vol. lxi. N° 54. Ferber's Travels through Italy, tranſlated by Mr. Raſpe, 1778.

BASANITES, in *Natural Hiſtory*, a name given by many authors to the TOUCHSTONE, uſed for trying gold, &c. Pliny ſpeaks of a *baſanites* which yielded a bloody juice, and was good againſt diſeaſes of the liver.

BASANUS, in *Natural Hiſtory*. See TOUCHSTONE.

BASARUCO, in *Commerce*, a ſmall baſe coin in the Eaſt Indies, being made only of very bad tin. Of this coin there are two ſorts, good and bad; the value of the baſe ſort is $\frac{1}{6}$ lower than that of the good. Three *baſarucos* are equal to two *rees* of Portugal.

BASCANIA, in *Antiquity*, ridiculous or groteſque figures hung up by the ancient ſmiths before their furnaces, to divert envy.

BASE, BASIS, in *Architecture*, denotes the lower part of a column, or pedeſtal.

The *baſe* is alſo ſometimes called *ſpira*, from *ſpiræ*, the folds of a ſerpent laid at reſt, which makes a figure not unlike it.—See *Tab. Archit. fig.* 24. 25. 26. 27. 28.

BASE *of a column* is that part between the ſhaft and the pedeſtal, if there be any pedeſtal; or, if there be none, between the ſhaft and the plinth, or zocle.

The *baſe* is ſuppoſed to be the foot of the column; or, as ſome will have it, it is that to a column, which a ſhoe is to a man.—The members, or ornaments whereof it is compoſed, are ſuppoſed, by ſome, to have been originally intended to repreſent the iron circles wherewith the feet of trees and poſts, which ſupported the ancient houſes, were girt, in order to ſtrengthen them.

The *baſe* is different in the different orders.—The

Base, *Tuſcan*, is the moſt ſimple of all others; conſiſting only of a ſingle tore beſides the plinth.—See *Tab. Archit. fig.* 24.

Base, *Doric*, has an aſtragal more than the Tuſcan; though that was introduced by the moderns. See *fig.* 25.

Base, *Ionic*, has a large tore over two ſlender ſcotias, ſeparated by two aſtragals; though in the moſt ancient monuments of this order there are no *baſes* at all; which the architects are at a loſs to account for. See *fig.* 26.

Base, *Corinthian*, has two tores, two ſcotias, and a fillet.—See *fig.* 27.

Base, *Compoſite*, has an aſtragal leſs than the Corinthian. See *fig.* 28. See the meaſures of the parts of the *baſe* in theſe ſeveral orders, under Column.

Base, *Attic*, or *Atticurgic*, ſo called, becauſe firſt uſed by the Athenians, has two tores, and a ſcotia.

Base *rudentée*, is that which has its tores cut like cables.

Base, in *Fortification*, denotes the external ſide of the polygon; or that imaginary line which is drawn from the flanked angle of a baſtion to that which is oppoſite thereto.

Base, in *Gunnery*. See Cannon.

Base, *line of the*. See Line.

Base *of a figure*, in *Geometry*, denotes the loweſt part of its perimeter.

In which ſenſe, the *baſe* ſtands oppoſed to the *vertex*, which denotes the higheſt part.

Base *of a triangle*, any ſide thereof is occaſionally ſo called; though properly it is the loweſt ſide, or that which lies parallel to the horizon.

Thus, the line AB is the *baſe* of the triangle ABC, *Tab. Geom. fig.* 68. Not, but on other occaſions, the lines AC, or BC in the triangle, may be made the *baſe*.

In a rectangled triangle, the *baſe* is properly that ſide oppoſite to the right angle, i. e. the hypothenuſe.

Base *of a ſolid figure* is its loweſt ſide, or that whereon it ſtands.

Thus, the circular plane DFE is the *baſe* of the cylinder ABDE. *Tab. Geom. fig.* 56.

Base *of a conic ſection* is a right line in the hyperbola and parabola, formed by the common interſection of the ſecant plane, and the *baſe* of the cone.

Base, *altern*. See Altern.

Base, *diſtinct*, in *Optics*. See Distinct.

Base *of the heart*, in *Anatomy*, denotes the broader or upper part of that viſcus, to the ſides of which the two auricles are affixed.—See *Tab. Anat.* (*Splanch.*) *fig.* 12. *litt. aa, and cc.*

This is ſometimes alſo called the vertex or head, κεφαλη; in oppoſition to which, is the leſſer or narrower part, called *apex*, or *mucro*, the point or tip of the heart.

Some alſo give the denomination *baſe*, to the root of the *os hyoides*.

Base, or Basis, in *Chemiſtry*, any body which is diſſolved by another body, which it receives and fixes, and with which it forms a compound, may be called the *baſis* of that compound. Thus, for example, the *baſes* of neutral ſalts are the alkaline, earthy, and metallic matters, which are ſaturated by the ſeveral acids, and form with them theſe neutral ſalts. It is proper for the conveniency of chemical language to retain this manner of expreſſion; but theſe *baſes* muſt not be conſidered as inactive, and only yielding to the action of the acids which they fix, and to which they give a body and conſiſtence. In every combination and ſolution, the ſeveral bodies which unite are equally active, their action being reciprocal. They diſſolve each other; ſo that it is as proper to ſay (as Mr. Gellert obſerves) that a metal or an earth diſſolves an acid, as that an acid diſſolves a metal or an earth; though this latter mode of expreſſion is moſt common. Probably the diſſolving power which the more weighty and fixed bodies have, is really much ſtronger than that of bodies leſs weighty and fixed. It certainly is ſo, if the tendency to unite be only the effect of the general attraction, or the gravitation of all particles of matter to each other. See Combination and Solution.

Basis, in *Pharmacy*, is that ingredient on which moſt ſtreſs is laid, for effecting the purpoſe of any compound medicine.

Base, in *Muſic*. See Bass.

Base, in *Law*.—*Baſe eſtate* is that eſtate which baſe tenants have in their lands.

Base *fee* denotes a tenure in fee at the will of the lord. By which it ſtands diſtinguiſhed from ſocage, or free tenure. See Fee.

Base *court* is any court not of record.—Such, e. gr. is the court-baron.

Base *tenure*, *baſſa tenura*, denotes holding by villenage, or other cuſtomary ſervice; as diſtinguiſhed from the higher tenures in capite, or by military ſervice.

Base *rocket*, in *Botany*, reseda. See Rocket.

Base *knights*, *bas chevaliers*, denote the inferior order of knights, as diſtinguiſhed from barons and bannerets, who were the chief or ſuperior knights.

Base *point*, in *Heraldry*. See Point and Escutcheon.

Base *ring of a cannon* is the great ring next behind the touch-hole.

BASELS, Baselli, in our *Old Writers*, a kind of coin aboliſhed by king Henry II. 1158.

BASELLA, in *Botany*, climbing nightſhade, from Malabar, a genus of the *pentandria trigynia* claſs. The characters are theſe: the flower hath no empalement; it is ſhaped like a pitcher, cloſed toward the brim. It hath five ſtamina faſtened to the petal; the globular germen, which is ſituated in the center, ſupports three ſlender ſtyles, crowned by oblong ſtigma. The petal of the flower remains, and encloſes a roundiſh fleſhy berry, including one round ſeed. There are two ſpecies.

From the berries of the firſt ſort, a beautiful colour is drawn; but when uſed for painting, it did not laſt, but changed to a pale colour; it is probable, however, that ſome method might be found to fix it, as it is ſaid that the juice of theſe berries is uſed for ſtaining calicoes in India.

Basella, is ſometimes uſed for the *cuſcuta*, or dodder.

BASEMENT, in *Architecture*, a continued baſe, extended a conſiderable length, as around a houſe, a room, or other piece of building.

This is alſo called, by ancient architects, *ſtereobata*; by the French, *embaſement*, or *ſoubaſement*; ſometimes *ſocle continu*, when it is without either baſe or cornice.

BASHARIANS, a ſect of Mahometans, being a branch or ſubdiviſion of the *Motazalites*.

The *Baſharians* are thoſe who maintain the tenets of Baſhar Ebn Motamer, a principal man among the *Motazalites*, who varied, in ſome points, from the general tenets of the ſect, as extending man's free agency to a great length, even to the making him independent. He aſſerted, that God is not always obliged to do that which is beſt; for that, if he pleaſed, he could make all men true believers. Accordingly he taught, that God might doom an infant to eternal puniſhment; but taught at the ſame time, that he would be unjuſt in ſo doing. Vid. Sale's Prelim. Diſc. to Koran.

BASHAW, Pascha, or Pacha, a Turkiſh governor of a province, city, or other diſtrict.

We ſay, the *baſhaw* of Babylon, the *baſhaw* of Anatolia, the *baſhaw* of Bender, &c.

All Egypt is, on the part of the grand ſeignior, governed by a *baſhaw*, who has in reality but little power; but ſeems principally to be meant for the means of communicating to his divan of *beys*, and to the divans of the ſeveral military *ogiacs*, that is, their bodies, the orders of the grand ſeignior, and to ſee that they be executed by the proper officers.

If he farms the country of the grand ſeignior, the fines that are paid, when any life drops upon the lands, belong to him; for originally all the lands of Egypt belonged to the grand ſeignior; and the Porte ſtill looks on them as its own: but the grand ſeignior's power being now loſt, they all go to the next heir; who muſt, however, be inveſted by the *baſhaw*, and is glad to compound for a ſmall ſum.

The nature of the *baſhaw's* office requires him to be ever attempting means to cut off ſuch as are too aſpiring, or engaged in deſigns that may be any way prejudicial to the Porte. This often occaſions his own depoſition; but he is unconcerned about that, as his perſon is always ſacred; and his loſing this poſt is only a ſtep to higher preferment.

Baſhaws include *beglerbegs*, and ſometimes *ſangiacbegs*; though a diſtinction is ſometimes made, and the name *baſhaw* is appropriated to the middle ſort, or ſuch as have two enſigns or horſe-tails carried before them.—Thoſe who have the honour of three tails, are called *beglerbegs*; and thoſe who have only one, *ſangiacbegs*.

The appellation *baſhaw* is alſo given by way of courteſy at Conſtantinople, to the lords about the grand ſeignior's court, the officers in the army, and almoſt every perſon of any figure.

A *baſhaw* is made with the ſolemnity of carrying a flag or banner before him, accompanied with muſic and ſongs, by the *mirialem*, an officer on purpoſe for the inveſtiture of *baſhaws*.

Baſhaw, uſed abſolutely, denotes the prime vizier; the reſt of the denomination being diſtinguiſhed by the addition of the province, city, or the like, which they have the command of; as the *baſhaw* of Egypt, of Paleſtine, &c. The *baſhaws* are the emperor's ſpunges. We find loud complaints among Chriſtians of their avarice and extortions. As they buy their governments, every thing is venal with them.

When glutted with wealth, the emperor frequently makes them a preſent of a bow-ſtring, and becomes heir to all their ſpoil. Tourn. Voyag. tom. i. & ii.

There are alſo *ſub-baſhaws*, or deputy-governors under the firſt. Phil. Tranſ. N° 218.

Bashaw, *captain*, is the title of the Turkiſh high-admiral.

BASIA *ultima*. See Ultima.

BASIATRAHAGI, in *Botany*, a name uſed by ſome for the common *polygonum*, or knot-graſs.

BASIL, among *Joiners*, denotes the angle to which the edge of an iron tool is ground.

To work on ſoft wood they uſually make their *baſil* 12 degrees, for hard wood 18; it being obſerved, that the more acute or thin the *baſil* is, the better and ſmoother it cuts; and the more obtuſe, the ſtronger and fitter it is for ſervice.

Basil, *order of St.* is the moſt ancient of all the religious orders; it takes its name from St. Baſil, biſhop of Cæſarea, in Cappadocia, about the middle of the fourth century; who is ſuppoſed to have been the author of the rules obſerved by this order, though ſome diſpute it.—The order of St. *Baſil* was anciently very famous in the Eaſt.

The order of St. *Baſil* ſtill continues in Greece. The habit of the monks is black, and plain, conſiſting of a long caſſock, and a great gown with large ſleeves: on their head they wear a hood, which reaches to the ſhoulders: they wear no linen; ſleep without ſheets, in ſtraw; eat no fleſh; faſt often; and till the ground with their own hands.

This order was introduced in the Weſt in 1057, and was reformed in 1579, by pope Gregory XIII. who united the religious of this order in Italy, Spain, and Sicily, into one congregation; of which the monaſtery of St. Saviour at Meſſina is the chief, and enjoys pre-eminence over the reſt. Each community has its particular rule, beſides the rule of St. *Baſil*, which is very general, and preſcribes little more than the common duties of a Chriſtian life.

Basil, in *Botany*, *ocymum*, a genus of the *didynamia gymnoſpermia* claſs of plants, the characters of which are theſe: The empalement of the flower is ſhort, permanent, of one leaf, divided into two lips. The flower is of the lip kind, of one petal inverted; the riſing lip is broad, and cut into four obtuſe equal parts; the reflexed lip is long, narrow, and ſawed. It hath four ſtamina on the lower lip, which are reflexed; two of which are a little longer than the other, terminated by half-moon-ſhaped ſummits; the germen is divided into four parts, which afterward become four naked ſeeds encloſed in the empalement. There are ſeven ſpecies.

Baſil, though it has a fragrant, and, to moſt, a pleaſant ſmell, is but little uſed in phyſic. The ancients condemned the inward uſe of it, as hurtful to the ſight. Schroder ſays it cleanſes the lungs of phlegm, and provokes the menſes. It is an ingredient in the *aqua bryoniæ compoſita*, or hyſteric water.

Basil, *field*. See Clinopodium.

Basil, *American field*. See Monarda.

Basil, *Syrian field*; *Ziziphora*, in *Botany*, a genus of the *diandria monogynia* claſs. The characters are theſe: the flower hath a long, rough, cylindrical empalement, which is ſlightly cut into five parts at the brim; and the flower is of the labiated kind, having a long cylindrical tube. The upper lip is oval, reflexed, and entire; and the under lip, or beard, is divided into three equal ſegments. It has two ſpreading ſtamina, terminated by oblong ſummits, and a quadrifid germen, ſupporting a briſtly ſtyle, crowned by a ſharp-pointed inflexed ſtigma. The germen turns to four oblong ſeeds, which ripen in the empalement. There are three ſpecies.

Basil, *ſtone, and wild*. See Thymus.

BASILARE *os*, in *Anatomy*, a barbarous denomination given to the *os* sphenoides, on account of its being ſituated at the bottom or *baſis* of the ſkull; or becauſe a great part of the brain reſts hereon, as on its *baſis*.

BASILEUS, βασιλευς, a title aſſumed by the emperors of Conſtantinople, excluſive of all other princes, to whom they gave the title *rex*, *king*.

The ſame quality was afterwards given by them to the kings of Bulgaria, and to Charlemagne, from the ſucceſſors of which laſt they endeavoured to wreſt it back again.

The title *baſileus* has been ſince aſſumed by other kings, particularly the kings of England, *Ego Edgar totius Angliæ baſileus confirmavi*.

Hence alſo the queen of England was intitled *Baſilea* and *Baſiliſſa*.

Basileus, in *Zoology*, a name by which ſeveral of the old authors called the *regulus criſtatus*, or golden crowned wren.

BASILIANS. See Bogomili.

BASILIC, or **Basilica**, in the *Ancient Architecture*, denotes a kind of public hall, or court of judicature, where the princes or magiſtrates ſat to adminiſter juſtice. See *fig.* 40. *Tab. Architect.* The figure is drawn to introduce ſeveral rules and decorations, which could not be ſo well explained as by repreſenting them in their proper order, and exhibiting their uſe, and the manner in which they may be applied.

The word is originally Greek, βασιλικη, q. d. *royal houſe*, or *palace*.

The *baſilics* conſiſted of a great hall, with ailes, porticos, tribunes, and tribunals. With us Weſtminſter-hall is properly a *baſilic*; but architects have taken the liberty to extend its meaning farther; and *baſilic* is now uſed as a name for any ſpacious building, as hall, church, &c. When applied to a church, it conveys the idea of great magnificence.

The bankers too had one part of the *baſilicæ* allotted for their reſidence. The ſcholars alſo went thither to make their declamations, according to the teſtimony of Quinctilian.

The Roman *baſilicæ* were covered, by which they were diſtinguiſhed from the *fora*, which were public places open to the air.

In after-times the denomination *baſilica* was alſo given to other buildings of public uſe, as town-houſes, exchanges, burſes, and the like.

The firſt *baſilica* was built at Rome by Cato the elder; whence it was called *Porcia*; the ſecond was called *Opimia*; the third was that of Paulus, built with a great expence, and with much magnificence, whence it was called by ſome *regia Pauli*: another was built by Julius Cæſar, called *baſilica Julia*; of which Vitruvius tells us he had the direction.

There were others alſo, to the number of eighteen or twenty. The *baſilica Julia* not only ſerved for the hearing of cauſes, but for the reception and audience of foreign ambaſſadors. It was ſupported by an hundred marble pillars in four rows, and enriched with decorations of gold and precious ſtones. In it were thirteen tribunals or judgment ſeats, where the prætors ſat to diſpatch cauſes.

Basilic, **Basilica**, is alſo uſed, in *Eccleſiaſtical Writers*, for a church.

In which ſenſe, this name frequently occurs in St. Ambroſe, St. Auſtin, St. Jerom, Sidonius Apollinaris, and other writers of the fourth and fifth centuries.

M. Perrault ſays, that *baſilics* differed from *temples*, in that the columns of temples were without-ſide, and thoſe of *baſilics* within.

Some will have the ancient churches to have been called *baſilicæ*, becauſe generally built in the faſhion of the Roman halls, called by that name: others, becauſe divers churches were formed of thoſe halls. In reality, on the converſion of Conſtantine, many of the ancient *baſilicæ* were given to the church, and turned to another uſe, viz. for Chriſtian aſſemblies to meet in, as may be collected from that paſſage in Auſonius, where ſpeaking to the emperor Gratian, he tells him, the *baſilicæ*, which heretofore were wont to be filled with men of buſineſs, were now thronged with votaries praying for his ſafety. By which he muſt needs mean, that the Roman halls or courts were turned into Chriſtian churches: and hence, we conceive, the name *baſilicæ* came to be a general name for churches in after-ages.

Basilic is chiefly applied, in modern times, to churches of royal foundation; as thoſe of St. John de Lateran, and St. Peter of the Vatican at Rome, founded by the emperor Conſtantine.

Basilic appears alſo to have been given in later ages to churches before conſecration.

Basilics were alſo little chapels built by the ancient Franks over the tombs of their great men, ſo called, as reſembling the figure of the ſacred *baſilicæ* or churches.

Perſons of inferior condition had only *tumbæ*, or *porticuli*, erected over them. By an article in the Salic law, he that robbed a *tumba* or *porticulus*, was to be fined fifteen *ſolidi*; but he that robbed a *baſilica* thirty *ſolidi*.

BASILICA, or **Basilicus**, in *Anatomy*, the name of a vein, ariſing from the axillary branch, and running the whole length of the arm. See *Tab. Anat.* (*Angeiol.*) *fig.* 6. *lit. o.* The *baſilica* is one of the veins opened in bleeding in the arm.

BASILICS, **Basilica**, a collection of the Roman laws, tranſlated into Greek by order of the emperors Baſil and Leo, and which were of force in the eaſtern empire till its diſſolution.

The *baſilics* comprehend the inſtitutes, digeſts, code, and novels, and ſome edicts of Juſtinian, and other emperors. The collection conſiſted of ſixty books, for which reaſon it was called ἑξηκονταϐιϐλος. It is ſuppoſed to be chiefly the work of the emperor Leo the Philoſopher, who denominated it from his father Baſilius Macedo, who firſt began it in 867. It was publiſhed by Leo, with additions, in 880; and thirty years after, corrected and improved by his ſon Conſtantin Porphyrogenitus.—Of theſe ſixty books there are now remaining only forty-one; the other nineteen are, in ſome meaſure, ſupplied by Fabrottus, from the *Synopſis Baſilicon*, &c.

BASILICI, *βασιλικοι*, in the Greek *Empire*, was a denomination given to the prince's mandatories, or thoſe who carried his orders and commands.

BASILICON, or BASILICUM, in *Pharmacy*, is the denomination of an officinal unguent or plaſter; called alſo *tetrapharmacum*, as being compoſed of four ſimples, viz. reſin, wax, pitch, and oil-olives.

BASILICUS, or BASILICA, in *Aſtronomy*, is the name of a fixed ſtar of the firſt magnitude, in the conſtellation Leo; called alſo REGULUS, and COR LEONIS.

BASILIDIANS, the followers of Baſilides, an Egyptian, who lived near the beginning of the ſecond century. In general, the *Baſilidians* held much the ſame opinions with the Valentinians, another branch of the GNOSTICS.

BASILISCUS, in *Zoology*, a name given by ſome of the old authors to the *regulus criſtatus*, or golden-crowned wren. This name is a diminutive of the word *baſileus*, *king*, another of its names, given it becauſe of its golden crown.

BASILISCUS, BASILISC, or BASILISK, is alſo uſed to denote a very dangerous ſort of ſerpent, which kills, as it is ſaid, by its breath or ſight only.

The generation of the *baſiliſk* is not leſs marvellous, being ſaid to be produced from a cock's egg, brooded on by a ſerpent. Theſe, and other things equally ridiculous, are related by Matthiolus, Galen, Dioſcorides, Pliny, and Eraſiſtratus. Kirchmayer and Vander Wiel have given the hiſtory of the *baſiliſk*, and detected the folly and impoſture of the traditions concerning it.

We find the *baſiliſc* mentioned in the Bible; but the Hebrew word *pethen*, which is tranſlated *baſiliſc*, ſignifies an *aſp*, as the beſt interpreters agree. Calmet.

The *baſiliſc*, in the Linnæan *Syſtem*, is a ſpecies of the LACERTA.

BASILISC is alſo myſtically uſed by the alchemiſts, to denote the ſublimate mercury of the philoſophers.

BASILISC alſo denotes a great piece of ordnance; thus denominated from its reſemblance to the ſuppoſed ſerpent of that name.

The *baſiliſc* throws an iron ball of two hundred pounds weight. It was much talked of in the time of Solyman, emperor of the Turks, in the wars in Hungary; but ſeems now out of uſe.

Maffeus ſpeaks of *baſiliſcs* made of braſs, which were drawn each by an hundred yoke of oxen.

Modern writers alſo give the name *baſiliſc* to a much ſmaller and ſizeable piece of ordnance, which the Dutch make fifteen feet long, and the French only ten. It carries forty-eight pound.

BASIOGLOSSUM, or rather BASIGLOSSUM, in *Anatomy*, a pair of muſcles, which ariſe fleſhy from the baſis of the *os hyoides*, and are inſerted into the root of the tongue: ſerving to draw the tongue towards the bottom of the mouth.

The word comes from the Greek *βασις*, *foundation*; and *γλωσσα*, a *tongue*.

The *par baſioglaſſum* is otherwiſe denominated, from its figure, *par hypſiloideum*.

Some have denied the exiſtence of the *par baſiogloſſum*, particularly Fallopius and Mr. Cowper; though this laſt, on further inquiry, found ſome fibres; which, by their contrary order to thoſe of the *geniogloſſum*, induced him to allow the *baſiogloſſum*. Heiſter only makes the *baſiogloſſum* a part of the *ceratogloſſum*.

The *baſiogloſſum*, with the *geniogloſſum*, *ceratogloſſum*, and *ſtylogloſſum*, form the body of the TONGUE.

BASIS, in the *Ancient Muſic* and *Poetry*, denotes the equability of ſounds proceeding in the ſame tenor.

In which ſenſe, *baſis* ſtands contradiſtinguiſhed from *arſis*, or elevation, as well as from *theſis*, or depreſſion.

BASIS, in *Oratory*, denotes the fourth member of a complete exordium, being that which ſucceeds the *apodoſis*, and prepares the way for the propoſition.

BASIUM. Chemiſts uſe the word *baſium*, which literally in Latin ſignifies *a kiſs*, for an extemporaneous tincture of iron and copper, invented by Cloſſæus.

BASKET, a kind of veſſel made of oſier, wicker, ruſhes, or the like, of different figures and ſizes, according to the uſe it is intended for.

Baſkets have their uſes not only in the œconomical, but military affairs: at ſieges, they make uſe of a ſmall *baſket* filled with earth, and ranged on the top of the parapet.

They are about a foot and a half high, as much in diameter at top, and eight or ten inches at bottom; ſo that being ſet together, they leave a ſort of embraſures at their bottom, through which the ſoldiers fire, without expoſing themſelves.

BASKET alſo imports a kind of meaſure or quantity of certain commodities.

BASKET, *corbeille*, in *Architecture*, a kind of vaſe, or figure-piece of ſculpture, in form of a *baſket* filled with flowers or fruits, ſerving to terminate ſome decoration.

BASKET *fiſh*, in *Natural Hiſtory*, a name given by the Engliſh in North America to a very remarkable fiſh, ſometimes caught in the ſeas thereabout, though not frequent any where.

Mr. Hooke, to whom it was referred by the Royal Society to name it, has called it, *Piſcis echinoſtellaris viſciformis*, the body of it reſembling an egg-fiſh, or *echinus marinus*, and the arms a ſtar-fiſh, and finally, the dividing of the branches being more like that of the branches of miſletoe than any other natural production we are acquainted with.

This fiſh ſpreads itſelf from a pentagonal mouth-piece, or root, in the centre of which the mouth is placed, into five main limbs or branches; and each of theſe, at its firſt iſſuing out of the body, is divided into two: this makes ten. Each of theſe ten again divides into two, which makes twenty, and ſo on, each dividing to the fourteenth time; at which place they make more than fourſcore thouſand limbs. Theſe are too ſmall to be traced farther by the eye, or preſerved in carriage; but it is very probable, that even theſe were again divided, perhaps, ſeveral times.

The branches between the joints are not all equally of a length, though, for the moſt part, they are pretty nearly ſo. The arms or branches are never very ſtrong; but, when they are dry, they are greatly more brittle than before, the leaſt force imaginable deſtroying them.

The ſhoals of Nantucket, an iſland on the coaſt of New England, at times furniſh the fiſhermen with this creature; but it is remarkable, that they are never ſeen there, unleſs when taken by hooks in fiſhing for other fiſh. They claſp the hook-bait faſt, and encircle it with all their arms, coming up, when drawn by it, in form of a wicker baſket; whence the name: but, when they have been ſome time out of the water, they become flat.

The uſe of the numerous arms of this fiſh is plainly to catch its prey. It probably extends them to their full length while under the water, and then claſps hold of any thing fit for food that chances to ſwim over them. The fiſhermen have ſometimes found the arms containing ſmall mackrel, or pieces of larger. Phil. Tranſ. Nº 57 and 74.

It is evident from the deſcription, that this fiſh is of the *ſtella arboreſcens*, or branched ſtar-fiſh kind; but whether the ſame with the commonly known kind, called the *caput meduſæ*, is not evident from this deſcription. The body of this fiſh, by what is related of its protuberance, and reſemblance to the *echini marini*, may probably be the *aſteropodium*, in its foſſil ſtate.

BASKET *ſalt*. This is a brime ſalt, made from the water of our ſalt ſprings in Cheſhire, and elſewhere, differing from the common brime ſalt in the fineneſs of the grain, and in its whiteneſs and purity.

In the preparing of this kind of ſalt, ſome uſe reſin, and other additions, to break the grain, and make it ſmall: others effect this by keeping up a very briſk fire under it, and ſtirring it all the while; but the moſt approved method is only to take out for this kind the third draught of every pan that is working for the common brime ſalt, and to do this before the granules or cryſtals are perfectly formed. By this means the ſalt is very fine; and when it has been hard preſſed down into ſmall wicker baſkets, it is dried at the ſtove in them, and ſo kept for ſale.

BASON, *pelvis*, in *Anatomy*, a round cavity in form of a tunnel, ſituate between the anterior ventricles of the brain, deſcending from its baſe, and ending in a point at the *glandula pituitaria*.

It is formed of the *pia mater*, and receives the *pituita* which comes from the brain, and paſſes through the pituitary gland, and from thence into the veins.

That capacity is alſo called *pelvis*, or *baſon*, which is formed by the *oſſa ilia* and *ſacrum*, and contains the bladder of urine, the *matrix*, and the inteſtines.

BASONS *of a balance*, two pieces of braſs, or other matter, faſtened to the extremities of the ſtrings; the one to hold the weight, the other the thing to be weighed.

BASON, or *diſh*, among *Glaſs Grinders*.—Theſe artificers uſe various kinds of *baſons*, of copper, iron, &c. and of various forms, ſome deeper, others ſhallower, according to the focus of the glaſſes that are to be ground. In theſe *baſons* it is, that convex glaſſes are formed, as concave ones are formed on ſpheres or bowls.

Glaſſes are worked in *baſons* two ways.—In the firſt, the *baſon* is fitted to the arbor, or tree of a lath, and the glaſs (fixed with cement to a handle of wood) preſented and held faſt in the right hand within the *baſon*, while the proper motion is given by the foot to the *baſon*. In the other, the *baſon* is fixed to a ſtand or block, and the glaſs with its wooden handle moved.

The moveable *baſons* are very ſmall, ſeldom exceeding five or ſix inches in diameter; the others are larger, ſometimes above ten feet diameter.

After the glaſs has been ground in the *baſon*, it is brought ſmoother with greaſe and emery; and poliſhed firſt with tripoli, and finiſhed with paper cemented to the bottom of the *baſon*.

Bason, among *Hatters*, is a large, round ſhell, or caſe, ordinarily of iron, placed over a furnace; wherein the matter of the hat is moulded into form.

The hatters have alſo *baſons* for the brims of hats, uſually of lead, having an aperture in the middle, of a diameter ſufficient for the largeſt block to go through.

Bason is alſo uſed on various occaſions for a ſmall reſervatory of water: as the *baſon* of a *jet d'eau*, or fountain; the *baſon* of a port, of a bath, &c. which laſt Vitruvius calls *labrum*. *Baſons* are made either with clay, cement, or lead; but they are moſt uſually made with clay. In the making them this way, the diameter muſt be made four feet longer on each ſide than the *baſon* is to be. This will be taken up by the walls and clay. For the ſame reaſon, it muſt be dug two feet deeper than the intended depth of the water; becauſe it is to be laid over eighteen inches thick with clay, and ſix inches with gravel and paving. The wall is to be made with ſhards, rubbiſh, or flints, with the natural earth for mortar; and the clay muſt be well worked, and trod firmly down with the naked feet.

The way of making them with cement is, to allow one foot nine inches every way for the work; then cut the banks perpendicularly, and raiſe a wall of maſonry a foot thick, made of pebble ſtones, or the like, laid in mortar of lime and ſand: the bottom is then to be covered to the ſame thickneſs; and then the ſolid lining of the cement is to be backed up againſt the walls, and over the bottom. This is to be made of ſmall flints in beds of mortar made of lime and cement. When this ſolid is eight inches thick, it muſt be plaſtered over the whole ſurface with cement well ſifted, before it be mixed with the lime; and with this it is to be wrought over ſmooth with a trowel. The proportion of this cement ſhould be two thirds of the cement, or powdered tile, to one third of lime; and this cement has the property of hardening ſo under water, that it will become like ſtone or marble, and will not be ſubject to decay of a long time.

After the finiſhing, the *baſon* ſhould, for four or five days, be anointed over very often with oil, or bullocks blood, to keep it from flawing or cracking in the drying; and after this, the water ſhould be let in as ſoon as may be.

The leaded *baſons* are made with walls a foot thick, and a bottom of half a foot. Theſe muſt be of rubble ſtones cemented with plaſter; for the lime would injure and eat the lead. The ſheets of lead are to be ſpread over theſe walls and bottom, and ſeamed with ſolder. Theſe *baſons*, however, are but little in uſe now, from the expence of making them, and the danger of the lead being ſtolen.

The waſte pipes of fountains ought always to be made large enough, for fear of choaking. When the waſte water is to be carried off into common ſewers, it may be carried away in drains, or earthen pipes; but when it is to ſerve for *baſons* that lie below it, it is to be conveyed in leaden ones. Miller.

There are divers ſorts of *baſons*; as

Bason, *figured*, that whoſe plan or circumference makes ſeveral turns and returns, either ſtraight, circular, or the like. Such are moſt of the *baſons* of fountains at Rome.

Bason *with a baluſtrade*, that whoſe cavity is ſurrounded with a baluſtrade of ſtone, marble, braſs, or the like.

Bason *with a trench*, or *baſſin a rigole*, that whoſe border being of marble, or other ſtone, has a trench cut in it, from whence, at certain diſtances, ſprings out a thread of water, which lines the trench, and forms a kind of nape or gargle around the baluſtrade. Such is that of the fountain of the rock of the Bellvidere at Rome.

Bason *en coquille*, that ſhaped like a ſhell.

Bason is likewiſe uſed for a dock.

Bason *of the ſea*. See Sea.

Bason, *ſale by the*, at Amſterdam, is uſed for the public ſales made under the direction of the *ven du meeſter*; thus called, by reaſon that, before adjudging the lot or commodity to the laſt bidder, they uſually ſtrike a braſs *baſon*, to give notice of it.

BASS, in *Muſic*, that part of a concert which is the moſt heard, which conſiſts of the graveſt, deepeſt, and longeſt ſounds; or which is played on the largeſt pipes or ſtrings of a common inſtrument, or on inſtruments larger than ordinary, for the purpoſe.

It is called *baſs*, from the Italian *baſſo*, of the Latin *baſis*, as being the foundation of the harmony.

Muſicians hold the *baſs* the principal part of a concert, and the foundation of the compoſition; though ſome will have the *treble* the chief part; which others only make a circumſtance, or ornament.

The ingenious Dr. Franklin, in his very curious letter to lord Kaimes on this ſubject, declares it to be his opinion that the *baſs* is unneceſſary to ſome tunes, and gives ſome reaſons in ſupport of it, which the curious may ſee there. Experiments, Obſervations, &c. 4to. 5th ed. p. 489. Rouſſeau appears to be of the ſame opinion. See Dict. de Muſique, an. 1768.

Bass, *counter*, is a ſecond *baſs*, where there are ſeveral in the ſame concert.

Bass, *thorough*, is that which proceeds, without interruption, from the beginning of a muſical compoſition to the end.—By which it ſtands contradiſtinguiſhed from the *ſinging baſs*, and the *baſſes of violins*, which make pauſes from time to time. The *thorough-baſs* is the harmony made by *baſs* viols, theorbos, or the like, continuing to play, both while the voices ſing, and the other inſtruments perform their part; and alſo filling the intervals when any of thoſe ſtop. M. Broſſard obſerves the *thorough-baſs* to be a part of the modern muſic, firſt invented in 1600, by an Italian, called Ludovico Viadana.

It is commonly diſtinguiſhed from the other *baſſes* by figures over the notes, directing what chords are to be played to them; which figures are proper only for the organ, harpſichord, ſpinet, and theorbo lute.—But it is to be obſerved a *thorough-baſs* is not always figured, though it ought to be ſo.

Bass, *fundamental*. See Fundamental and Key.

Bass, among *Gardeners*, a ſoft kind of ſedge or ruſh, uſed in binding plants, &c.

BASSAD, or Besd, an Arabian name for the purple *fucus* of the Greeks, uſed by the women to paint their cheeks, and by the dyers of cloths. It has been ſo far miſunderſtood by late authors as to be interpreted by the word coral; but the error of this is evident, ſince coral has none of theſe properties. See Margian.

BASSANUS, in *Ornithology*, a ſpecies of the pelican.

BASSE, in *Ichthyology*, the Engliſh name of the *ſea-wolf*, the *lupus piſcis* of authors. The Greeks have called this *labrax*; and ſome of the later writers, as Paulus Jovius, and others, *ſpigola*. It is properly a ſpecies of pearch, and is diſtinguiſhed by Artedi by the name of the pearch with thirteen rays in the ſecond fin of the back, and fourteen in the *pinna auri*. See Perca and Lupus *Marinus*.

Basse-*cour*, in *Building*; a court ſeparated from the principal one, and deſtined for the ſtables, coach-houſes, and livery-ſervants.

Basse-*cour* of a country-ſeat, is the yard, or place where the cattle, fowls, &c. are kept.

That where ſtrange creatures of divers ſorts are kept for curioſity, is called by the French *menagiere*. The Romans gave the name *vivarium* to that place, where beaſts were kept for the public ſhews.

Basse, in *Middle Age Writers*, denotes a collar for carthorſes, made of flags.

Hence alſo the round, matted cuſhion of flags, uſed for kneeling in churches, is called *baſſe*; in Kent, a *truſh*.

BASSET, or Basette, a game with cards, ſaid to have been invented by a noble Venetian, for which he was baniſhed. It was firſt introduced into France by ſignior Juſtiniani, ambaſſador of Venice, in 1674. Severe laws were made againſt it by Louis XIV. to elude which they diſguiſed *baſſet* under the name of *pour & contre*, that is, *for and againſt*, which occaſioned new arrets and prohibitions of parliament. The parties concerned in it are, a dealer or banker, his aſſiſtant, who ſuperviſes the loſing cards, and the punter, or any one who plays againſt the banker. Beſides theſe, there are other terms uſed in this game, as,

1. The *faſſe*, or *face*, which is the firſt card turned up by the *tailleur* belonging to the pack; by which he gains half the value of the money laid down on every card of that ſort by the punters.

2. The *couch*, or firſt money which every punter puts on each card; each perſon that plays, having a book of thirteen ſeveral cards before him, on which he may lay his money, more or leſs, at diſcretion.

3. The *paroli*, which is, when a punter having won the firſt ſtake, and having a mind to purſue his good fortune, crooks the corner of his card, and lets his prize lie, aiming at a *ſept et le va*.

4. The *maſſe*, when having won the firſt ſtake, the punter is willing to venture more money on the ſame card.

5. The *pay*, when the punter having won the firſt ſtake, be it a ſhilling, half-crown, guinea, or whatever he laid down on his card, and not caring to hazard the paroli, leaves off, or *goes the pay*; in which caſe, if the card turn up wrong, he loſes nothing, having won the couch before; whereas if it turn right, he, by this adventure, wins double the money ſtaked.

6. The *alpiew*, much the ſame with paroli, and uſed when a couch is won by turning up, or crooking the corner of the winning card.

7. *Sept et le va*, the firſt great chance or prize, when the punter having won the couch, makes a paroli, and goes on to a ſecond chance; ſo that if his winning card turns up again, it comes to *ſept et le va*, which is ſeven times as much as he laid down on his card.

8. *Quinze et le va* is the next higher prize, when the punter having won the former, is reſolved to puſh his fortune, and

lay his money a ſecond time on the ſame card, by crooking another corner; in which caſe, if it come up, he wins fifteen times the money he laid down.

9. *Trent et le va* is the next higher prize, when the punter crooking the fourth corner of his winning card, if it turn up, wins thirty-three times the money he firſt ſtaked.

10. *Soixant et le va* is the higheſt prize, and entitles the winner to ſixty-ſeven times his firſt money; which, if it were conſiderable, ſtands a chance to break the bank: but the bank ſtands many chances firſt of breaking the punter. This cannot be won, but by the *tailleur's* dealing the cards over again.

The rules of the game of *baſſet* are as follow:

The banker holds a pack of fifty-two cards, and having ſhuffled them, he turns the whole pack at once, ſo as to diſcover the laſt card; after which he lays down all the cards by couples.

The punter has his book of thirteen cards in his hand, from the king to the ace; out of theſe he takes one card, or more, at pleaſure, upon which he lays a ſtake.

The punter may, at his choice, either lay down his ſtake, before the pack is turned, or immediately after it is turned, or after any number of couples are down.

Suppoſing the punter to lay down his ſtake after the pack is turned, and calling 1, 2, 3, 4, 5, &c. the places of thoſe cards which follow the card in view, either immediately after the pack is turned, or after any number of couples are drawn. Then,

If the card, upon which the punter has laid a ſtake, comes out in any odd place, except the firſt, he wins a ſtake equal to his own.

If the card, upon which the punter has laid a ſtake, comes out in any even place, except the ſecond, he loſes his ſtake.

If the card of the punter comes out in the firſt place, he neither wins nor loſes, but takes his own ſtake again.

If the card of the punter comes out in the ſecond place, he does not loſe his whole ſtake, but only one half; and this is the caſe in which the punter is ſaid to be *faced*.

When the punter chooſes to come in after any number of couples are down, if his card happens to be but once in the pack, and is the laſt of all, there is an exception from the general rule; for though it comes out in an odd place, which ſhould entitle him to win a ſtake equal to his own, yet he neither wins nor loſes from that circumſtance, but takes back his own ſtake.

This game has been the object of mathematical calculations. Mr. De Moivre ſolves this problem: to eſtimate at *baſſet* the loſs of the punter under any circumſtance of cards remaining in the ſtock when he lays his ſtake, and of any number of times that his card is repeated in the ſtock. From his ſolution he has formed a table, ſhewing the ſeveral loſſes of the punter in whatſoever circumſtances he may happen to be. See Doctr. of Chances, p. 63.

From this table it appears, 1. That the fewer the cards are in the ſtock, the greater is the loſs of the punter. 2. That the leaſt loſs of the punter, under the ſame circumſtances of cards remaining in the ſtock, is when his card is but twice in it; the next greater when but three times; ſtill greater when four times; and the greateſt when but once. The gain of the banker, upon all the money adventured at *baſſet*, is 15*s.* 3*d. per cent.* De Moivre, Doctr. of Chances, p. 69. Edit. 3.

BASSETING, in the *Coal Mines*, denotes the riſe of the vein of coal towards the ſurface of the earth, till it come within two or three feet of the ſurface itſelf.

This is alſo called by the workmen *croping*, and ſtands oppoſed to *dipping*, which is the deſcent of the vein to ſuch a depth, that it is rarely, if ever, followed to the end.

BASSIA, in *Botany*, a genus of the *dodecandria monogynia* claſs.

BASSON, or **BASSOON**, a muſical inſtrument of the wind kind, blown with a reed, and furniſhed with eleven holes; ſerving for the *baſs* in concerts of hautboys, &c.

To make it more portable, it divides into two parts, whence it alſo bears the denomination *fagot*. Its diameter at bottom is nine inches, and its holes are ſtopped, like thoſe of large flutes.—A good *baſſoon* is ſaid to be worth four or five hundred piſtoles.

BASSO *relievo*, or **BAS** *relief*, a piece of ſculpture, the figures whereof do not project far, or ſtand out from the ground, with their full proportion.

Mr. Hellot, in the Mem. Acad. des Scienc. an. 1745, communicates a method of making raiſed figures of gold, on works of gold or ſilver, found among the papers of Mr. Du Fay, who had ſeen ſeveral trials of it. See the proceſs in the memoir above referred to, and in the Commerc. Phil. Techn. 4to. p. 80.

M. Felibien diſtinguiſhes three kinds of *relievos*: in the firſt, the front figures appear almoſt with their *full relievo*, called *alto relievo*; in the ſecond, they do but ſtand out one half, called *mezzo relievo*; and in the third, much leſs, which is the proper *baſſo relievo*, as in coins, vaſes, &c. See RELIEVO.

BASSO *relievos* make part of the furniture of antiquaries. Thoſe of the Trajan and Antonine columns have been copied by Bartoli, and explained by Bellori, &c. Thoſe of the arch of Severus by Suareſius.

Some have alſo made maps and proſpects of countries in *baſſo relievo*. Phil. Tranſ. Nº 6. p. 99.

BASSO *&* *alto*, in *Law*. See ALTO.

BASS-VIOL, a muſical inſtrument of the ſame form with that of the violin, except that it is much larger.—It is ſtruck like that, with a bow; and has ſtrings, and eight ſtops, divided by half-ſtops, or ſemi-tones.

The ſound it yields is much more grave, ſweet, and agreeable, than that of the VIOLIN, and of a much nobler effect in a concert.

BASTAGARII, in *Antiquity*, a college or company at Rome, who carried the fiſcal ſpecies out of the provinces to Rome or Conſtantinople.

The directors of theſe were called *præpoſiti baſtagarum*.

The word is derived from *baſtaga*, which properly imports the office of carriage or conveyance, from βαςαζειν, *portare, to carry*.

The denomination *baſtagarii* has alſo been given to thoſe who carry the images of ſaints at proceſſions. Du-Cange.

BASTARD, a natural child, or one born out of lawful wedlock.

The word is of Saxon etymology, and is compounded of *baſe*, *vile* or *ignoble*; and *ſtart*, or *ſteart*, *original*.

A *baſtard* differs from one born in adultery, or inceſt, in that the parents of the former are free, or allowed to marry, which thoſe of the latter are not.

The *baſtards*, or natural ſons of a king in France, are princes when owned; thoſe of a prince, or nobleman, are gentlemen; but thoſe of a gentleman are only plebeians, and pay taxes accordingly.

By the French laws, *baſtards* cannot inherit before they are legitimated; nor have heirs, except their own children begot in wedlock: for want of theſe, their inheritance devolves on the king.

By the Roman law, the mother inherited from her *baſtard* child, and *vice verſa*: but there was a great difference between *baſtards*, *nothi*, and thoſe they called *ſpurious*. The law did not own the latter, nor allow them ſuſtenance, becauſe they were born in common and uncertain proſtitution. *Is non habet patrem, cui pater eſt populus.* The former ſort, born in concubinage, which reſembles marriage, inherited from their mothers, and had a right to demand ſuſtenance of their natural fathers. They were looked upon as domeſtic creditors, that ought to be treated the more favourably, for being the innocent product of their parents crimes. Solon would have it, that the parents ſhould be deprived of their paternal authority over their *baſtards*, becauſe, as they were only parents for pleaſure, that ought to be their only reward.

Anciently, in Rome, natural children were quite excluded from inheriting after their fathers *ab inteſtato*: but they might be appointed heirs in general. The emperors Arcadius and Honorius made a reſtriction, that when there were legitimate children, the *baſtards* ſhould only come in for a twelfth, to be ſhared with their mother. Juſtinian afterwards ordered, that they might come in for half; and ſucceed *ab inteſtat.* for a ſixth, when there were legitimates.

Baſtards might be legitimated by ſubſequent marriage, or by the emperor's letters. Only the king in France, and the king and parliament in England, can give *baſtards* a right of legitimacy, and a power to inherit. The emperor Anaſtaſius allowed fathers to legitimate their *baſtards* by adoption alone: but this was aboliſhed by Juſtin and Juſtinian, leſt by this indulgence they ſhould authorize concubinage. The pope has ſometimes legitimated *baſtards*. Nay, the holy ſee has on ſome occaſions diſpenſed not only with illegitimates, but with the offspring of adultery, as to ſpiritual conſiderations, in allowing of their promotion to epiſcopacy.

Baſtards not legitimated may diſpoſe of their goods by donation when alive, or by will afterwards. Thoſe legitimated by ſubſequent marriage are in the ſame ſtate, and enjoy the ſame right with thoſe born in wedlock: but thoſe who are legitimated by the king's letters, are not eſteemed legitimate, or capable of inheriting, but with regard to ſuch of their parents as have conſented to their legitimation. Pope Clement VII. by his bull, forbad a prieſt to reſign his benefice to his *baſtard*.

An attempt was once made to introduce the civil law here in this reſpect, by declaring children legitimated by a ſubſequent marriage; but it was rejected: and it was upon this occaſion that the barons of England made that famous anſwer, *Nolumus leges Angliæ mutari*.

A *baſtard's* arms ſhould be croſſed with a bar, fillet, or traverſe, from the left to the right. They were not formerly allowed to carry the arms of their father, and therefore they invented arms for themſelves, and this is ſtill done by the natural ſons of a king.

Baſtards cannot be admitted to ſimple benefices, or the loweſt orders, or to more than a ſimple benefice, without orders from the pope: nor are they allowed to bear office without the prince's letters. But this doctrine ſeems now obſolete.

A *baſtard* by the law of England cannot inherit land as heir to his father, being *nullius filius*; nor can any perſon inherit land as heir to him, but one that is heir of his body. If a child be begotten by him who doth marry the woman after the child's birth, yet it is in judgment of the law a *baſtard*, though the church holds it legitimate.—If one marry a woman, and die before night, and never bed her, and ſhe have a child after, it is yet accounted his child, and legitimate.—If a man or woman marry again, and have iſſue by the ſecond wife or huſband, while the firſt is living, ſuch iſſue is a *baſtard*.—If a woman elope with a ſtranger, and have a child by him, her huſband being within the four ſeas, this is legitimate, and ſhall inherit the huſband's lands. But this notion is not now adhered to; for though the huſband and wife are both in England, if there be ſufficient proof that he had no acceſs to her, the child will be a *baſtard*.—He that gets a *baſtard* in the hundred of Middleton, in Kent, forfeits all his goods and chattels to the king. By ſtat. 18 Eliz. cap. 3. two juſtices may take order for the puniſhment of the mother and reputed father of a baſtard; and by ſtat. 7 Jac. I. cap. 4. the penalty of commitment to the houſe of correction is inflicted on the woman only. But it ſeems that in both caſes the penalty can only be inflicted, when the child becomes chargeable to the pariſh. By 6 Geo. II. cap. 31. the reputed father may be apprehended by warrant of a juſtice, on the oath of the pregnant woman, and committed, unleſs he gives ſecurity to indemnify the pariſh to which the child belongs. But by ſtat. 18 Eliz. the woman is not compellable to anſwer any queſtions relative to her pregnancy, till one month after her delivery.

If a *baſtard* be got under the umbrage of a certain oak in Knollwood in Staffordſhire, belonging to the manor of Terley Caſtle, no puniſhment can be inflicted; nor can the lord, nor the biſhop, take cognizance of it. Plott's Hiſt. Stafford. p. 279.

BASTARD, in the *Sea Language*, is uſed for a large ſail of a galley, which will make way with a ſlack wind.

BASTARD is alſo uſed adjectively, or in compoſition with divers other words, to denotes things of inferior or diminutive value.

In this ſenſe we meet with *baſtard*-coral, *baſtard*-alabaſter, *baſtard*-amianthus, &c.

BASTARD-*ſaffron* is the ſame with what is otherwiſe called *ſaf-flower*, ſometimes *ſcarlet-flower*, as being uſed in dying ſcarlets.

BASTARD-*ſcarlet* is a name given to red dyed with bale-madder, as coming neareſt the Bow-dye, or new ſcarlet.

BASTARD, in reſpect of artillery, is applied to thoſe pieces, which are of an unuſual or illegitimate make or proportion. Theſe are of two kinds, long and ſhort, according as the defect is on the redundant or defective ſide.

The long *baſtards*, again, are either common or uncommon. To the common kind belong the double culverin extraordinary, half culverin extraordinary, quarter culverin extraordinary, falcon extraordinary, &c.

The ordinary *baſtard*-culverin carries a ball of eight pounds.

BASTARDS are alſo an appellation given to a kind of faction or troop of banditti, who roſe in Guienne, about the beginning of the fourteenth century, and joining with ſome Engliſh parties, ravaged the country, and ſet fire to the city of Xaintes.

Mezeray ſuppoſes them to have conſiſted of the natural ſons of the nobility of Guyenne, who being excluded the right of inheriting from their fathers, put themſelves at the head of robbers and plunderers, to maintain themſelves.

BASTARDY is a defect of birth objected to one born out of wedlock.

BASTARDY, *right of*, *droit de batardiſe*, in the French *Laws*, is a right, in virtue whereof the effects of baſtards dying inteſtate, devolve to the king, or the lord.

BASTARD *diſeaſes*, &c. See SPURIOUS.

BASTARD *dittany*, &c. See DITTANY.

BASTERNA, a kind of vehicle, or chariot, uſed by the ancient Roman ladies.

Papias thinks, that *baſterna* was firſt written for *veſterna*: Roſweild ſays, it ſhould be *via ſterna*, which he concludes from Iſidore, who ſays, *baſterna, viæ ſterna*. But the word ſeems better derived from the Greek *βαςαζω*, *porto*, *I carry*.

Salmaſius obſerves, that the *baſterna* ſucceeded the *lectica*, or *litter*; from whence it differed very little, except that the litter was borne on the ſhoulders of ſlaves, and the *baſterna* borne or drawn by beaſts. Caſaubon ſays it was borne by mules. F. Daniel, Mabillon, &c. aſſert it was drawn by oxen, to go the more gently; and Gregory de Tours gives an inſtance of its being drawn by wild bulls. The inſide they called the *caveo*, or *cage*: it had ſoft cuſhions or beds, beſides glaſſes on each ſide like our chariots.

The mode of *baſternas* paſſed from Italy into Gaul, and thence into other countries; and to this we owe our chariots; which, though we call them *currus*, yet have they no conformity to the ancient *currus*, but are in effect *baſternas* improved.

The *baſterna* appears alſo to have been uſed in war, for carrying of baggage.

BASTILE denotes a ſmall antique caſtle, fortified with turrets. Such is the *baſtile* of Paris, which ſeems the only caſtle that has retained the name: it was begun to be built in 1369, by order of Charles V. and finiſhed in 1383, under the reign of his ſucceſſor.—Its chief uſe is for the cuſtody of ſtate-priſoners.

BASTION, in the *Modern Fortification*, a huge maſs of earth uſually faced with ſods, ſometimes with brick, rarely with ſtone, ſtanding out from a rampart, whereof it is a principal part.

This anſwers to what in the ancient fortification is called *propugnaculum*, or a *bulwark*.

Baſtions, ſome ſay, were firſt introduced by Ziſca the Bohemian; others attribute the invention of them to Achmet Baſhaw, in the year 1480, mentioning the fortification of Otranto, as the firſt inſtance in which they were uſed. However, they were well known ſoon after the year 1500; for Tartalea gives a plan of Turin, which had been completely fortified for ſome time with four *baſtions*, in his Queſiti & Inventioni diverſe, publiſhed in 1546. The firſt *baſtions*, ſuch as thoſe of Turin and of Antwerp, which was fortified about the year 1540, were ſmall, and removed at a great diſtance from each other: but they were made much larger, and brought nearer to each other in the citadel of Antwerp, erected under the direction of the duke d'Alva, about the year 1566.

A *baſtion* conſiſts of two faces, and two flanks, and an opening towards the center of the place, called the GORGE.—The faces are the lines BC and CS (*Tab. Fortificat. fig.* 1.) including the angle of the *baſtion*. See FACE.—The flanks are the lines BA, SD.

The union of the two faces makes the outmoſt or ſaliant angle, called alſo the *angle of the baſtion*, BCS.

The union of the two faces to the two flanks makes the ſide-angles, called the *ſhoulders*, or *epaules of the baſtion*.

And the union of the two other ends of the flanks to the two curtins, the angles of the flanks of the *baſtion*.—See *Tab. Fortific. fig.* 21. *lit. oo. &c. ppp.*

The foundation of the *baſtion*, i. e. of a work conſiſting of flanks and faces, is that great rule in fortification, viz that every part of a work muſt be ſeen and defended, from ſome other part: mere angles therefore are not ſufficient, but flanks and faces are indiſpenſibly requiſite.—Thus, if the *baſtion* conſiſts of flanks and faces, as ABCSD, *fig.* 1. all the points may be defended from the flanks; there being none, v. gr. in the face BC, but what may be defended from the oppoſite flank EL, nor any in the curtin AE, but may be defended from the adjacent flanks BA and EL; nor in any one flank BA, but may be defended from the other EL.

For the proportions of the faces, they are not to be leſs than 40 toiſes, nor more than 60: or differing little from 100 yards.

The flanks of *baſtions* are better as they are longer, provided they ſtand at the ſame angle under the line of defence: hence the flank muſt ſtand at right angles to the line of defence. Indeed, in the ancient fortification, the flank is made perpendicular to the curtin, ſo as to have the angle out of the enemies eye; but this is now provided for, by withdrawing the lower part of the flank two or three perches, towards the capital line: which part, thus withdrawn, is better, if made concave, than rectilinear; and, if double, with a ditch between, than if ſingle.

The buſineſs of diſpoſing the flanks of *baſtions* makes the principal part of the art of fortification; it is that on which the defence principally depends, and which has introduced the various forms and manners of fortifying.

If the angle of the *baſtion* be leſs than ſixty degrees, it will be too ſmall to give room for guns; and beſides, ſo acute as to be eaſily beaten down by the enemies guns: to which may be added, that it will either render the line of defence too long, or the flanks too ſhort: it muſt therefore be more than ſixty degrees; but whether or no it ſhould be a right angle, ſome intermediate angle between ſixty and ninety, or even whether or no it ſhould exceed a right angle, is ſtill diſputed; though thoſe are generally preferred, which are not much leſs than 90°, and not exceeding 120° or 130°. Hence it follows, that a triangle can never be fortified, in regard either ſome or all of the angles will be either ſixty degrees, or leſs than ſixty.

Baſtions are of divers kinds, *ſolid*, *void*, *flat*, *cut*, &c.

Baſtions, *ſolid*, are thoſe that are filled up intirely, and have the earth equal to the height of the rampart, without any void ſpace towards the centre.

Baſtions, *void*, or *hollow*, are thoſe ſurrounded with a rampart and parapet, only ranging round their flanks and faces, ſo as to leave a void ſpace towards the centre; where the ground is ſo low, that if the rampart be taken, no retrenchment can be made in the centre, but what will lie under the fire of the beſieged.

Baſtion, *flat*, is a *baſtion* built on a right line in the middle of the curtin, when it is too long to be defended by the *baſtion* at its extremes.

Baſtion, *cut*, is that whoſe point is cut off, and in lieu thereof has a re-entering angle, or an angle inwards with two points outward; this is ſometimes alſo called, *baſtion with a tenaille*; and is uſed either when, without ſuch a contrivance, the angle would be too acute, or when water, or ſome other impediment, hinders the carrying on the *baſtion* to its full extent.

Baſtion, *compoſed*, is when the two ſides of the interior polygon are very unequal, which makes the gorges alſo unequal.

Baſtion, *regular*, is that which has its due proportion of faces, flanks, and gorges; the faces being of an equal length, the flanks the ſame, and the two angles of the ſhoulder equal.

Baſtion, *irregular*, is where this proportion and equality is not obſerved.

Baſtion, *deformed*, is where the irregularity of the lines and angles makes the *baſtion* out of ſhape, as when it wants one of its demi-gorges; one ſide of the interior polygon being too ſhort.

Baſtion, *demi*, is that which hath but one face, and one flank; called alſo an *epaulement*.

To fortify the angle of a place that is too acute, they cut off the point, and make two *demi-baſtions*, which form a *tenaille*, or a re-entering angle.—Their chief uſe is before a hornwork, or crownwork.

Baſtion, *double*, is that, which on the plain of the great *baſtion*, has another *baſtion* built higher, ſomewhat after the manner of a cavalier; leaving twelve or eighteen feet between the parapet of the lower, and the foot of the higher.

Baſtion, *capital of a*. See Capital.

Baſtion, *gorge of a*. See Gorge.

Baſtion, *diſtance of the*. See Distance.

Baſtion *company of France*. See Company.

BASTON, in *Law*, is uſed for one of the warden of the Fleet's men, who attends the king's courts with a red ſtaff, for taking ſuch to ward as are committed by the court; and likewiſe attends on ſuch priſoners as are ſuffered to go at large by licence.

The word is French, literally ſignifying a *ſtaff*, and technically a *verge*, or *mace*.

Baſton, or Batoon, in *Architecture*, denotes a mould in the baſe of a column, otherwiſe called a *tore*.—See *Tab. Archit. fig.* 3.

Baſton, or Batoon, in *Heraldry*, a kind of bend, which has only one fourth of the uſual breadth.

The *baſton* does not go from ſide to ſide of the eſcutcheon, as the bend or ſcarf does, but is broken off ſhort, in form of a truncheon: its uſe in Engliſh coats of arms is a mark of baſtardy: but French heralds introduce it in arms as a difference, a mark of conſanguinity.

Baſton alſo ſignifies the earl marſhal's ſtaff.

BASTONADO, Baſtonade, the puniſhment of beating or drubbing a criminal with a ſtick.

The word is formed of the French *baſton*, a *ſtick* or *ſtaff*.

The *baſtonade* is a puniſhment uſed both among the ancient Greeks, Romans, and Jews, and ſtill obtains among the Turks.

The Romans called it *fuſtigatio*, *fuſtium admonitio*, or *fuſtibus cædi*, which differed from the *flagellatio*, as the former was done with a ſtick, the latter with a rod or ſcourge. The fuſtigation was a lighter puniſhment, and inflicted on freemen; the flagellation a ſeverer, and reſerved for ſlaves. It was alſo called *tympanum*, becauſe the patient here was beat with ſticks, like a drum.

The penalty is much in uſe in the Eaſt to this day. The method there practiſed is thus: the criminal being laid on his belly, his feet are raiſed, and tied to a ſtake, held faſt by officers for the purpoſe; in which poſture he is beaten by a cudgel on the ſoles of his feet, back, chin, &c. to the number of one or more hundred blows. Calmet. Dict. Bib. tom. i. p. 260.

BASTONIER, or Batonier, in the French *Law*, an ancient advocate, elected yearly according to ſeniority, to be the head or maſter of the community of advocates and attornies. He is preſident of the board held for maintenance of the order, and diſcipline of the *palais*. To him alſo belongs the commiſſion of the inferior judges, when put under interdict, ſo long as the interdiction laſts.

Baſtonier is alſo uſed for him who keeps the ſtaff of a community, and carries or follows it in proceſſions.

BAT, in *Zoology*, a genus of quadrupeds, of the order of *feræ*, the characters of which are theſe. The fore-teeth of the upper-jaw are ſix in number, acute, and diſtant from each other; the fore-teeth of the lower jaw are alſo ſix, and acute, but contiguous; the canine teeth are two, both above and below, on each ſide; the feet have each five toes; the fore-feet have the toes connected by a membrane, and expanded into a kind of wings, whereby it flies: whence this animal has been generally, but with the utmoſt impropriety, ranged among birds.

The *bat*, called alſo by us *lapwing*, and *flittermouſe*, by the Latins *veſpertilio*, ſeems a medium between the quadruped and the feathered kinds; but it partakes moſt of the former tribe; agreeing only with the birds in the ſternum, and the poſition of its liver; and with the quadrupeds in the kidneys, bladder, teeth, *penis*, teſticles, diaphragm, and lungs. In reality, it only appears to be a bird by its flying. They lay themſelves up in winter in the drieſt apartments of caves; where planting their talons to the roof, they cover their bodies with their wings, and ſo hanging perpendicularly in great numbers, but ſo as not to touch each other, they ſleep for ſome months.

Travellers ſpeak of a ſort of *bats* in Golconda bigger than hens.

In Braſil there is a large ſpecies of this animal, which, if men lie aſleep with their legs naked, will, it is ſaid, make a wound in them ſo gently, as not to wake them, but ſo deep, that they will ſuck the blood at it, and leave the perſon in ſome danger of bleeding to death. Piſo. Hiſt. Braſil.

Bat, in *Commerce*, a ſmall baſe ſilver-coin, current in divers parts of Germany and Switzerland at different prices.

The *bat*, or *fludermouſe*, at Nuremberg, is equal to four criotzers; at Zurich, to $\frac{1}{18}$ of the French crown; at Baſil, Schaffhauſen, &c. to $\frac{1}{17}$; and at Bern and Friburg to $\frac{1}{30}$ of the ſame crown. Theſe laſt are called *ſhort bats*.

BATARDIERE, a place in a garden, prepared for the planting of fruit-trees in, which being tranſplanted thither from the nurſery, are to be placed in eſpaliers, or elſewhere, to ſupply the place of dead trees.

BATATAS. See Potato.

BATCHELOR. See Bachelor.

Batchelor's *Buttons*, in *Botany*. See Campion.

Batchelor's *Pear*, a name given to a ſpecies of nightshade.

BATEMAN's *Drops*, in *Pharmacy*, are the anodyne balſam made with a weaker ſpirit, ſo that a larger doſe can be taken: they are tinctured with aniſeed.

BATENKETOS, a ſtar about the third magnitude, in the conſtellation of cetus.

BAT-FOWLING, a method of catching birds in the night, by lighting ſome ſtraw, or torches, near the place where they are at rooſt; for, upon beating them up, they fly to the flames, where, being amazed, they are eaſily caught in nets, or beat down with buſhes fixed to the end of poles, &c.

BATH, Balneum, a convenient receptacle of water for perſons to waſh, or plunge in, either for health or pleaſure.

Baths are either *natural* or *artificial*. *Natural*, again, are either *hot* or *cold*.

Baths, *hot*, called by the ancients *thermæ*, owe their origin partly to the admixture of ſulphureous particles, while the water is paſſing through its ſubterraneous canals, or rather while it creeps through beds and mines of ſulphur, &c. and partly to the fumes and vapours exhaling through the pores of the earth where ſulphur is, either pure or impure, as in coals, amber, &c.—Though in moſt hot baths there are likewiſe mixed particles of iron, alum, nitre, and other mineral bodies, which give them an acid aſtringent taſte.

The chief hot *baths* in our country are thoſe at Bath and Briſtol, in Somerſetſhire; and thoſe others at Buxton and Matlock in Derbyſhire; which latter, however, are rather warm or tepid than hot.

In the city of Bath there are four hot *baths*: one triangular, called the *croſs bath*, from a croſs that formerly ſtood in the midſt of it; the heat of which is more gentle than that of the others, becauſe it has fewer ſprings.—The ſecond is the *hot bath*, which heretofore was much hotter than the reſt, when it was not ſo large as it now is.—The other two are the *king's* and *queen's bath*, divided only by a wall; the laſt having no ſpring, but receiving the water from the king's *bath*, which is about ſixty feet ſquare, and has in the middle of it many hot ſprings, which render its healing quality more effectual.—Each of theſe is furniſhed with a pump to throw out water upon the diſeaſed, where that is required.

It has been thought by many, that the practice of drinking our Bath waters in Somerſetſhire is not very ancient, and that their ancient uſe was in bathing; but Dr. Freind endeavours to ſhew the internal uſe of thoſe waters to have been very early. Dr. Guidot, in whoſe time this uſage revived, and who has given us the beſt hiſtorical narrative of theſe waters, goes no higher for their internal uſe than the latter end of the ſixteenth century. But they appear to have been in uſe in the thirteenth century: Gilbert, ſurnamed Anglicus, who, according to Bayle, lived in 1210, in the reign of king John, or more probably in that of Edward I. mentions a perſon cured of a leucophlegmacy, attending with a ſwelling, &c. by the ſulphureous *baths*; which Dr. Freind underſtands of the Bath waters; and that the cure was wrought by drinking, not bathing, which had been improper in ſuch a caſe.

Dr. Muſgrave makes it probable, that they were reſorted to in the time of Geta; there being ſtill the remains of a ſtatue erected to that general, in gratitude for ſome benefactions which he had conferred on the place. Some pretend that theſe waters were in uſe 800 years before Chriſt. Phil. Tranſ. N° 49. N° 346.

See the uſes of Bath waters, and their difference from thoſe of Briſtol, under the head *Briſtol*-WATER.

The waters abound with a mineral ſulphur: they are hot, of a blueiſh colour, and ſtrong ſcent, and ſend forth thin vapours.—They do not paſs through the body like moſt other mineral waters; though, if ſalt be added, they purge preſently. On ſettlement they afford a black mud, which is uſed by way of cataplaſm in aches; of more ſervice to ſome than the waters themſelves: the like they depoſit on diſtillation, and no other.

Dr. Aſtendoff found the colour of the ſalt drawn from the *king's* and *hot bath* to be yellow; and that from the *croſs bath*, white; whence he concludes, that the *croſs bath* has more alum and nitre than the *hotter*, which abounds more with ſulphur; and yet the *croſs bath* is found to looſen ſhrunk ſinews, by which it ſhould ſeem to abound leſs with alum: it is harſher to the taſte than the others, and ſoaks the hands more.—The *croſs bath* preys on ſilver, and all of them on iron, but none on braſs.

The two ſtated ſeaſons for drinking the Bath waters are ſpring and fall; though they may be uſed whenever they are found neceſſary. The heat of theſe waters, and their milky detergent quality, are aſcribed to a mixture and fermentation of two different kinds of water, diſtilling from Clarton Down, and Lanſdown; of which the former has ſprings that are ſulphureous, or bituminous, mixed with nitre; and the latter ſuch as are tinctured with iron ore. Beſides, the adjacent country abounds with mines of coal, which all naturaliſts agree to be ſulphureous and bituminous.—It is from the combination of ſulphur, iron, and ſea-ſalt, that Bath water is ſo uſeful, whenever the vital heat requires an increaſe. Nothing but iron can make ſuch a quick improvement, as this water does in decayed conſtitutions; and it is the ſoapineſs of it, from the union of its ſulphur and iron, that relaxes, ſo as to give vent to gouty, and other peccant matters, by perſpiration. More than two pints per day can never be required, and they may be drank at three or four times. In all internal diſorders, where iron and ſulphur are preſcribed, the internal uſe of this water is effectual; and by merely bathing in it, much relief is obtained in a great variety of diſorders.

The virtues of many of our mineral waters have been very juſtly aſcribed to the fixed air with which they abound; and ſome have aſcribed thoſe of the Bath waters to the ſame principle. But Dr. Prieſtley found upon trial, that the quantity of fixed air contained in them is ſo ſmall as to render it very improbable that their virtues ſhould be at all owing to it. And Dr. Falconer obſerves, that theſe waters do not ſo properly contain fixed air, as a calcareous earth; which though it contain fixed air, may not part with it in the ſtomach, unleſs it meet with ſome acid to decompoſe it. By ſome accurate obſervations that were made on the heat of Bath and Briſtol water, by Mr. Canton, it appears, that a Fahrenheit's thermometer held in the ſtream from the common pump of the king's *bath*, after pumping about ¼ of an hour, was raiſed to 112°. The ſtream from the common pump of the hot *bath* raiſed it to 114°½. At the pump of the *croſs bath* it ſtood at 110°; the heat of the ſhaded air at noon being 66°, and of common water expoſed to it 61°. And the Briſtol water raiſed the thermometer to 76°, whilſt in common water, expoſed to the ſhaded air, it ſtood at 62°. Phil. Tranſ. vol. lvii. N° 22.

Buxton water has been obſerved to raiſe the thermometer to 80°, and that of Matlock to 66° or 68°. See WATERS.

The uſe of hot *baths*, it is obſerved, increaſe the weight of the body for the preſent, but cauſe a plentiful perſpiration afterwards; though not ſo great as ſet down by Dr. Keill, who makes it amount to 1½ pound in an hour's time.—By Mr. Martin's experiment at Buxton, it was only 5 ounces in one hour, and from 8 to 12 ounces in an hour and an half. Phil. Tranſ. N° 407. p. 27.

The uſe of theſe *baths* is found beneficial in diſeaſes of the head, as palſies, &c. in cuticular diſeaſes, as leproſies, &c. obſtructions and conſtipations of the bowels, the ſcurvy and ſtone, and in moſt diſeaſes of women and children.—The *baths* have performed many cures, and are commonly uſed as a laſt remedy in obſtinate chronic diſeaſes; where they ſucceed well, if they agree with the conſtitution of the patient: but whether they will agree or not, cannot be known without trial.

BATHS, *cold*, were long baniſhed out of medicine, though the ancients had them in the greateſt eſteem: but the improvements accruing to phyſic from geometry and mechanics, have brought them into uſe again; and the preſent age can boaſt abundance of noble cures performed by them, and ſuch as were long attempted in vain by the moſt powerful medicines. The *cold bath* is found one of the moſt univerſal and innocent remedies yet diſcovered. It is ſerviceable in moſt chronic diſtempers; and is reckoned ſo ſafe, that phyſicians ſometimes preſcribe it in a beginning *phthiſis*, or conſumption, when the lungs are but ſlightly affected.

The effect of cold bathing is attributed not only to its chilneſs, and conſtringing power, but in ſome meaſure to the weight of the water.—For, ſuppoſing a perſon immerged two feet, and the *area* of his ſkin to be fifteen feet, he ſuſtains a weight of water, added to that of the air, =228clb. For 2, the number of cubical feet of water preſſing upon a foot ſquare of the ſkin × 76, the number of pounds in a cubical foot of water, is = 152; which × 15, the ſuppoſed number of ſquare feet on the ſurface of the body, is =2280lb. troy.—Beſides, the water in bathing enters the body, and mixes with the blood, and dilutes this as well as the other juices.

The riſe and progreſs of *cold-bathing*, and the cures effected thereby, are deſcribed at large in Sir J. Floyer's, and Dr. Baynard's Hiſtory of Cold Bathing.

In tender conſtitutions, and ſome diſeaſes, a moderate *warm bath* ſhould be uſed before the *cold bath*, the approach to which ought to be gradual. People of rigid fibres, and unſound *viſcera*, are injured by the *cold bath*; fat people are little benefited by it; and, in general, nobody ought to go into it before a gentle glow be excited by moderate exerciſe, when the ſtomach is moſt empty; and ſuch evacuations, as the patient's conſtitution require, ought to precede the uſe of it; which is beneficial, and may ſafely be continued, when an univerſal glow ſucceeds the coming out of it. The *cold bath* is hurtful, and ought to be diſcontinued, when the patient continues to be cold and numb after coming out of it, notwithſtanding all precautions to prevent it. Even where immerſion in the *cold bath* is ſtrengthening, a continuance in it is weakening, and in proportion to its duration.

BATHS, *artificial*, are various, according to the various occaſions; ſome aqueous, others vaporous, others dry, &c.

BATHS, *aqueous*, are thoſe prepared from common plants, and other ſubſtances of emollient, reſolvent, and nervine kinds. *Aqueous baths* ſometimes conſiſt of milk and emollient herbs, with roſe-water, &c. when the deſign is to humectate; at other times of bran and water, when the deſign is only to cleanſe: ſometimes again, they are made of a decoction of roots and plants, with an addition of ſpirit of wine, when a perſon bathes for a great pain or tumour, &c.

BATHS, *in vapour*, the fume or ſteam of ſome decoction is received upon the body to promote a perſpiration.—Theſe are alſo by ſome called *Balnea Laconica*.

Vapour baths are, when the patient is not plunged into what is prepared for the *bath*, but only receives its ſteam upon thoſe parts of his body which require it: as in ſome diſtempers of the fundament and womb, where the patient ſits and receives the fumes of ſome proper fomentation, &c. To theſe may be added the *bagnio*, where people are made to ſweat by the heat of a room, and pouring on of hot water; after which they generally go into a *hot bath*, or BAGNIO.

BATHS, *dry*, are thoſe made of aſhes, ſalt, ſand, ſhreds of leather, and the like.

The ancients had divers ways of ſweating by a dry heat; as by the means of a hot ſand, ſtove-rooms, or artificial bagnios, and certain natural hot ſteams of the earth, received under a proper arch, or hot-houſe, as we learn from Celſus. They alſo had another kind of *bath* by inſolation, where the body was expoſed to the ſun for ſome time, in order to draw forth the ſuperfluous moiſture from the inward parts; and to this day it is a practice in ſome nations to cover the body over with horſe-dung, eſpecially in chronical diſeaſes, to digeſt and breathe out the humour that cauſes the diſtemper. In New England they make a kind of ſtoves of turf, wherein the ſick are ſhut up to bathe or ſweat. Phil. Tranſ. N° 384. p. 130.

The ſame name is ſometimes alſo given to another kind of *bath*, made of kindled coals, or burning ſpirit of wine; the patient being placed in a convenient cloſe chair for the reception of the fume, which riſes and provokes ſweat in a plentiful manner: care is here taken to keep the head out, and to ſecure reſpiration.

This *bath* has been found very effectual in removing old, obſtinate pains in the limbs, and venereal complaints;

and will often complete a cure leſt unperformed by ſalivation.

Some authors ſpeak of *bloody baths, balnea ſanguinolenta,* prepared eſpecially of the blood of infants, anciently ſuppoſed to be a kind of ſpecific for the leproſy.

Baths, *metalline,* thoſe made of water, impregnated with the *ſcoriæ* of metals. The moſt common and uſeful of this kind are thoſe prepared with the *ſcoriæ* of iron, which abound with the earthy, ſaline, and ſulphureous ſubſtance of the metal; and theſe are of excellent ſervice for ſtrengthening and bracing up the part to which they are applied, and recovering weak and decayed limbs; ſtopping various kinds of bleeding; and reſtoring the menſtrual and hæmorrhoidal flux, where obſtructed; inſomuch that they may well be ſubſtituted for the natural iron *baths.*

Adjacent to the ſmelting huts where metals are run from their ore, are to be found large quantities of the ſlag of copper, antimony, and cobalt, which abounding with ſulphur, vitriolic ſalt, and an earthy principle, make ſerviceable *baths* for ſtrengthening the loſt tone of the fibres, and relaxing them when they are too ſtiff. Theſe *baths* have likewiſe a deterſive and cleanſing virtue; ſo that, with prudence, and due regard to circumſtances, they may be uſed on many occaſions. The way of making theſe artificial *baths* is, either to take the flags as they come hot from the furnace, or elſe to heat them afreſh, and throw them into hot water; which is afterwards to be uſed either in the way of *bath,* or fomentation, occaſionally.

There are other artificial *baths,* prepared of alum and quick-lime, by boiling them together in fine rain-water. Such *baths* are highly ſerviceable in paralytic diſorders, and weakneſs of the limbs.

The *pepper bath,* or *peffer waſſer* on the Alps, is one of the moſt celebrated in Europe, and has been the ſubject of treatiſes expreſs, beſides what has been ſaid of it occaſionally by Scheuchzer, and others. It was firſt diſcovered in the year 1240, and is of the periodical kind. The water breaks forth in a dreadful place, ſcarce acceſſible to the ſun-beams, or indeed to men, unleſs of the greateſt boldneſs, and ſuch as are not in the leaſt ſubject to dizzineſs. Theſe *baths* have this ſingularity above all others, that they commonly break forth in May, and that with a ſort of impetuouſneſs, bringing with them beech-leaves, crabs, or other wood-fruit; and that their courſe deſiſts in September or October.

Scheuchzer profeſſes himſelf of opinion, that theſe waters are not impregnated with any minerals, or, if they do contain any, that their virtues in curing diſtempers, and preſerving health, do not proceed from them. They are exceeding clear, deſtitute of colour, taſte, or ſmell. Phil. Tranſ. N° 316. p. 151.

Baths, Balnea, in *Architecture,* denote large pompous buildings among the ancients, erected for the ſake of bathing. *Baths* made a part of the ancient *gymnaſia.* Though they were frequented more for the ſake of pleaſure than health.

The moſt magnificent *baths* were thoſe of Titus, Paulus Æmilius, and Diocleſian, of which there are ſome ruins ſtill remaining. It is ſaid, that at Rome there were 856 public *baths.* Fabricius adds, that the exceſſive luxury of the Romans appeared in nothing more viſible, than in their *baths.* Seneca complains, that the *baths* of plebeians were filled from ſilver pumps; and that the freed-men trod on gems. Macrobius tells us of one Sergius Oratus, a voluptuary, who had *pendant baths* hanging in the air.

According to Dion, Mæcenas was the firſt who made a *bath* at Rome: yet there are inſtances of public *baths* prior to this; but they were of cold water, ſmall, and poorly decorated.

Agrippa, in his ædilate, built one hundred and ſixty places for bathing, where the citizens might be accommodated, either with hot or cold, *gratis.* After his example, Nero, Veſpaſian, Titus, Domitian, Severus, Gordian, Aurelian, Maximilian, Diocleſian, and moſt of the emperors who ſtudied to gain the affections of the people, erected *baths* laid with the richeſt marble, and wrought according to the rules of the moſt delicate architecture. Plin. Hiſt. Nat. lib. xxxv. c. 13. Mem. Acad. R. Inſcr. tom. ii. p. 417.

The rich had *baths* at home, and frequently very magnificent ones, eſpecially after the time that the practice of pillaging the provinces had begun; but they only uſed them on extraordinary occaſions. The great men, and even emperors themſelves, ſometimes bathed in public with the reſt of the people. Alexander Severus was the firſt who allowed the public *baths* to be open in the night-time during the heats of ſummer.

The Greek *baths* were uſually annexed to *paleſtræ* or *gymnaſia,* of which they were conſidered as a part. Theſe *baths* conſiſted of ſeven different apartments, uſually ſeparated from each other, and intermixed with other buildings belonging to the other ſorts of exerciſes. Theſe were, firſt, the *cold bath, frigida lavatio*; ſecondly, the *elæotheſium,* or room where they were anointed with oil; thirdly, the *frigidarium,* or cooling room; fourthly, the *propnigeum,* or entrance of the *hypocauſtum,* or ſtove; fifthly, the vaulted room for ſweating in, or *vapour bath,* called *concamerata ſudatio,* or *tepidarium*; ſixthly, the *laconicum,* or dry ſtove; ſeventhly, the *hot baths,* called *callida lavatio.* Potter, Archæol. Gr. lib. iv. c. 19.

As for the *baths* ſeparate from the *paleſtræ,* they appear to have been uſually double, one for men, the other for women; but ſo near, that the ſame furnace heated both. The middle part was poſſeſſed by a large baſon, that received water by ſeveral pipes, and was ſurrounded by a baluſtrade, behind which there was an area for the reception of thoſe who waited to uſe the *bath.* They were vaulted over, and only received light from the top.

In the Roman *baths,* the firſt part that appeared was a large baſon, called κολυμβηθρα in Greek, and *natatio* or *piſcina* in Latin. In the middle was the *hypocauſtum,* which had a row of four apartments on each ſide, called *balnearia*: theſe were the ſtove, the *bath,* cold *bath,* and *tepidarium.* The two ſtoves, called *laconicum* and *tepidarium,* were circular and joined together. Their floor was hollow and ſuſpended, in order to receive the heat of a large furnace, which was communicated to the ſtoves through the vacuities of their floor. This furnace alſo heated another room called *vaſarium,* in which were three large braſen veſſels called *milliaria,* reſpectively containing hot, warm, and cold water; which were ſo diſpoſed, that the water might be made to paſs by ſyphons and pipes out of one or other of them into the *bath,* in order to adjuſt its temperature. The deſcription is given by Vitruvius.

At three in the afternoon, which is what Pliny calls *hora octava & nona,* the Romans all repaired to the *baths,* either the public or the private ones: this was called the *bath-hour, hora balnei,* which in winter was at nine, in ſummer at eight. The public *baths* were all opened by the ſound of a bell, and always at the ſame hour.

Thoſe who came too late, ſtood a chance for bathing in cold water.

They began with hot water, after which, as the pores were now opened, and might give room for too plentiful a perſpiration, they thought it neceſſary for their health to cloſe them again, either with the cold *bath,* or at leaſt with a ſprinkling of cold water. During the *bath,* the body was ſcraped with a kind of knives, or ſmall ſtrigils, ſuch as are ſtill found in the cabinets of the curious. After bathing, ſucceeded unction and perfuming, from which they went freſh to ſupper.

The Romans, when they found their ſtomachs overcharged with meat, went to the *bath,* as we learn from Juvenal, who inveighs againſt thoſe, who having gorged themſelves with eating, were forced to go into the *baths,* to give themſelves relief. They found alſo that a *bath* was good to refreſh themſelves after ſome conſiderable fatigue or travel, as Celſus tells us; which makes Plautus ſay, that all the *baths* in this world were not ſufficient to remove the wearineſs he felt.

After Pompey's time, the humour of bathing was carried to great exceſs, by which many were ruined, ſeveral having brought themſelves to ſuch a pitch, that they could not bear food without bathing firſt. The emperor Titus is ſaid to have loſt his life hereby. Hence Pliny inveighs ſeverely againſt thoſe phyſicians, who held, that hot *baths* digeſted the food. The emperor Hadrian firſt laid a reſtraint on the immoderate humour of bathing, by a public edict, prohibiting all perſons to bathe before the eighth hour.

Baths *of Agrippa, thermæ Agrippinæ,* were built of brick, but painted in enamel: thoſe of Nero, *thermæ Neronianæ,* were not only furniſhed with freſh water, but even had the ſea brought into them: thoſe of Caracalla were adorned with two hundred marble columns, and furniſhed with ſixteen hundred ſeats of the ſame matter. Lipſius aſſures us they were ſo large, that eighteen hundred perſons might conveniently bathe in them at the ſame time. But the *baths* of Diocleſian, *thermæ Diocleſianæ,* ſurpaſſed all the reſt in magnificence. One hundred and forty thouſand men were employed many years in building them. Great part of theſe, as well as thoſe of Caracalla, are ſtill ſtanding; and, with the vaſt high arches, the beautiful and ſtately pillars, the extraordinary plenty of foreign marble, the curious vaulting of the roofs, the prodigious number of ſpacious apartments, and a thouſand other ornaments, make one of the greateſt curioſities of modern Rome. Kennet, Rom. Ant. p. ii. lib. i. c. 7. and Schott. Itin. Ital. p. 132.

Bath, in *Chemiſtry,* ſeveral matters employed to tranſmit heat are called *baths,* but the ſubſtances moſt frequently uſed by chemiſts for this purpoſe, are *water* and *ſand.* When water is employed, it is called **Balneum** *mariæ,* or **Water** *bath*; which is very much uſed, very convenient for many operations, and may be employed ſucceſsfully for all degrees of heat inferior to that of boiling water. See Col. Acad. Part. Etr. tom. vi. p. 377.—As water, when expoſed to fire in any veſſel from which it can evaporate, does only receive a determinate degree of heat, which always remains the ſame, when once it has arrived to the boiling heat, it follows, that by the *water bath*, a degree of heat always equal may be tranſmitted with certainty. Further, this degree of heat being incapable of burning, or of communicating an empyreumatic quality to matters ſuſceptible of it, the *water bath* has alſo the advantage of not expoſing ſubſtances to this inconvenience.

When veſſels in which DISTILLATIONS and DIGESTIONS are made, are placed in *ſand*, then a SAND *bath* is formed. This intermediate ſubſtance of ſand is very convenient to moderate the too great activity of the naked fire, and to tranſmit any degree of heat, from the weakeſt, to a red heat. As this *bath* is attended with leſs trouble, and requires leſs apparatus than the *water bath*, it is much uſed in laboratories. Nothing is requiſite for the *ſand bath*, but an earthen or iron veſſel filled with fine ſand, which is fitted in to a furnace, and capable of containing the cucurbits, retorts, matraſſes, or other veſſels containing the matter to be operated upon.

Ancient chemiſts had all a tincture more or leſs of ALCHEMY; they were therefore much more careful and laborious in their operations, and uſed many different *baths*, in order to apply preciſely the proper degree of heat. They uſed the vapour of water, aſhes, dung, the ſubſtance remaining after the ſqueezing of grapes, and whatever elſe they imagined moſt proper for their purpoſe. Hence the names of *aſh bath*, *bath of a horſe's belly*, *dung bath*, *mercurial bath*, *vapour bath*, &c. See Commerc. Phil. Techn. 4to. p. 31.—But an intelligent experienced artiſt may very well perform all the chemical operations which do not require a naked fire, by means of the *water* and *ſand baths*; and as they are the moſt convenient, they are the only *baths* now generally uſed. Macquer.

BATH is alſo uſed by *Chemiſts*, to ſignify the fuſion of metallic matters in certain operations. In REFINING or CUPELLING, for example, the metals are ſaid to be *in bath* when they are melted. When gold is purified by antimony, this ſemi-metal melted is called by ſome, the BATH *of gold*; alchemiſts, who conſider gold as the king of metals, call antimony the *bath of the king only*, becauſe in fact gold only can reſiſt the action of antimony. Macquer. See BALNEUM.

BATH, in *Jewiſh Antiquity*, is alſo the name of a liquid meaſure, containing the tenth part of an omer.

Some diſtinguiſh five kinds of *baths*; viz. the greater *bath*, containing 80 pounds of water, or, according to Joſephus, 1440 Roman ounces; the ſecond *bath*, containing 100 ounces; the third, 66⅔ ounces; the fourth, containing 25 ounces; and the fifth, 6⅔ ounces of water. Beverin. Synt. de Menſ. p. ii. p. 127.

Some have eſtimated the ſacred *bath* at half as much again as the common *bath*; but there is no ſufficient reaſon for this diſtinction. Calmet.

BATH, *knights of the*, a military order in England, inſtituted by Richard II. who ordained that there ſhould be no more than four; however, his ſucceſſor Henry IV. increaſed them to forty-ſix. Their motto was *Tres in uno*, ſignifying the three theological virtues.

It was the cuſtom to bathe before they received the golden ſpurs; but this was only obſerved at firſt, being afterwards gradually dropt: however, it was this occaſioned the denomination of *knights of the bath*.

The order of *knight of the bath* is ſcarce ever conferred, but at the coronation of kings, or the inauguration of a prince of Wales, or duke of York. They wear a red ribband belt-wiſe; to which is affixed the badge of the order, viz. a ſceptre, roſe, thiſtle, and three imperial crowns joined within a circle; upon which circle is the motto in pure gold. Each knight wears a ſilver ſtar of eight points upon the left breaſt of his upper garment.

Camden and others ſay, Henry IV. was the inſtitutor in 1399, and upon this occaſion: that prince, being in the *bath*, was told by ſome knight, that two widows came to demand juſtice of him; when his majeſty, leaping out of the *bath*, cried, He ought to prefer doing juſtice to his ſubjects to the pleaſure of the *bath*; and thereupon created *knights of the bath*.

Some authors, however, will have the order of the *bath* to have been on foot long before Henry IV. even as early as the Saxon times: at leaſt, it is certain, the *bath* has been uſed long before, in the creation of knights, in France; though there was no order of knights under this name.

The order of the *bath*, after remaining many years extinct, was revived under king George I. by a ſolemn creation of a great number of knights.

BATH *metal*, is a preparation of copper with zink, which gives a more beautiful colour than the calamine uſed in the preparation of the common braſs. See *Prince's* METAL.

BATH *Kol*, in *Jewiſh Antiquity*, a ſpecies of revelation by a voice or echo from heaven.

The word ſignifies in the Hebrew original, *daughter voice*, or *daughter of a voice*; for it may be interpreted both ways. It ſeems to have been thus called with reſpect to the oracular voice delivered from the mercy-ſeat, when God was conſulted by *urim* and *thummim*: this latter was the grand and primary voice of revelation; the former, of ſecondary dignity, and inferior to it as the daughter to the mother. Prideaux Connect. P. ii. l. 5. p. 462.

The Jewiſh writers ſpeak of three kinds of revelation among them; the firſt by *urim* and *thummim*, which obtained from the erecting of the tabernacle to the building of the temple; the ſecond by the ſpirit of prophecy, which prevailed from the beginning of the world to the death of Malachi; the third, the *bath kol*, or *filia vocis*, which took place when the ſpirit of prophecy was wholly ceaſed in Iſrael; and was, ſays Grotius, the ſole oracle which remained during the time of the ſecond temple. Godw. Moſes and Aaron, lib. iv. c. 8. Lightfoot's Works, tom. i. p. 485. Grot. in John, xii. 28.

Danzius has a diſſertation on the iniquity and impoſture of the *bath kol*; *De filia vocis nefanda, divinæ æmula.*

BATHING, the act of uſing or applying a bath; that is, of immerging the body, or part of it, in water, or other fluid. See BATH.

Bathing, on a religious account, is more properly called ABLUTION, or BAPTISM.

Bathing is a practice of great antiquity. The Greeks, as early as the heroic age, are ſaid to have bathed themſelves in the ſea, in rivers, &c. We even find mention in Homer of hot baths in the Trojan times; but theſe ſeem to have been very rare, and only uſed on extraordinary occaſions. Athenæus ſpeaks of hot baths as unuſual even in his age. In reality, public baths appear to have been diſcouraged, and even prohibited, by the ancient Greeks, who were contented to waſh themſelves at home in a ſort of *bathing* tubs. Pott, Archæol. tom. ii. lib. iv. c. 19.

The method of *bathing* among the ancient Greeks was, by heating water in a large veſſel with three feet, and thence pouring it on the head and ſhoulders of the perſon, ſeated in a tub for that purpoſe, who, at coming out, was anointed with oil. Burette, in Hiſt. Acad. Inſcr. tom. i. p. 117.

The Romans were alſo long ere they came into the uſe of baths, the very name of which, *thermæ*, ſhews they borrowed it from the Greeks. As the ancient Romans were chiefly employed in agriculture, their cuſtom was, every evening, after work, to waſh their arms and legs, that they might ſit down to ſupper with more decency: for it is to be obſerved, the uſe of linen was then unknown, and the people of that age went with their arms and legs bare, and conſequently expoſed to duſt and filth. But this was not all; for every ninth day, when they repaired to the city, either to the *nundinæ*, or to attend at the aſſemblies of the people, they bathed all over in the Tiber, or ſome other river which happened to be neareſt them. This ſeems to have been all the *bathing* known till the time of Pompey, when the cuſtom began of *bathing* every day. Mercurial. de Art. Gymn. lib. i. c. 10. Mem. Acad. Inſcr. tom. ii. p. 414.

The Celtic nations were not without the uſe of *bathing*: the ancient Germans bathed every day, in winter in warm water, and in ſummer in cold. This is what Tacitus ſeems to ſuggeſt, *ſtatim e ſomno—lavantur, ſæpius calida, aut apud quos plurimum hiems occupat.* De Mor. Ger. cap. 22.

Bathing, among the ancients, made a part of diet, and was uſed as familiarly as eating, or ſleep: on which footing it ſtill remains among the Turks, where there are public baths in every town, and even village. But among us, it is become only a part of medicine, and rarely practiſed but under the direction of phyſicians. Great diſtinction is now made between thoſe who are fit, and thoſe unfit, to undergo the operation, and many rules and preſcriptions given for the more ſucceſsful uſe of it.

Bathing is either cold, or hot, or warm, ſimple, or mixed, according to the temperature and conditions of the fluids.

Bathing in waters too hot, heats and expands the blood and humours to exceſs; whence palpitations of the heart, pains in the head, faintneſs, &c. The miſchief is ſtill greater if the body be full of blood, or turgid with ill juices.

The waters uſed for *bathing* are either pure and ſimple, or ſuch as abound with heterogeneous parts of different kinds. Thoſe fitteſt for medicinal purpoſes are, the pureſt, lighteſt, ſimpleſt, and moſt free from all participations of mineral or metallic parts.

Bathing is not to be practiſed without great care and precaution, in melancholic, œdematous, or paralytic caſes. As to the *phthiſis*, authors are divided: ſome abſolutely reject the uſe of baths for this diſorder; others allow it, provided the water be only of a moderate degree of warmth, and the body be previouſly prepared by laxatives and venæſection. Different *baths* have different effects, according to the ingredients of their waters: thoſe of the vitriolic kind are ſaid to fix the morbific matter in arthritic diſorders, and render them ſtill more obſtinate. They are alſo leſs proper where the body is foul, and the *viſcera* weak or obſtructed, being apt to render ſuch patients hydropic.

Sulphureous and aluminous *baths* are commended againſt an incontinency of urine; but prove hurtful to cachectic habits.

The Caroline *baths* have this quality beyond other hot waters, that they do not ſoften the body, but rather, by reaſon of the copious earthy and aſtringent matter they contain, bind up the parts, ſtrengthen thoſe which are weak, block up the pores, and thus produce a contrary effect to other hot ſprings.

Hence they are prejudicial to people of a tender and delicate habit, where the body is foul, or affected with ſpaſmodic, hypocondriac, or colic diſorders, and in many other caſes. They are of uſe where the limbs are to be ſtrengthened, the ligaments and tendons to be gently excited to motion, and the body to be dried.

The uſefulneſs and miſchievouſneſs of *bathing* makes a complicated conſideration, only to be decided by taking the nation, climate, habit, the time of the day, ſeaſon of the year, diſorder, &c. of the perſon, and the particular qualities and ingredients of the water into conſideration.

In general, hot or warm *bathing* tends to relax the ſkin, promote perſpiration, cleanſe the body, dilute the blood, and carry off cuticular foulneſſes by the pores. To conceive the manner of its operation, it is to be obſerved, that when the body is plunged in a pure, light, and ſimple warm water, it muſt neceſſarily undergo the following changes:

1. The heat neceſſarily rarifies and expands the blood and all the juices, and thus dilates the whole ſyſtem of the veſſels; the conſequence of which is, that the pulſe, or contractive ſtroke of the arteries, increaſes; whence the blood circulates with greater force, and the external parts of the body become red, and begin to ſweat.

2. By the gravity of the water, the body, plunged therein, is greatly altered; as its ſurface, in that caſe, ſuſtains a violent preſſure, which ſqueezes the blood forcibly in upon the *viſcera*. See BATH. But the additional preſſure in common cold *bathing* is very inconſiderable, and therefore the contraction of the fibres is principally owing to the ſtimulus of cold. Thus, whilſt the veſſels are compreſſed from without, and dilated from within, the inteſtine motion of the conſtituent parts of the blood is increaſed, and conſequently the viſcid juices are thus diſſolved, obſtructions overcome, and the humours are better fitted to paſs through all the ſecretory and excretory ducts.

Thence, as by the water's gravity the parts are compreſſed from without, and the blood driven plentifully upon the heart, the lungs, the brain, and the larger veſſels, we ſee why, if the bath be too hot, it cauſes palpitations of the heart, oppreſſions in the *viſcera*, or ſometimes fainting; and again, why, when the body is foul, or full of bad juices, it produces continued fevers, or inveterate intermittents, if the firſt paſſages abound with crudities. Theſe ill effects are more frequently obſerved from the hot ſprings, which have alſo an aſtringent quality, as the violently hot Caroline ſpring evidently has.

3. Another change enſues upon the body from the moiſture of the bath, which, aſſiſted with a temperate heat, procures a great ſuppleneſs to the ſkin and fibres; inſomuch that, upon coming out of the water, the whole habit of the body ſwells conſiderably, is looſened in its texture, and opened in its pores and veſſels; whilſt the blood and juices have a more free paſſage to the ſurface. Hence it is, that if a perſon go directly out of the warm bath to bed, he preſently begins to ſweat plentifully, which is the beſt effect that can proceed from *bathing*, and of great ſervice in the cure of diſeaſes.

Bathing is found more eſpecially beneficial to thoſe of a moiſt habit, and who have ſtore of humours in their veſſels and pores, as it colliquates the humours, and promotes their diſcharge.

In the ſummer it ſerves to cleanſe the ſkin from ſweat, and keep the pores open; in winter, to promote perſpiration. It is uſed with good effect in many chronic diſorders, in atrophies, the ſtone, &c. It is a good palliative in the *coryza*; but uſeleſs in the jaundice, and hurtful in the *aſcites* and *ſciatica*, and generally to all in a time of plague. By its promoting perſpiration, it becomes noxious to perſons of a dry conſtitution, as it exſiccates too faſt; more eſpecially to perſons hectically inclined, as by means thereof the humours, already too prone to colliquation, are ſtill more reſolved.

Cold *bathing* was in high eſteem among the ancient phyſicians for the cure of diſeaſes, as appears from Strabo, Pliny, Hippocrates, and Oribaſius. Whence frequent exhortations to waſhing in the ſea, and plunging into cold water.

Hot *bathing* firſt, and then uſing the cold *bath* immediately afterwards, is ſaid to be good for the SCURVY, at leaſt for that kind ſo common in cold countries. This is confirmed by the practice of the Ruſſians, and other northern nations.

In violent pains, hot and cold *bathing* produce the ſame effects, and in the ſame way, in one reſpect, viz. aſſuaging the pain, by taking off the attention from it. When one is much pained, withdrawing the action of the nerves correſponding to the affected part, employing many nerves, or ſome of them violently, another way, will ſeldom fail of giving eaſe. One pain is often a cure for another. Applying garlic to a diſtant part, burning, and bliſtering, cure altogether in this way.

The efficacy of hot and cold *bathing* is acknowledged in many caſes. How they act, ſeems a queſtion not yet fully decided in the writings of phyſicians.

BATHING *a hawk or falcon* is, when being weaned from her ramage fooleries, and alſo hired, rewarded, and thoroughly reclaimed, ſhe is offered ſome water to *bathe* herſelf in, in a baſon, where ſhe may ſtand up to the thighs, chooſing a temperate clear day for that purpoſe. By the uſe of *bathing* ſhe gains ſtrength, with a ſharp appetite, and ſo grows bold.

BATHING, among the Cophts and Æthiopians, denotes the day of Chriſt's baptiſm, reputed the 6th of January; when, from an opinion of an extraordinary ſanctity in the waters on that day, they not only, by ancient cuſtom, baptized their catechumens, but were re-baptized themſelves. The water of this day they carry home to keep: and Chryſoſtom aſſures us, that it had often been known to remain ſweet, uncorrupted, for two or three years. Orat. 74.

BATHING *tub*, in the Roman baths. There were two kinds of *bathing tubs*, the one fixed, and the other moveable: among the latter, ſome were contrived on purpoſe to be ſuſpended in the air, whereby, to the pleaſure of *bathing*, was added that of being ſwung or rocked, by the motion given to the *bathing tub*. Burette, in Hiſt. Acad. Inſcript. tom. i. p. 123.

BATHMUS, βαθμος, from βαινω, *I move*; an appellation given to ſuch cavities of bones as receive the prominences of other bones into them.

BATHRUM, a name given by ancient ſurgeons to a kind of ſtool or bench proper for the reduction of diſlocated bones. This is called βαθρον Ἱπποκρατειον, or the *Hippocratic ſtool*. Its deſcription and uſe are repreſented at large by Sculterus, Arm. Chir. p. i.

BATHYCHRUS *color*, in *Painting*, a term uſed by the Greeks to expreſs what the Romans call *auſterus color*. Such a colour was coarſe and dull, and wanted the life of the florid colours. See EVANTHI *colores*.

BATILLUS, a muſical inſtrument made of metal, in the form of a ſtaff, furniſhed with metalline rings, which being ſtruck, yielded a kind of harmonical ſounds; uſed by the Armenians in their church-ſervice.

BATIS, in *Botany*, a name by which Pliny and ſome other authors call the ſea-plant, which we know by the name of *ſamphire*, and eat as a pickle.

In the Linnæan ſyſtem, it is a genus of the *diœcia tetrandria* claſs.

BATIS, in *Ichthyology*; ſee BATOS, and RAIA.

BATISTE, in *Commerce*, a fine white kind of linen cloth, manufactured in Flanders and Picardy.

There are three kinds of *batiſte*; the firſt very thin; the ſecond leſs thin; and the third much thicker, called Holland *batiſte*, as coming very near the goodneſs of Hollands.

The chief uſe of *batiſte* is for neck-cloths, head-cloths, ſurplices, &c.

BATMAN, a weight in Turky, conſiſting of ſix okes. Forty of theſe *batmans* make a camel's load, and amount to about ſeven hundred and twenty pounds Engliſh weight.

Batman, or *battemant*, is a weight uſed in Turky and Perſia. The Turkiſh *batman* is of two kinds; the larger containing ſix okes, or *ocquos*, at three pounds three quarters Paris weight the *ocquo*; ſo that the *batman* amounts to about twenty-two Paris pounds and an half; the ſmaller, compoſed likewiſe of ſix *ocquos*, at fifteen ounces the *ocquo*, amounting to five pounds ten ounces.

The Perſian *batman* is likewiſe of two kinds: one called the *king's weight*, *batman de chabi*, or *cheray*, uſed for weighing moſt of the neceſſaries of life, equivalent to about twelve pounds and an half Paris weight; the other called *batman of Tauris*, equal to ſix pounds four ounces Paris or Amſterdam weight.

Theſe, at leaſt, are the proportions given by Tavernier. Chardin rates the Perſian *batmans* ſomewhat lower, viz. the former at twelve pounds twelve ounces; and the latter at five pounds fourteen ounces.

BATON, or BATOON, in *Heraldry*; ſee BASTON.

BATON, in *Botany*, a name by which ſome authors call the true turpentine-tree.

BATOONS *of St. Paul*, BASTONCINI *di San Paulo*, in *Natural Hiſtory*, a name given by ſome of the Italian writers, as Aguſtino Scilla, and others, to the *lapides Judaici*, or other ſpines of *echini*. Theſe are found in vaſt abundance in the iſland of Malta; and as every thing there is commemorated with ſome title, with St. Paul at the end of it, theſe are called *baculi Sti Pauli*, or *St. Paul's batoons.*

BATOS, in *Ichthyology*, the name given by Ariſtotle, and all the old writers, to the ſkaite, or ſlaire. They have generally called the male BATOS, and the female BATIS. It is a ſpecies of the RAIA, and is diſtinguiſhed by Artedi, by the name of the variegated ray, with the middle of the back ſmooth, and with one row of ſpines on the tail. Albertus calls it the *rayte*, and *rubus*.

BATRACHIAS *lapis*, the *frog-ſtone*, a name applied by different writers to two very different ſubſtances; ſome underſtanding by it lumps of common flint, which have accidentally formed themſelves into this figure; and others, thoſe pieces of amber which contain either a whole frog, or any part of one.

BATRACHITES, among *Ancient Naturaliſts*, a kind of gem found in Egypt, denominated from its reſemblance in colour to a frog.

The word is formed from βατραχος, *rana, a frog.*

Pliny ſpeaks of three ſtones under this denomination; *unam ranæ ſimilem colore, alteram ebori* (or rather, according to Hardouin's correction, *ebeni), tertiam rubentis e nigro.*

The *batrachites* differed from the modern BUFONITES, which does not appear to have been known to the ancients.

BATRACHOMYOMACHIA, *battle of the frogs and the mice*; the title of a burleſque poem, uſually aſcribed to Homer.

The word comes from the Greek βατραχος, *frog*, μυς, *mouſe*, and μαχια, *pugna.*

The ſubject of the war is the death of Pſycharpax, a mouſe, ſon of Toxartes, who, being mounted on the back of Phyſignathus, a frog, on a voyage to his palace, to which he had been invited, was ſeized with fear when he ſaw himſelf in the middle of the pond, ſo that he tumbled off, and was drowned. Phyſignathus being ſuſpected to have ſhaken him off with deſign, the mice demanded ſatisfaction, and unanimouſly declared war againſt the frogs. Stephens, Nunneſius, and other modern authors, take the poem not to be Homer's; but ſeveral of the ancients ſeem of another opinion; and Statius, who wrote under Domitian, makes no doubt of it. See Fabric. Bibl. Græc. lib. ii. c. 1. § 3.

BATRACHOSALIS, in *Ichthyology*, a name given by many of the Greek authors to the LOPHIUS, or *rana piſcatrix* of authors.

BATRACHUS, a ſpecies of the SILURUS.

BATTABLE *ground*, denotes land lying between England and Scotland, heretofore in queſtion to which it belonged, when they were two diſtinct kingdoms.

The word imports as much as *litigious*, or *diſputable ground*; from *battre, to beat* or *fight.*

BATTALIA, an army ranged in order of battle, or ready for engagement.

In this ſenſe, we meet with the depth of a *battalia*; to march in *battalia*, with the baggage in the middle; to break the *battalia*, &c. In the Roman *battalia*, the HASTATI made the front.

BATTALION, in the *Military Art*, a little body of infantry ranged in form of battle, and ready to engage.

The word comes from *battel, an engagement of two armies*, &c. and that from *battualia, the place where two men fight*; or from *battalia, the exerciſe of people who learn to fight.*

A *battalion* uſually contains from five to eight hundred men, of which one third were formerly pikes in the middle, and the other two thirds muſqets poſted on the wings: they are now armed with firelocks, ſwords, and bayonets. The *battalion* is divided into thirteen companies, one of which is grenadiers, but the number of men it conſiſts of is not determined.

Battalions are uſually drawn up with three men in file, or one before another.—Some regiments conſiſt but of one *battalion*, which is too few: others more numerous are divided into four or five, which are too many.

M. De Folard decries the modern method of ranging *battalions* ſo ſhallow, which renders them weak, and unable to ſupport each other; ſo that they are eaſily penetrated or broken: an eſſential fault in the modern tactics. The real ſtrength of a corps, according to this author, conſiſts in its thickneſs, or the depth of its files, and their connection and cloſeneſs. This depth renders the flanks almoſt as ſtrong as the front. He adds, that it may be laid down as a maxim, that every *battalion* ranged deep, and with a ſmall front, will beat another ſtronger than itſelf, ranged according to the uſual method. Polyb. tom. i. p. 7. But this opinion of Folard has not been adopted in modern practice; and his theory has been vigorouſly attacked by two French officers in the ſervice of the States-General. They admit the ſuperior ſtrength of his column to that of a modern *battalion*, if the action were to be decided with pikes and ſwords; but where fire-arms muſt be uſed, M. Folard's column is ſo very ill diſpoſed for this purpoſe, that it muſt infallibly be deſtroyed.

BATTALION, *round*, is that in which the ſoldiers are ranged in concentric circles. This was much uſed by the Romans, and called *in orbem*. Cæſar, in his Commentaries, has given many inſtances of this kind of arrangement.

BATTALION, *ſquare*, is that, where the number of men in file is equal to the number of men in rank. To form any number of men, e. g. 500, into a *ſquare battalion*, extract the neareſt ſquare root of 500, which is in integers 22; and that will give the number of men for rank and file. There wlll be a remainder of 16 men, who may be diſpoſed of, as the commander thinks beſt.

M. Folard ſhews at large, in his book *De la Colonne*, the weakneſs of the *ſquare battalion*. Both the full and the *hollow ſquare*, according to him, are equally bad.

BATTALION, *triangular*, is a body of troops diſpoſed of in the form of a triangle; in which the ranks form an arithmetical progreſſion.

BATTALION, *doubling a*, is a motion of the ſoldiers, whereby two ranks, or two files, are put into one.
